We recommend, therefore, that preparations should be made by the mains departments for dividing up and testing systematically their whole networks as soon as the weather breaks. Not only will it then be possible to discover and repair any incipient faults that may be developing—thus guarding against subsequent surprise interruptions to supply—but this course will have the additional advantage of enabling such repairs as will be needed to be carried out during the season of light load, when the temporary disconnections that may be necessary can be made with the least inconvenience to consumers.

"THE FUSING OF ELECTRIC WIRES"

AT least one daily paper has stated that the serious fire at the Carlton Hotel, London, last week was due to the fusing of electric wires, but our readers are by this time sufficiently experienced to know that this has become almost the stock explanation that is given when the source of a fire is undiscoverable. The official report of the Fire Brigade was to the effect that the cause of the outbreak was unknown, and at the coroner's inquest on Saturday there was not a particle of evidence pointing to the fire having originated in the electrical circuits. Superintendent W. J. May, of the Fire Brigade, said that there were wires short-circuited after the fire, but it is hardly conceivable that this should be otherwise in view of the general damage done to the building. Another witness, Mr. S. Neumann, the staff manager, spoke of noticing a smell resembling that of burnt rubber while on his round, but as he saw the fire well alight and flames shooting through the service lift when he got downstairs, the smell he noticed was obviously that of some burning material after the outbreak, and does not point in any way to the fire being occasioned by the short-circuit of a cable.

As was to be expected, the jury found that there was not sufficient evidence to show how the fire originated.

Electricity in Textile Mills.—In a note on page 442 of ELECTRICAL ENGINEERING of August 3rd, we regret that the name of Mr. S. D. Schofield, Electrical Engineer to the Shipley Urban District Council, was given incorrectly as J. Schofield in the list of members of the Textile Mill Driving Joint Committee.

CORRESPONDENCE

THE ELECTRICAL CONTRACTORS' ASSOCIATION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—You ask why the E.C.A. is not progressing. I may sum up the situation in one word: "jealousy." Our branch here has not met for *eight* months. Ask why, and the reply is "There is nothing to discuss."

This is pure nonsense. There are many burning questions to discuss: The general keeping up of prices; the keeping out of little firms that spring up for a year, break the prices, and go bankrupt; the blacklisting of competing wholesale houses; &c.

For anything to be done to meet *any* of these difficulties contractors must have confidence, and lay information before *regular* meetings. It is here the big failure comes. Contractors are frightened of bringing up anything that may place a competitor in possession of the name of a customer. The same with the wholesale-cum-wiring house. The idea is to get the sublet contract. Refusing to tender and blacklisting the firm seems to be utterly unthought of. Others will tender if we don't, is the cry.

A scheme of development with some backbone in it organised from the central office. Something to show what the C.M.A. exists for, and then for big revival meetings. Each member seeing how many contractors he can get to come. An active policy, and then we shall have sufficient weight to make ourselves a power instead of a sleepy, go-as-you-please, troubles-must-not-be-mentioned, pleasure club.

Yours faithfully,

Sheffield. H. G. HALL.
Aug. 15th, 1911

ELECTRIC STEEL

AN interesting article appeared in last week's "*Times* Engineering Supplement" on the claims of the electric furnace for melting and refining steel. It is pointed out that the electric furnace can give larger casts with cheaper and cleaner melting, and that the demand for big ingots of crucible quality for die ingots up to 2 tons weight of sound and regular steel for crank shafts and car axles is growing rapidly.

The writer points out that a 2-ton electric furnace cast is as easy if not easier to effect than a 50-lb. crucible cast. Taking the theoretical figure of 490 Board of Trade units for melting, superheating, and "killing" one ton of steel, and assuming an efficiency of from 50 per cent. to 55 per cent., and a price of 0·6d. per unit (which is being charged by the Sheffield Corporation for this purpose), the melting cost for power comes out between £2 and £2 3s. per ton of steel product, say £3 when lining repairs, &c., are included. This can be compared with the cost of about £7 10s. per ton by the ordinary methods. The writer thinks that the immediate commercial future of the furnace is for small foundries making light and intricate castings, and considers that the characteristics of electric furnaces at the present time fit them for the manufacture of special steel for which there is no demand in great bulk. Later on he thinks that the results will lead to the replacement of crucible steel, Swedish billets, and products of intermediate quality, by electric steel in tube-making concerns. The statement that has been made that the electric furnace can produce a high-class steel from inferior materials he characterises as merely an enthusiastic deduction from laboratory experiments.

As to the characteristics of electric steel, he points out that steel can only be freed from occluded gases and deoxidised by an iron free slag, and it is on this that the superiority of electric over other steel depends. He gives particulars of some tests which certainly show the superiority of electric over ordinary steel, but he points out that the quality depends not only on the purity of the raw materials, but largely on the skill of the metallurgist, and he sounds a note of warning against forming a judgment on the material produced by inexperienced melters or ineffective furnaces.

The Institution of Civil Engineers.—The Council of the Institution of Civil Engineers have made the following awards in respect of students' Papers read during the session 1910–1911:—The "James Forrest" Medal and a Miller Prize to Mr. D. Hay, B.Sc. (Birmingham), and Miller Prizes to Messrs. D. A. Howell (Bristol), R. Bonner (Bristol), G. F. Walton (London), R. G. Parrott (Manchester), E. E. Farrant (London), A. C. Dean. B.Sc. (Manchester), H. W. Coales (Birmingham), A. H. Meade (London), A. C. Swales (Leeds), and H. J. F. Gourley, B.Eng. (Manchester).

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published August 10, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

16,904/10. **Contact Switches.** S. Lichtenfeld. Two strips of thin sheet-metal of opposite polarity are placed on either side of a room under the carpet. Extensions, arranged alternately, are attached to these. A series of curved strip metallic springs are fixed to one set of extensions, which bridge one or more of the extensions of opposite polarity, so that when they are subjected to pressure, contact is made and the circuit completed. These are suitable for working electric circuits, burglar alarms, etc. Five figures.

17,236/10. **Grinding Carbon Brushes.** A. Watkins. A machine for grinding the contact surfaces of dynamo brushes has a rocking frame with inclined sides, and carried by a spindle. The spindle is mounted in side frames supporting a cross piece, which carries a wooden block with a curved surface to correspond to that of the commutator. One end of the spindle is fixed to a handle for rocking the frame to and fro, and over the block a sheet of glass-paper is placed, and fixed by clamps at each end of the frame. The brushes are held in a fixed position by carriers attached to the centre of the side frames, and are adjusted to the desired angle by a pivoted plate holding the same. This may be set to any angle by a rod engaging with radial slots formed in the carriers and fixed by screw nuts. The grinding is effected by working the handle backwards and forwards. Four figures.

17,469/10. **Tungsten Filaments.** F. Eisner. A new binding medium, which renders the filament free from carbon, is composed of hydrazine or its compounds, which is mixed with the tungsten. The mixture is squirted through a dye, forming a thread, which is heated in vacuo or in a reducing gas to convert it into a conductor. This heating partly decomposes the mixture and allows some of the metallic elements to escape. In order to complete the elimination of the foreign elements, and to weld the tungsten particles together, the filament is flashed by a current in a glass bell.

17,684/10. **Heating Apparatus.** R. F. Venner. For the purpose of increasing the efficiency of such apparatus, an insulated resistance conductor is immersed in mercury, which is poured into the heating vessel. This is made of a material which is not affected by the mercury. The conductor terminals are hermetically sealed into the vessel, which may be advantageously exhausted of air. The heat generated in the conductor causes a continuous circulation of the mercury, which transfers the heat to the walls of the vessel, the surface of which is much larger than that of the conductor itself.

21,206/10. **Production of Metals.** J. Härdin and Electric Furnaces & Smelters, Ltd. This invention refers particularly to the reduction of tin ores. Both the reduction and the purification of the impure metal are effected at a very high temperature of 1,500 to 2,500° C. in one, instead of the usual two furnaces. The impurities are removed by adding to the furnace a quantity of a strong and rapid oxidising agent, such as saltpetre, in the form of briquettes from 1 in. to 1½ in. cube. To prevent the metal leaking through the porous lining, the latter is lined at the back with sheet-metal, with openings at the lowest part, through which the metal can escape into a channel underneath. Two figures.

27,240/10. **Incandescent Lamp.** R. Bacci. A lamp capable of being disassembled for the renewal of parts, has the glass part of the base, which makes contact with the bulb, made either concave or convex, and their surfaces are ground so as to make an exact fit. In addition to this, air-tightness is further assured, first by coating the surfaces very uniformly with a fatty substance, such as grease having a graphite base, and secondly by a collet of a substance soluble in boiling water, which is placed around the exterior of the joint. The grease does not solidify nor effect a tight hold when the lamp is put into boiling water, but allows the bulb to come away. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables & Wires, Insulating Materials, &c.: Bullers, Ltd., and Twiss [Insulators] 3,272/11.

Dynamos, Motors and Transformers: Electric & Ordnance Accessories Co., Garner, and Mueller [Controllers for] 17,349/10; Hallstream [Automatic stopping of machines] 18,012/10; Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Controllers] 18,191/10; Brown, Boveri & Co. (*Akt.-Ges. Brown, Boveri et Cie.*) [Dynamos] 18,195/10; Fried. Krupp Akt.-Ges. [Separately-excited current generators] 7,045/11.

Electrometallurgy and Electrochemistry: Helfenstein [Furnace] 17,650/10; Imray (*Shawinigan Carbide Co.*) [Furnace electrodes] 9,633/11.

Incandescent Lamps: Wardle [Lanterns for] 18,241/10; Pape, 29,939/10; Lobel and British Ever Ready Electrical Co. [Portable] 9,050/11.

Instruments and Meters: Kessels [Printing telegraph instruments] 17,322/10; Weintraub [Meters] 3,648/11.

Switchgear, Fuses and Fittings: Olvis [Switching means for accumulator charging] 9,775/10; Reyrolle and A. Reyrolle & Co. [Cut-outs] 19,851/10; Leitner [Automatic switches] 20,257/10; Sutton and Sutton [Control of electrical circuits] 20,685/10; Etchells [Push-button switches] 22,355/10; Electric & Ordnance Accessories Co. and Collins [Time limit devices] 4,457/11; Wallace and Graham [Switch] 6,861/11 and 6,862/11; Creswick and Bentham [Cartridge fuses] 9,038/11.

Telephony and Telegraphy: Neuhold [Automatic systems] 23,669/10.

Traction: Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Alt.-current block circuits for signalling] 10,834/11.

Miscellaneous: J. Hawley, Ltd., Saunders and Jones [Electromagnetic separator] 17,126/10; Belshaw [Electric light reflector] 17,902/10; Tribelhorn [Driving mechanism] 3,151/11; Timar and Presser [Welding] 4,602/11; Whalton [Hammers] 12,742/11; Galletti [Production of quenched spark discharges] 10,639/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: Benz & Co., Rheinische Gasmotoren Fabrik Akt.-Ges., 16,604/11.

Electrochemistry, &c.: Elektrochemische Werke Ges. [Production of ammonium nitrate] 16,426/11.

Switchgear, &c.: Stille [Switch] 13,648/11; Gasnier [Electromechanical speed control] 16,644/11.

Miscellaneous: Chemische Fabrik Buckau [Manufacture of magnetite electrodes] 16,902/11.

Amendments

25,129/09. **Block Signalling Systems.** Hans Theodore Hansen. The amendments to this specification, referred to in Electrical Engineering of June 15th, 1911, p. 334, have been allowed. It deals with a method of utilising Hertzian waves, which control an apparatus on the train for setting a signal at danger.

25,670/10. **Röntgen Ray Apparatus.** H. F. Bigge and F. R. Butt. As a result of the extended investigation under Section 8 of the Patents Act, a disclaiming note has been inserted in this specification. It provides certain improvements, so that it can be used for either right- or left-hand operation, or from above or below the patient.

1,037/11. **Switches.** A. W. Penrose. This specification has been amended under Section 8 of the Patents Act, by way of disclaimer. It deals with the construction of a switch in convenient form for readily attaching the conductors.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: A. Gross, 9,591/07.

Distributing Systems, &c.: Bullers, Ltd., and E. H. Chambers [Insulators] 9,515/07; S. B. Storer [Transformers] 9,683/07.

Dynamos, &c.: Akt.-Ges. Brown, Boveri et Cie. [Regulation of] 9,306/04 and 9,385/04; A. F. Hills, D. Urquhart, and A. E. Honey, 9,372/04; Elektricitäts Akt.-Ges. Vorm. W. Lahmeyer & Co. [Regulation of] 8,785/06; F. Thursfield [Control of] 9,576/07.

Instruments, &c.: B. North and R. Pohl [Meters] 9,463/07.

Storage Batteries: H. W. Lake (*C. E. Hite, U.S.A.*) [Primary] 9,477/07.

Switchgear, &c.: W. W. Lackie, W. T. Calderwood and W. H. D. MacEwen [Switches] 9,535/03; V. Mainprize [Cut-outs] 9,434/07; P. Watson [Switches and cut-outs] 9,652/07; C. A. Day (*Dr. Paul Meyer Akt.-Ges.*) [Switches] 9,743/07; Electric & Ordnance Accessories Co. and R. F. Hall [Cut-outs] 9,868/07.

Telephony, &c.: Oliver J. Lodge [Telephones] 9,712/98; J Murgas [Wireless telegraphy] 9,726/07; H. J. Roberts, 9,923/07; D. Marzi, 17,704/07.

Traction: S. P. Wood and Mackenzie & Holland [Signal contacts] 9,377/04; H. H. Lake (*Hall Signal Co., U.S.A.*) [Signalling] 9,586/04; A. N. Connett [Points, switches, and conduits] 8,931/05; J. F. Simpson [Track brakes] 9,390/07; H. M. Abernethy and G. L. Weiss [Semaphore signals] 9,437/07, 0,438/07, and 9,439/07.

Miscellaneous: A. E. T. Bergstrom [Locking device for submarine mines] 9,465/07; G. Whittaker and J. R. Ashworth [Magnetic Separators] 9,718/07.

ELECTRIC TRACTION NOTES

The attention of most persons in this country lately has been focussed largely upon the strikes and general labour unrest which has been spreading like an epidemic throughout the land during the last few days, presenting problems still far from solution. So far as the electric traction industry is concerned, the most serious manifestations have been at Glasgow, where on Saturday morning last, after a midnight ballot, about 2,000 motormen and conductors, out of the total of 2,739, struck work, and the service was practically suspended, with the accompaniment of rioting, collisions with the police, damage to the cars, and injury to several persons. The points at issue have been under discussion for some time, and are mainly connected with hours of labour, as to which a compromise was thought to have been arrived at. Attempts were made to persuade the employees at the Pinkston power station to come out, but these remained staunch to their duty. A mass meeting was held on Sunday night, and further disorder broke out. The situation improved slightly on Monday, while the decision of the Corporation was awaited, and a limited service was run with some difficulty. The tramway committee decided to leave the matter in the hands of Mr. Dalrymple, the general manager, and late in the day the men agreed to abide by the arbitration of the Board of Trade. On Tuesday the strike had practically collapsed, and the full service was resumed. Many of the men, however, will not be reinstated. The loss in revenue is estimated at £6,000.

The state of affairs in London is also causing some uneasiness. The men have formulated a series of demands, and, if a satisfactory reply is not received, threaten to hold a mass meeting on Saturday, followed by 24 hours' notice of a general strike on Monday. A scheme of Conciliation Boards has been in operation since Nov., 1909, and has so far dealt satisfactorily with matters in dispute, but the men addressed a deputation direct to the Highways Committee in April last, urging certain demands for slightly higher wages, but mainly revision of working hours; but the Council were unwilling to override the Conciliation Boards, and hence the present deadlock. The final reply of the Council was expected last night.

There is also some unrest among the London Tube railway men, who have taken advantage of the situation to urge demands formulated before the present labour struggles began. A statement has, however, been made by the general manager of the City & South London Railway that there is no disaffection on that line.

In several other towns dissatisfaction has been expressed by labour organisations claiming to represent tramway men, including Blackpool, Preston (where a threatened strike was averted by certain concessions last week), and on the Mossley, Hyde, and Dukinfield tramways, where a demand for increased wages and holidays has been refused by the Ashton Corporation. The motormen and guards on the electrified section of the Lancashire & Yorkshire Railway are also threatening to make common cause with the Liverpool railway strikers.

A strike of the tramway men at Douglas (Isle of Man) has been settled by a revision of wages.

The tramway men at York have also been holding meetings to urge their grievances.

We recently published a note referring to the purchase by the Birmingham Corporation of some sections of the company-worked lines in the district for a sum of £151,500, and are now able to add some additional particulars with regard to the transfer arranged. With the falling in of the leases of the cable line operated by the City of Birmingham Tramways Co. and of the company's electrical lines along the Bristol Road and Pershore Road, the company was left with three "fag ends," viz., (*a*) One at the end of the Bristol Road route, including a power house and depot, about 0·6 mile long; (*b*) a length of line at the end of the Stratford Road route, about 1¼ miles long; and (*c*) a length of line about 0·9 mile long at the end of the Yardley route. In addition to these fragments the City of Birmingham Tramways Company was operating the whole of the tramways in Aston on behalf of the Aston Local Authority. At the present moment all these lines are outside Birmingham, but on and after Nov. 9th next they will be included in the area embraced by Greater Birmingham. The Birmingham Corporation, which has made it a *sine quâ non* for some time past that all tramways in Birmingham shall be operated by the Corporation, were naturally anxious to acquire the residual interests of the City of Birmingham Tramways Company, and, after lengthy negotiations, have purchased these interests, lock, stock, and barrel, for the round sum mentioned, viz., £151,500. These lines will, until the end of the year, be operated by the Company for and on behalf of the Corporation, and from the beginning of next year will pass completely over to the Corporation. The cars of the Birmingham and Midland Tramways Joint Committee (to which the City of Birmingham Tramways Company belongs) will continue to have access to the city, as the working arrangements with the Birmingham Corporation are of a very friendly character and mutually satisfactory. The cars from Dudley already run into the heart of Birmingham under an arrangement with the Corporation, and in a few months' time the cars from West Bromwich will do the same.

The annual report of the Salford Corporation tramways, which now embrace 75 miles of route, employing 200 cars, records an increase in receipts of £4,636. The receipts average 9·98d. per car mile. The year's working resulted in a gross profit of £87,277, of which, after capital charges and payments to local authorities for running powers, &c., had been met, and contributing £692 to depreciation and renewals fund, left £18,750 available for relief of rates. The total working expenses averaged 6·411d. per car mile.

The introduction of trolley omnibuses on the Clepington Road route, Dundee, as feeders to the Maryfield and Downfield routes, has been definitely decided upon. The matter has been under consideration for some time, and a deputation visited the Continent in connection with the matter some time back.

At the annual meeting of the New General Traction Company, Baron d'Erlanger expressed himself confident that the corner had been turned. They awaited the result of arbitration as to the price that they would receive for the Coventry system when taken over by the Municipality, but it was now paying 5¾ per cent. instead of 3½ per cent. as before. The Norwich system was also improving. The profit for the year was £3,675, against £501 for the previous year.

The North Metropolitan Tramways Co. have still their Leytonstone and Barking depôts to be disposed of. As soon as purchasers are found for these the company will go into liquidation.

The year's working of the Stalybridge and District tramways has resulted in a deficit of £5,938. The working expenses per car mile are given as 5·44d.

An interim dividend of 5 per cent. is announced on the ordinary shares of the Oldham, Ashton & Hyde Electric Tramways.

According to an official report just issued, the last extension on the L. and Y. Rly. Co.'s lines to Town Green is already showing gratifying results. One half of the total increase in the number of passengers carried by the L. and Y. Rly. Co. during the past half-year was in respect of the company's electrified lines.

Among forthcoming foreign electric traction enterprises mentioned by the *Board of Trade Journal* are a line from Sevastopol to Alushta (about 84 miles), for which Imperial assent has been granted to the formation of a company by a Mr. Ushkoff, and additional tramways at Barcelona and Madrid.

The York City Council have decided not to proceed at present with the tramway extensions on the Heworth route.

At the yearly meeting of the Mersey Railway Co., J. Falconer, Esq., M.P., the chairman, in reply to a question, stated that the Tirrill Regulator recently installed was effecting a saving of £500 a year, so that it has abundantly justified itself.

The last half-year's working of the Dublin and Lucan Electric Railway has resulted in an available balance of £919 after providing for debenture interest. A dividend at the rate of 5 per cent. on the preference shares is to be paid, with £444 carried forward.

The Board of Trade have inspected and passed the Lanarkshire Tramway Co.'s extensions from Motherwell to New Stevenston.

Hosted by Google

Plans have been approved by the Stalybridge Corporation for reconstruction of track on the Ditchcroft Hill section of the Stalybridge, Hyde, Mossley, and Dukinfield tramways in view of a recent accident.

A network of local lines in southern Hungary, which are now worked principally by petrol-electric cars (see ELECTRICAL ENGINEERING, Vol. IV., page 510), are to be converted to electric traction with overhead lines at 1,650 volts continuous current. Current will be supplied over a three-phase line from a power station at Arad, and converted to 1,650 volts continuous at a sub-station at Gyorok. Each motor coach will have four 50-h.p. motors, arranged in groups of two in series.

According to *Elektrische Kraftbetriebe und Bahnen*, the tramways at Parma are equipped on the single-phase system with 400 volts contact line pressure, and employ the Brown, Boveri Co.'s Deri motor, in which the whole of the control is effected by shifting the brushes. The newest cars have two 25 h.p. motors, and the controller hand wheel is connected to the brush holders by flexible shafts.

A Paper by J. Petit, recently published in the Bulletin of the Soc. Internationale des Electriciens (Paris), contains an account of the Nord-Sud Metropolitan Railway of Paris, which is distinct from the other metropolitan lines and has been in operation for nearly a year. The line is about 12 miles in length, and is run on the three-wire system with 1,200 volts continuous, using the track as neutral conductor. Each train has a motor-car at either end provided with four 125 h.p. motors arranged in groups of two in parallel. One motor-car takes current from the overhead wire, and is thus on one side of the three-wire system, and the other is connected by shoes to an insulated third rail, which forms the other outer conductor and is thus on the other side of the system. This arrangement avoids earth currents, and the insulation has only to be designed for 600 volts. The overhead circuit feeders are of aluminium cable. Some of the motors are of the Thomson-Houston interpole pattern, and others, without interpoles, were supplied by the Westinghouse Co. The power supply is 13,000 volts three-phase, which is converted by transformers and 1,500 kw. rotary connectors in the substations to 600 volts continuous. The convertors are of the American General Electric Co.'s interpole design, and are arranged in pairs on the two sides of the three-wire system.

A form of petrol-electric road train, known as the Müller road train, which has been adopted experimentally by the German Army, is described in *Motor Traction*. The locomotive is equipped with two petrol motors aggregating about 180 h.p., and placed one at each end. These drive continuous-current generators contained in the central cab, which supply current to motors geared to every axle throughout the train. Each vehicle, including the locomotive, is provided with two two-wheeled bogies, upon each of which is mounted a motor driving through a differential gear and side chains. The bogies are connected together by the coupling rods between the vehicles in such a way that every vehicle steers itself automatically in the path of the locomotive. Either one or both of the generating sets may be used according to circumstances, and the control is mainly by generator shunt regulation. Electric braking throughout the train is provided for. For train making up purposes each vehicle is provided with a controller, so that it can be moved about independently by being connected to a flexible trailing cable. The cars can also be fitted with electric cranes if required. A complete train can transport a load of 30 to 33 tons in six waggons at about eight miles per hour.

The Federal Storage Battery Car Company, New York, has issued some striking average figures on the daily performance of Beach cars equipped with Edison batteries. A double-truck car, carrying 190 cells and four 15-ampere 200-volt motors, ran 312·2 miles, making 1·9 stops per mile. It propelled a weight of 16·8 tons at 20·2 miles per hour over an average maximum grade of 1·84 per cent., and it required only 43·8 watt-hours per ton mile. Its longest run on one charge was 135 miles. A single track car with 90 to 110 cells and two 30 ampere 85-volt motors ran 110 miles a day. It made five stops per mile, and carried seven passengers per car mile. It operated over grades of 3·8 to 4·5 per cent., and required 63·4 watt-hours per ton mile. The weight of the car is 7 tons, and it is geared for a speed of 22 miles per hour, including stops. This car has taken the place of steam equipment, and is said to save £7 a day in operating expenses.

TRANSMISSION SYSTEM OF THE CENTRAL COLORADO POWER CO.

A PAPER on the above system was read by P. T. Hanscom at the Annual Convention of the American Institute of Electrical Engineers, of which the following is a summary.

The transformers at the Glenwood power house and at all sub-stations are "delta" connected. Those at the Boulder power house are star connected, and are operated with ungrounded neutral. Two overhead earth wires are used throughout the Boulder line, and for a distance of five miles from any station on the Glenwood line, and they are earthed at each tower. The standard span is 660 ft., and the average throughout the lines is 750 ft. The conductors on the Glenwood line are No. 0 B. & S. copper, composed of six strands with a hemp centre, except between Leadville and Dillon, where they are of No. 1 copper, which is also used on the Boulder line. They are drawn to an elastic limit of 35,000 lbs. per sq. in., and ultimate strength of 60,000 lbs. per sq. in. There are a number of spans of 1,500 ft. and 2,000 ft., and one span of about 2,900 ft. with standard copper conductors. At some of the railroad crossings, and in a few spans exposed to severe winds, ½ in. high-strength stranded steel cable is used for conductors. The records of the operating department show ten interruptions during the season of 1910 from 63 lightning storms on the high-tension lines.

No electrical difficulties were traced to the insulators, while the mechanical difficulties of the insulators were limited to a few defective connecting links between units. The normal strength of the links was equal to the No. 0 conductor. In local sections exposed to the more violent winds, some difficulties were experienced from lack of stability of the conductors due to low horizontal stress and low vertical component at the point of support. In some of the spans where the line crosses the opening of canons, the wind which whirled with great force tended to lift the entire span. This shook the conductors violently, and mixed them up generally. It was therefore necessary to dead-end the spans, to increase the horizontal stress, and in one case, even to increase the spacing of the conductors. High-tension switches of the oil-break type are installed at all sub-stations, and no difficulties occurred in the operation of them with or without load. Under the present operating conditions, the power factor at all the power stations is about unity, so no attempt was made to control the charging current of the line. There are two 5,000 kw. generators installed in the Glenwood power house, and two of similar capacity at the Boulder power house The combined water-wheel capacity at both plants is 39,000 h.p. Aluminium cell lightning arresters are installed in some places, and their performance was satisfactory. Snow and sleet collect on the wires at the lower elevations during the spring and autumn months, and in one instance before the line was in commission the accumulation on a No. 0 conductor was found to be 1·9 lb. per linear foot. The voltage regulation at the Denver sub-station under normal working conditions is within 1 per cent. of a given value, the departure from which for different periods of the day is about 3 per cent.

SCHONEBERG-BERLIN UNDERGROUND RAILWAY

THE rolling stock on this line consists of twelve motor-cars. The electrical equipment of each of these, which are under multiple-unit control, consists of two 750-volt 40 h.p. direct-current motors. The brakes consist of a hand equipment and Siemens-Schuckert air brakes, which can be operated by the passengers in cases of emergency. Short-circuiting brakes are available should the air brakes fail. Each car is illuminated with 40-watt tantalum lamps, and are all equipped with Hartmann and Braun current clocks. These operate only when current is in the motor circuit. It was found that they reduced the current consumption by about 10 per cent. The energy is transmitted to a sub-station at 6,600 volts, which is transformed to 780 volts direct current by two 750 kw. motor-generator sets. A 375-cell storage battery is also installed. This has a discharge capacity of 888 ampere-hours, and is used in circuit with a reversible booster. It also supplies a 750-volt lighting circuit through two independent circuits for the tunnels and stations. One of these circuits is a bare copper wire, which is carried on porcelain insulators, so that the line can be tapped at any point for lighting and power.

The tunnel service is greatly assisted by the use of a

Hosted by Google

private telephone system, and an elaborate clock synchronising system is installed to insure the same time at all stations. The clocks are operated electrically in half-minute impulses in synchronism with the master clock. A relay system is used in cases where the distance from the main clock is too great to insure absolute synchronism. They are regulated to keep the same time as those of the Berlin subway system.

In the car house an ingenious scheme is provided to shift cars without employing the third rail. This is accomplished by using an overhead trolley carriage. One side of this has a collecting mechanism running in an overhead contact trough, and the other a pair of wheels which run on an overhead track parallel to the trough. The trolley rod, through which the current is conveyed, carries a contact shoe, and this makes contact with a recessed casting on the top of the car. In order to keep the contact shoe free of the car roofs, the rod is under tension. Directly the shoe is interlocked, the car can be moved along until it strikes a stop in the trough. This stop automatically disconnects the car when it reaches the third rail section. This method renders the car independent of the ordinary conductors. The contact rail, which is of soft iron of **T**-section, is placed on vulcanised rubber insulators, having a cast-iron base. For these particulars we are indebted to the *Electric Railway Journal*.

LOCAL NOTES

Aldrington: *Electricity Accounts.*—The year's working has resulted in a deficit of £207, as against that of £404 for the previous year.

Berlin: *Labour Unrest.*—Reuter states that some 3,000 electrical fitters are agitating for higher wages.

Brighton: *Electrical Exhibition.*—It has been decided to hold an exhibition of electrical appliances in the entrance hall of the Aquarium during October.

Burnley: *Supply to Reedley Hallows.*—The Rural District Council on August 10th decided to consent to the application by Burnley to the Board of Trade, for the grant of a Provisional Order under the Electric Lighting Acts, authorising the supply of electricity within the parish of Reedley Hallows.

Cheltenham: *Extension of Area of Supply.*—Application is to be made to the Board of Trade for a Provisional Order extending the area of supply to include Leckhampton, Swindon, Prestbury, Bishop's Cleeve, Southham, Brockhampton, and Woodmancote, and the Borough Electrical Engineer has been instructed to prepare a scheme.

Donaghadee (Ireland).—The Council's Electric Lighting Order, which has passed its third reading in the House of Lords, has been amended with respect to breaking up of a railway crossing so as to make it necessary for application to be made to the Board of Trade if it should be decided to carry the lines under the railway.

Ealing: *Electricity Accounts.*—The past year's working has resulted in a profit, after meeting capital charges, of £1,665, of which £118 has been expended on disconnecting pillars, £316 has been transferred to machinery replacement account, and £208 has been paid to permanent men engaged on capital account, and about £100 expended on cookers and arc lamps for hiring out. With the inclusion of last year's balance, £4,275 is carried forward.

Finchley: *Interruption of Supply.*—Owing to a fault on the main, the street lighting in part of North Finchley was extinguished on Sunday and Monday nights.

Glasgow: *Electricity Accounts.*—The year's revenue has increased by £14,567, largely due to new power consumers. The final surplus on the year's working was £6,680, and the total costs work out at just under 1·5d. per unit.

Police Lamps.—The Chief Constable suggests that electric lamps be substituted for oil lamps for the constables, and the matter has been remitted for consideration and report.

Herne Bay: *Interruption of Supply.*—Owing to a mishap to an engine, the electric light on the new pier pavilion was extinguished last Friday night for an hour or two.

Hessle: *Electricity Supply.*—The Hessle Urban District Council has adopted a scheme for the purchase of supply in bulk from the City of Hull.

Irvine: *Lighting of the Harbour.*—The Harbour Trust has decided to obtain a report on the cost of lighting the harbour by electricity, and as to what further use could be made of that power with a view to cheapening the costs in any other branch of the harbour plant.

Killeshandra (Ireland).—An inquiry has been held by a Local Government Board inspector into an application by the Cavan Rural District Council for power for electricity supply in Killeshandra.

London: *Islington.*—The price of street lighting is to be reduced from £12,000 to £11,000, and the surplus of £1,000 is to be applied to relief of rates.

Lytham.—Mr. Butterworth, a solicitor, of London, has intimated to the Council that he intends, on behalf of a client, to apply to the Board of Trade for an Electric Lighting Order for this Urban District.

Newport (Mon.): *The Electricity and Tramway Undertakings.*—The Town Council, after considerable discussion, adopted a resolution at the last meeting, that the Electricity Committee be requested at an early date to report to the Council upon the whole position of the administration of the electricity and tramway undertakings, and as to any, and if so what, changes are desirable in the present control and management.

North Berwick: *Electricity Supply.*—A site for a generating station has been leased to the Company on the application of Messrs. Crompton & Co.

Oldham: *Motor Hiring.*—On account of a local protest, the Town Council have decided to discontinue motor hiring, provided that local traders will take up the business.

Turin (Italy): *Fire.*—The Northern Italy power station, which supplies the greater part of Turin, has been almost entirely destroyed by fire. The City tramway service is at a standstill, but the Exhibition, which, as described in another column, has its own power station, is not affected.

Whitworth (Lancs.).—The District Council here have applied for an extension of their Electric Lighting Order of 1905.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Dublin.—The Local Government Board has now sanctioned a further loan of £50,000 in addition to the £50,000 already sanctioned out of the £128,129 originally applied for. A clearer statement of the proposals is required before the remainder is sanctioned.

Dumbarton.—Extensions are to be made to the electricity works.

Hereford.—It has been decided to apply to the Local Government Board for sanction to the following loans:—£500 for short extension mains; £1,000 for services; £850 for mechanical stokers.

Ipswich.—Tenders are required by Aug. 24th for the annual contract for paper-insulated underground cables. Fee, £1 1s. Particulars from Chief Engineer, Constantine Road.

Penang.—Tenders are invited by the Municipal Commissioners of Penang for one 500 kw. steam dynamo, condensing plant, and switchgear. Fee, £1 1s. Particulars from Preece & Cardew. Tenders by Sept. 5th.

Wimbledon.—A Local Government Board inquiry was held last week into an application for a loan of £7,459, in connection with the supply of the Maldens and Coombe.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

LONDON.

Westminster.—Reconstruction of Middlesex County Guildhall.

Upper Tooting.—Primitive Methodist lecture hall, Lynwood Road. A. W. Edwards, 11, Foxbourne Road.

Hosted by Google

PROVINCES.

Birmingham.—Parcels office extensions. Secretary, H.M. Office of Works, London.

Blackpool.—Electric light fittings are required for the new central library and art gallery. Particulars from Borough Electrical Engineer, West Caroline Street.

Bradford.—Corporation milk depot. Town Clerk.

Brighton.—Grammar school. Architect, S. B. Russell, 11, Gray's Inn Square.

Bristol.—Extensions to Grand Hotel. F. A. Jenkins, 44 Corn Street.

Carmarthen.—Extension to asylum. W. J. Wallis Jones, 34 Quay Street.

Edinburgh.—Ice rink at Fountainbridge, Edinburgh. Ice & Cold Storage Co., Ltd.

New school at Viewforth.

Farnborough.—Fire station. J. A. Hargreaves, Surveyor, Town Hall.

Gravesend.—Electric light is to be installed in the Technical School.

Lochgelly.—Additions to school. R. Small, Clerk, Town House.

Maidstone.—New County Council offices.

Mansfield.—New post office. Secretary, H.M. Office of Works, London.

Mansfield Woodhouse.—New Mission Church.

Northfleet.—Tenders are required for lighting of the Factory Club. W. H. Browne, Park House, Gravesend. Fee, 5s.

Nottingham.—Veterans' club. Architect, A. Marshall, King Street.

Pontefract.—Public Baths (Borough Surveyor).

Pontypridd.—New schools at Treorchy.

Ramsbottom (Bury).—A movement is on foot for electric lighting of St. Paul's Church.

Richmond.—Receiving homes. Architect, E. J. Partridge, Bank Chambers.

Rochdale.—Nurses' home at the Dearnley Workhouse.

Romford.—New council school. Architect, A. S. R. Ley, 214, Bishopsgate, E.C.

Swinton and Pendlebury.—Tenders are invited for electric lighting of a school in course of erection. T. J. Bushell, architect, John Dalton Street, Manchester.

Wareham (Dorset).—Drill hall and offices. Fletcher, Son, & Brett, Wimborne.

Wigan.—Isolation Hospital (A. Bornes, Surveyor, Town Hall).

Wye.—Extensions to Agricultural College.

MISCELLANEOUS

Australia.—Tenders are invited by October 3rd for paper-insulated lead-covered telephone cable by the Melbourne Deputy Postmaster-General. Particulars from 73 Basinghall Street.

France.—An expenditure of £466,708 has been authorised for improving the Paris telephone system.

London.—Tenders are required by Sept. 10th for telegraph poles by the General Post Office. Particulars from G. Morgan, Controller of Stores, 17-19 Bedford Street.

Sunderland.—Side lifeguards are to be fitted to the tramcars at an estimated cost of £250.

TENDERS RECEIVED AND ACCEPTED

Balmain, Australia.—The Balmain Electric Light & Power Supply Company, Ltd., have placed an order with Willans & Robinson, Ltd., Rugby, for a 500 kw. Willans Impulse-disc and drum mixed-pressure steam turbine, coupled to a general electric alternator and exciter. The turbine will exhaust into a vacuum augmentor surface condensing plant, which Willans & Robinson, Ltd., will also supply.

Bordon Camp.—Willans & Robinson, Ltd., Rugby, have received an order from the War Office for three Willans-Diesel direct-current generating sets to the specification of Messrs. Kennedy & Jenkin.

Haslingden.—At Haslingden Board of Guardians, on August 10th, the following tenders were accepted:—Mr. C. D. Copland: low-tension main cable between transformer chamber and main switchboard, £52 12s. 6d.; four vertical end boxes, £6 2s.; 50 yds. of rubber-covered cables, 2s. 4d. per yd.; coupling and laying cable, £3 10s.; seven lanterns, 37s. each; two pillar standards, £13. The tender of Messrs. Simpson Bros., of Hapton, for telephone and bell installations in the new infirmary (£42) was also accepted.

New Zealand.—The tender of the General Electric Co. for electrical plant, switchboards, and motor pumps for the Gisbourne Council has been accepted.

APPOINTMENTS AND PERSONAL NOTES

An engineer experienced in tramway track and concrete bed construction is required by the City of Santos Improvements Co. (See an advertisement in another column.)

It is announced that the partnership between W. C. C. Hawtayne and G. A. Zeden, carrying on business as consulting engineers at No. 9, Queen Street Place, in the City of London, under the style of Hawtayne & Zeden, has been dissolved by mutual consent as and from the 30th day of June, 1911. All debts due to and owing by the said late firm will be received and paid respectively by Mr. Hawtayne, who will continue the said business in his own name.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 5s. to £58 15s. (last week, £58 to £58 10s.).

Cables.—A firm in Turin desires to represent a British manufacturer of wires and cables.

J. L. Cateaux & Co.—We are informed that the business of Messrs. J. L. Cateaux & Co. (10 Bush Lane, Cannon Street, E.C.), including all assets and liabilities as from July 1st, 1911, has been acquired by the London & Rugby Engineering Co., Ltd., of the same address. Any accounts owing by Messrs. J. L. Cateaux & Co. will be settled by them as they become due, and all accounts owing to Messrs. Cateaux should be settled with the London & Rugby Engineering Co., Ltd. The business will be carried on by the new company on the same lines as heretofore, and will be managed by the principals of the old firm.

Mr. A. J. Greenly informs us that he has joined Mr. Marcus Heber Smith (115, Fleet Street, E.C.), who has a large business among the most prominent British advertisers in supplying them with ideas and designs for all kinds of business literature. Mr. Greenly, whose experience in this class of business has included four years in the advertisement department of Electrical Engineering, will devote himself chiefly to the branch of the business in connection with electrical and engineering industries. Mr. Greenly desires us to make it clear that his firm are neither printers nor advertising agents, and while it is a department of their business to act as advisers or advertising managers to any firm, in addition to the preparation of every kind of business literature, they do not accept commission from the papers in which the advertisements are inserted. Some of the designs which Mr. Greenly has shown us are certainly on strikingly original lines, and we understand that the firm has also retained the services of engineers having special aptitude for writing on technical subjects. We have no doubt that Mr. Greenly will be successful in his new undertaking.

NEW COMPANIES

LONDON & MEXICO CONCESSION SYNDICATE, 3 Lombard Street, E.C. Capital £20,000. To acquire concessions for the construction of tramways, telegraph, and telephone systems, &c.

PROVINCIAL ELECTRICAL CO., Birmingham. Capital £250. Manufacturers of and dealers in electrical apparatus.

ANGLO-FRENCH WIRELESS.—Capital, £50,000. Private company. To adopt an agreement with Compagnie Generale Radiotelegraphique. Registered by Waterhouse & Co., 1, New Court, Carey Street, W.C.

COMPANIA DE ELECTRICIDAD DE LA PROVINCIA DE BUENOS AIRES.—Capital £1,000,000. To adopt an agreement with A. L. Secretan & Co.

HYDRAULIC POWER & SMELTING CO.—Capital, £1,000,000. To adopt an agreement with Norse Power & Smelting Syndicate and K. Tillberg. Registered by Ingle, Holmes, Sons, & Pott, Capel House, E.C.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

W. T. Henley's Telegraph Works.—An interim dividend on the preference shares at 4½ per cent. per annum and on the ordinary shares at 10 per cent., have been declared.

Waste Heat and Gas Electrical Generating Stations.—An interim dividend at the rate of 5 per cent. per annum on the amount of share capital called up on July 31st has been declared.

Newcastle and District Electric Lighting Co.—An interim dividend at the rate of 3 per cent. per annum has been declared, with £6,885 carried forward.

Para Electric Railways and Lighting.—An interim dividend at the rate of 10 per cent. per annum is announced.

SUMMARY

We publish an additional list of intending exhibitors at the Olympia Electrical Exhibition next month. (Page 468.)

The British Thomson-Houston Co. are now manufacturing all their Mazda lamps with drawn tungsten wire. An article describes the company's lamp works and methods of manufacture, explaining the direction in which the new lamps should be an improvement; appended to it is an account of the colossal research work which they and their American house have carried out in this direction, as revealed by the patents they have taken out. (Page 469.)

The Glasgow Corporation have successfully introduced a method of charging domestic consumers for heating and cooking, which obviates the necessity of putting in an additional meter to the lighting meter, and the placing of the apparatus on an independent set of circuits. (Page 472.)

The Cedegolo (Italy) water-power station of the Adamello power company is described. It generates at 12,000 volts, and transforms up to 72,000 volts by single phase transformers with primary and secondary "delta" connected. The station is to work in parallel with another one, which will also generate at 12,000 volts. (Page 472.)

An article upon the strike so far as it directly affected electric railways and power houses appears on page 473.

Among the specifications published by the Patent Office last week was one covering an automatic switch for connecting a dynamo to a battery of accumulators by H. Leitner. An electrode suitable for conducting very large currents into furnaces has been protected by O. Imray, and a new form of cartridge fuse is patented by W. Creswick and J. Bentham. Opposition has been entered to the grant of a patent to G. Lüdecke and the Imperial Lamp Works (Brimsdown), dealing with the manufacture of metal filaments. A patent by B. G. Lamme, relating to the rotary transformer for converting polyphase currents, has expired after the full term of fourteen years. (Page 474.)

Among the matters dealt with in our notes on "Telephony and Telegraphy (including Wireless)" are the granting to Lloyds of a wireless telegraph monopoly in Egypt, an alteration that has been made in the pension arrangements in connection with the transfer of the National Telephone Co.'s staff to the Post Office, a projected telephone line between France and Austria, and the provisions of the new Pacific Cable Bill and the Telegraph (Construction) Bill. (Page 475.)

In our Electric Traction Notes we record the fact that the Perth (Australia) Electric Tramways have offered their undertaking to the Perth Council for £500,000. An arbitrator is to be appointed in relation to the purchase, by the Coventry Corporation, of the local tramway system. A scheme of trolley omnibuses

Hosted by Google

is proposed at Dewsbury. A number of other interesting traction notes are to be found on page 475.

Lieut.-Col. Von Donop's report to the Board of Trade on the serious accident on the Stalybridge Tramways last June has been issued. He has come to the conclusion that the driver failed to stop at the compulsory stop at the top of the hill on which the accident occurred, that the brakes were in order, and that it is doubtful whether the driver released the hand-brake before applying the magnetic brake. In the course of his report he mentions that the Westinghouse Brake Co. are now fitting their magnetic brake equipment with an additional contrivance enabling the track-brake to be applied mechanically as well as magnetically. (Page 476.)

A short article describes an electrically operated dam of the swing-bridge type. The structure can be swung across the stream in 90 seconds by two motors. In case of flood, the water is controlled by 32 wickets, which can be dropped into position in 60 seconds. The cables are laid in a shaft tunnel constructed under the stream. (Page 477.)

A short article describes the equipment of the Victoria Falls and Transvaal Power Co.'s Simmer Pan power house. It has a capacity of 18,000 kw., and supplies six 40,000 volt lines as well as six 10,000 volt lines. (Page 477.)

A new type of silica mercury vapour lamp burning in a quartz tube has been introduced, which is suitable for D.C. circuits, and requires a current of only 1½ ampere at 200–250 volts. The candle-power is stated to be 800. A fluorescent reflector for use with the tubular form of lamp to improve the colour of the light is also being put on the market. (Page 477.)

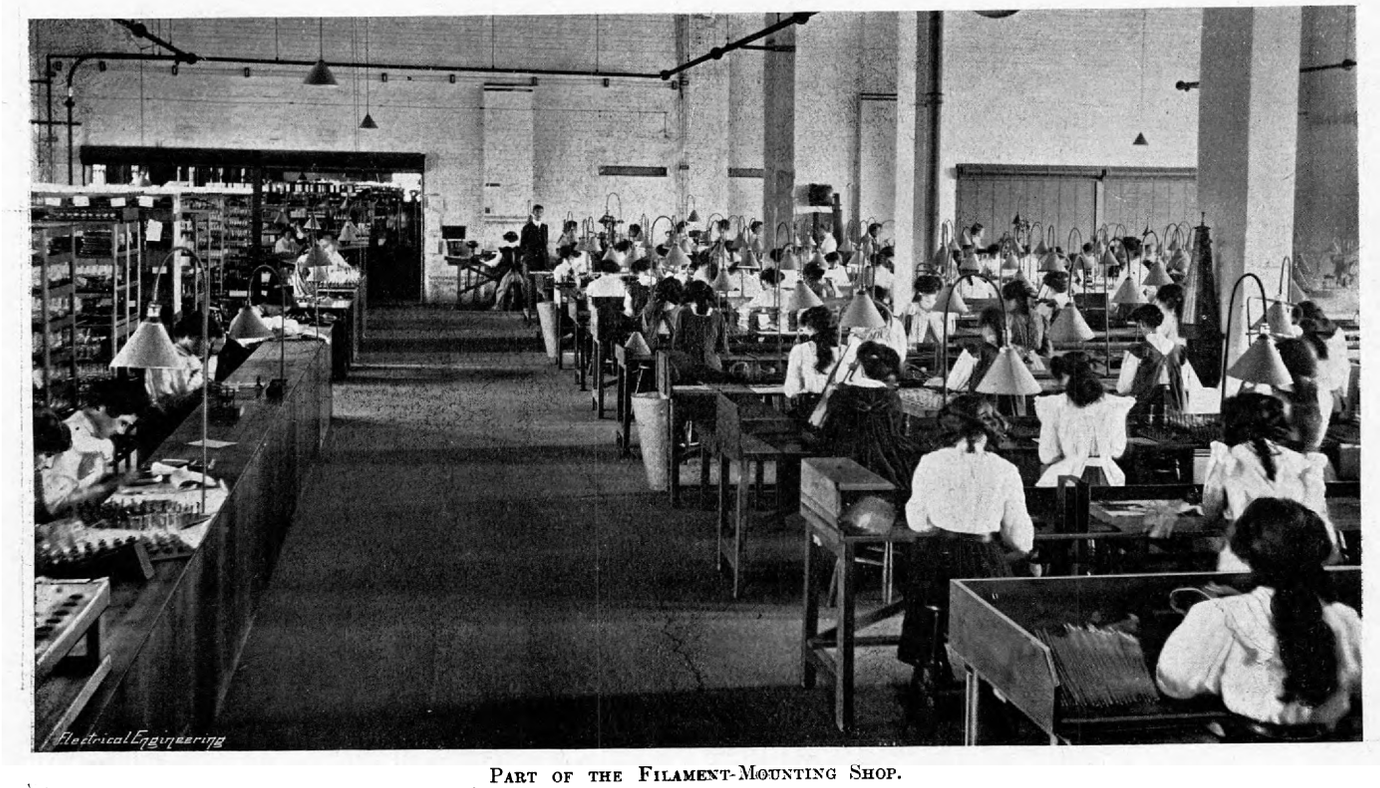
A fire doing damage to the extent of £2,000 occurred last week in a storeroom at the Gillingham Electricity Works.—Net profits are reported for last year upon the Melbourne Electricity Works (£44,402), Greenock (£5,520), Ilford (£1,400), and Halifax (£5,332).—The Local Government Board have refused a loan to the Biddulph Council for wiring and fitting premises.—The Board of Trade do not consider that the recent accident to a lady on a Dublin tramcar was due to any electrical defect, and have refused to order an inquiry. (Page 477.)

The Westminster Electric Supply Corporation require battery boosters and switchboards; the Dublin Corporation a large quantity of single-phase and three-phase meters, and the Cleethorpes Council vulcanised bitumen cables. An electricity supply scheme is under consideration for Burnham, and expenditures of £20,000 and £8,000 are contemplated in South Africa upon two electricity schemes. Considerable extensions are contemplated at the Worksop Electricity Works (Page 478.)

THE OLYMPIA ELECTRICAL EXHIBITION

SINCE the list of exhibitors which we published in our issue of July 6th, the following firms have taken space at the Olympia Electrical Exhibition, which will be held from September 23rd until October 21st:—

C. W. Armitage, Aron Electricity Meter, Ltd., British American Stamp Co., Bi-Metals, Ltd., Credenda Signs Co., Chicago Rawhide Co., Ltd., Micanite & Insulators Co., Ltd., W. F. Dennis & Co., Edison Manufacturing Co., Electrical Contractors' Association, Felt & Tarrant Manufacturing Co., Ltd., Heatly-Gresham Engineering Co., Haydn Harrison, Krausse & Auerbach, Kingolite Co., Mirrlees, Bickerton & Day, Ltd., Magic Appliances, Ltd., Peyton & Peyton, Ltd., August Reichwald, Ltd., Rose Bros., Sparkes & Co., Skefka Ball-Bearing Co., Ltd., W. J. Stokvis, C. Winston & Co., T. & E. Waunbacher, Wilson Hartnell & Co., Ltd., A. R. Witting and K. & Th. Moeller.



It has been suggested to us that Travellers in metal filament lamps should be prepared with some means of demonstrating visually to prospective purchasers the mechanical strength of their lamp filaments.

Hosted by Google

THE NEW MAZDA LAMP: A STRONG DRAWN WIRE FILAMENT

AN important advance has been made in the methods of manufacture of "Mazda" lamps by the British Thomson-Houston Co., so important that a party of some fifty members of the technical and daily press were invited down to Rugby last week to inspect the Company's works. In future all the tungsten lamps made by the British Thomson-Houston Company will have drawn wire filaments instead of filaments prepared by the squirting or pressing process. The company are already prepared to execute orders for the new lamp with drawn wire filaments of 50 and 60 watt sizes for all voltages from 200 to 260 volts, and all standard sizes from the 10-watt 25-volt lamp to the 60-watt 130-volt lamp, excepting the 17-watt 100-130 volt size. The 17-watt 100-130 volt lamps, and the 32-watt 200-260 volt lamps, and all other sizes of Mazda lamps, will be also made with drawn wire filaments, as has been stated above, but will not be ready for delivery before October 31st, 1911.

PART OF THE FILAMENT-MOUNTING SHOP.

Ever since the supersession of the carbon lamp by the metal filament lamp became a certainty, lamp manufacturers have been endeavouring to solve the problem of drawing fine tungsten wire for the filaments. The extreme fineness of the filaments renders it necessary that they should be as strong and flexible as possible, and absolutely uniform in cross section, and it was evident that the ideal method of manufacture was to produce the metal in a sufficiently ductile form to enable it to be drawn into wire.

The usual method for the manufacture of "pressed" or "squirted" filaments is, briefly, to mix finely divided tungsten with a binding material, to press the mass through a die, and then to remove the binding material and to fuse the tungsten together by heating the filament to a high temperature in a "forming gas"—in some cases ammonia, in others a mixture of hydrogen and nitrogen—by passing an electric current through it. The filaments thus formed are in comparatively short lengths, which are then mounted by welding them to a number of wire supports projecting radially from the central stem of the lamp. The drawn wire filament, on the other hand, is one continuous wire, which is sufficiently strong to be threaded round the supports in one length, so that the manufacture is considerably simplified. The British Thomson-Houston Co. is therefore to be congratulated both on being able to produce a stronger lamp and on eliminating some difficult and delicate operations in the course of manufacture.

ELECTRICAL ENGINEERING was, we believe, the first paper to call attention to the progress that was being made in the manufacture of drawn tungsten filaments. An article dealing at length with one of the British Thomson-Houston Co.'s early patents was published in our columns on May 14th, 1908. On January 5th last year we dealt with the question again at some length, recording the British Thomson-Houston Co.'s claim for holding a master patent for a wire-drawing process of manufacture, which we described. On March 31st of the same year we gave some further information as to the progress the company had made, and were able to announce that some sizes of lamps with drawn tungsten filaments—to which the name "Mazdawire" was then given—were being placed on the market. It therefore gives us great pleasure to be able to publish further particulars with regard to the manufacture of the new lamp by the company on a very large industrial scale.

The lamp works employ some 500 hands, and are capable of turning out about 30,000 tungsten lamps and 35,000 carbon lamps per week, and they form one of the buildings of the British Thomson-Houston Co.'s electrical engineering works at Rugby. Everything is arranged so as to facilitate supervision, and the systematic progress through the shops of the lamps and parts in their various stages of manufacture. The

D

Hosted by Google

workers showed considerable skill in carrying out the various processes, whether those carried out by hand or the glass work in which the operations involve the aid of special machines, and one could see that they worked with the regularity and precision of experience. The most interesting part of the manufacturing process was the extreme simplicity of mounting the tungsten wire on its supports. Instead of a lamp with from five to nine separate V-shaped filaments, each of which has to be separately welded at both ends to the supporting wires, the new Mazda lamp has a filament in one continuous length of wire, wound round the supports, and the two ends are simply pinched into small copper tubes at the ends of the leading-in wires. The filament is as fine as that of other metal filament lamps, but it can be handled as wire, and is simply reeled off a bobbin, cut to length, and wound on as stated above. The low voltage lamps are made with a plain wire, and the high voltage lamps with a crinkled wire, which gets supporting point is of course a great help in reducing breakages due to mechanical shock.

In fixing the exhausting tubes on the bulbs, a device is employed which we believe has not been adopted at all lamp works. The bulb is first punctured by a gas jet drawn out by compressed air, and as soon as the bulb is punctured the compressed air is automatically cut off, so that the flame recedes from the glass. The interior of the exhausting tube is covered with a phosphorus preparation, which assists in the complete exhaustion.

The next process is sealing the mounted foot and stem into the bulb, in which the operators are assisted by machines of the most modern type.

Rotary pumps are employed for exhausting, and these are connected up in such a way as to be particularly effective, the fine exhausting pumps being "backed up" by others, so as to enable each pump to work over a smaller range of pressure.

Another Shop in the Lamp Factory.

a greater length of filament into a smaller space, but until examined closely, so that the absence of welds at the bottom of each loop of the filament is noticed, both lamps resemble the ordinary metal filament lamp in appearance. The visitors were not privileged to view the wire-drawing shop, but were shown the filament-pressing, weighing, and forming shop—empty of workpeople.

As in other lamps, the first processes in the manufacture are cutting the tube for the foot, widening out the ends, and making and fixing the central stem and fusing in the leading-in wires. Platinum wire is employed as usual to pass through the glass, and copper wires lead from the ends of this to the lamp cap and the filament respectively. Copper is also used for the wires supporting the filament in the case of low voltage lamps, and molybdenum for high voltage. As regards the number of turns of the filament, the tendency is rather to increase these, and thus to use shorter spans, as this gives greater strength. Thus a 100 volt lamp would have six turns instead of the five filaments of the pressed filament lamp, and a 200 volt ten instead of nine. The absence of rigidity at each

The photometring and testing arrangements are very complete. On the testing racks the lamps are first subjected to 25 per cent. excess voltage for a quarter of an hour, and are then run for a longer period at their normal voltage to weed out any faulty lamps. The visitors were also shown some 100 volt lamps withstanding a pressure of 300 volts. Needless to say this was done solely for the benefit of the visitors, and is not the test to which Mazdawire lamps are normally subjected before being sent out to purchasers.

Our thanks are due to Mr. R. McNeil, the manager of the lamp works, who personally conducted our representative over the works, and took great pains to explain all the processes to us. We have also to acknowledge the cordial reception given us by Mr. Sporborg, the chief engineer of the company, and the efforts of Mr. F. Willcox, the organiser of the commercial side of the lamp department, who also gave us much interesting information and a long sample of tungsten wire about one mil in diameter, and who took the party to and from Rugby in a special train, arranging everything for their comfort and convenience.

The enormous amount of preliminary research and

Hosted by Google

experiment which has culminated in the production of a commercial drawn-wire tungsten lamp by the British Thomson-Houston Co. is well brought out by a review of the numerous patents they have taken out:—

Probably the first indication in this country that metal filament lamp manufacturers were on the road to the production of drawn tungsten filaments was the publication in 1907 of a patent No. 21,513 of 1906, taken out by the British Thomson-Houston Co. (communicated to them by the General Electric Co. of America). The specification of this patent points out that tungsten, after prolonged heating, becomes altered in molecular structure, and is then ductile enough, when at a red heat, to be worked and drawn into wire. The initial rods of tungsten were produced by squirting or compressing a carbonaceous paste of tungsten powder, and these were then rolled and drawn. Special methods of keeping the tungsten hot during rolling and drawing, such as passing current through the wire during the process, are covered by this patent, and methods of preventing oxidation by enclosing the die and the hot part of the wire in a chamber containing hydrogen, are also described.

A later patent, No. 23,335 of 1906 by the British Thomson-Houston Co., covered the method of alloying tungsten with a ductile metal, and extracting the latter after the alloy had been drawn into fine wire for lamp filaments. This patent was the subject of a special hearing before the Comptroller-General (see Electrical Engineering, January 6th, 1910, Vol. 6, p. 5)., when the British Thomson-Houston Co. claimed that this was a master patent for the alloying of tungsten with a ductile metal for this purpose.

A later patent, No. 16,530 of 1907, also by the British Thomson-Houston Co., described the production of tungsten filaments from an amalgam paste, and referred to the possibility of drawing filaments from wires produced by this method. The specification of this patent was published in full in Electrical Engineering, May 14th, 1908, Vol. 3, p. 738. Its chief feature was an indication that a means had been found to work and draw the metal at a temperature below that at which tungsten oxidises in an ordinary atmosphere.

During 1907 and 1908 several patents were taken out by the British Thomson-Houston Co. for the manufacture of metal filaments, but all these seem to have referred to squirted filaments. A patent taken out in the following year, No. 23,499 of 1909, however, appears to mark an important step in the manufacture of drawn tungsten filaments. A full abstract of this patent was given in Electrical Engineering of February 16th, 1911, p. 84, a week after it was published. It relates to the mechanical treatment of tungsten whilst hot in order to render it ductile, as described in specifications 21,513/06 and 16,530/07. Pure tungsten powder is compressed into sticks about 8 in. long and $\frac{3}{8}$ in. square, in heated steel moulds. After heating in hydrogen to dispel any impurities, the sticks are sintered so as to become dense and hard by passing an alternating current of about 1,400 amperes through them for several minutes. They are then rolled or worked in a special swaging machine described in the specification, and, after repeated and prolonged working, the crystalline structure is said to change to a pronounced fibrous structure, so that the sticks are pliable, ductile, and very strong. Drawing is begun when the diameter is reduced to 35 mils, and is continued in successive stages until the diameter is 1 mil or less, as is required. In this patent again reference is made to the possibility of drawing the tungsten wire at ordinary room temperatures after prolonged mechanical working, and the claims of this patent cover this, but it will be seen that a later patent described drawing the wire at a dull red heat.

The next year again showed great activity on the part of the British Thomson-Houston Co. and their American house. The first patent taken out by the company in 1910 for drawn tungsten was referred to in Electrical Engineering of March 2nd, 1911, immediately after publication.

According to this patent, rods of about 40 mils diameter are squirted through dies or pressed into shape under hydraulic pressure from a paste of powdered tungsten and either a carbonaceous or an amalgam binder. They are then sintered at a much higher temperature than usual—closely approaching the melting point of tungsten—in an atmosphere of hydrogen and nitrogen for one to five minutes, and are then allowed to cool gradually, the current being reduced step by step over a period of from two to even 30 or 40 hours. After thus cooling from a very high temperature, the metal was said to be ductile when cold.

Patent No. 3,981/10 (Electrical Engineering, August 18th, 1910, p. 540) covered a process of pointing wires for insertion into the fine dies.

This was followed by a patent which is evidently a great advance, since it describes a process of manufacturing rods or filaments of tungsten without previously alloying it with any ductile metal, or adding a binder or amalgam paste. It is not unreasonable to suppose that this process or a modification of it is the one now employed by the British Thomson-Houston Co. in the manufacture of Mazda lamps. The patent (No. 8,031 of 1910) was applied for on April 2nd, 1910, accepted on July 3rd, 1911, and published just four weeks ago. Tungsten filaments prepared according to this process are said to remain ductile after prolonged use.

The preparation of the tungsten powder is highly important. Pure tungstic oxide (WO_3) is reduced to a very coarse powder by packing a tube of fused quartz ($1\frac{1}{2}$ in. diam. and five feet long) with the tungstic oxide. A passage is left right along the tube, and pure dry hydrogen is passed through it for from 5 to 15 hours, while the tube is heated to between 1,100° C. and 1,300° C. Water vapour is produced, and lower oxides are formed, the mass changing from the yellow oxide to the blue, brown, and black oxides, and finally to pure tungsten. The crystals of oxide are found to coarsen, especially during the brown stage. During the last few hours the same hydrogen may be used over and over again provided it is dried during circulation. (The yellow oxide may be previously heated to 1,000° C. for five hours in a covered Hessian crucible to coarsen the particles further.) The coarse tungsten powder is then pressed up in a strongly reinforced steel mould by an hydraulic press into sticks $\frac{1}{4}$ in. square and 6 in. long, special care being taken to avoid producing cracks in the sticks. The sticks are then placed in electrically heated tube furnaces for a preliminary firing in hydrogen at, say, 1,200° C. for 10 mins. to 60 mins. in order to harden them so that they can be handled without fear of breakage.

After this, the sticks are placed in a treating vessel, and current passed through them so that they are raised to a white heat. A reducing atmosphere of hydrogen is employed, and the metal sinters together into a strong coherent body, any traces of oxide being removed. To ensure thorough penetration of the hydrogen without fear of melting the interior of the rods, the temperature is raised gradually, and thus the current may be 1,400 amps. per rod for 15 mins., and then 1,700 amps. for another 15 mins., the current being then reduced in steps of 200 amps. per min., so as to cool the metal slowly, and to avoid a sudden drop of pressure of the hydrogen, which might cause air to be drawn into the vessel. A constant stream of pure dry hydrogen must be kept up.

The rods, which have a frosted appearance and a crystalline structure, are then worked in a swaging machine and drawn as described in Patent No. 23,499/09 (see above). They are passed into the swaging machine at a bright red heat by being previously heated in a tubular furnace with hydrogen. A reduction of 8 per cent. occurs each pass, and when the diameter is reduced to 0·03 in. the rods are drawn (through diamond dies) at a low red heat until a diameter of 0·0015 in. or finer is obtained. Before placing the filament in the lamp, it is freed from oxides or impurities on the surface by heating at 1,000° C. or higher in pure dry hydrogen. The fibrous structure developed during working and drawing disappears during heating, and a filament prepared by this process and run at 1·25 watts per candle is claimed to be quite free from brittleness, and to be ductile and strong.

There are 10 claims to this patent. The first covers broadly a conductor of ductile metallic tungsten which retains its ductility after prolonged heating. Claim 2 covers the use of "metallic tungsten in the form of relatively coarse powder" in the manufacture of such a conductor. The method of producing this coarse powder by the treatment of tungstic oxide as described above is covered by Claim 3, while Claim 4 covers the alternative method, including the previous heating of the oxide before reduction. The production of rods of pure tungsten by compressing the coarse powder in steel moulds and heating the compressed rod in hydrogen is covered by Claim 5, and the sixth claim covers the heating of the rods at an intense white heat in a vessel containing hydrogen. Claim 7 covers the method, described above, of sintering the rods, which consists in passing heavy currents through them. Claim 8 covers the working and drawing of these rods into wire, and the final heating of the wire to remove surface impurities. The whole process as described in the specification is covered by Claim 9, and Claim 10 is for the application of the process for the manufacture of filaments for incandescent lamps.

Two 1910 patents (Nos. 8,984 and 10,206) relate to the crinkling of the tungsten filament so that it can contract without pulling on the supports. The first only of these two patents has been published up to the present.

Patent No. 13,295/10.—This patent covers a leading-in wire of tungsten or molybdenum. The wire is cleaned in fused potassium nitrite before fusing into the glass. Apparently, however, platinum is still used for leading in through the glass.

Two other patents for lamp filaments (Nos. 30,323 and 30,324) were applied for by the British Thomson-Houston Co. in 1910, but have not yet been published by the Patent Office.

During the current year four patents relating to incandescent lamp manufacture have already been applied for by the British Thomson-Houston Co. Three of these, No. 2,826, relating to working refractory metals; No. 5,068, dealing with the exhaustion of lamp bulbs; and No. 6,988, broadly referred to in the title as for incandescent lamps, have not yet been published. The fourth (No. 3,028) describes a method of mounting the filaments on rows of alternating long and short arms on the carrier.

CHARGING FOR COOKING AND HEATING THROUGH THE LIGHTING METER

CENTRAL station engineers and managers and also wiring contractors are always confronted with the difficulty of an extra meter, distribution board and wiring being required when a lighting consumer proposes to go in for electric heating on a small scale, and to profit by the cheaper heating rate. Many consumers who would willingly put in one or two electric radiators for occasional use, or an electric iron or small cooking and heating apparatus, for consuming energy at, say, 1d. or 1½d. per unit, object to having to pay some pounds for extra wiring, &c.; and the central station engineer may also find, if a heating and cooking circuit is added consuming only a few units a year, that the profit will hardly pay the capital charges and depreciation on the additional meter and its connections.

During the last few months Mr. W. W. Lackie, Chief Engineer to the Glasgow Corporation Electricity Department, has adopted a very simple system of charging which enables him to connect the heating and cooking apparatus used by domestic consumers to the lighting circuits, and to pass the current through the same meter. From examination of a large number of accounts from such consumers for a period of three years, he has found that they are practically stable from year to year, and even in the corresponding two-monthly account periods of different years, he has calculated that on an average the domestic consumer uses his maximum demand for 800 hours in the year divided up approximately as follows:—

June-July	40 hours
August-September	60 ,,
October-November	200 ,,
December-January	300 ,,
February-March	160 ,,
April-May	40 ,,

The present flat rate charged to domestic consumers is 3d. per unit. If, therefore, a consumer adds electric heating to his existing lighting connections, he is charged, for instance, during August and September on the basis of 60 hours' use of his maximum demand at 3d. per unit, and the balance of the amount his meter registers at a 1d. per unit, the latter being the regular charge for heating and cooking.

Thus, if a consumer intimates that he is going to instal a heating or cooking appliance, the District Superintendent visits the premises and reports whether the wiring is suitable for this or not. In the case of one-room-and-kitchen, two-rooms-and-kitchen, three-rooms-and-kitchen, and four-rooms-and-kitchen houses, the electric lighting department has practically fixed, from their experience gained over a number of years, the number of units to be charged at the lighting rate of 3d. in each two-monthly period, and they do not instal a maximum demand indicator.

In exceptional cases, such as large houses, however, they have sometimes taken the maximum demand, but in the majority of cases they simply assume that the consumer will use the same total number of lighting units, and they have divided these units in the proportions indicated above for each two months.

In the case of new consumers an estimate is made of the number of hours' use of maximum lighting demand that is likely to occur, and they are charged in the same manner.

Poor Electricity!—"Salamander" writes as follows to the *Evening News*:—"Last year you had voluminous correspondence on the alleged fact that the enormous use of electricity was responsible for the rainfall in general and the Paris floods in particular. Where are those correspondents now?" Probably they are preparing letters for the *Evening News* to explain that electrical engineers have profited by their warnings, and have reversed the direction of the current, so that drought has been produced instead of rain.

THE ADAMELLO 72,000 VOLT POWER TRANSMISSION PLANT

THE Cedegolo generating station, which forms part of the system of the Adamello Company in Upper Italy, contains several interesting features. The building covers an area of about half an acre, and half of this is occupied by the machine room, which will contain seven turbo-alternators and two exciters. Five of these have already been installed, each of which is of 5,000 h.p. of the Pelton type with horizontal shafts.

The three-phase alternators are connected to the turbines by rigid couplings; each set has an output of 5,000 K.V.A. at a speed of 500 r.p.m., and current is generated at a pressure of 9,000 to 11,000 volts at 42 cycles per sec. For this speed the turbines require about 35½ cubic feet of water at full load, using a fall of 1,542½ feet.

The high voltage of the generators is due to the fact that the station is required to work in parallel with the central station to be erected at Isola, three miles away, which will generate current at 12,000 volts. Fifteen single-phase transformers are erected in two rows, and are separated from one another by cells. They are connected in delta on both the primary and secondary sides. Each of these has an output of 2,700 K.V.A. at a pressure of 10,000 to 60,000 volts, which may be increased to 72,000 volts if one of the transmission lines breaks down and the entire energy has to be transmitted by the one line. They are of the oil type with water-cooling coils. The switchboard is designed so that it can combine the energy generated in the station itself with that supplied by the other plants, and transform it up to 72,000 volts for transmission and distribution to the industrial districts in Lombardy. The single-phase cables from the alternators are laid in a spacious underground passage, and run into the 12,000-volt bus-bar chamber on the ground floor, where they are connected to oil switches by bare copper connections. The switches are three-phase with instantaneous release, and allow the circuit to be broken in an oil-bath at two different points in each phase. The three phases pass through circuit-breakers and isolating switches, and are then led to the 12,000-volt bus-bars, which are separated by cement partitions. As two separate working systems are required for the power station, two sets of bus-bars are provided, which, if necessary, can be connected to one another to form ring mains. From the bus-bars the connections rise to the first floor, after passing through the 12,000-volt transformer oil switches. These are mechanically connected by a link chain to the corresponding switches for the primary side (72,000 volts), so that each transformer can be isolated in one operation. Switching in and out can be done by hand or electrically. The connections next pass to the 72,000-volt bus-bars on the second floor, where they are taken through current transformers, and to the switches for the outgoing line; finally, they rise to the last floor, where the lightning arresters are erected, both for the 72,000-volt outgoing lines, and for the 12,000-volt incoming lines from the Isola station.

The whole of the plant is controlled from switch desks, of which three have been installed, one each for the alternators, transformers, and transmission lines. On the machine floor there are twelve white marble panels carrying the instruments, and apparatus for the two exciters, a 500 h.p. synchronous motor, the two auxiliary transformers, the switches for the operating circuits, and for the motors driving the battery-charging dynamos. The battery consists of 69 cells, and has a capacity of 1,450 ampere-hours, with a discharge of 145 amperes. A double battery switch, for charge and discharge, is electrically operated from the switch panel mounted close to the machine room. The Allgemeine Elektricitäts Gesellschaft supplied the whole of the electrical plant above described.

Death from Electric Shock.—A verdict of accidental death was returned at an inquest last week concerning the death of a workman named F. H. Best, employed at Smith's Dock, Middlesbrough. An electric crane working on a jetty is supplied with power from bare wires at a voltage of 440. These wires run in a conduit, and the unfortunate workman received a fatal shock whilst endeavouring to recover a packet of white lead which had fallen into the conduit.

Fire at German Electrical Works.—According to a Reuter cable message from Berlin, a fire broke out on Thursday in the main cable shaft of the Essen-Rheinish-Westphalisches Electrical Works, which had the effect of completely cutting off the supply. The works furnish current to a number of large mines and factories, and considerable inconvenience was caused.

THE STRIKE

NOW that the conditions of labour among the railway and other workers of the country seem to be gradually getting back to the normal state, it is pleasing to reflect what a small part electrical workmen generally have taken in the dislocation of our daily routine during the past fortnight, which reached a climax on Friday and Saturday. The absence of any serious signs of dissatisfaction among those employed in central stations may be attributed to the more happy conditions under which they work, or to a keener sense of their responsibility to the public than was exhibited by the railway men and others. Whatever the cause, we have reason to be proud of the fact, for the absence of effective street and domestic lighting for however short a period would have enormously increased the discomfort and even the dangers which were present. It is true that the tramway men in several towns showed signs of restlessness, but with a few notable exceptions, such as Liverpool and Glasgow, they were easily satisfied. One of the main grievances of the tramway men, especially drivers and conductors, is the large amount of time which they have to be away from their homes in order to put in their allotted number of hours work per day. This difficulty of "spread-over" time is one which tramway managers all over the country have had to contend with for years, and it seems impossible for the employees to realise that it is an inevitable condition of tramway working, due to the "rush hour" periods of traffic, and that it cannot be avoided if the undertakings are to be carried on with any pretence to commercial success. It is not a matter which managers have ignored; indeed, it has been given most earnest consideration, and strikes can in no way solve a problem of this magnitude.

At the present moment, there is considerable uncertainty as to what the L.C.C. tramway men intend to do. Their threat to strike last week, unless the Highways Committee will immediately meet to consider certain demands as to recognition of the Union, increase of wages, and a 48-hour week, have not been put into effect, in spite of the decision not to convene a meeting of the Highways Committee or the Conciliation Boards to go into the question during the recess. At a mass meeting on Sunday night a ballot was decided upon, but at the moment of writing no definite result has been issued. It is to be hoped that the lesson of the Glasgow tramway strike will not be lost upon the London tramway men, whose conditions, like those of all tramway workers, have vastly improved since the introduction of electric traction. It was stated in the daily papers that a company of soldiers guarded the Greenwich power station of the L.C.C. during the railway strike, but we are able to state that this was not so.

In spite of the withdrawal of so many railway men on Thursday, Friday, and Saturday, all the London electric railways maintained restricted services, with the exception of the City and South London Railway Co., who found it necessary on Thursday afternoon to suspend the whole of their service. All the railway power stations were guarded by troops, and as the men there were loyal, no anxiety was felt on the score of power supply. The inconvenience to the public, though considerable, was by no means of a magnitude to be termed a "paralysis" of the railways; indeed, from this point of view the strike was a failure. Once the railway managements were able to marshal the forces available, a degree of regularity was maintained which was quite astonishing in the circumstances. Probably the least affected line was the Central London, only a certain proportion of drivers having left their work.

At Manchester the railway men on strike made strong endeavours to induce the tramway drivers and conductors to come out, but without success. At first cars were forced through the crowd of strikers, but when this became impossible the police were able to keep the track clear at the depôts, and enabled the cars to get into the streets.

A dispute at Bath was settled. At Newcastle-under-Lyme a number of track workers employed by the Potteries Electric Traction Co. came out, and grievances were brought forward by the tramway men in several other towns, but no serious results are reported. Rumours were current that the Sheffield tramway men intended to strike, but this was officially denied by the district secretary of the Tramway and Vehicle Workers Union.

The chief anxiety was the possibility of getting coal supplies for the various electric power stations. Most had reserves sufficient to maintain the works for a week or more, but with the Government's promise of assistance from the military forces, there should have been little difficulty in getting further supplies.

The only real case of a strike at an electricity works was at the Liverpool Corporation main station at Lister Drive. At two o'clock on Thursday the workmen employed there followed the instructions of the Strike Committee, and withdrew from the station. It appears that although the services of a large number of volunteers were accepted, both from the remaining staff at the station (of all grades, including clerks and others), and of loyal citizens of all social rank, yet a complete supply of electrical energy for all purposes was not maintained. For some reason, in spite of this generous assistance, it appears that sufficient steam could not be kept up to supply the whole load, and although the street lighting and a portion of the tramway service was continued, a large portion, if not all, of the private lighting was switched off. We cannot but express our surprise that some means could not have been found to keep the whole supply going, at any rate on the Friday. If the incident came as a complete surprise to those in authority it may have been difficult to obtain sufficient stokers or supervision of inexperienced stokers between two o'clock on Thursday and peak time, but arrangements for a complete resumption of the supply ought to have been possible on Friday. It would be interesting to know whether as a last resort, when it was found that sufficient workers could not be obtained, troops were requisitioned, not merely to guard the station, but to do actual work in it, and if so, whether this request was refused. We cannot but think that the Commanding Officer would have considered it desirable to grant such a request in view of the terrible consequences of increased rioting and looting that might have occurred through the lighting of large buildings, stores, and warehouses being discontinued. Of course some damage might have been done to the electricity works plant which prevented the supply being maintained, but in any case a full explanation of the circumstances would be welcome.

The trouble at Liverpool is not yet ended, for a serious question has arisen as to the reinstatement of the 250 tramway men who went on strike. The Tramways Committee is in an awkward predicament, for the 1,500 men who remained loyal have threatened to strike if the 250 strikers are reinstated. The places of the strikers have been filled, and the Strike Committee refuse to allow the dockers to return until the tramway trouble is settled.

Among the various questions asked in the House of Commons on Tuesday was one with regard to the sending of soldiers to guard the Poplar Electricity Works. It seems that when the troops were first sent to London a list of the most important places to be guarded was prepared and military pickets provided. Included in these, presumably, was the Poplar Electricity Works. According to Mr. Lansbury, the Labour member, the Poplar Council resented this action, and ordered the troops away.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published August 17, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

20,257/10. **Automatic Switches.** H. Leitner. These are adapted to connect a dynamo to a battery for charging purposes. Two parallel electro-magnets are arranged with one of the cores to rotate through a suitable arc within its bobbin. One of them is placed across the dynamo brushes, and, when excited, it attracts a spring, which puts a fine winding on the other magnet in series between the dynamo and battery. If the current flows towards the machine the magnets repel one another, but if the flow is in the opposite direction, they attract each other, and actuate a contact which closes the circuit through a thick wire wound on the magnet containing the thin winding. When the battery voltage predominates, the thick winding releases the contact, and throws the switch out. Three figures.

9,038/11. **Cartridge Fuses.** W. Creswick and J. Bentham. The body of the cartridge is provided at both ends with a metallic socket, each of which carries one of the fuse terminals, and the usual bridge through which the fuse wire passes. Metallic caps screw on to the sockets, fixing the wire, and making the required contact, For renewals the end caps have only to be unscrewed and the wire placed in position. One figure.

9,050. **Portable Lamp.** A. Lobel and The British Ever-Ready Electrical Co., Ltd. The metal casing of the lamp has an insulating plug at one end, hollowed on its outside to receive a metal reflector, which is screw threaded to take the usual bulb. A dry cell is mounted inside the case with one pole connected to one lamp terminal, and the other, through a spring at the bottom, to the casing. Between the cell and and the casing a slidable switch tongue is placed. This is made to slide over one or more studs arranged between the outer casing and the plug to make contact between the reflector and the casing, and thus to close the circuit. Two figures.

9,633/11. **Furnace Electrodes.** O. Imray (*The Shawinigan Carbide Co., Ltd.*). An electrode suitable for carrying very large currents into furnaces has a metal head capable of conducting electricity, and containing a series of screw-threaded sockets. Graphite rods are screwed into these at one end. The other ends of the rods are internally screw-threaded, and recessed to take a similar number of non-graphite carbon rods, so that a series of pencils of high conductivity are formed, containing substances of different degrees of hardness. These are protected by a substance of a slightly lower conductivity, and are enclosed by a sheet-iron shell. Three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Siemens Schuckertwerke-Ges., 7,501/11.

Distributing Systems, Cables & Wires, Insulating Materials, &c.: Friedmann [Joint boxes for wiring] 12,931/10; Bowden Wire, Ltd., and Larkin [Connecting devices for wires] 20,501/10; Electric & Ordnance Accessories Co. and Mueller [Combined switch and fuse-box for cranes] 20,995/10; Bullers, Ltd., and Dagnall [Cable supports] 22,153/10; Speakman [Insulators] 27,804/10; Adam [Tightening devices for cable conveyors] 1,909/10; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Materials] 5,167/11.

Dynamos, Motors, and Transformers: Adams Manufacturing Co. (*Cutler Hammer Manufacturing Co.*) [Controllers] 18,190/10; and [Control of] 18,306/10; Lewis [Control systems for] 8,783/11.

Electric Ignition: Fletcher and Dale, 23,807/10; Smith and Platt, 1,028/11; Wasserzier [For gas burners] 6,182/11.

Electrometallurgy and Electrochemistry: Ges. Für Chemische Industrie in Basel [Electrolysis of fused alkali chlorides] 18,300/10 and 17,047/11; Popp [Furnaces] 30,390/10.

Heating and Cooking: Hirst and Archer [Irons] 23,902/10.

Incandescent Lamps: Renton [Cord attachment for lamp-holders] 18,656/10; Marks (*Siemens and Halske Akt.-Ges.*) [Process for treating the surface of tantalum] 18,780/10; Gray [Portable, for mines] 21,080/10.

Instruments and Meters: British Thomson-Houston Co. and Martin [Meters] 23,066/10; Chamberlain & Hookham Ltd., and Holden [Meters] 10,080/11; Krummerer and Ges. Für Elektrotechnische Industrie [Photometers] 11,111/11.

Switchgear, Fuses, and Fittings: Herbert Morris & Bastert, Ltd., and Thorrington [Switches for runways] 19,352/10.

Telephony and Telegraphy: Habermann [Morse transmitter] 26,856/10; Klupathy and Berger [Submarine telegraphy and signalling] 27,144/10; Siemens Bros. & Co. (*Siemens and Halske Akt.-Ges.*) [Semi-automatic exchange systems] 12,117/11.

Traction: Webb, Brettell, and Adamson [Overhead switch-gear] 279/11; Klupathy and Berger [Railway signalling] 5,603/11.

Miscellaneous: Gabreau [Lighting for vehicles] 13,035/10; Rideal [Utilisation of the silent discharge] 18,680/10; Girardelli and Holzman [Time alarm device] 20,696/10; Rumpler [Formation of metallic coatings on aluminium] 23,359/10; Field and Ferranti, Ltd. [Resistances] 24,485/10; Parkes [Magnets for indicators, relays, &c.] 4,806/11; Dowsing [Apparatus for applying radiant heat to body] 6,526/11; Zickel [Shutter indicators] 10,545/10; Siemens Schuckertwerke-Ges. [Automatic regulators for circuits] 14,432/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution, &c.: Siemens Schuckertwerke-Ges. [Safety device for cables] 17,046/11.

Electric Ignition: Heyer [High-pressure current distributors for] 16,968/11, and [Make and break device for primary circuit of] 17,053/11.

Dynamos, Motors, &c.: Hüther [Enclosed, cooling of] 17,110/11.

Switchgear, &c.: Compagnie Des Compteurs Aron [Electro-magnetic circuit-breakers] 16,962/11.

Telephony, &c.: McBerty [Automatic exchange selector] 16,867/11, and [Semi-automatic systems] 16,869/11 and 17,211/11.

Traction: Legrand and Armel [Locking railway carriages electrically] 16,458/11.

Miscellaneous: Duschnitz [Formation of arc] 16,992/11.

Opposition to Grant of Patent

132/11. **Metal Filaments.** G. Lüdecke and The Imperial Lamp Works (Brimsdown) Ltd. Opposition has been entered to the grant of this patent. It relates to a process of treating filaments made from collodial tungsten, and a binding agent. These are heated in an open-tube furnace, which is supplied with a reducing atmosphere. This consists of a reducing agent mixed with an inert gas in such proportion that the filament is decarbonised.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

19,719 of August 26th, 1897. **Electrical Conversion and Distribution.** B. G. Lamme. For converting polyphase currents a rotary transformer is provided, having a rotary or stationary field, and a rotary armature wound with coils. The width of these coils is much narrower than the pole pitch, so that the maximum induction takes place over a greater portion of the polar surface. An arrangement for supplying a direct-current three-wire system is described. The outers are connected to the commutator brushes on the D.C. side of the rotary, and the neutral wire is taken to the centre point of the secondary windings of two stationary transformers, which are connected to the slip-rings of the rotary. The primaries of these are supplied by a two-phase generator. The currents flowing in the neutral wire are always direct currents. Although an alternating current flows in each of the transformer secondary coils, a reversal takes place at its ends once in each alternation, so that the direct current flowing in the neutral wire is a true alternating current in the transformer coil, which acts as an auto-transformer in supplying the two branches of the three-wire system.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: J. P. Gallois, 10,040/07.

Distributing Systems, &c.: British Thomson-Houston Co. (*W. S. Clark and G. H. Rupley, U.S.A.*) [Conductors] 8,207/00; B. G. Lamme, 8,711/05; W. T. Henley's Telegraph Works Co. and W. H. Nichols [Cable junction boxes] 10,406/07.

Dynamos, &c.: S. Z. De Ferranti, 10,231/02.

Electrometallurgy, &c.: O. Frick [Furnaces] 10,097/06.

Switchgear, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Switches] 10,242/04; Akt.-Ges. Brown, Boveri et Cie. [Switches] 543/07; G. M. Newbery and British Prometheus Co. [Switches] 10,119/07.

Telephony, &c.: J. Kitsee [Telegraphs] 10,249A/06; W. Sutcliffe [Relay] 10,091A/07; Siemens & Halske Akt.-Ges., 10,152/07; F. W. C. Le Tall (*P. C. Hewitt, U.S.A.*) [Wireless telegraphy] 10,259/07; R. C. Browne [Microphones] 10,440/07; S. C. Houghton [Telephones] 10,537/07.

Traction: H. A. L. Hepper [Interlocking points and signals] 9,219/01; C. W. Collins, W. J. Hayes, and F. W. Watson [Trolley-head sockets] 10,293/07; C. Crutchley, W. H. Whaite, H. S. Timmis, and W. R. Reeves [Recording signals] 10,348/07.

Miscellaneous: Sir W. J. Armstrong Whitworth & Co. and J. Honner [Cranes, capstans] 9,193/01; Allgemeine Elektricitäts-Ges. [Lifts] 10,171/07; K. Hahn [Vapour rectifier] 10,469/07; J. H. Robertson and J. C. Klatzl [Medical apparatus] 10,514/07.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Egyptian Government have granted a concession to Lloyd's for a monopoly of wireless telegraph work in Egypt. The large station which is to be erected at Port Said is expected to be working by October. At present there are small stations at Aden, Port Said, and Suez, but these will be superseded by the larger station mentioned above.

It is stated that a telephone line is to be constructed between France and Austria, passing through Germany and Switzerland. The Austrian administration was the first in Europe to equip long overhead lines with Pupin coils, and, as these were very successful, particulars as to the design of this new international line will be awaited with interest.

Clause 5 of the Telephone Transfer Act, which deals with the superannuation of transferred officers of the National Telephone Co., has been slightly modified in favour of the Company's employees. The Postmaster-General has altered the clause so that those members of the Company's construction staff who are now pensionable, and also pensionable officers in the contract department, will be placed on the Post Office establishment. Those employees not pensionable will be placed upon an equal footing with similar Post Office employees. Upon consideration of the Bill in the House of Commons last Thursday, an amendment was moved to Clause 2 with the object of providing specifically for telephonic developments in rural places. The Postmaster-General opposed the amendment, pointing out that it had always been left to the discretion of the Post Office to deal with these matters subject to the general control of the House of Commons. The amendment was negatived without a division.

With regard to the matter of rural telephones, the Post Office has already taken some steps, and a circular has been issued explaining the scheme which has been devised. According to the *Morning Post*, the system has been for some time working in the Bradsby District of Yorkshire with complete success, and the Board of Agriculture is co-operating with the Post Office with a view to its rapid extension throughout all rural districts.

According to a Canadian contemporary, there will be, when the constructional work for the present year is completed, 4,000 miles of telephone lines and 3,000 miles of rural telephone lines in the province of Alberta. At present there are 11,905 subscribers.

The central battery system of telephone working is at last to supersede the older method in Cape Town. The first C.B. exchange there is now in course of construction. In Durban there has been a central battery system for some years, whilst a large new installation was completed in Johannesburg a short time ago. Cape Town appears to have taken its time.

The text of the Pacific Cable Bill has now been published. The Bill provides for the construction of an additional submarine cable between Australia and New Zealand, and any extensions, connections, or re-arrangements in or near the Pacific Ocean which may be deemed necessary for the improvement of the Pacific Cable Board's undertaking in those parts. The contributing Governments have authorised the application of money for this purpose out of the reserve fund of the Board, provided that the reserve fund is not reduced below £100,000. Any money so applied is to be repaid in 35 years at 3½ per cent. per annum interest.

Under the Telegraph (Construction) Bill, which has passed its third reading in the House of Commons, the Post Office is empowered to place telegraphic lines across railways and canals, and to maintain and repair them. The Bill provides that 21 days' notice shall be given before the erection of such lines, that no damage shall be done by the Postmaster-General in the maintenance of the lines, and for the payment of any expenses incurred by the railway or canal companies in consequence of their existence. The Postmaster-General is also upon request, to alter within reasonable time, and to the reasonable satisfaction of the railway or canal company, any lines which interfere with the working of the companies. The Bill does not vary the existing conditions as to wayleaves. All matters in dispute are referred to the Railway and Canal Commission as arbitrators.

No interruption of great moment has occurred to telegraph and cable lines during the past week. Communication has failed between Sabang and Koetaradja (Sumatra), telegrams for the latter place being sent by telephone from Pangkalanbrandan, or by post from Sabang.

ELECTRIC TRACTION NOTES

We publish on page 476 the result of the Board of Trade inquiry into the accident which occurred on a steep hill on the Stalybridge tramways last June. The evidence showed that, as has unfortunately so frequently happened, the driver had in all probability locked the wheels with the hand-brake before applying the magnetic brake. Lieutenant-Colonel Von Donop, in his report, it will be seen, calls attention to the fact that the Westinghouse magnetic brakes are now fitted with an additional device enabling the track brake to be applied mechanically as well as magnetically.

At the half-yearly meeting of the Liverpool Overhead Railway Co. last week, Sir William Forwood, the chairman, stated that during the past few years the main structure of the Company's lines had been strengthened from end to end, and the cost met out of revenue.

A new agreement has been entered into between the Swansea Corporation and the Swansea Tramways & Improvements Co. with regard to the running of the tramways. This agreement provides for an extension of the lease to cover a period of 30 years at a rental of 2 per cent. upon the gross profits. In addition to the rental the Company is to pay the Corporation a further annual sum equal to 7 per cent. on the Corporation's capital outlay as from April, 1919.

The Dewsbury Tramway Co. have refused a request by the Corporation that a tramway should be constructed to Westborough, on the ground that it would not be commercially successful. The Company offer to prepare estimates for the installation of a trolley omnibus system to that district, or in the alternative for the Council to provide the necessary capital for the construction of a tramway, the company working the lines at an agreed rate per car mile.

The net profits upon the working of the Kalgoorlie Electric Tramways last year amounted to £15,199, against £16,573 in the previous twelve months. There was a decrease in the traffic receipts in consequence of a rush to the Bullfinch District, which took a large number of the mining population away from Kalgoorlie.

A scheme for the construction of electric tramways in the Western Valleys District of Monmouthshire has been discussed by the Abercarn District Council. A company deposited a Bill in Parliament this session for the installation of a trolley omnibus system in this district, but it was subsequently abandoned.

With reference to the notice of purchase given by the Coventry Corporation to the Coventry Electric Tramways Co., neither side can see their way to name a price which would form the basis of negotiations with a view to avoiding arbitration. Under the Company's Act of 1903, the Corporation have to buy upon "going concern" terms, and as the parties have failed to agree, the Board of Trade will appoint an arbitrator.

Due to the strike of motormen and conductors in July and August last year, the receipts of the Perth (Australia) Electric Tramways, Ltd., dropped from £74,649 to £68,790. The report deals at length with the cause of the strike, which finally came about through the men refusing to abide by a decision of the Arbitration Court in Australia. The net profit amounted to £8,999, and after meeting debenture interest and preference dividends, a 2½ per cent. dividend is declared upon the ordinary shares, placing £1,000 to reserve, and carrying forward £554. The Company still has a term of 29 years to run, and in view of the feeling that the undertaking should be acquired either by the Perth City Council or the State, the directors have offered the Council the undertaking for a sum of £500,000. Negotiations are still proceeding.

Finsbury Technical College Old Students' Association.—At the annual general meeting, held recently, Mr. R. J. Wallis-Jones was elected President. The following gentlemen were elected to represent the electrical students on the Council of the Association:—Vice-President J. E. Raworth, W. B. Esson, F. R. C. Rouse, C. B. Nadaud, T. H. West, and E. W. Moss. Mr. H. W. Gregory is Electrical Hon. Secretary.

REPORT ON THE STALYBRIDGE TRAMWAY ACCIDENT

LIEUT.-COL. P. G. VON DONOP has reported on the serious tramway accident which occurred at Millbrook, on the Stalybridge, Hyde, Mossley, and Dukinfield Electric Tramways at 6.30 a.m. on June 5th. As a tramcar was descending Ditchcroft Hill, Millbrook, it got out of the control of the driver, and ran away. In running down the hill it attained a high rate of speed, and on reaching a curve at the bottom of the hill it overturned, falling over on its right side. There were 43 passengers riding in the car at the time; of these 13 were so seriously injured that they had to be taken at once to the Infirmary, and one of them subsequently died. Twenty other passengers were slightly injured, and the driver of the car was also somewhat injured. The car to which this accident occurred was a four-wheeled, single-truck, double-deck car; it was fitted with a hand-brake working blocks on all four wheels, and with the Westinghouse magnetic brake, which by one action applies a track brake on each rail, and at the same time works the blocks on the wheels. The car was fitted at each end with two sand pipes.

The steep portion of the hill is 229 yards in length, the first 83 yards of the descent being on a gradient of 1 in 15·3, and the remaining 146 yards on a gradient of 1 in 11·4. At the top of the hill, where the gradient of 1 in 15·3 commences, there is a curve of 1½ chains radius, which is right-handed for descending cars; there is then a length of about 100 yards which is straight, and then at the bottom of the hill, near the termination of the 1 in 11·4 gradient, there is a left-handed curve, which also is said to be of 1½ chains radius. For descending cars there is a compulsory stopping place at the top of the hill, *i.e.*, just at the commencement of the 1 in 15·3 gradient; there is a second compulsory stop about half-way down the hill, and a third one at the bottom of it. Speed when approaching this hill and when running down it is limited by Regulation to 4 miles an hour.

The line on which cars approach the top of the hill is on a falling gradient of 1 in 28·8.

There appears to have been a certain amount of moisture in the air at the time that this accident occurred, and it is stated that the rails were on that account in a slippery condition.

The evidence of the driver was that before leaving the Stalybridge Depôt at 4.33 a.m. he had satisfied himself that the controller and the sanding arrangements were in order, and on reaching a Board of Trade stopping place a short distance from the car shed, he tested the Westinghouse brake and found it worked satisfactorily. During his first journey down Ditchcroft Hill he had no difficulty in controlling his car with the Westinghouse magnetic brake. On the journey when the accident occurred, he stated that he stopped at the compulsory stopping place at the top of the hill, but seven passengers gave evidence to the contrary effect. On starting down the hill, he said, he released his hand-brake, and moved the controller handle to the first notch of power; the car started slowly, and when it had gathered sufficient speed he applied the magnetic brake at the first notch, and then moved it on to the second; the car appeared to be gaining speed, which he attributed to the bad rail, so he kept on dropping sand, but the car did not retard at all; he then moved the controller handle to the third magnetic notch, and then to the fourth, but with no effect; the car had by this time acquired a great speed, and coming to the conclusion that the magnetic brake had failed, he shut it off altogether and applied the hand-brake; he thought that the car was going to get round the curve safely, but owing to the passengers on the top not keeping their seats the car turned over and fell on its right side. He is confident that the magnetic brake did not act at all the whole way down the hill.

In connection with the above evidence, says Lieut.-Col. von Donop, it may be at once pointed out that the driver, according to his own statement, acted in entire opposition to his instructions. According to the rule for coasting gradients, he should have set the controller handle at the fourth braking notch, and eased off his hand-brake; on the gradient on which the car was standing, no application of power was necessary to start the car, as it would have at once commenced to run forward by its own weight, and the magnetic brake would then have come into action whilst it was travelling at a low rate of speed; if this speed had been found to be too low, the controller handle might then have been moved to the third notch, which would have allowed a slightly increased speed to the car before the brake came into action again. The special object of this rule is to ensure that in coasting down a hill the brake is applied whilst the car is running at a very low rate of speed, but the driver's action in first applying power and then applying the magnetic brake at the second notch would have prevented the brake from coming into action until the car had attained a comparatively high rate of speed. He had also neglected to carry out the instruction to test his magnetic brake before starting down the steep gradient.

At the time that the car in question commenced to descend Ditchcroft Hill, there was another car, which had just ascended the hill and which was standing inside the loop points at the top of the hill, nearly opposite the compulsory stopping place. Both the driver and conductor of this other car are certain that the car which met with the accident did not come to a stop before commencing to descend the hill. Both these witnesses concur in stating that when the car was entering the loop points the driver was applying his hand-brake very hard, and that shortly after running past the compulsory stopping place they saw him apply the magnetic brake, but that neither brake appeared to check the speed of the car.

The car had been examined before leaving the sheds, and was believed to have been in perfect order. The flanges of its wheels were found after the accident to be in excellent condition. After the accident occurred, the police very properly did not allow the car to be touched until the responsible officials of the tramways reached the spot. It was then found that the hand-brake was applied nearly fully, and the blocks were tight on the wheels. The car was drawn back to the sheds by another car, and on that journey its hand-brake was tried and found to be in thoroughly good order. After Lieut.-Col. Donop's arrival, a new trolley pole was fitted to the car, and it was taken for a run in his presence; the magnetic brake was then tried, and was found to act perfectly. There are, in his opinion, therefore no grounds for attributing this runaway to any defect either in the hand-brake or in the Westinghouse magnetic brake, and he thinks that it is very doubtful whether the driver released the hand-brake before applying the magnetic brake.

The Westinghouse Brake Company are now fitting their magnetic brake equipment with an additional contrivance, which enables the track-brake to be applied mechanically as well as magnetically; the driver has thus the power to apply the track-brake, even though the wheels of the car are not revolving. For gradients such as those which exist at Stalybridge, this device would form an additional safeguard, and the Stalybridge, Hyde, Mossley, and Dukinfield Joint Board, says Lieut.-Col. Donop, might be asked to consider the advisability of fitting it on their cars.

The report concludes:—"As regards the overturning of the car, it is certain that on approaching the left-handed curve at the bottom of the hill the car must have been travelling at a high rate of speed, and centrifugal force would tend to make it heel over to the right or outside of the curve. The curve was examined after the accident, and it was found that at one point its curvature was of but 56 ft. radius, which is an exceedingly sharp curve for a car to run over at a high rate of speed. The superelevation was also examined, and it was found to have become very irregular; the maximum was 2¼ in., but at some points, even where the curvature was sharp, it was as little as ⅛ in. Under these circumstances it was almost inevitable, at the speed at which the car was travelling, that it should have overturned at this curve. The rails on the curve were found after the accident to be in good condition, and there does not appear to have been any defect either in them or in the wheels of the car which can have contributed to the overturning. This is now the third case which has occurred on this hill of a car having been allowed to get out of the control of the driver, and there is clearly no assurance that it will not occur again. To a runaway car, the curve at the bottom of the hill is an almost certain source of danger, and it is imperative that some steps should be taken to minimise the danger arising from it. The want of uniform superelevation could be corrected by banking up the road, and this should in any case be done forthwith. But the curve itself requires relaying so as to do away with the very sharp portions of it which now exist. It should, in fact, be so relaid that the curvature should at no point be sharper than the 1½ chains radius originally approved for it. This is, I am aware, a more difficult matter, as it will probably entail some widening or diversion of the road. But until this alteration to the curve is carried out, I do not consider that any top-deck car should be allowed to travel on this hill. The improvement on this curve is a matter calling for the Joint Board's urgent attention."

ELECTRICALLY OPERATED DAM

A NEW dam, of the swing bridge type, has just been completed at the Soo Locks by the United States Government, and is described in the *Electrical World* of New York. It is intended to be used in cases of emergency, should the gates of other locks fail. The structure is 308 ft. long, 25 ft. wide, and weighs 2,100 tons. It is pivoted on a central island pier, giving 108 ft. clear channel on each side. The deck of the dam is provided with 32 wickets, each 6½ ft. wide. These are mounted to slide on rollers between steel girders, hinged from the structure, but normally folded under the bridge. Before dropping the girder frames, the wickets are first run out to the hinged ends of the frames, which are lowered to the bottom of the channel, where they seat themselves against 12 in. square concrete-anchored oak sills. The sliding wickets are then lowered in the frames, gradually stopping the flow of water. The swing motion of the dam is operated by two 52 h.p. geared motors, one of which is sufficient to move the structure in a heavy wind. Either or both motors can be manipulated from one or both of the duplicate controllers provided, by means of a double throw switch. The sixteen frame and wicket mechanisms on each side of the dam are operated from a pair of line shafts extending across the spans from the central deck. Each shaft is driven through clutches by a 150 h.p. 440-volt induction motor, and a third clutch is provided to interconnect the other two, so that either or both motors can be utilised to work the entire mechanisms. The girders and wickets are operated from these shafts by lever-controlled switches.

The energy, which is three-phase at 60 cycles, is supplied from the water-power plant of the Edison Sault Electric Co. It is transmitted at 2,300 volts, and stepped down to 440 volts by three 100 kw. transformers. These are mounted on a concrete base near the centre pier. Instead of using submarine cables to convey the current, a tunnel is constructed under the north channel, through which the cables are brought. It is reached by vertical shafts, and is 3 ft. wide, 6 ft. high, and its floor is 33 ft. below the water. It is kept free from water by a float-controlled motor-driven pump. The structure has been tested under flood conditions with a 20 ft. head of water, and found capable of controlling and stopping the flow. It can be swung across the stream in less than 90 seconds, and it is estimated that all the wickets can be lowered in less than another 60 seconds.

THE SIMMER PAN (TRANSVAAL) GENERATING STATION

A DESCRIPTION of the Victoria Falls & Transvaal Power Co.'s station at Simmer Pan appears in the *Journal of the South African Institute of Electrical Engineers.* This station is situated on Victoria Lake, from which it obtains its water supply. There are sixteen Babcock & Wilcox boilers, fitted with chain-grate mechanical stokers, and the Pratt system of mechanical induced draught. The capacity of each boiler is 20,000 lbs. of water per hour at a steam pressure of 200 lbs. per sq. in. The steam is superheated to 300° C. The coal is carried to the boiler bunkers by motor-operated conveyors, and fed by gravitation to the stokers. The generating plant in the turbine house consists of six sets of 3,000 kw. A.E.G.-Curtis turbo-generators, which generate at 2,240 and 10,500 volts, stepping up to 40,000 volts. The auxiliary plant, such as condenser, pumps, &c., are all electrically driven.

The high pressure switchgear is fixed into fireproof brickwork cubicles. This apparatus is under remote control from a separate operating room by means of current at a low pressure. The main switchboard consists of six generator panels placed together; another panel for three station transformers; two more for three 40,000-volt line transformers; another six 40,000-volt line panels; and six 10,000-volt line panels. Each of these is provided with a small control switch for operating the main oil switches. Lamps for indicating whether the switches are open or closed are also provided. The generator panels have control switches for regulating the turbine governors and the generator rheostats, besides the usual ammeters, wattmeters, and reverse current relays. The feeder panels are supplied with overload and Merz-Price protective relays. The exciters are controlled from a separate board. A storage battery is used for the lighting and operation of the relays, and is charged by a motor-generator. A large diagram is provided, which indicates at a glance the arrangement of the switches at any point on the system. Lines for various voltages are differently coloured, the switches are represented by discs, and it is easy to see the position of the switch and the pressure of the line on which it is operating.

SILICA LAMPS

THE Westinghouse Cooper Hewitt Co., Ltd. (151-152 Great Saffron Hill, Holborn Circus, London, E.C.), has recently put upon the market a new type of silica lamp for direct current, taking only 1½ ampere at 200-250 volts, and giving, it is stated, 800 c.p. The light is obtained from the incandescence of mercury vapour in a short tube of transparent quartz. This tube (called the "burner" for convenience by the makers, although, of course, no consumption of material takes place) is provided with two electrodes of mercury, and is exhausted to a high degree of vacuum. The lamp is started by the tilting of the burner by an electromagnet, which is automatically cut out of circuit as soon as the lamp lights up, and allows the burner to fall back to its normal position by gravitation. At first the colour of the light emitted is blue, but after a very short time, owing to the high temperature of the quartz, the light becomes whiter. This allows of clear or very slightly opal glass globes being used, which increases the output of light. The lamp is self-contained, and totally enclosed, and the makers are recommending it for use in places where enclosed carbon arcs are at present employed. It will stand fluctuations of voltage 10 per cent. above or below the normal without giving any trouble. We are informed that the life of the burner is, on an average, between 2,000 and 3,000 hours, and a minimum of 1,000 hours is guaranteed. About 260 of these lamps have been installed in Messrs. Vickers' works in Sheffield, and other firms which are using them include Vickers, Ltd., Barrow-in-Furness; John Brown & Co., Ltd., Clydebank; Leith Harbour and Docks, Leith; Messenger & Co., Loughborough; and North British Loco. Works, Glasgow.

The firm is also introducing the new "light transformer" reflector, described in ELECTRICAL ENGINEERING of Sept. 29th last, which can be fitted to the tubular pattern of lamp for the purpose of overcoming the peculiar colour of the light. It is coated with a special fluorescent material, and mounted behind the tube of the lamp in such a manner that the redder rays from the reflector mingle with the direct rays from the lamp.

LOCAL NOTES

Australia: *Melbourne Electricity Accounts.*—The accounts of the municipal electrical department for the year to Feb. 28th show a net profit of £19,532 after meeting capital charges amounting to £44,402. The number of consumers added to the mains was 546, compared with 359 during the previous year, bringing the total to 3,758. The total number of units sold was 8,920,489, an increase of 760,526. A new contract for coal has been entered into at 10s. 7d. per ton, against 16s. 10d. previously paid. A new battery is to be installed at the power house at an estimated cost of £21,000.

Belfast: *Dispute with Corporation.*—Messrs. William Coates & Son, Ltd., electrical engineers, of Belfast, applied last week in the Irish King's Bench Division, Dublin, for an order requiring the Corporation to approve of certain plans of buildings which the Company are erecting. It appears that the buildings in question are being erected upon land which the Corporation have taken powers to acquire under an Act of Parliament, this session. For Messrs. Coates it was submitted that disapproval under such circumstances was *ultra vires.* After a little discussion, the case was ordered to stand over until next sittings.

Biddulph: *Wiring.*—The Local Government Board have

Hosted by Google

refused to sanction a loan for the supply of fittings and installation work in consumers' premises.

Dublin: *Tramcar Accident.*—A short time ago a girl was burned to death whilst travelling on the top of an electric tramcar. It is not known how her clothes became alight, and several suggestions have been made that it was due to an electrical defect on the car. The Board of Trade have considered the circumstances, and have refused to order an inquiry, as they have no reason to believe that there was any electrical defect.

Gillingham: *Fire at Electricity Works.*—A serious fire occurred at the Gillingham Electricity Works last week, doing damage estimated to cost £2,000. The fire was in a building where lamps, radiators, and other electrical appliances were stored.

Greenock: *Electricity Profits.*—Satisfaction was expressed at the last meeting of the Corporation at the large surplus upon the electricity department last year, viz., £5,520, after meeting capital charges and setting aside a sum for depreciation. It was unanimously decided to place £1,500 to reserve fund. The question of dealing with the remainder will be discussed at the next meeting of the Council.

Halifax: *Electricity Accounts.*—The Electricity Accounts for the year to March 31st, 1911, show a net profit of £5,323, after meeting capital charges amounting to £6,600. After writing off the balance of the cost of No. 1 economiser and part of the cost of a rotary converter, the sum of £693 is handed over to relief of rates, and £3,673 transferred to renewals fund. The total number of units sold was 5,964,665, against 5,477,369, and the maximum supply demanded 2,960 kw. against 2,870 kw.

Heckmondwike: *Plant Extensions.*—The Council have sent a strongly worded request to the Local Government Board for a decision with regard to the recent inquiry for a loan for extensions at the electricity works. It is complained that decisions have been given in other inquiries held later than that at Heckmondwike, and that the efficient working of the undertaking is being interfered with by the absence of a decision regarding the loan in question.

Holmfirth: *Lighting.*—A poll of the ratepayers is to be taken with a view to an application being made for an electric lighting Provisional Order.

Ilford: *Accounts.*—The accounts of the electricity department for the year to March 31st, 1911, show a net profit of £1,400 compared with £1,569 in the previous year, after meeting capital charges. This balance has been carried to reserve and depreciation account. The number of units sold increased from 3,152,591 to 3,299,927. The total costs, exclusive of capital charges, were 1·02d. per unit, against 1·03d. in the previous year.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Burnham.—Mr. W. H. Trentham has been appointed consulting engineer by the Council in connection with a proposed electric lighting scheme.

Cleethorpes.—Tenders are invited for a system of vulcanised bitumen distribution and feeder cables on a low-pressure three-wire D.C. system at 460 volts on the outers. Consulting Engineers, Messrs. Vesey Brown & Hall, Milburn House, Newcastle-on-Tyne. Tenders to Town Clerk by Sept. 2nd.

Ireland.—A Local Government Board inquiry has just been held at Killeshandra (County Cavan) in connection with a proposed electric lighting scheme. The Cavan Rural District Council are the authority.

London.—The Westminster Electric Supply Corporation require battery boosters and switchboards. Consulting Engineers, Messrs. Kennedy & Jenkin, 17 Victoria Street, S.W. Tenders by Sept. 2nd.

South Africa.—The Roodepoort-Maraisburg Municipality contemplate an expenditure of £8,000 upon an electric lighting scheme. According to the *Board of Trade Journal*, the Potchefstroom Municipality has been authorised to spend £20,000 upon an electric lighting scheme.

Worksop.—The Borough Electrical Engineer has prepared a report dealing with overhead wires, extensions to plant, street lighting, &c.

OSRAM·LAMPS

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

London.—Additions to the Western Fever Hospital, Seagrave Road, Fulham. W. T. Hatch, Engineer in Chief, Metropolitan Asylums Board.

PROVINCES.

Aberdeen.—Proposed new City baths.

Brighton.—Four new receiving homes and Infirmary at Warren Farm schools. Builders, Messrs. Mark Martin & Sons, Eastbourne.

Derby.—Electric lighting of Melbourne Church.

Dumfermline.—Drill hall for Fife Territorial Association. Women's Institute in Bath Street.

Glasgow.—Extensions to head offices of Caledonian Railway Co.

Extensions to the General Post Office. H.M. Office of Works, 3 Parliament Square, Edinburgh.—Buildings at North East Corner of Gallowgate and Graham Square. Architects, Burnet & Boston.

Warrington.—Tenders are invited for the electric lighting of the Evelyn Street Council school. Architect, Mr. A. Buttery, Exchange Place, Queen Street, Morley.

Warwick.—Children's Homes for the Guardians. Architect, F. G. Cundall, 4 Parade, Leamington Spa.

Worksop.—Additions to children's and males' wards, new kitchens, &c., at Victoria Hospital. Architect, A. H. Richardson, Market Place.

MISCELLANEOUS

Dublin.—The Electricity Committee invite tenders for 750 single-phase and 200 three-phase meters. Tenders to Chairman of Electricity Committee by September 7th.

TENDERS RECEIVED AND ACCEPTED

Australia.—A contract has been placed by the Sydney Council with Messrs. Noyes Bros. for a supply of electric motors. Orders for Ferranti and A.E.G. meters have also been placed.

Barnstaple.—A contract has been entered into with the D.P. Battery Co. for the supply and maintenance of a new battery at the Council's electricity works.

Belfast.—Messrs. J. Dowling & Sons, Queen Street, have secured the contract for the wiring and fitting of the new Argyle Place Presbyterian Church. Current will be taken from the Corporation mains.

Blackburn.—The tender of Messrs. J. W. Garsden & Co., electricians, Blackburn, has been accepted for the new fire alarm installation at the local workhouse, at £192 10s.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 10s. (last week, £58 5s. to £58 15s.).

Plant for Sale.—The Great Northern Railway Co. of Ireland have two Crossley gas engines and two shunt-wound dynamos and switchgear for sale. Full particulars from the Secretary, Amiens Street, Dublin.

Liquidations.—A meeting of creditors of the Havana Telephone Securities Co., Ltd., will be held at New Broad Street House, London, E.C., on August 31st, at 2.30 p.m.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. E. McKenzie, who has held the position of resident engineer at the Stuart Street (Manchester) Electricity Works since 1903, has been promoted to chief assistant electrical engineer to the Manchester Electricity Department.

Mr. David Smith has severed his connection with the Foster Engineering Co., Ltd.

Mr. F. Swarbrick, for the past six years engaged at the Leigh (Lancs.) Electricity Works, has commenced his duties as Chief Engineer at the Galway (Ireland) Electricity Works.

Draughtsmen used to switchgear design are required by a large electrical firm. (See an advertisement.)

Hosted by Google

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—Two leaflets are to hand from the British Aluminium Company (109 Queen Victoria Street, London, E.C.) illustrating aluminium plant in chemical works, and aluminium trolley heads.

BATTERIES.—We have received from the Hart Accumulator Co. (Stratford, London) a neat advertising novelty in the form of a small celluloid case containing court plaster. It also provides a calendar for 1911 and 1912 on the back.

THE RUPING PROCESS OF CREOSOTING.—A pamphlet dealing with the antiseptic treatment of timber has been issued by Richard Wade, Sons & Co., Ltd. (Garrison Side, Hull). That creosote is the best preservative known is shown by its great export to America for this purpose, and the increasing demand for timber-preserving in this country. From 80 to 85 per cent. of the timber used is lost from decay. This is due to fungi, which are always present in the air and ready to lodge on unprotected timber. They, however, require moisture, air, and warmth, and if these are absent they cannot live. Hitherto the practice was to inject so many pounds of creosote per cubic foot of timber. It has been proved by test that moisture is not excluded by the method now in use. The aim of this process is to thoroughly saturate the fibre and cell walls with the preserving liquid, without leaving any in the interior of the cells. No new substances are used, the only thing new being the method of putting them into the wood. The cost of this process is said to be greatly reduced compared to the existing method.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC CLOCKS.—The Silent Electric Clock Co. (192 Goswell Road, London, E.C.) has published a "catechism" fully describing a system in which any number of clocks in an installation can be controlled and kept in time by electric impulses sent from a master clock. These are sent every half-minute, and are used to rotate a circular armature instead of using a steel claw to engage a ratchet wheel. The company also make a special worm-driven movement for turret clocks up to 6 ft. or 8 ft. diameter. Various types of "programme ringing" attachments are also described. These consist of an arrangement for ringing bells throughout the installation at predetermined times, and include an automatic switch, which cuts off the bells during the week end.

ELECTRIC COOKING APPLIANCES.—A card has reached us from Simplex Conduits, Ltd. (Garrison Lane, Birmingham), illustrating an improved pattern nickel-plated toaster, and a two-pint copper kettle, which boils in ten minutes at 500 watts.

CARBONS.—A catalogue, published in English, has been issued by Rylander & Rudolphs (Henriksdal, Sweden), and sent to us by James McMillan & Co. (Clun House, Surrey Street, Strand, London, W.C.). It relates chiefly to carbons for brushes, telegraphs, and telephones, and several particulars are given of the various patterns of carbon brush in which the firm specialises.

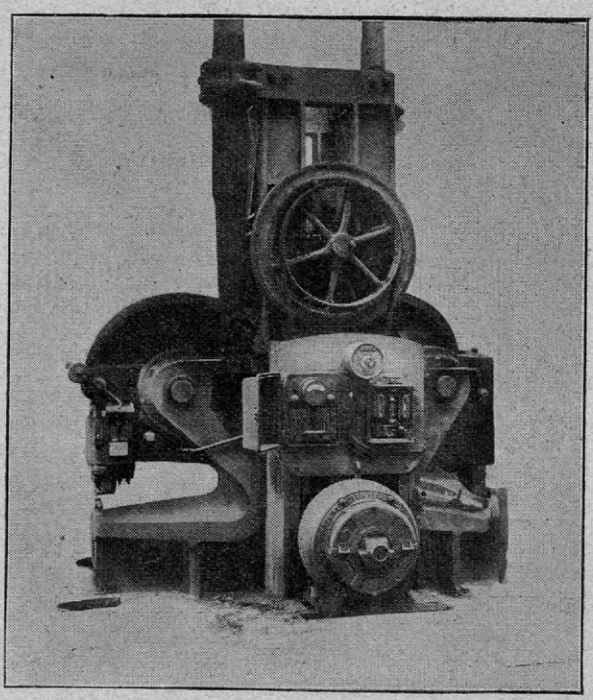
NEW COMPANIES

TAYLOR & FRASER, 31 Argyle Street, Glasgow. Capital £4,000. Heating and ventilating engineers.

SKELMORLIE ELECTRIC SUPPLY CO., 13 St. James Place, Paisley. Capital £10,000.

BRAUNTON ELECTRIC LIGHT & POWER CO.—Registered by Jordan & Son, 115 Chancery Lane. Capital £5,000. Messrs. Crompton & Co. are interested in this promotion.

ARDROSSAN & SALTCOATS ELECTRIC LIGHT & POWER CO., 63 Castle Street, Edinburgh. Capital £20,000. The first directors are G. Balfour and H. A. Beatty.



COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Jandus Arc Lamp & Electric Co.—The result of the trading for 1910 allows of the payment of a 10 per cent. dividend on the ordinary shares, the transfer of £2,500 to reserve, and the carrying forward of £3,289.

Northern Light, Power & Coal Co.—A special meeting was held in London last week at which the creation of $1,000,000 debentures, to rank in priority to the existing first mortgage gold bonds, was sanctioned. The company supply electricity in the city of Dawson, and for the half-year to June 30th the profits amounted to £14,400.

SILVERTOWN MOTORS

15 B.H.P. Silvertown Motor driving 1⅛" × 1½" punching and Shearing Machine, in Shipbuilding Yard.

OPEN PROTECTED, ENCLOSED VENTILATED, AND TOTALLY ENCLOSED TYPES.

EVERY MACHINE is GUARANTEED TO DEVELOP ITS RATED HORSE POWER

SUMMARY

The Liverpool tramway strike has been settled; the Committee has agreed to take back the strikers "as and when required." In London, the chief officers of the L.C.C. tramways department have met the officials of the men's union, and there seems every prospect of an amicable settlement. (Page 482.)

Electric power is transmitted from Niagara to several Canadian towns by a 110,000-volt transmission line. Particulars of the arrangements are given, and details with regard to the construction of the line. Aluminium cable is employed, and the cost of this is compared with the relative cost of copper; with due allowance for the additional cost of the supporting towers, there has still been a large gain in the use of aluminium. (Page 483.)

We are in a position to state that when the allocation of the grant by the Board of Agriculture of £50,000 annually for research work comes to be determined, the use of electricity in agriculture will receive serious consideration, and it is anticipated that a sum of money will be applied to experimental work in this connection. (Page 485.)

A new back geared screw limit switch for lifts and similar cases as a substitute for a tappet switch is described on p. 485.

"Graphic" instruments is a new name for recording instruments suggested by Messrs. Everett, Edgcumbe & Co., who have also sent us a description of their new instruments of this class. (Page 486.)

Sir William Ramsey's Presidential Address to the British Association contained some caustic criticisms on the present organisation of technical education in this country, and also dealt with the problem which arises in view of the ultimate exhaustion of our coal supplies. (Page 487.)

Letters from the "Z" Electric Lamp Manufacturing Co. with regard to patent litigation, and from the Sandycroft Foundry Co., on the Dundalk storage battery contract, appear on p. 488.

In our "Notes on Telephony and Telegraphy (Including Wireless)" we refer to a novel prosecution in California for publication of a stolen wireless message, and a wireless telegraph installation for the American Navy having a range of 3,200 miles. (Page 489.)

Alterations and extensions in connection with the Walsall electricity undertaking are described on p. 489.

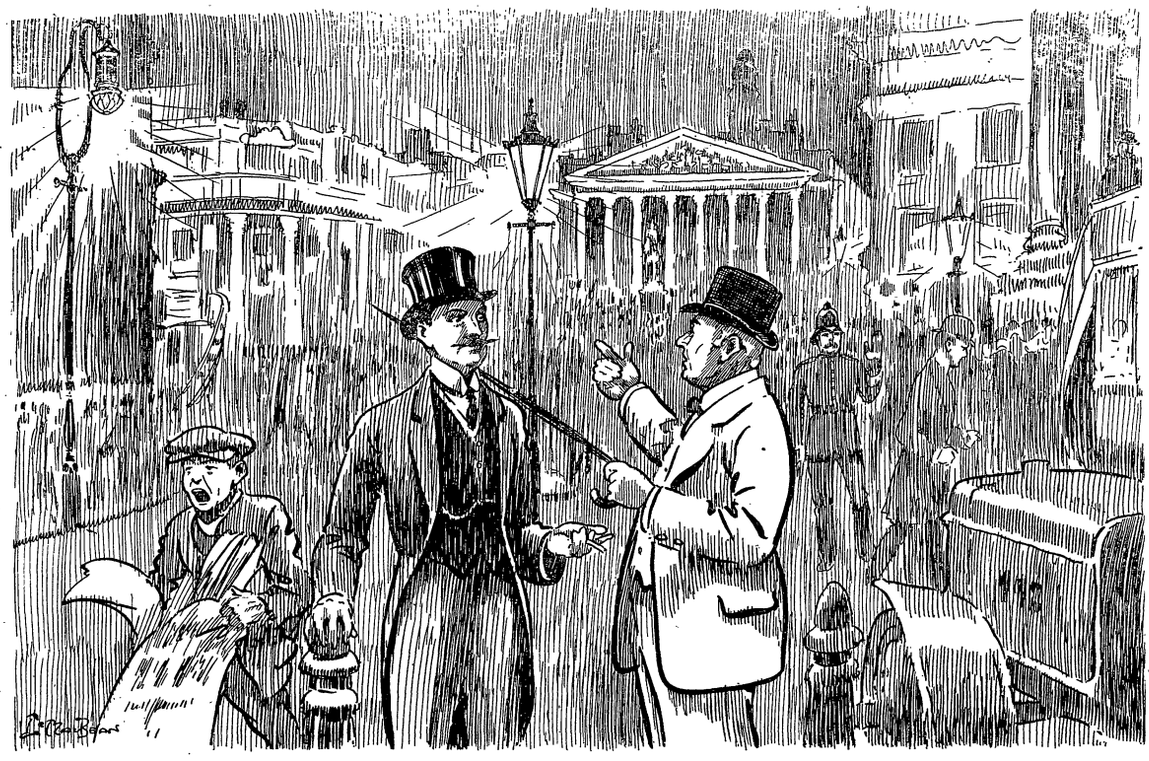
In a review of an illustrated book on meters issued by the Electrical Co., we describe an automatic brush-shifting device to compensate for the friction at light loads, and a D.C. meter of the oscillating type without brushes, and mention a suggestion for determining the "life factor" of meters. (Page 489.)

The British Thomson-Houston Co. have patented a new insulating material formed by the impregnation of soft absorbent paper with a liquid formed by the reaction between phenolic bodies and aldehydes. Another specification published by the Patent Office

Hosted by Google

last week describes a reversing controller for A.C. commutator motors, in which the field coils are connected in series with one half of the primary of a transformer, and the armature is connected to the secondary. A patent taken out by Siemens & Halske describes a method of hardening the surface of tantalum. Opposition to a patent by J. Keith describing a new design of runner for centrifugal fans has been unsuccessful. (Page 490.)

The Lancashire Electric Power Co. are making another effort to secure powers to supply electricity in Radcliffe in competition with the Council.—In his annual report, Mr. A. Ellis, Borough Electrical Engineer at Cardiff, deplores the absence of powers to carry out installation work.—A new street lighting scheme, which substitutes clusters of metal filament lamps for arc lamps, has been drawn up at Maidstone.—The Dolcoath mine, in Cornwall, is being electrically equipped. (Page 492.)



Local Government Board inquiries have been held at Bangor (£2,000); Barnsley (£16,000); Darwen (£7,600); Rawtenstall (£2,000); and the Llandudno Council are to apply for a loan of £500 for mains. The Eccles Electricity Department require a H.T. single-phase switchboard, and the Swinton Council cables, &c. (Page 492.)

THE STRIKE

THE dispute between the Liverpool Strike Committee and the Liverpool Tramways Committee with regard to the reinstatement of the tramway men who struck, referred to in our article last week dealing with the strike, was settled on Thursday. At first the Liverpool Tramways Committee had refused to guarantee to reinstate these men, with the result that the whole of the dock workers were kept on strike by the Strike Committee. After a long meeting of the Tramways Committee on Thursday, a resolution was passed agreeing to reinstate the men in question "as and when required." This was the most which the Committee would do to meet the demands of the Strike Committee, in spite of the fact that the strike leaders had threatened to bring about another national railway strike if the tramway strikers were not reinstated at once, and the Strike Committee had no option but to accept these terms. With the settlement of the tramway dispute, work all round Liverpool was immediately recommenced, and the city is gradually getting back to its normal state.

Whilst the Liverpool dispute was being settled, the London tramway men were still persisting in their demand for consideration of their grievances, and for these to be discussed through the medium of their Trade Union officials. On Saturday, however, Mr. A. L. C. Fell, Chief Officer of the Tramways, Mr. Bruce, Deputy Chief Officer, and Mr. Slattery, Traffic Superintendent, received the men's representatives, and it is stated that a number of the grievances were adjusted, and several minor concessions made which it is hoped will lead to a satisfactory settlement of the trouble. At any rate for the moment, all thought of a strike of the London tramway men has been put on one side, the ballot on the question not having been completed.

Faraday House.—The training of the electrical engineer is fully discussed in a pamphlet received from Faraday House. It is well illustrated with views of all the departments of the Institution, as well as a few of the more important firms with which the college is affiliated. The great respect with which the course is held is evident from a list of testimonials, showing the great appreciation of both students and parents for the way in which the former have been trained and turned out fully equipped for taking up important positions. Assistance in placing students who have finished their courses is given by the energetic secretary, who, being in touch with most of the best men of business, spares no efforts to place his students in a satisfactory position for their future welfare. Besides this, applications are always being received from firms, and other branches of the profession, for men "such as you have sent us before." The next term commences on September 25th, and a prospectus giving every detail of the four years' course, which includes two years pupilage at a manufacturing works or electricity supply station, can be had on application.

LONDONER (*to his friend from the Country*): There are two companies supplying electric lighting in the City.
THE OBSERVANT FRIEND FROM THE COUNTRY (*pointing to the open and flame arc lamps*): Yes, I had already noticed that their two electricities have different colours.

Hosted by Google

THE 110,000-VOLT TRANSMISSION LINES OF THE HYDRO-ELECTRIC POWER COMMISSION OF ONTARIO

THE Hydro-Electric Power Commission of Ontario, Canada, is the outcome of an agitation started in various towns in the Province for a supply of cheap power from Niagara. The movement dates back to the years between 1900 and 1902; in 1903 a Commission representing seven municipal authorities was formed, and this was replaced by a permanent Commission nominated by the Government in 1906. This Commission consists of three members, who are invested with powers to control the rates charged for light and power in the Province, to construct works, and generally to further the utilisation of electric power for industrial purposes. The Commission has worked for the last five years in conjunction with the municipalities of the Province, and has now a transmission system of some 100,000 h.p. capacity, supplying power to over twenty large towns, and having overhead lines aggregating 283 miles.

As there were already a number of companies with large power stations at Niagara Falls, it was decided that, for the present at any rate, the Commission would buy power from one of these, and confine itself to the transmission of the energy to the various towns, and to a general control of the system. Tenders were therefore invited from the several power companies, and an agreement was ultimately made with the Ontario Power Company, whose enormous station at Niagara was described in ELECTRICAL ENGINEERING, Jan. 13th, 1910 (Vol. VI., p. 21). The power is bought at the generated pressure of 12,000 volts, and transformed to 110,000 volts by the Commission. Originally it was intended to require delivery of the power at 60,000 volts, and to transmit it at that pressure, but it was thought that a still higher transmission voltage would be feasible. The company has agreed to provide power up to 100,000 h.p., but the Commission may purchase from other sources also after a certain amount is reached. The contract price is £1·875 per horse-power per annum, and this enables the Commission to supply the various municipalities at charges ranging from £3·65 to £8·6 per horse-power per annum, according to the distance away from Niagara.

The 12,000 : 110,000-volt transforming station at Niagara is connected to the generating station by an underground cable conduit, 2,500 feet long, and containing six 3-core paper-insulated cables of 0·236 sq. in. section. These cables, which were tested up to 50,000 volts between cores, were manufactured and supplied by Messrs. Siemens Bros. & Co., of London. The transforming sub-station is equipped with oil circuit-breakers with overload relays, and, at present, nine star-connected 3,000 K.V.A. single-phase transformers, which can be regulated to give a secondary pressure of from 110,000 to 132,000 volts. On the high-tension side, the current passes through disconnecting switches and oil-switches to the 110,000-volt 'bus-bars, which consist of one-inch copper tubes spaced 6 feet apart. From these the current passes through further switches and oil circuit-breakers to the line exits, which are built up of heavy porcelain tubes supported in the centre of a 5-foot square opening in the wall filled in with four sheets of plate glass. Choking coils and horn-gaps with electrolytic lightning-arresters are provided at this end of the line. All this equipment was supplied by the Canadian Westinghouse Co. The transformers are oil-insulated, water-cooled, and the terminals of these and of the circuit-breakers are provided with the Westinghouse condenser bushing.

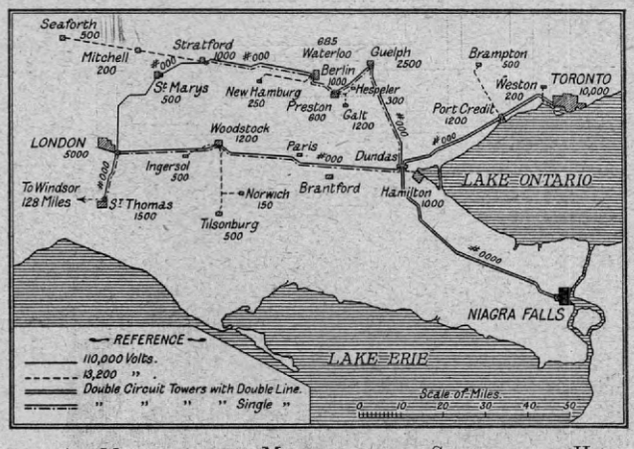


FIG. 1.—MAP SHOWING MUNICIPALITIES SERVED AND HORSE-POWER TAKEN BY EACH.

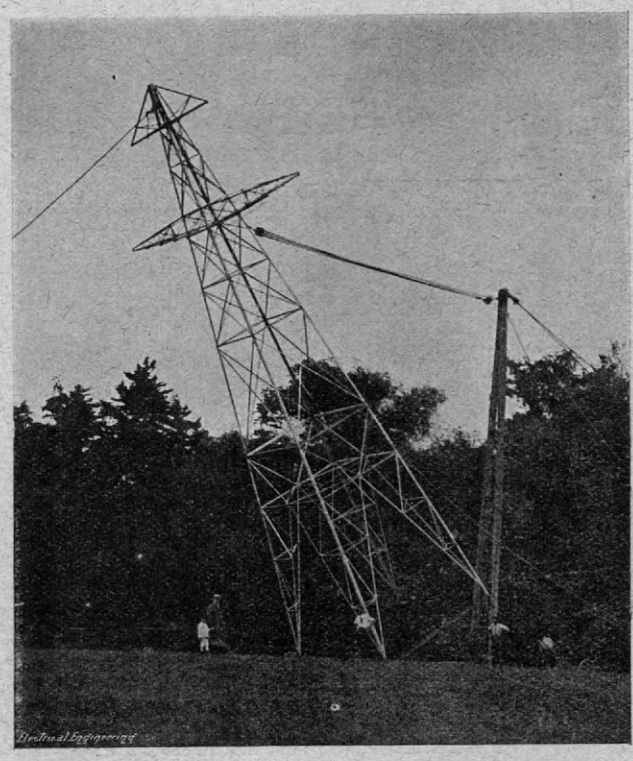

FIG. 2.—ONE OF THE STANDARD TOWERS FOR THE LINE IN PROCESS OF ERECTION.

Fig. 1 shows the extent of the system and the municipalities served. The main line from Niagara Falls to Dundas is erected on steel towers, spaced about 550 feet apart, and each carrying two three-phase circuits of stranded aluminium cable of 0·1662 sq. in. section. An illustration of one of the standard towers is given in Fig. 2, and Fig. 3 gives the dimensions. The actual cost of this line, including towers, cables, insulators, telephone lines, and cost of carriage and erection was £1,180 per mile, of which the six aluminium cables accounted for some £302 per mile, and the insulators £90 per mile. The alternative tender for a copper line was £1,250 per mile, of which the copper cables accounted for £428 per mile. These relative costs are on the basis of aluminium ingots at £80 per ton (aluminium wire about £105 per ton), and copper bars at £60 per ton (copper wire at £75). It will be seen that

Hosted by Google

an actual saving of £70 per mile of line, or some 5·6 per cent. of the total cost of a copper line, was effected by employing aluminium cables. Thus on the 52 miles of line between Niagara and Dundas alone a saving of £3,640 has been obtained. If a comparison is made of the cost of the aluminium and copper cables only, there is, of course, a still larger difference—in fact, the gain then shows as 29 per cent. of the cost of the copper cables. Owing to the small proportion of the cost of the cables to the total cost, however, and the necessity for somewhat higher and therefore more costly towers due to the greater sag of aluminium cables, this saving is reduced to 5·6 per cent. of the total cost of the line. The tendered and accepted costs referred to above have been extracted from a report of the Commission, and the figures deduced from these form, therefore, a practical example of the actual saving to be effected by the use of aluminium for extra high-tension transmission lines.

The line from Dundas to Toronto is 36 miles in length, and consists of towers with two three-phase circuits of stranded aluminium cable of 0·1318 sq. in. section. The cost of this line was £1,096 per mile, of

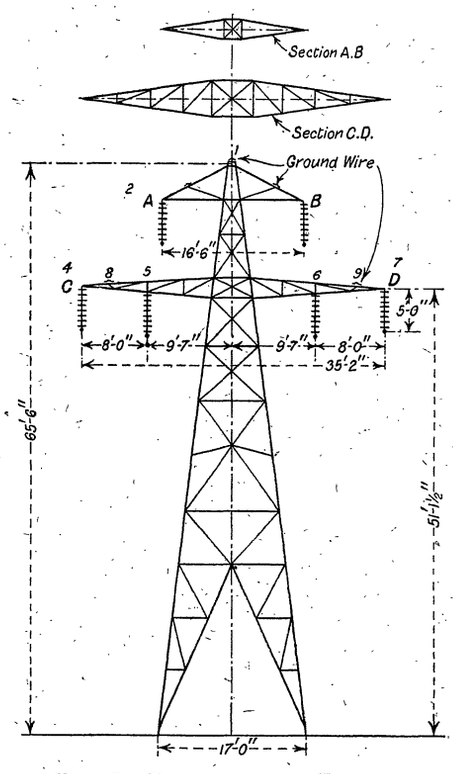

Fig. 3.—Dimensions of Towers.

which the cables accounted for some £240. The alternative tender for a copper line was £1,142 per mile, so that the saving consequent upon the adoption of aluminium conductors amounted to £46 per mile, or about 4 per cent. only, due to the smaller proportion of the cost of the cables to the total cost.

The steel towers were constructed by the Canadian Bridge Co., according to the designs of the Power Commission's engineers, and a test tower withstood a horizontal pull near the top of over 20,000 lbs. before buckling. About 3,000 towers were required for the 283 miles of line already constructed, there being about 10 towers to the mile. All the steelwork, except the footings, were hot galvanised. The steel footings were painted with a special preservative, and concrete footings were provided only in a few cases. The whole line is protected by overhead earthed steel cables, two on the double-circuit towers and one on the single-circuit towers. The minimum distance between the conductors is 8 feet, but this is increased to 14 feet in the case of a very long span of 1,100 feet. Special towers 140 feet high are used for one long span over a canal. The standard double-circuit towers, of which there are 2,305, are 65·6 feet in height, and weigh 1·78 tons each. The other dimensions are shown in Fig. 3.

The insulators are of the suspension type, and were supplied by the Ohio Brass Co. As shown in Fig. 4, each insulator consists of eight pieces, each 10½ in. diameter, and is 5 feet 2 in. in length overall. The lowest piece is provided with a special malleable cast-iron clamp with grooves for gripping the cable, which is protected by an aluminium sleeve. Two sheet-iron covers project over the cable on each side to protect it from burning in the event of a flash-over. At all

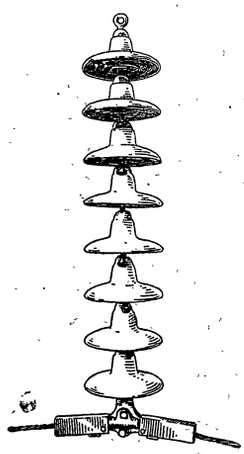

Fig. 4.—Suspension Insulator.

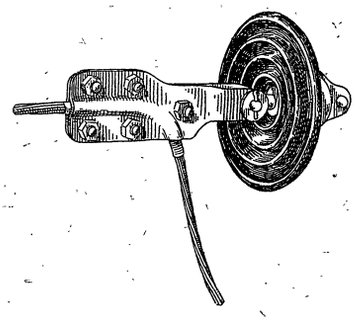

Fig. 5.—Strain Clamp.

angles and also at about every 1½ mile along the line, the cables are strung up to the towers by special strain insulators (Fig. 5) of ten pieces each, with a clamp formed of two ¼ in. steel plates, which grip the cable in an aluminium sleeve. All clamps are heavily galvanised. The price of the insulators was £1 9s. 3d. each for the complete 8-unit ordinary pattern, and just over £2 each for the 10-unit strain type. Over 6,000 of the former and 2,000 of the latter have been supplied. These figures do not include the cost of the clamps. The specification demanded that the complete insulator should withstand a pressure of 330,000 volts (three times normal) dry, and 220,000 volts under a heavy rainfall combined with a wind strong enough to

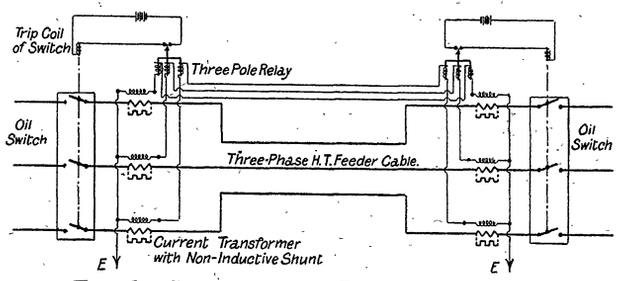

Fig. 6.—Connections of Protecting Device.

blow the rain at an angle of 45° towards the insulator. Mechanically, the ordinary insulator was required to withstand a pull of 8,000 lbs., while the strain insulator was required to withstand a 10,000 lbs. pull. The Ohio Brass Co.'s insulator was chosen from seven different types submitted by five different makers. Owing to the high test pressure specified, the insulators are suitable for a working pressure of 150,000 volts should the Commission decide to raise the transmission line pressure to this amount.

The aluminium cables are jointed by the torsion sleeve joint.

The system of protection employed is illustrated in Fig. 6. A triple-pole relay at each end of the section closes the local battery trip-coil circuit of the main

Hosted by Google

oil-switch, and completely disconnects the section on the balance being disturbed. It will be seen that the relay coils at each end of the section are connected in series with current transformers to an earthed neutral point on one side, and are joined to the corresponding relay coils of the other station by three pilot wires which are strung alongside the telephone wires. In the event of a break or short-circuit in any section, that section is cut out immediately by the action of the relays. As all the important sub-stations are connected on a ring main, however, the shut-down of any one section will not interrupt the supply.

For intercommunication between the different sub-stations and switching stations, a comprehensive telephone system has been provided. A separate pole line parallels the whole of the transmission line network, and the patrol men are provided with means for connecting to the line at any point. The two main exchanges, at Dundas and London respectively, are equipped with boards wired for twenty lines, and provided with six-cord equipments. Special impedance coils are provided to drain off any static charges which may be induced in the lines.

The Dundas station is mainly an interswitching station, but contains also transformers for a local supply at 13,200 volts. The electrical equipment of this station was supplied by the Canadian Westinghouse Co., and includes six 110,000-volt electrically-operated circuit-breakers, lightning arresters, operating switchboard, &c. Toronto has the largest terminal sub-station in the system; the capacity of the transformers is 7,500 kw., divided amongst six 1,250 kw. units. Power is distributed locally at 13,200 volts to numerous sub-stations forming a ring round the outskirts of the city. The distribution systems are mainly overhead, some 30,000 pin insulators being employed. The chief municipalities taking power from the Commission are those of Toronto, London, Guelph, St. Thomas, Woodstock, Galt, Berlin, Stratford, Hamilton, and Brampton, but numerous smaller municipalities also take power to the amount of several hundred horse-power. In all of the sub-stations the leading-in and switching arrangements for the 110,000-volt line show carefully thought-out design for the special circumstances of the case. The apparatus has been mostly supplied by the Canadian Westinghouse Co. and the Canadian General Electric Co.

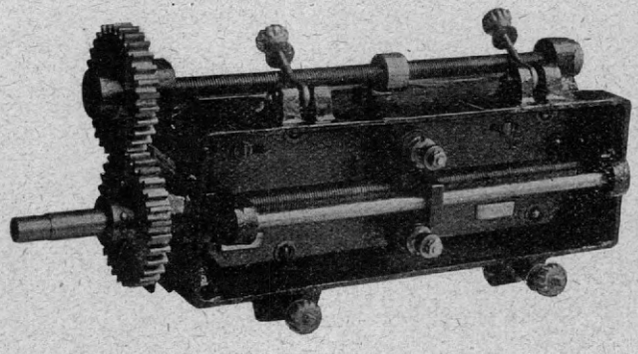
It is interesting to note that in all about 2,000 tons of aluminium cable is in use in the transmission and distribution systems. Some 500 miles of this cable was supplied by the British Aluminium Co.

The chief engineer appointed by the Commission to superintend the construction and organisation of the whole system is Mr. P. W. Sothman, who has had considerable experience in Germany, Russia, and South Africa, and was at one time manager of the large power distribution system of Strasburg, which includes 97 municipalities.

In the preparation of the above article we have been assisted by the published reports of the Hydro-Electric Power Commission, and also by information contained in the *Canadian Electrical News*.

In concluding, it will not be without interest to give our readers an idea of the enormous amount of electric power generated from the Niagara Falls. There are five large power companies. The Ontario Power Co. has already been mentioned; its power house (whose ultimate capacity will, it is said, be 200,000 h.p.) is now equipped with eight 12,000 h.p. sets. The Hydraulic Power Co. has three stations, the largest of which has ten units of 10,000 h.p. each; the Niagara Falls Power Co. has two stations, one containing ten 5,000 h.p. units and the other eleven 5,500 sets; the Canadian Niagara Co., which is interconnected with the Niagara Falls Co.'s station, has six units of 10,000 h.p.; and lastly a station of somewhat smaller size is owned by the Toronto Power Co., which is, however, nearly doubling its capacity this year. The total capacity of the power houses at Niagara is therefore approximately 400,000 h.p., which, it may be added, represents but 4 per cent. of the estimated power which would be available if the total flow of water were utilised.

ELECTRICITY IN AGRICULTURE



THE announcement is made that the Board of Agriculture have adopted a scheme which has been formulated by the Development Commissioners for considerable agricultural research work. For this purpose the Treasury has sanctioned an annual expenditure of £50,000. The scheme, which is at present in the earliest stages, provides for the carrying out of research work in practically all branches of agriculture, including plant nutrition and soil problems.

We are in a position to state that the question of the use of electricity in agriculture will receive serious consideration, and it is to be anticipated that a sum of money will be allocated to this purpose. Any experiments of this nature which may be carried out, even if placed in the hands of private individuals, will, of course, be under Government control, and it is not unlikely that the Bristol University, where Dr. J. H. Priestley has done so much valuable pioneer work, will receive a substantial grant for the continuation of that work. At the same time it will be several months before any actual grants are made, as a large amount of preliminary work, in the way of co-ordinating the past efforts of private individuals, has to be done. It is certainly to be hoped that the practical experimental work started by Mr. J. E. Newman independently at first, and later with the assistance of Sir Oliver Lodge and Mr. Lionel Lodge, will be extended, and that further valuable results will be obtained. A *résumé* of the work carried out to date will be found in Electrical Engineering of July 21st, 1910, and April 6th, 1911.

A BACK-GEARED SCREW LIMIT SWITCH

THE illustration below shows a back-geared screw limit switch for valve control, and for use with lifts or machine tools, which has been introduced by the Adams Manufacturing Co., Ltd. (106 New Bond Street, W.).

It is not always convenient or desirable to instal limit switches of the tappet-operated type in the well of a lift or hoist, and in such a case it becomes necessary to employ

limit switches of the travelling-nut or equivalent type. The switch illustrated above is adapted to be driven directly from a lift or valve mechanism, either by means of back gear, sprocket wheel and chain, or other positive drive. Protecting covers, or completely enclosed, or water-tight cases and covers can, of course, be provided if required, and for use in connection with electrically-controlled motor-driven valves or slow-moving reciprocating machine tools, similar screw-actuated limit switches can be fitted with contacts opening with a snap action.

"GRAPHIC" INSTRUMENTS

An instrument which records kilowatt hours or Board of Trade units is called a meter. Instruments which indicate volts, amperes, or watts respectively, are called ammeters, voltmeters, or wattmeters. If the instrument records on a chart the current, voltage, or watts at any moment, it should be called a recording ammeter, voltmeter, or wattmeter as the case may be. But some people follow a practice initiated in America, and call a meter that measures kilowatt hours a recording wattmeter. Messrs. Everett, Edgcumbe & Co. suggest, therefore, that to avoid confusion, the word "recording," as applied to electrical instruments should be dropped, and that it should be replaced by the word "graphic."

Fig. 1.

The firm at the same time are introducing some new recording instruments to which this name will doubtless be given on their trade literature.

Fig. 1 shows the general appearance of the new recording voltmeter. Externally, the instrument calls for little remark beyond drawing attention to the exceptionally large glass window through which a long length of record can be clearly seen, and to the special spring fastening which affords an absolutely dust-tight joint, and yet can be opened with one hand. It is also so arranged that a padlock or seal can be employed if desired.

Fig. 2 shows the internal appearance of a moving coil recording ammeter. Covering the permanent magnet, and shielding it from stray magnetic fields, is a detachable hood which is seen as a "ghost" in the figure. As will be gathered

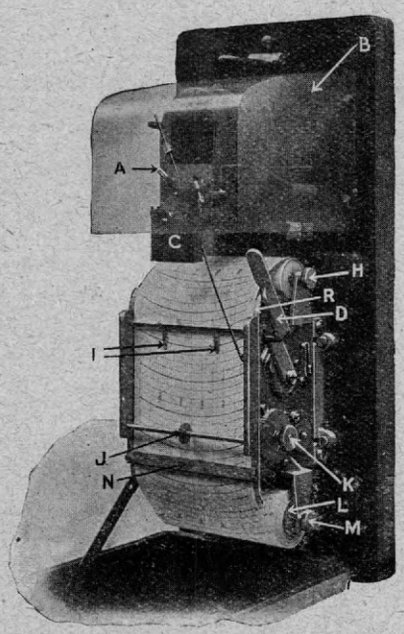

Fig. 2.

from the illustration, a roll of chart is inserted between spring centres above the clock, and passes down under two springs and a toothed guiding wheel in the centre. Under this latter lies the driving wheel of the clock mechanism. The arrangement is devised with a view to rendering any slipping of the chart impossible, and also to avoid any troublesome tendency to creep to one side or the other. Below the clock is a roller on which the chart can be made to wind itself up, if required, as it is passed through the recorder. On the right hand side will be noticed the winding lever which, owing to the construction of the case, is accessible and conveniently placed. Below this lever are the change wheels whereby any desired paper speed can be provided. These wheels are also readily accessible, and any subsequent change in the chart speed can be carried out without returning the recorder to the factory. Further, by means of a simple gear-changing device, two or more speeds can be provided on a single instrument, so that the same recorder can be used for widely different purposes. For example, a speed of 1 in. per hour can be provided for ordinary work, and this can instantly be altered to, say, 1 in. per minute for use in connection with machine tool driving.

The makers make a special feature of a hinged pen arm which can be instantly removed for cleaning or replacement. The operation is shown in Fig. 3, which indicates the method of removing the pen by merely pressing together the two arms of the spring fork between the finger and thumb. Amongst the advantages claimed for this construction of pen, are, besides ease of removal, a constant and readily adjustable pressure on the paper, and the maintenance of a very high insulation resistance between the electrical winding and the pen, which last is a most important point, particularly in connection with traction and other earthed systems. It will also be noticed that the pen moves over the surface of the chart between the two rollers, and not on the curved portion. Oil bath damping is employed, and this is adjustable so that any required amount of dead-beatness can be obtained.

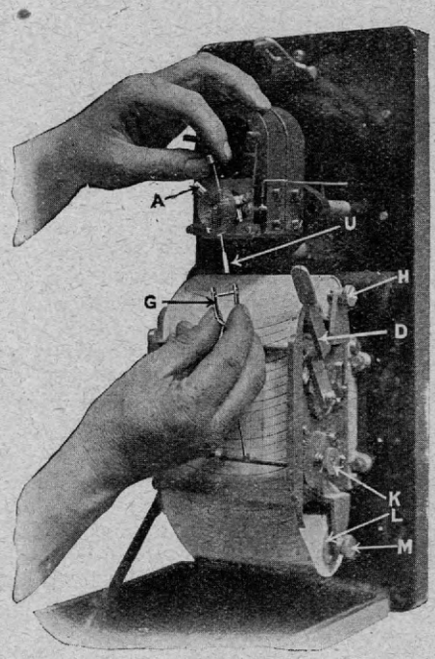

Fig. 3.

Further particulars as to the ranges of the instruments, &c., may be obtained from Messrs. Everett, Edgcumbe & Co. (117 Victoria Street, Westminster, S.W.).

Record Summer Peak Load on New York Power Station.—A severe electrical storm occurred in New York on August 15th, and was responsible for a very heavy and sudden demand upon the power stations of the New York Edison Company. *The Electrical World* of New York states that the approach of the storm was reported by the weather observer of the company, and preparations were made for carrying the expected increase in load. Before the storm came, the normal summer load, aggregating some 60,000 kw. was being carried by the stations. At two o'clock, when the skies darkened, this reached 73,000 kw. At 2.45 intense darkness became widespread, and the peak on the stations finally reached 105,000 kw. in two sudden jumps, which was the highest summer load ever carried, and it was maintained for fifteen minutes. At Waterside No. 1 two 10,000-kw. units, six 4000-kw. units, and one 5,000-kw. unit were used, and at Waterside No. 2 one 14,000-kw. unit, six 10,000-kw. units, and one 8,000-kw. unit were in operation to meet the conditions. So efficient were the preparations for meeting the storm that not the least drop occurred in the supply voltage, and it was not necessary to fall back upon storage batteries while placing any of the units on the lines.

THE BRITISH ASSOCIATION AT PORTSMOUTH

THE meeting of the British Association for the Advancement of Science was opened at Portsmouth last evening, when Sir William Ramsay, K.C.B., F.R.S., delivered his Presidential Address in the presence of the usual distinguished audience. The meeting continues until Wednesday next, Sept. 6th. This (Thursday) morning the work of the sections begins with the reading of the Sectional Presidential Addresses.

The interest of our readers will mainly be in Section G (Engineering), where a number of electrical Papers will be read. Mr. H. A. Mavor will give a Paper on "Electrical Drives for Screw Propellers," and "Electrical Steering" will be dealt with by Mr. B. P. Haigh. Prof. G. W. O. Howe has a Paper on recent developments in wireless telegraphy, and Capt. H. Riall Sankey will exhibit a portable equipment. Mr. W. Worby Beaumont will read a Paper "On the Origin and Production of Corrugation on Tramway Rails," and Mr. T. F. Wall will read one on "The Single-phase Repulsion Motor." A general discussion will take place upon the relative efficiency of steam, gas, and oil engines in connection with the following Papers:—(1) "Economical and Reliable Power Generation by Over-type Superheated Steam Engines," by Captain H. Riall Sankey and W. J. Marshall; (2) "Suction Gas Engines and Producers," by W. A. Tookey; (3) "Diesel Engines," by C. Day. Among the other Papers to be read in Section G are:—"Some Preliminary Notes on a Study as to Human Susceptibility to Vibration," by W. Pollard Digby and Capt. H. Riall Sankey; "Smoke Abatement: the Possibility of fixing a New Standard of Smoke Emission from Factory Chimneys," by Dr. J. S. Owen, and "The Electrical Conductivity of Light Aluminium Alloys," by Prof. E. Wilson.

A report on "Electric Steel Furnaces" will be presented to Section B (Chemistry) by Prof. McWilliam, of Sheffield University, and in Sub-Section K (Agriculture) Messrs. J. H. Priestley and R. C. Knight will read a Paper on "The Effect of High-Tension Electric Discharges and Current Electricity on Plant Respiration." A report by the Electrical Standards Committee will be presented to Section A (Mathematical and Physical Science).

The greater part of Sir William Ramsay's address was on ancient and modern views regarding the chemical elements, but our readers will be most interested in his remarks on technical education, and on the problem that will be raised by the early exhaustion of our coal supplies.

Referring generally to the advances made in engineering, Sir William said that the question "Can it be done?" hardly arises, but rather "Will it pay to do it?" In a word, the human race has been familiarised with the applications of science; and men are ready to believe almost anything, if brought forward in its name.

His criticism of the organisation of technical education in this country was that in England we have made technical educational a local, not an Imperial question; instead of half a dozen first-rate institutions of University rank, we have a hundred, in which the institutions are necessarily understaffed, in which the staffs are mostly overworked and underpaid; and the training given is that not for captains of industry, but for workmen and foremen. "Efficient captains cannot be replaced by a large number of fairly good corporals." Moreover, to induce scholars to enter these institutions, they are bribed by scholarships, a form of pauperisation practically unknown in every country but our own; and to crown the edifice, we test results by examinations of a kind not adapted to gauge originality and character (if, indeed, these can ever be tested by examination), instead of, as on the Continent and in America, trusting the teachers to form an honest estimate of the capacity and ability of each student, and awarding honours accordingly.

The remedy, Sir William suggests, is that an undertaking should be exacted from all gainers of University scholarships that, if and when circumstances permit, they will repay the sum which they have received. It would then be possible for an insurance company to advance a sum representing the capital value, viz., £7,464,931, of the scholarships, reserving, say, 20 per cent. for non-payment, the result of mishap or death. A large part of the income of this sum, he suggests, should be spent in increasing the emoluments of the chairs; for, unless the income of a professor is made in some degree commensurate with the earnings of a professional man who has succeeded in his profession, it is idle to suppose that the best brains will be attracted to the teaching profession.

Having made the profession of a teacher so lucrative as to tempt the best intellects in the country to enter it, it is clear that such men are alone capable of testing their pupils. The modern system of "external examinations" would disappear; schools of thought would arise in all subjects, and the intellectual as well as the industrial prosperity of our nation would be assured.

In the concluding part of his address, Sir William Ramsay quoted from the General Report of the Royal Commission on Coal Supplies (1906), pointing out that, in 1870, 110 million tons of coal were mined in Great Britain, and ever since the amount has increased by three and a third million tons a year. The available quantity of coal in the proved coalfields is very nearly 100,000 million tons, and if the rate of working increases as it is doing our coal will be completely exhausted in 175 years. Between 1905 and 1907 the amount of coal raised in the United Kingdom increased from 236 to 268 million tons, equal to six tons per head of the population, against three and a half tons in Belgium, two and a half tons in Germany, and one ton in France. Our commercial supremacy and our power of competing with other European nations are obviously governed, so far as we can see, by the relative price of coal; and when our prices rise, owing to the approaching exhaustion of our supplies, we may look forward to the near approach of famine and misery.

At Sir William Ramsay's suggestion a committee of the British Science Guild was formed to investigate our available sources of energy. This Guild is an organisation for the purpose of endeavouring to impress on the people and the Government the necessity of viewing problems affecting the race and the State from the standpoint of science. The Science Guild enlisted the services of a number of men, each eminent in his own department, and each has now reported on the particular source of energy of which he has special knowledge. The Hon. R. J. Strutt has shown that in this country at least it would be impracticable to attempt to utilise terrestrial heat from bore-holes; others have deduced that from the tides, the winds, and water-power small supplies of energy are no doubt obtainable, but that, in comparison with that derived from the combustion of coal, they are negligible; nothing is to be hoped for from the direct utilisation of solar heat in this temperate and uncertain climate; and it would be folly to consider seriously a possible supply of energy in a conceivable acceleration of the liberation of energy by atomic change. It looks utterly improbable, too, that we shall ever be able to utilise the energy due to the revolution of the earth on her axis, or to her proper motion round the sun. Attention should, however, undoubtedly be paid to forestry, and to the utilisation of our stores of peat. Sir William also attached importance to the increase in our water-power, which an increase in our forests would bring with it, since, without forest land rain rapidly reaches the sea, instead of distributing itself so as to keep the supply of water regular and more easily utilised.

We must therefore rely chiefly on our coal reserve for our supply of energy, and for the means of supporting our population; and it is to the more economical use of coal that we must look, in order that our life as a nation may be prolonged. We can economise in many ways: By the substitution of turbine engines for reciprocating engines, thereby reducing the coal required per horse-power from 4 to 5 lbs. to 1½ or 2 lbs.; by the further replacement of turbines by gas engines, raising the economyto 30 per cent. of the total energy available in the coal, that is, lowering the coal consumption per horse-power to 1 or 1¼ lb.; by creating the power at the pit-mouth, and distributing it electrically, as is already done in the Tyne district. Economy can also be effected in replacing "bee-hive" coke ovens by recovery ovens; this is rapidly being done; and Dr. Beilby calculates that in 1909 nearly six million tons of coal, out of a total of sixteen to eighteen millions, were coked in recovery ovens, thus effecting a saving of two to three million tons of fuel annually. Progress is

Hosted by Google

also being made in substituting gas for coal or coke in metallurgical, chemical, and other works. But it must be remembered that for economic use, gaseous fuel must not be charged with the heavy costs of piping and distribution.

It is true, Sir William continued, that the self-interest of coal consumers is slowly leading them to adopt more economical means of turning coal into energy. But I have noticed, and frequently publicly announced, a fact which cannot but strike even the most unobservant. When trade is good, as it appears to be at present, manufacturers are making money; they are overwhelmed with orders, and have no inclination to adopt economies which do not appear to them to be essential, and the introduction of which would take thought and time, and which would withdraw the attention of their employés from the chief object of the business—how to make the most of the present opportunities. Hence improvements are postponed. When bad times come, then there is no money to spend on improvements; they are again postponed until better times arrive. What can be done? I would answer: Do as other nations have done and are doing; take stock annually. The Americans have a permanent Commission initiated by Mr. Roosevelt, consisting of three representatives from each State, the sole object of which is to keep abreast with the diminution of the stores of natural energy, and to take steps to lessen its rate. This is a non-political undertaking, and one worthy of being initiated by the ruler of a great country. If the example is followed here the question will become a national one.

The two great principles which I have alluded to in an earlier part of this address must not, however, be lost sight of; they should guide all our efforts to use energy economically. Concentration of energy in the form of electric current at high potential makes it possible to convey it for long distances through thin and therefore comparatively inexpensive wires; and the economic coefficient of the conversion of mechanical into electrical, and of electrical into mechanical energy is a high one; the useless expenditure does not much exceed one-twentieth part of the energy which can be utilised. These considerations would point to the conversion at the pit-mouth of the energy of the fuel into electrical energy, using as an intermediary, turbines, or preferably gas engines; and distributing the electrical energy to where it is wanted. The use of gas engines may, if desired, be accompanied by the production of half-distilled coal, a fuel which burns nearly without smoke, and one which is suitable for domestic fires, if it is found too difficult to displace them, and to induce our population to adopt the more efficient and economical systems of domestic heating which are used in America and on the Continent. The increasing use of gas for factory, metallurgical, and chemical purposes points to the gradual concentration of works near the coal mines, in order that the laying-down of expensive piping may be avoided.

An invention which would enable us to convert the energy of coal directly into electrical energy would revolutionise our ideas and methods, yet it is not unthinkable. The nearest practical approach to this is the Mond gas-battery, which, however, has not succeeded, owing to the imperfection of the machine.

The President concluded his address with a plea for the study of pure science, without regard to its applications.

CORRESPONDENCE

METAL FILAMENT LAMP PATENTS.

To the Editor of Electrical Engineering.

Sir,—Our attention has been called to a statement under the above heading appearing in your journal of the 17th inst., addressed to you by the Osram Lamp Works, Ltd., to which is appended a notice of an order made in reference to an action brought by that company against the British Tungsten Lamp Co., Ltd.

As one of the various manufacturers referred to in that letter against whom litigation has been commenced, we desire to call your attention to the fact that the order referred to was made with the consent of the defendants, who took no steps to defend the action.

The business of the British Tungsten Lamp Co., Ltd., was in the hands of a receiver for the debenture-holders, who did not feel justified in contesting the proceedings. The point is material, as your correspondent's letter might convey the impression that the order was the outcome of an investigation by the Court.

We may add that the proceedings instituted against us are being defended, and we are content to await the decision of the Court.

Yours faithfully,
The "Z" Electric Lamp Manufacturing Co., Ltd.
Kilburn, Brown & Co.,
August 23rd, 1911. Managers.

THE DUNDALK STORAGE BATTERY CONTRACT.

To the Editor of Electrical Engineering.

Sir,—*Dundalk U.D.C.*—We notice an announcement in Electrical Engineering of the 10th inst. that we have been favoured with the order for the storage battery required for the above. This is quite correct; but you state that the plates are to be of the Tudor Accumulator Co.'s make, which is incorrect. The plates will be of our own manufacture—manufactured at Sandycroft; we have taken over the business of Messrs. W. O. Rooper & Co. and the Epstein Accumulator Company over twelve months ago.

We might mention the Tudor Accumulator Co.'s name was not referred to by us in connection with the tender, and the Consulting Engineers, Messrs. Miller, Wilson & Pegg, are certainly under no misapprehension. In fact, one partner, prior to the order being placed, had been over our new accumulator factory at Sandycroft.

Trusting you will be able to insert this in your next issue.

Yours faithfully,
August 26, 1911. The Sandycroft Foundry Co., Ltd.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Some radio-telegraphic apparatus, in use at the City and Guilds Engineering College, was described in a Paper read by Prof. G. W. O. Howe before the Physical Society last March. We referred to this briefly at the time, but we now have before us the complete paper, which has just been issued. Mr. Howe mentions that the signals from the Marconi station at Glace Bay, Nova Scotia, can be picked up. The antenna employed consists of a single No. 14 copper-coated steel wire, the upper end of which is attached to the central tower of the Imperial Institute, 260 ft. above the ground. It is brought across in a single span of 530 ft. to a chimney stack on the college, from whence a wire passes down into the laboratory. For demonstrating purposes another wire is connected to the antenna, and brought into the lecture theatre. The fundamental wave-length of this antenna is about 900 metres. In addition to this a T antenna is suspended horizontally above the roof of the college, consisting of five parallel wires 190 ft. long and 110 ft. high. A single wire connects the mid point to the laboratory. The fundamental wave-length is about 520 metres. The wave-length of the waves sent out from Clifden (Ireland) and Glace Bay is over 6 km.

A special transformer for receiving these low-frequency waves consists of square coils, supported at the corners on ebonite strips fitted to a wooden frame. The primary coil is movable, and can be raised 4 ft. above the secondary by turning a handle. Each coil is subdivided into three parts, and the ends brought to a plug board. The coil is wound with a cable made up of 27 wires, No. 36, each being single silk covered, and the whole covered with double silk. The primary has 160 turns 13·5 in. square, the winding length is 16 in., and the inductance of the coil is 6·45 millihenries. The fixed secondary has 187 turns 15 in. square, with a winding length of 13 in. and an inductance of 12·9 millihenries. If the inductance placed in series with the aerial for tuning it be plotted against the square of the wave-length, the result will be a straight line through the origin, except for short wave-lengths, where the inductance of the aerial is comparable with that placed in series with it. The slope, therefore, depends only on the capacity of the aerial. The exact inductance required for any wave-length is obtained by using suitable coils of the transformer primary and by adjusting the tuning coils, but for shorter wave-lengths than 1,200 metres, capacity must be inserted in the aerial tuning condenser. In the receiving circuit there are two alternative detectors. These consist of a light contact be-

Hosted by Google

tween small pieces of zincite and copper pyrites. This is very sensitive, but requires frequent adjustment, and is apt to be rendered inoperative by a bad "atmospheric." The telephone head set used with the detectors has 7,000 ohms resistance. By means of a switch this telephone can be cut out, and a Brown telephone relay inserted. This operates a 40-ohm head set with trumpets instead of the ordinary ear-pieces. With this arrangement, the messages and time signals sent out from the Eiffel Tower and from Norddeich, near Wilhelmshaven, can be distinctly heard all over the large lecture theatre. The relay, unfortunately, does not discriminate between radio-telegrams and atmospheric disturbances, but this could be improved by tuning the reed to the spark frequency.

The National Telephone Co. have erected a new exchange in Glasgow, at the corner of Renfrew Street and Hope Street, which will take the place of the existing "Douglas" Exchange. This was taken into use on Saturday, August 19th, when all the subscribers' lines were transferred from the old exchange to the new one. The new exchange is equipped for 4,000 lines, and has an ultimate capacity of 7,000. It is on the usual central battery system, the equipment being supplied by the Western Electric Co., Ltd.

The question of local rating in respect of the telephone system of the country after it has been taken over by the State at the end of this year, was discussed at a conference of representatives of important rating authorities in Glasgow last week. This conference was convened by the Corporation of Glasgow, and it was resolved to approach the Government and ask them to continue to pay local rates on the National Telephone Company's undertaking after the transfer, or to pay an equivalent annual contribution. English, Irish, and Welsh rating authorities are being communicated with.

According to the *Electrical World* of New York, the new wireless station now being installed at the Charlestown Navy Yard, Boston, Mass., will be among the most powerful in the world, having a maximum range under favourable conditions of about 3,200 miles. The building will be erected of stone, and there will be two aerial poles, each 170 ft. high. The old equipment, mostly Stone wireless apparatus, will be supplanted by modern Telefunken sending apparatus, with a Pickard receiver. There will be a 5-kw. Telefunken high-frequency, quench-gap machine, the old sending equipment being a 2-kw. Stone low-tone spark machine.

The New York correspondent of the *Yorkshire Post* gives some details of a novel prosecution in Los Angeles, California, where a newspaper editor has been arrested on the charge of publishing a stolen wireless message. The message was sent from Los Angeles to Mr. Peard, editor of the *Los Angeles Herald*, who was holiday-making at Avalon, and was intercepted by some amateur wireless operators. Three young fellows who were experimenting with Marconi apparatus picked up the message on its way to Avalon, and took it to Mr. Earl, editor of the *Los Angeles Tribune*, who published it without asking questions. General Otis, the sender of the message, who has been waging a bitter newspaper war on the *Tribune*, promptly secured the arrest of Mr. Earl, against whom a formal indictment was returned. There was some argument on the technical point as to whether the message could be called "stolen," as it was contended on behalf of Mr. Earl that messages sent through the air which could be read by anyone possessing a receiver, could not be called private or copyright. There is no case to go upon for "tampering with United States mails," for the message was not despatched by a Government operator. Mr. Earl has been released upon bail, and the case is being watched with the greatest interest by newspaper proprietors and people owning private wireless apparatus.

We have received the first number of the *Telefunken Zeitung*, a journal which will be issued by the Gesellschaft für drahtlose Telegraphie once every two months. The first number contains several interesting articles and notes, and commences with a short history of the Telefunken Co. (with excellent portraits of Dr. Slaby and Professor Braun), which will be continued in future numbers. There is a note on the founding of the Australasian Wireless Telegraph Co., in which the Telefunken Co. have an interest; several contracts have apparently already been made for wireless stations in Australia. Some notes on wireless telegraphy in the Philippines are given, illustrated with a map. There is a description of a model wireless telegraph station for demonstration purposes, a list of recent wireless telegraph stations for overland routes, and a short illustrated description of the large Nauen wireless station. The Company (whose address is 9 Tempelhofer Ufer, Berlin, S.W.) will doubtless be pleased to send copies of this journal to any of our readers who may be interested in it.

The cable between Saigon and Pontianak was interrupted on Wednesday and Thursday last week. The failure took place between Ponlocondore and Pontianak. The cable between Cotonon and Grand Bassam also gave out on 23rd inst., and telegrams for the Ivory Coast are being forwarded by the best means. The Persian landlines were interrupted between Teheran and Tauris on the 23rd inst., and telegrams for the latter place are being sent via Djoulfa.

ALTERATIONS AND EXTENSIONS AT THE WALSALL ELECTRICITY WORKS

THE Walsall electricity works is one of the few in this country on the high-tension D.-C. system. Eight generators, varying in size from 80 to 400 kw., furnish current at 2,000 volts to motor-transformers in 15 sub-stations scattered about the area of supply. The boiler house, which was placed end on to the engine room, contains two Lancashire, one Stirling, and four B. & W. boilers. In November, 1909, a scheme for an entirely new works, to cost £35,000, was brought forward by Mr. Barnard, the Borough Electrical Engineer, but the Local Government Board refused to sanction the necessary loan, and suggested a modified scheme to cost £23,000. This latter was the subject of an enquiry last September, and the sanction to this loan, long withheld, was finally given in May last. The extensions are now well on the way towards completion. Owing to Mr. Barnard's ill-health, and the necessity for him to have six months' leave of absence, Mr. Ashton Bremner, late Borough Electrical Engineer to the Borough of Burslem, was appointed to act during this period, and upon him has devolved the entire responsibility of carrying on the works, and at the same time carrying out the alterations which, besides involving the laying down of new plant, have included the working out of the new arrangement of the whole of the condensing plant and the A.-C. switchgear.

The original engine room has been taken down, a new roof of wider span and greater height has been built over it, a three-ton crane and the steam pipes and pipe supports have had to be removed, and all this had necessarily to be done whilst a supply of electricity was being given to a large area and to the tramways.

The new plant consists of a B. & W. boiler to evaporate 14,000 lb. of steam per hour, a Lee-Howl feed pump to deliver 4,000 gallons of water per hour against 160 lb. steam pressure, and the necessary steam and feed pipes, mechanical stoker, and coal elevator. In the engine room will be two Richardson-Westgarth steam turbines coupled to British Westinghouse generators, each capable of developing 500 kw. three-phase current at a pressure of 3,300 volts, and a frequency of fifty cycles per second, and two low-level counter-current jet condensers by Isaac Storey, Ltd. The switchboards, both in the generating station and at the Bloxwich substation, are being supplied by the British Westinghouse Co.

It is intended to supply electricity to Bloxwich, an outlying portion of the Borough of Walsall, and an industrial and residential neighbourhood, on the three-phase four-wire system, and it will be interesting to notice how the supply of power to large works in this area will affect the lighting pressure, as it has been decided not to instal a voltage regulator but to rely solely upon the regulation of the Westinghouse generators.

THE ELECTRICAL COMPANY'S METERS

THE Electrical Co., Ltd. (122-4 Charing Cross Road, London, W.C.) are to be congratulated on the production of an exceedingly fine illustrated description of their electricity meters. It is not a mere catalogue, and in fact does not embody a price list, but is a beautifully illustrated volume dealing in detail with the design and methods of manufacture, and concluding with some practical notes on testing. Of the 67 illustrations, the most striking are six beautifully executed full-size coloured plates showing the working mechanisms distinctly. Space will only permit us to deal in detail with some of the contents and to mention some of the points that seem to be of novelty.

A self-adjusting brush device has been designed for D.C. ampere-hour meters, by means of which an additional torque is produced at low loads to counterbalance friction at the brushes and in the counter bearings. The brushes are mounted on one arm of a metal lever pivoted to move vertically, and a coil is fixed to the other arm of the lever. This coil is connected in series with the armature winding, and lies in the stray field zone of the permanent magnet of the meter. It is wound so that the greater the current

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published August 24, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

12,931/10. **Joint Boxes.** A. Friedmann. For wiring boxes a core is made the shape of the box, and consists of paper compressed with the aid of a suitable binding agent. It is hardened by impregnation and rendered proof from water, acid, and oil. It is then coated with a conductive substance and electrically plated with metal in a bath.

18,780/10. **Tantalum.** E. C. R. Marks (*Siemens & Halske Akt.-Ges.*). This relates to a process for hardening the surface of tantalum. It is first roughened by means of a sand-blast in order to increase the surface for the hardening agent to act upon. The hardening is done by treating it with oxygen either electrically or by heating in air, and forming a very hard layer on its surface. In the former method the metal forms the anode in an aqueous solution.

1,028/11. **Ignition Plug.** T. G. Smith and F. J. Platt. In combustion engines, in which ignition is produced by a make-and-break spark, a convenient arrangement for examining the spark consists in constructing the fixed terminal of the spark producer in the form of a hollow observation tube. A glass window is provided at the inner end, and the sparking pin is formed eccentrically in the hollow terminal, so that the point of contact between the moving terminal and the pin is visible through the window.

5,167/11. **Insulating Material.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*) A hard and tough material with a high insulating power is obtained by treating paper or other material with a liquid condensation product. This is formed by the reaction between phenolic bodies and aldehydes. Sheets of a soft obsorbent paper are soaked in the liquid, and when they are thoroughly impregnated, they are withdrawn, drained, and dried in air. A number of these sheets is then subjected to a heat treatment under a pressure of 1,000 to 1,500 lbs. per square inch. Asbestos fibre and Portland cement or plaster of Paris can be treated in the same way.

8,783/11. **Motor Control.** L. V. Lewis. In a system of control of one or more A.-C. motors of the commutator type, The field winding is connected between one of the live conductors and the middle point of the primary winding of a transformer. The other live conductor can be connected by means of a control switch to either end of the primary winding, depending on the direction of rotation desired. The armature winding is connected across the secondary winding. Six figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Lewis [Electrodes for] 22,803/10; Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke*), 12,735/11.

Dynamos, Motors, &c.: Allgemeine Elektricitäts-Ges. [Means for varying voltage] 20,759/10; Merryweather [Driving magneto-electric machines] 26,409/10; Vickers, Ltd., Williamson, and Brown [Commutators] 29,161/10; Golby (*Draper Latham Magneto Co.*) [Magneto generator] 30,166/10 and 30,167/10; Otis Elevator Co. (*Otis Elevator Co.*) [Controlling apparatus] 498/11; Sire, 2,903/11; Siemens Bros. Dynamo Works, Ltd. (*Siemens-Schuckertwerke*) [Braking polyphase series motors] 7,631/11.

Electric Ignition: Hall, 16,093/10.

Electrometallurgy: Ruthenburg [Furnace electrodes] 28,536/10; Rodeck, 13,808/11.

Heating and Cooking: Schmidt [Thermostats] 616/11.

Incandescent Lamps: Hailwood [For miners] 18,415/10; Etablissements, Paz, and Silva [Sockets for] 20,040/10; Harrison [Means for supporting] 22,775/10; Schilling [Metallic filaments] 23,639/10; Schwab [Incandescing bodies for] 8,004/11.

Instruments and Meters: Johnson and Billington [Meters] 18,470/10.

Telephony and Telegraphy: Crowe and British L. M. Ericsson Manufacturing Co. [Contact keys] 5,564/11; Fessenden [Wireless signalling] 11,154/10; Smith and Lyon [Detectors for electro-magnetic waves] 22,164/10; Girardeau [Emission of Hertz oscillation] 27,247/10; Bellini [Transmitters and receivers for wireless] 11,339/11.

Traction: Mittelhausen and Williams [Supporting and insulating overhead wires] 22,735/10; Lefebvre [Automatic tractors] 11,307/11; Allgemeine Elektricitäts-Ges. [Railway signals] 13,985/11.

Miscellaneous: Reeve [Electrical apparatus] 16,172/10; Henri, Helbronner, and Von Recklinghausen [Treatment of liquids by ultra violet rays] 18,768/10; Clark (*Telelectric Co.*) [Electrically operated playing apparatus] 20,095/10; Meigh [Conductor terminal] 23,891/10; Walker and R. Waygood & Co. [Lifts, hoists, etc.] 13,183/11; Süchting and Oloff [Thermo-electric batteries] 13,715/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution, &c.: Müller [Protecting insulated wires from fire] 16,533/11.

Dynamos and Motors: Siemens Schuckertwerke-Ges. [Induction motors] 17,768/11.

Incandescent Lamps: Houskeeper [Filaments] 17,480/11.

Switchgear, &c.: Larzelere [Electro-magnetic switch] 17,142/11.

Telephony and Telegraphy: Girardeau [Automatic commutator for wireless plant] 3,946/11; Faiella [Telegraphic systems] 17,151/11; Schepeler [Receiver for signal transmission] 17,978/11.

Traction: Pintner [Trolley wheels] 10,038/11.

Miscellaneous: Rümpler [Formation of metallic coatings on aluminium] 11,215/11; Chemische Fabrik Griesheim-Elektron [Batteries for lamps] 15,447/11; Felten and Guilleaume Carlswerk Akt.-Ges. [Electro-osmosis treatment] 17,597/11.

Opposition to Grant of Patent

23,096/10. **Centrifugal Fans.** J. Keith. This patent has been granted in spite of opposition. The specification describes an improved design of fan-runner. A number of tapered blades have the outer and inner edges lying on conical surfaces differently inclined to the axis of the runner. The outer cone is less inclined than the inner, both of which are truncated. The narrow ends of the blades, where the internal and external diameter of the runner is a maximum, are held by a ring, whilst the wider ends, where the diameter is least, are fitted to a disc.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

20,536 of September 7th, 1897. **Steam Turbines.** C. K. Mills (*C. G. Curtis, U.S.A.*). This invention relates to fluid turbines such as described in Patents 19,246-7-8 of September 1st, 1896, which were abstracted in Electrical Engineering of August 25th, 1910, page 554. It is constructed to operate either condensing or non-condensing or with different boiler pressures, by the combination of a delivery nozzle and a working passage through movable vanes, adjustable to vary the ratio of expansion. It is also arranged to vary the volume of the fluid jet without any great variation in its velocity.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, &c.: J. M. Locke [Insulators for H.-T. conductors] 10,694/07; R. Brown [Cable coupling] 10,943/07; O. T. Hungerford [Conductors] 11,123/07.

Dynamos, &c.: British Thomson-Houston Co. and H. M. Hobart [Induction] 8,476/00; Allgemeine Elektricitäts-Ges. [Regulation and control] 11,071/07.

Electrometallurgy, &c.: Chemische Fabrik Buckan [Production of chromic acid] 9,636/07, and [Treating carbon electrodes for durability] 9,637/07.

Incandescent Lamps: M. Stern [Electroliers] 10,837/07.

Storage Batteries: M. Margulis, 11,072/07.

Switchgear, &c.: S. Z. de Ferranti and C. C. Garrard [Cut-outs] 10,899/02; British Thomson-Houston Co. (*Allgemeine Electricitäts-Ges.*) [Combined switch and fuse] 10,665/07 and [Oil switch] 10,666/07; E. F. Woodman, T. A. Kelley, and G. W. Varney [Thermal switch] 11,078/07.

Telephony, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Order telegraphs, transmitter for] 10,786/07.

Traction: P. B. and T. H. Black [Stud contact system] 10,636/07; E. A. Mitchell [Leakage detector for surface contact systems] 10,641/07; E. Dewhurst [Railway signalling] 10,991/07.

Miscellaneous: P. C. Hewitt [Vapour converter] 8,973/05; J. Schiele [Electro-deposition of metals] 10,120/05; W. Dixon [Cranes] 10,630/06; W. Smith [Lifts for mines] 10,671/07; W. Gifford and E. M. Dixon [Lightning arresters] 11,163/07; H. J. Haddan (*Polyphos Electricitäts-Ges.*) [Röntgen-ray apparatus] 11,177/07.

Hosted by Google

flowing through it, the more it will be repelled from the stray field. The commutator segments are made straight up to a certain point, and are then twisted spirally, so that the brushes will take up a position on the commutator according to the current consumption. In this way commutation at full load will take place when the brushes are away from the neutral zone of the magnet, when the torque is not a maximum, whilst, as the load decreases, the brushes will move higher up on to the spiral portion of the segments, and commutation will be shifted more and more towards the neutral zone, when the torque will increase in proportion as the load decreases. The meter is guaranteed to start at 0·8 per cent. of full load, and to record correctly within 2½ per cent. at from 1/20th to full load.

The oscillating D.C. meter, in which neither commutator nor brushes are used, is of considerable interest. The shunt current coil is caused to oscillate by means of the field produced in the fixed main coils. The oscillating motion, which is limited by contact pins, is set up by means of a relay, which, directly contact is made, reverses the current in the shunt coil, and changes the direction of rotation. To prevent burning at the contacts, a resistance is inserted in parallel with the pressure coil, and the relay is so adjusted that, although the contact pins are approached at full pressure, the pressure at the contacts at the moment of reversal is only 6 or 7 volts.

Another interesting instrument is the type "LIa" alternating-current watt-hour meter. It is of the induction type, with two magnetic alternating fields placed radially and at right angles to each other, which set up eddy currents in a disc. One field is produced by the main current winding, and is proportional to and in phase with the current. The second field must be proportional to the voltage, but differing in phase by exactly 90°. The driving system consists of a laminated iron core having three limbs; the middle one carries the main current coil, and on the outers the pressure coils are connected in series. An adjustable laminated yoke is mounted above the iron core, to form an air gap up to about 10 mm., in which an aluminium disc rotates, and is braked by a magnet. The latter, the inductive load, and the low load adjustments, are regulated by means of one screw.

Mention may also be made of the company's maximum demand attachments to indicate the average maximum demand during a working period.

Some description of testing apparatus and notes on testing and calibrating will be found useful, and the determination of the "life factor" of a meter, viz.,

$$\frac{\text{Torque} \times 1000}{\text{Weight of moving system} \times \text{Speed}}$$

is suggested as an indication of the durability of the meter.

CATALOGUES AND PAMPHLETS RECEIVED

GEAR CASES.—The British Thomson-Houston Co. (Rugby) have designed a gear case for tramway motors. It is made from pressed steel, in which each half is jointless, being pressed from a single sheet of steel. The supporting lugs are very stiff, and are fastened in such a way that fracture is almost impossible. It is lighter than those hitherto made from malleable cast iron.

WATT-HOUR METER.—The same firm have issued a pamphlet describing their high torque A.C. meter. It operates on the two-wattmeter method of measuring power. It is of the single-disc type, and two single-phase meter driving elements are arranged in diametrically opposite positions near the edge of the disc. Each element produces a torque on the disc proportional to the watts impressed upon it, so that the total torque at any instant is equal to the sum of the torques due to the two elements.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

CONTROLLERS.—Another pamphlet from the Rugby firm relates to a new feature in the design of tramway controllers, enabling rheostatic braking to be obtained, regardless of the direction of motion of the car or of the position of the reversing handle, by simply moving the main controller handle on to the braking notches. Another feature is the mechanism for cutting out a defective motor. This takes the form of a switch, which is operated by removing the reversing switch handle on to the spindle of the cut-out switch.

RHEOSTATS.—Automatic starting rheostats for induction motors with slip-ring rotors are also being introduced by the above firm. They are supplied in capacities from 1 to 500 h.p., 110 to 550 volts, and are designed for use chiefly with motor-driven pumps, air compressors, &c., where automatic starting and stopping are required.

ENAMEL-INSULATED WIRES.—The enamel-insulated wire made by Connolly Bros., Ltd. (Blackley, Manchester) for coil winding has long been known. So satisfactory have been the tests upon it, that the makers have now introduced wires with thicker insulation of this character for electric lighting circuits. Among the tests described on this latter class is one on a twin 18 S.W.G. wire with 4 mils thickness of enamel on each wire, which is then double cotton-covered, vacuum-dried, and impregnated, and, after the two wires were laid up together, braided, and impregnated with flame-resisting compound. A sample of this was immersed in water and tested daily for 30 minutes at 2,000 volts A.C. for 8 days before it broke down. Enamelled wire made to the above specification for house wiring is listed in sizes up to 3/18, and the firm inform us that its adoption for running in conduits for this purpose has been recommended by the Bradford Corporation engineers. For overhead cables the wire is made in sizes from single 20 to 19/12, and its employment for electric bell and telephone line wires is also suggested.

ELECTRIC CLOCKS.—A catalogue of electric clocks, finely illustrated in colours, has been issued by the Electrical Co., Ltd. (122-124 Charing Cross Road, London, W.C.). It describes an electrically-wound self-contained clock, which is intended to form a substitute for the system controlled by a master clock. These can be supplied with current from a dry battery or from a D.C. or A.C. supply up to a pressure of 150 volts. If the mains are used, in order to provide for an interruption in the supply, an auxiliary spring is fitted, which has always a reserve tension sufficient for a run of twelve hours. It is claimed that accurate timekeeping is ensured, because, owing to the frequency of the electric impulses imparted to the driving spring, the tension is always constant. The cost of running is exceedingly small, the consumption being only 0·16 unit at 110 volts per year. Particular attention has been given to the design and finish of the cases, to which the illustrations certainly do justice. The company is certainly doing its best to remove the reproach, frequently levelled at electrical clocks, that they are ugly.

LOCAL NOTES

Cardiff: *Electric Lighting Accounts.*—There was a net profit of £909 upon the electric lighting accounts last year, after meeting capital charges. The number of units sold increased by 287,193, an additional 247 consumers being connected to the mains. The power load at present amounts to 3,688 h.p. Mr. Ellis points out in his report that the undertaking is very much restricted owing to the absence of powers to carry out installation work on the hire-purchase system, and expresses the hope that the Corporation will apply for these powers, despite the refusal of Parliament to grant them in 1908. He points to the anomaly that whilst Newport have these powers Cardiff have been refused them.

Cornwall: *Equipment of Mines.*—Electric haulage plant has been installed at the Williams shaft of the Dolcoath mine. The necessary overhead electric transmission lines have been completed, and the steam engines driving sundry plant are gradually being superseded by electric motors.

Dungiven: *Electric Lighting.*—The Council's electric lighting installation was put into successful operation last week. The station contains a 46-b.h.p. Fielding & Platt suction gas with Siemen's generator, and a 360 ampere-hour battery.

India: *Electric Supply.*—According to the *Times of India*, the People's Bank of India, Ltd., of Lahore, has applied to the Punjab Government for a licence to supply electrical energy for all purposes within the municipal area of Lahore.

Llangollen: *Electric Lighting.*—The Council have appointed a committee to consider their position with regard to the Llangollen Electric Lighting Co. It appears that a few years ago the Council obtained an electric lighting provisional order which has not been put into force, the local company at present supplying without any statutory powers. In these circumstances, of course, the Council have no control over the supply, and it is the general desire that the Company and the Council should work in greater co-operation. The present position is that if the Company were to cease to supply,

Hosted by Google

consumers could not call upon the Council to maintain it, for the latter would have no authority to take over the Company's undertaking.

Maidstone: *Street Lighting.*—A joint sub-committee of the Highways and Electricity Committees have presented a report re-arranging the street lighting, thereby bringing about a saving of nearly £300 per annum. The scheme provides for the abolition of 19 arc lamps and the substitution of clusters of three 100 c.p. Osram lamps; also the substitution of clusters of four 100 c.p. Osram lamps for a number of Brockie-Pell arc lamps.

Radcliffe: *Electricity Supply.*—The Lancashire Electric Power Co. have given the Council notice that they intend to apply for an electric lighting provisional order, authorising the Company to supply electricity for all public and private purposes in the urban district. The Company's power station is situated in Radcliffe, and for several years they have made efforts to supply certain people in Radcliffe by whom they have been approached. The Company claim to be able to supply at cheaper rates than the Council, but were unsuccessful in an application to the Board of Trade some time ago for an electric lighting provisional order. In giving their decision on that occasion, the Board of Trade expressed the opinion that the facilities in Radcliffe for a cheap supply of electric power were inadequate, and urged the Council to take the necessary steps to remedy this state of things. The Board added that in the event of the Company making a fresh application at a later date, they might find it necessary to arrive at a different conclusion if it were again shown that the demand was not being adequately met.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bangor.—A Local Government Board inquiry was held last week concerning an application for sanction to borrow £2,000 for additional machinery at the electricity works. There was no opposition.

Barnsley.—A Local Government Board inquiry was held last week concerning a loan of £16,000 for extensions at the electricity works. The loan is necessitated by the growing general demand, in addition to a proposal by the Corporation for substituting electricity for the remaining 500 street gas lamps.

Darwen.—A Local Government Board inquiry was held last week into an application for a loan of £7,600 for additional generating machinery. There was some opposition.

Eccles.—The Electricity Supply Committee invite tenders for the supply and installation of a high-tension, single-phase switchboard, consisting of three-generator and five-feeder panels. Particulars from Borough Electrical Engineer, and tenders by September 12th.

Gourock.—The question of an electric lighting scheme is under consideration.

Llandudno.—A loan of £500 is to be applied for to cover the estimated cost of additional mains during the next two years.

Montenegro.—According to *Commercial Intelligence*, Messrs. Boulton of London are reported to be interested in a project for the establishment of electric power works on the river Tara, and also on the river Moracha in Montenegro, for which the Government have granted concessions.

Moseley.—This district is now incorporated in Birmingham, and the City Electric Supply Department have arranged to lay mains immediately for the supply of electricity.

Rawtenstall.—A Local Government Board inquiry was held last week concerning a loan of £2,000 for street electric lighting. The Corporation at present pay £645 per annum for gas, but it is estimated that the electric lighting scheme will only cost half that amount.

Swinton.—Tenders are invited for twelve months' supply of cables, joint boxes, joint box compound, and bitumen. Particulars from Clerk to the Council, and tenders by September 9th.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

PROVINCES.

Barrow-in-Furness.—Extensions to head post office. H.M. Office of Works, London.

Birmingham.—Pathological and Bacteriological Laboratory and X-ray department at the Infirmary, Dudley Road. Architect, W. H. Ward, Paradise Street, Birmingham.

Bolton.—Church at Heaton. Architects, Wright & Son, Lancaster.

Bradford.—Branch library at Great Horton. City Architect.

Bridgend.—New school and additions to existing ones. Clerk, Glamorgan County Council Offices, Westgate Street, Cardiff.

Cardiff.—Proposed large building for Co-operative Wholesale Society.

Darlington.—Infectious Diseases hospital.

Dunfermline.—Institute for women in Bath Street.

Edinburgh.—Ice skating rink at Fountainbridge. Architects, Walker & Ramsay, 108, Douglas Street, Blythswood Square, Glasgow.

Greenock.—Five four-storied tenements at corner of Mearns Street and Armidale Place. Architect, Mr. W. Strachan.

Keighley.—New school at Highfield. Architect, A. P. Harrison, Highfields Lane.

Merthyr Tydfil.—Sanatorium for the Merthyr Guardians. Architect, Mr. T. Roderick, Clifton Street, Aberdare.

Newcastle-on-Tyne.—Six-story building in Northumberland Street. Architect, Mr. H. Gibson, Dean Street.

MISCELLANEOUS

Cuba.—In connection with the projected scheme of electric railways and power supply in Santa Clara Province, the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C., have an address to which catalogues of materials may be sent.

TENDERS RECEIVED AND ACCEPTED

Birkenhead.—The Electrical Power Storage Co. are supplying a battery of 260 cells of 1,500 ampère-hours capacity at £1,771. The contract also provides for the maintenance of the battery for 10 years.

Bispham.—The following contracts have been placed in connection with the electric lighting undertaking: Engines and dynamos, National Gas Engine Co.; switchboard, balancers, and boosters, Kelvin & James White, Ltd.; storage battery, Premier Accumulator Co.; mains, British Insulated & Helsby Cables, Ltd.

Devonport.—The Electrical Power Storage Co., Ltd., have received an order for renewing 261 cells of the lighting battery, and also part of the traction battery, at £1,024. The contract also provides for the maintenance of the batteries for 10 years.

Erdington.—A tender for the construction of the Slade Road tramways at £24,909 has been placed with Mr. H. Holloway, Wolverhampton. The electrical equipment of the lines will be carried out by the Birmingham Corporation.

Keighley.—The offer of the Tudor Accumulator Co. to cancel the present contract with regard to the maintenance of the battery, under which the Corporation pay £118 per annum, and to double the capacity of the battery, supplying suitable switchgear and booster, on a new ten years' maintenance agreement at £302 per annum, has been accepted.

Shrewsbury.—An order has been placed with Messrs. Danks & Co., of Oldbury, for a boiler at the electricity works at £422 10s.

Stoke-on-Trent.—The contract for the buildings for the new power plant has been placed with Mr. Wardle, of Longport, at £5,120.

Hosted by Google

APPOINTMENTS AND PERSONAL NOTES

Messrs. Dick, Kerr & Co., Ltd., require a Works Superintendent for the English Electric Works, Preston. (See an advertisement on another page.)

The salary of Mr. H. J. Andrews, Engineer and Manager of the Portsmouth Corporation Telephone Department, has been increased by £20 per annum. There is to be a further increase of £20 at the end of the year, making a total of £300.

The following candidates for the position of Chief Assistant and Electrical Engineer in the Bournemouth Corporation Tramway Department were interviewed by the Committee last week—H. Vickers, Deputy Manager and Tramway Engineer, Wolverhampton Corporation Tramways; F. W. Chattle, Ch. Engineer and Assistant Manager, Potteries Electric Traction Co.; G. F. Craven, Chief Resident Engineer, Reading Corporation Tramways; F. J. Kendrew, Deputy Tramways Manager, Southport Corporation Tramways, and E. C. Love, Chief Assistant Electricity Works, Halifax Corporation Tramways. The appointment was finally given to Mr. H. Vickers. The commencing salary is £300, rising to £400.

The Fife Electrical Power Co. have several vacancies for junior engineers. (See advertisement on another page.)

A young electrical engineer with a knowledge of German and electrical driving of collieries and iron and steel works, is required. (See advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 to £58 5s. (last week £58 to £58 10s.).

New Cable Works in Hungary.—The Ganz Company, in combination with the Buda-Pesth branch of Siemens Schuckert Co., are about to build a large cable factory, and the Electric Lighting Committee of Buda-Pesth have decided to give them the order for cable in connection with their new electricity works.

Cricket.—On Saturday a cricket match was played between the Tantalum Cricket Club (formed by members of Siemens' Dalston Works) and the Imperial Lamp Works (Brimsdown) Cricket Club. The match was played at Bailey's Lane Cricket Ground, Stamford Hill. The Imperial Lamp Works went in first and scored 30 runs, and the Tantalum Cricket Club followed with a score of 128 runs for five wickets.

Plant for Sale.—An electro-plating dynamo is for sale. (See an advertisemnt on another page.)

Liquidations.—The Havana Telephone Securities Co., Ltd., is to be wound up voluntarily. Mr. G. Banks, New Broad Street House, London, E.C., is liquidator.

Dissolution of Partnership.—A. Kerridge and H. Sloman, electrical engineers, 38 Alexander Street, Southend, trading as the Starlight Electric Co., have dissolved partnership.

Bankruptcies.—The last day for receiving proofs in the bankruptcy of W. H. Ridpath, electrical engineer, late 341 Nottingham Road, Ilkeston, is September 9th. The trustee is the Official Receiver, 5 Victoria Buildings, London Road, Derby.

NEW COMPANIES

WEAVERHAM ELECTRICITY SUPPLY CO.—Registered by Waterlow, Bros., and Layton, Birchin Lane, London. Capital £5,000.

WHITFIELD FAN CO., Dale Street, Shipley. Capital £2,000. Electrical and mechanical engineers and manufacturers of electric fans, &c.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Brown, Boveri & Co.—The annual report of this Swiss firm for the year ended March 31st last shows a net profit of 2,300,030 francs as against 2,142,122 for last year. This increased profit is, however, on a capital that has been increased to 28,000,000 francs from 20,000,000, and in consequence the dividend declared is only 7 per cent. as against 8 per cent. last year. Reference is made in the report to the taking over of the Alioth works during the year, and also to the formation of the new Austrian Brown, Boveri Co. The Mannheim Brown, Boveri Co. declares a dividend of 4 per cent., and the Compagnie Electro-Mécanique of Paris 10 per cent., both of which are the same as last year. The last-mentioned company has increased its share capital from two to five millions.

Northampton Electric Light & Power Co.—Interim dividend of 2½ per cent. on the ordinary shares.

Northern Light & Power Co.—The first report of this company covering the period from June 1st, 1909, to December 31st, 1910, states that the first portion of the power station at Dawson was completed in August, transmission being carried out over a distance of 40 miles. One of the largest contracts entered into by the company is with the White Channel Mining Co., which guarantees to take 14,000,000 units per annum. Reference to an issue of debentures was published in our last issue.

Liverpool District Lighting Company.—Interim dividend at the rate of 4 per cent. per annum for the June half-year.

Die Bank für Electrische Unternehmungen in Zurich.—A 10 per cent. dividend has been declared.

Companies Struck Off Register.—The names of the following have been struck off the register of Joint Stock Companies:—Albion Battery Co., Aberdare Electric Lighting Co., Buenos Ayres Electric Light Co., Private Wire and Telephone Installation Co.

SUMMARY.

Our monthly supplement on "Electrical Engineering in Mines," is included in this issue. It opens with a critical article on the New Coal Mines Bill, commenting upon the amendment suggesting that the use of electricity should be discontinued where a minute proportion of inflammable gas is present in the air, and urging that in the new Home Office Rules, the regulation prohibiting the use of electricity where there is the risk of explosion, should be more definite. Some other articles summarise some of the most important mining patents during August, and describe a new controller and a new form of earth plate, suitable for mining work. A report is given of some police court prosecutions relating to infringements of the mining rules.

A demonstration was recently given of a new process of creosoting timber at the works of Messrs. Richard Wade, Sons, & Co. (Page 496.)

Under electric traction notes are included some remarks on the recent tramway accidents in London and Glasgow, and an abstract of a paper at the British Association on Rail Corrugation. The Bremen trolley omnibus system, which has been taken up in this country by the Brush Electric Engineering Co., is also described, and notes are given on other electric railway and tramway matters. (Page 497.)

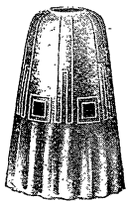
A wireless system of signalling has been patented by R. A. Fessenden, in which the recorder is actuated by the frictional pull caused by a gold leaf resting on the surface of a revolving wheel, between which there is a film of oil. A detector for electromagnetic waves, which has a platinum wire pressing on a small portion of carbonate of lead, is protected by J. C. Smith and T. H. Lyon. Another specification published by the Patent Office last week, relates to a process of manufacturing metallic filaments, in which the metal is mixed with a solution of ammonia. The appeal made against the Comptroller's decision in connection with the use of phospham in metallic filament lamps by Glühlampenwerk Anker-Ges has been withdrawn. (Page 498.)

Several papers of electrical engineering interest were read at the meeting of the British Association, at Portsmouth. Prof. Andrew McWilliam presented a useful report on the "Present Position of Electric Steel Melting," which included a list of the various patterns of electric furnace, and their distinctive features. (Page 499.) Mr. H. A. Mavor, in an illustrated paper, described his system for the electric propulsion of large ships, employing electricity as a gear between the steam turbine or oil engine and the propeller. An order for a 5,000 kw. equipment for the United States Navy has been placed. In reply to remarks in the discussion, Mr. Mavor laid great stress on the simplicity of control and the strong and mechanical construction of the motors. (Pages 500–502.) A paper on Electric Steering, by Mr. B. P. Haigh was only briefly discussed; Mr. T. F. Wall contributed a long paper on the single-phase reduction motor; Mr. W. P. Digby spoke on the investigations he is making as to human susceptibility to vibration; and papers were also read on the electrical conductivity of aluminium alloys, the effect of electricity on plants, and a friction permeameter. (Pages 503 and 504.)

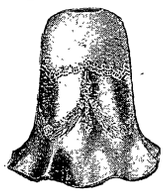
One or two papers on wireless telegraphy were read at the British Association, and signals were received from Continental stations. Several local authorities are taking measures to endeavour to obtain the equivalent of the rates paid by the National Telephone Co., after the transfer of the telephones to the Post Office has been effected. (Page 505.)

Reductions are to be made in the tariffs at Brighton. Profits on the year's working of the electricity undertaking are recorded at Aberdeen (£1,948), Peterborough (£184), Plymouth (£1,170), and Sheffield (£3,417), but a deficit of £357 is reported at Handsworth. A company with a large capital is being formed on the Continent to acquire and control the tramway

Hosted by Google



and lighting undertakings of Constantinople. (Page 505.)



A LOCAL Government Board Inquiry was held last week regarding a loan for electricity extensions at Darwin (£7,600). The loan applied for at Wimbledon in connection with the supply to the Malden and Coombe area has been sanctioned. Tenders are invited for gas and Diesel engines at New Zealand. (Page 506.)

CATALOGUES AND PAMPHLETS, &c., RECEIVED

BRIMSDOWN LAMPS.—The Imperial Lamp Works (Brimsdown), Ltd., whose name, by the way, is shortly to be changed to the "Brimsdown Lamp Works," have sent us two new lists. One of these is a small folder with a coloured reproduction of the well-known Brimsdown poster on the front, and containing a price list of the various sizes and styles of lamp made, with some views of premises where they are used. The other is a larger and fuller list, containing also some views of the various departments of the works, in addition to the ordinary size for high and low voltages ranging from 25 to 260 volts. High candle-power lamps are made up to 1,000 c.p., and special candle and train-lighting lamps are also listed. A complete telegraph code for ordering enhances the utility of the list.

SHADES.—We have received from Messrs. Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston), a new list of glass shades for tantalum and other lamps. The list is supplementary to their price list No. 2, and affords a varied selection from which to choose. Two of the designs are illustrated here.

There is a fine assortment of satin-finish and opalescent shades in various tints, as well as some very effective etched designs. Another feature is a series of artistic bead shades. The list will be sent to any contractor or person interested.

GENERATORS.—The Phœnix Dynamo Manufacturing Co., Ltd., Thornbury Works, Bradford, have issued their Bulletins 2a and 4a, dealing with D.C. and A.C. machines respectively. The contents of these are in the nature of general specifications of machines, illustrated with good reproductions of photographs showing details of construction.

ELECTRICITY SUPPLY ADVERTISING.—A further issue of supply advertising literature is being made by the Electric Supply Publicity Committee, including a booklet on electric heating with a cover by Mr. Cecil Aldin, representing two dogs enjoying the warmth of a radiator. The booklet consists of eight pages of a size fitting ordinary envelopes, and the letterpress is further relieved by dainty vignettes. The cover design is also reproduced as a postcard. A new booklet, briefly pointing out the advantages of electric driving of various classes of machinery is also being produced, and the new issue further comprises a four-page circular on the comparative safety of electric light and gas.

THE RÜPING PROCESS OF TIMBER PRESERVING

A NEW method of creosoting timber has been introduced at the works at Staddlethorpe of the well-known firm of timber preservers and merchants, Messrs. Richard Wade, Sons & Co., Ltd. A demonstration of the process was made recently, when various kinds and shapes of timber were selected for the experiment—redwood, poles, timbers, sleepers, fencing and paving blocks, and whitewood battens and boards. These were weighed and measured, and then sealed up in the cylinder, where they were subjected to an air pressure of about $3\frac{1}{3}$ atmospheres, or 50 lbs. per square inch, and then the cylinder was filled with creosote, whilst the air pressure was maintained. A pressure of 80 lbs. per sq. in. was then put on, after which the pressure was released and the cylinder opened, when the timber was taken out and re-weighed, showing the amount of oil remaining in it. Various pieces of the wood were cross cut, and showed the penetration of the oil, nearly to the centre, which we are told is impossible in the old method, except at a great cost. The wood was dry and clean to handle, and not dirty and clogged with oil, such as is often the case with creosoted wood. There are at present plants in the world, either specially erected for, or altered to suit the Rüping process, capable of doing over 38,000,000 sleepers, 9 ft. 10 by 5, by this process. The Santa Fé Railway Co., in America, are one of the largest users, and the German and Italian Governments have adopted the process.

SHADE OF NAPOLEON: I said that they were a nation of shopkeepers 100 years ago. There will be no doubt about it 175 years hence if they do not profit by Sir William Ramsay's warning now, for even their electrical industry cannot help them without coal.

ELECTRIC TRACTION NOTES

Among the Papers read before the Engineering Section of the Bristol Association at Portsmouth, was one by Mr. W. Worby Beaumont on Corrugation of Tramway Rails. The author looked for the remedy to rail corrugation in radical alterations in the design of rolling stock, and considered the evil inevitable with the great weights now carried at high speeds on small wheels. According to his explanation of the phenomenon, the repeated running of the heavily laden tramcar wheel over the rail gradually compresses the surface of the crown of the rail beyond its elastic limit. Of this stress transversely the material relieves itself partially by the detrusion at the edges of the rail, where it forms a lip on the outside or on the groove side, or on both. This lip remains on the outside of the rail, but is worn off on the inside by the wheel flange. In the longitudinal direction the stresses arising from the compression of the surface material are not thus relieved. The heavily laden tramcar wheel presses into the surface of the rail, and as it rolls along presses before it a wave of compression, the translation of which involves the destructive rupture of the surface or the rise of the wheel over the minute crest of the wave. The result is the formation of an extremely hard surface in patches of various shapes and lengths, and separated by distances depending on several conditions, including the mechanical properties of the rail, its combined hardness and toughness. Where the bright hard patches alternate with an approach to regularity with the dull and rougher surface patches the result is known as corrugation. Mr. Alexander Siemens, in the discussion, asked Mr. Beaumont whether he really believed in his own conclusions, and thought that the heavier equipment entailed by the larger and slower running wheels would make the remedy worse than the defect. He suggested a rail made harder at the edges than in the centre, so that the wheels could, so to speak, sink in. Sir William White characterised this suggestion as a dream, and referred to similar troubles with the roller paths of old-fashioned turrets on battleships. Prof. Howe seemed to question whether corrugation was really any disadvantage at all, and Prof. Petanvel asked whether the surface of the tyre could not be made more yielding. Mr. Beaumont, in his reply, did not seem hopeful that his remedies were really practical, and ridiculed Mr. Siemens' proposed rail. The main objections to corrugated rails were the noise and vibration which they caused.

As most of our readers will have become aware from the daily Press, a regrettable tramway accident occurred on the L.C.C. tramway system at Lewisham last Saturday, when a four-wheeled top canopy car left the rails on a curve, after descending a short, steep incline at the junction of Shardeloes Road and Lewisham High Road, and overturned. One passenger was killed, and over 30 were injured. An inquest was held on Tuesday, at which the jury, in returning a verdict of accidental death, found that there was not sufficient evidence to show by what means the car left the rails. An attempt was made to prove that a quantity of dried and caked sand was present in the groove of the rail, but evidence was conflicting upon this point. At any rate it seems to have been established that the magnetic brake, although found to be in perfect order after the accident, was slower in coming on than the driver and the learner under his charge expected, and, indeed, they failed to make the compulsory stop before the descent. This was due possibly to its having been applied too soon after a power notch had been used, and that the car gathered more speed than is realised. The explanation advanced by one morning paper, that the magnetic brake being a track brake, tended to lift the car, is, of course, absurd, as these brakes are not pressed down on the track mechanically, but depend on magnetic attraction between the brake block and the rail, tending rather to increase than to diminish the pressure of the wheels on the rail. If the wheel brakes, as is quite possible, had locked the wheels, the magnetic brake would have simply been inoperative if applied before the wheel brakes were released. The number of previous fatal accidents on the L.C.C. system is given as four, which considering the immense size of the system is comparatively few.

A slight tramway accident also occurred in Glasgow on Saturday, when a driver fell from a car in a faint, and despite the efforts of a man who endeavoured to get on to the platform and apply the brakes, the car collided with another before either he or the conductor could stop it. This contingency is provided for in the case of electric railways, where only one man occupies the driver's cab, by the use of the "dead man's handle," which automatically cuts off the current and applies brakes on the driver releasing his grip. Accidents of this kind have hitherto been rare on tramways. We have been informed that only one case of a driver fainting has occurred on the L.C.C. system, and then the conductor was able to stop the car from the rear platform.

We have received a circular from the Brush Electrical Engineering Co., Ltd. (Loughborough), describing the Bremen trolley omnibus system, the British patent rights for which have been acquired by the company. The main distinguishing feature of the system, which is to be used on a few lines on the Continent, is that the two overhead wires are placed one above the other, instead of side by side. The current collector is suspended from the upper wire whereon it runs on two grooved trolley wheels, while a special form of spring bow makes rubbing contact with the lower wire while allowing full lateral play. A flexible cable connects this trolley to a mast on the car, and an ingenious spring arm is provided to take up the shock of starting, which might derail the collector. The upper negative wire is earthed at intervals, and fulfils the functions of a guard wire as well as a return wire and a support for the trolley.

The report of the Underground Electric Railways Co. of London, Ltd., for the half-year ended June 30th, records revenue from investments, properties, &c., of £108,792, and a surplus from the power house of £24,602. Out of these sums, after meeting interest on bonds, &c., including 1½ per cent. on the 6 per cent. income bonds, there remained a balance of £246, applied in reduction of accumulated revenue deficiencies. The eighth Parsons turbine has now been installed at Lots Road, and the output of the station was over 69½ million units for the half-year.

After meeting capital charges, there was a net balance on the working of the Cardiff tramways for the past year of £12,034, of which £5,087 has been added to reserve fund, and £6,947 to depreciation fund. The number of passengers carried was 25,662,830, compared with 25,448,234 in the previous year, and as the car miles have been reduced by 39,106 miles, there has been considerable economy in working. The depreciation fund now amounts to £44,515. In his report Mr. Arthur Ellis, the Tramway Manager, calls attention to the fact that the workmen's cars involve a loss of £1,566 per annum.

The proposal of the Sheffield City Council to run a system of trolley omnibuses to Dronfield has received the unanimous support of the Norton Rural District Council.

According to a telegram from Berlin, a company is being formed for the consolidation of electrical undertakings in Turkey, which will mainly devote itself to traction. The German Orient Bank and the Deutsche Bank are prominent in the matter, whilst the Ganz Co. is interested as the holders of an electric lighting concession in Turkey. It is stated that an International Finance Co. has been formed, with headquarters in Belgium, £2,000,000 being mentioned as the nominal capital.

The *Board of Trade Journal* points out that the Vienna Council have decided to construct additional tramways.

Mr. James Dalrymple, General Manager of the Glasgow Corporation Tramways, has prepared a scheme of extensions. The most important deals with the construction of a new bridge to carry tramways across the Clyde in order to relieve the congestion of traffic on the Glasgow Bridge.

Blackburn Tramways Committee have decided to pay each driver and conductor in their service 10s. extra pay for the extra work occasioned by the recent railway strike.

At a meeting of the Perth Electric Tramways, Ltd. (Australia) last week, Mr. A. H. P. Stoneham referred to the negotiations regarding the acquisition of their lines, which now include over 30 miles of track, by the municipality. It was held in some quarters that the State and not the city should purchase the undertaking, but no decision had been yet arrived at. The company are averse from any sale, but public opinion in Perth demands it. A price of £500,000 is asked. The sale of the Adelaide tramways to Government is also contemplated, and a Bill giving powers to this effect is now before the South Australian Parliament. The Hobart City Council have tramway purchase also under consideration, and a special committee have placed the limiting price which the Council will be prepared to give at £150,000.

The extension to the Huddersfield tramways from Edgerton to Birchencliffe was inspected and approved by Major Druitt of the Board of Trade, and traffic was commenced on Friday last. No decision has yet been come to with regard to the Elland extension.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published August 31, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

11,154/10. **Wireless Signalling.** R. A. FESSENDEN.—An electrical recorder is described in which a light film of gold leaf rests upon a wheel with a conducting surface. The wheel is made to revolve at a uniform speed, and dips into a bath of lubricating oil. It is so arranged that, when an impulse is received, the leaf and wheel are charged through the medium of the lubricating film, producing an increased frictional drag between the two. This causes a recording pointer, which is attached to the gold leaf by a filament, to move and make a written signal. Four figures.

22,164/10. **Detectors for Electromagnetic Waves.** J. C. SMITH and T. H. LYON. A small portion of an ore, known as carbonate of lead, is inserted in series with the conductor carrying the oscillating current. The ore and the conductor are fixed on two separate standards placed close together, and a piece of platinum wire is attached to the conductor, which can be adjusted to obtain the required pressure of the wire on the ore.

22,803/10. **Electrodes for Arc Lamps.** J. M. LEWIS. To ensure the carbon core and flaming material in an electrode burning at the same rate, so that one shall not stand up more than the other, a divided electrode is provided. This can be constructed by placing a layer of the flaming material round the tubular carbon core in the form of rings cut in a lathe, or it can be placed inside the core in the shape of cylinders with spaces in between. Other methods of arranging them are included. The flaming material is made to a previous specification (No. 15,977/10), and consists of mixing finely-divided calcium fluoride and silicon carbide with gold size, and afterwards pressing and drying. Six figures.

23,639/10. **Metallic Filaments.** Dr. J. SCHILLING. Finely divided metal, such as tungsten, is mixed with a small quantity of ammonia solution, and then kneaded and worked up at the ordinary temperature; or the metal can be exposed to the action of ammonia gas in closed vessels at the ordinary temperature. The product is a plastic mass, which can be readily squirted into filaments, when the ammonia evaporates on passing a current through, leaving a filament of pure metal.

23,891/10. **Conductor Terminal.** C. H. MEIGH. This is stamped out of a sheet of metal in the form of an eight with the waist half the width of the loops for folding over. Through the centre of the loops a hole is punched, and dished strips are provided at each end. One of these takes the insulated part of the conductor, and the other, which is a little wider, folds over on to the narrower strip, which it is made to grip by pliers. The wires of the bared end of the conductor are in this way pressed tightly between the loops, making good contact. Eight figures.

8,004/11. **Drawn Tungsten Filaments.** K. SCHWAB. The filament is drawn from a tungsten alloy containing non-metallic substances in quantities insufficient to affect the resistance of the wire. Good results are obtained with an alloy of tungsten and a little phosphorus, and nickel can also be added if desired.

12,735/11. **Arc Lamps.** SIEMENS BROTHERS' DYNAMO WORKS, LTD. This invention provides for better distribution of the combustible materials, which are supplied to lamps of this kind. One method supplies three channels or pipes, set at an angle of 120° with each other around the electrode, whilst another method is to surround the electrode tips with a collar provided with channels, through which the fuel descends in equi-distant streams. Six figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: BLONDEL [Electrodes] 12,024/11.

Dynamos, Motors, and Transformers: BRITISH THOMSON-HOUSTON CO. (*General Electric Co.*) 30,233/10.

Incandescent Lamps: ALLGEMEINES CHEMISCHES LABORATORIUM ISKAR H. ARENDT, and SCHLESINGER [Supports for filaments] 29,505/10; RICHARDSON and CROWLEY, 1,907/11.

Switchgear, Fuses, and Fittings: DAVIES, KENT and DAVIES, KENT and STEWART, LTD. [Switches] 19,071/10.

Telephony and Telegraphy: SIEMENS BROS. & Co. (*Siemens and Halske Akt.-Ges.*) [Intercommunication sets] 9,375/11.

Traction: BRUSH ELECTRICAL ENGINEERING Co. and LEECH [Tramway motor supports] 27,725/10; OESTERREICHISCHE DAIMLER MOTOREN AKT.-GES. [Trolley wire construction] 4,397/11.

Miscellaneous: HERRDE [Regulating the closing of bell circuits] 19,199/10; GILES [Condensers] 28,179/10; ENGEL [Contact devices] 320/11; BARNES [Lug joints for accumulator box lids] 6,983/11; BENKÖ [Cells] 10,156/11; CHEMISCHE FABRIK GRIESHEIM-ELEKTRON [Depolarisers for primary batteries] 11,906/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Dynamos, Motors, &c.: Soc. "PHI.," 25,026/10; PIEPER [Speed regulation] 17,675/11.

Heating, &c.: HOUSKEEPER, 17,479/11.

Incandescent Lamps: KNIGHT [Supports for filaments] 17,482/11.

Switchgear, &c.: FAGERLUND [Automatic circuit-breakers] 17,284/11; SCHAIRER [Terminal devices] 17,481/11.

Telephony, &c.: STEINBERGER [Telephone mouthpieces] 14,590/11.

Miscellaneous: Soc. "PHI." [Electro-magnets, &c.] 23,831/10.

The following amended Specifications can now be obtained.

AKT.-GES. BROWN, BOVERI, ET CIE. [Spinning machines] 19,626/06; PENROSE [Switches] 1,037/11; HENRI HELBRONNER and RECKLINGHAUSEN [Destroying bacteria] 1,805/10.

Opposition to Grant of Patents

27,938/06. **Signalling by Wireless.** LEE DE FOREST. The appeal which was lodged against the Comptroller's decision has been withdrawn. The patent relates to a system of signalling whereby a ship with receiving apparatus may locate its position with respect to a station with transmitting apparatus. It comprises a rotatable signalling wheel divided into sectors and provided with electrical contacts, by which means the wave signals are changed with their direction of transmission, and the location of the transmitting station can be identified. A rotatable parabolic reflector is also used for concentrating the direction of the waves.

19,847/08. **Phospham in Metal Filament Lamps.** GLÜHLAMPENWERK ANKER-GES. The appeal, which was made against the decision of the Comptroller to refuse this patent, has been withdrawn. An abstract of the Comptroller's decision was given in ELECTRICAL ENGINEERING, June 16th, page 390.

29,960/09. **Fan.** J. KEITH and C. TUSON. The opposition which was entered to the grant of this patent has been withdrawn. It relates to a roof ventilator for ships' cabins, railway carriages, &c., which was described in ELECTRICAL ENGINEERING of November 24th, 1910, page 753.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: GUEST, KEEN, & NETTLEFOLDS, and C. WAKEMAN, 11,088/03.

Distributing Systems, &c.: J. S. PECK [Three-wire system] 25,753/01.

Dynamos, &c.: C. A. PARSONS and G. G. STONEY, 9,203/00; V. A. FYNN [Single-phase commutator motor] 11,288/07; LA COUR [Controlling] 11,466/07; C. W. KAY [Homopolar] 11,476/07; S. VON AMMON [Commutators] 11,673/07.

Electric Ignition: A. BILLING, 11,402/07.

Electrometallurgy, &c.: G. F. BRINDLEY [Furnaces] 11,675/06.

Incandescent Lamps: E. BÖHM, 9,959/01; H. H. LAKE (*Rheinische-Weste-Fälische Maschinenbau-Anstalt und Eisengieserei* [Miners' safety] 11,059/02.

Switchgear and Fittings: J. A. GOSLING [Holders] 11,528/07; A. J. BOULT (*T. von Zweigbergk*) [Controllers] 10,228/99; H. S. HATFIELD [Switches] 11,541/07.

Telephony, &c.: AMALGAMATED RADIO-TELEGRAPH Co. (*G. Seibt, Berlin*) [Wireless telephony] 11,695/07.

Traction: J. W. MACKENZIE (*Soc. Cousin & Co., France*) [Signals] 11,272/04; P. PLATTE [Bow collectors] 10,100/05; R. BRAUN [Brakes] 10,709/07; A. A. SCHNEIDER [Trolley wheels] 11,285/07; H. TUDOR, 11,501/07; W. KNEEN and H. C. KING [Tramway conduits] 11,523/07.

Miscellaneous: H. CAMPICHE [Electric clock apparatus] 10,393/99; C. NAYDIS [Governor valve control] 11,358/07; SIEMENS BROS. & Co. and G. S. GRIMSTON [Signalling] 11,381/07; W. N. and F. W. NICHOLLS [Tremblers] 11,386/07; J. FLUEGELMAN [Counting apparatus] 11,616/07.

ELECTRICAL ENGINEERING
IN
MINES

THE COAL MINES BILL

IT has been recognised for some time that a definite restriction as to the use of electricity in those parts of mines in which it would be dangerous would inevitably be made by the Government and enforced by the Home Office. Mine owners maintain that there is no desire on their part to utilise electric power in places where it would introduce a risk of explosion, and for that reason no exception was taken to the first of the proposed new special mining rules, by which the use of electricity is prohibited "in any part of a mine where, on account of the risk of explosion of gas or coal dust, such use would be dangerous to life." Electrical engineers, on the other hand, do not view the wording of this rule with satisfaction, for although they also would obviously not desire to utilise electricity in any circumstances where danger would attach, yet they would prefer that the cases where there would be a risk of explosion of gas or coal dust due to use of electricity should be more accurately defined in the rule. We believe that some at any rate of the mines managers are also now adopting this view. The mines managers are, naturally, in many instances not conversant with the details of the applications of electricity, and as they themselves would find it very difficult to decide in what circumstances the use of electricity would be dangerous, they might elect not to take the risk at all, and to eschew the use of electric power altogether.

In Clause 60 of the new Coal Mines Bill, as originally drafted, the special rule we have quoted above was practically repeated, and the clause in question read as follows:—

(1) Electricity shall not be used in any part of a mine where, on account of the risk of explosion of gas or coal dust, the use of electricity would be dangerous to life, and if the owner of a mine, on being required by an inspector of the division not to use, or to desist from using electricity in the mine or any part thereof on such ground as aforesaid, refuses to do so, the question as to the application of this section to the mine or part thereof shall be settled in manner provided by this Act for settling disputes.

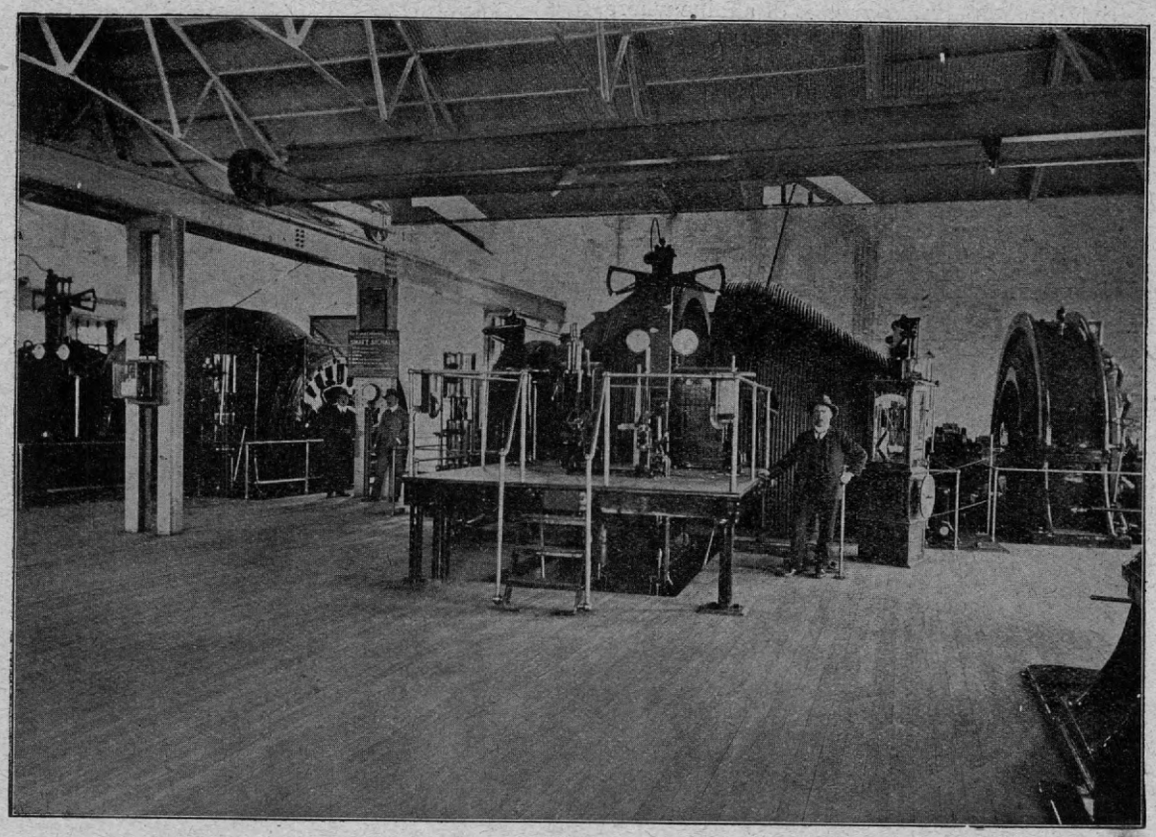
(2) The use of electricity in any mine shall be subject to general regulations under this Act.

The first sub-section of this clause is therefore obviously redundant, and it would be quite sufficient to let the second sub-section stand alone, as the prohibition of electricity, when there is a risk of explosion, is already contained in the new special rules to be issued under sub-section 2. In a consideration of the Bill by the Standing Committee of the House of Commons, to which it was referred, a good deal of discussion was devoted to this clause. It was first suggested that an amendment should be made that electricity must not be used in any part of a mine where safety lamps have to be employed, but this amendment was not adopted. As mentioned in our issue of August 3rd, however, on the motion of Sir Arthur Markham, an addition was made to the clause, to the effect that the use of electricity should be at once discontinued in any part of a mine in which the inflammable gas in the air current exceeds ½ per cent. The Solicitor-General for Scotland, who had charge of the Bill at the time on behalf of the Government, opposed this, but it was carried notwithstanding. As the Bill is left, therefore, the indefinite clause prohibiting electricity where there may be the danger of explosion still remains, and this addition of Sir Arthur Markham stands, not as a definition of when the danger of explosion may be anticipated, but as an additional restriction. When we add that it is highly improbable that the presence of ½ per cent. of inflammable gas could be detected in the air current by any of the ordinary means of testing in use at the mines, it will be seen that the position is one that must be altered. There appears little reason to doubt that the Government will move the omission of Sir Arthur Markham's addition to the Bill when the Bill comes up for third reading in the House of Commons during the autumn session; but those who desire to promote the increased use of electricity in mines with the consequent increased efficiency in working should endeavour to have the first part of the clause also omitted, so that any control as to the use of electricity should be contained only in the special rules for the purpose, and not partly in the Act itself. In addition, as the new rules proposed are not yet definitely adopted, and representations are to be heard by the Home Office as to the desirability of amending them, the question should then be debated as to whether rule No. 1 (prohibiting the use of electricity "where on account of the risk of explosion of gas or coal dust, such use would be dangerous to life") should not be made more definite and intelligible.

ELECTRICAL MINING PATENTS OF AUGUST

AMONG the patent specifications of interest to electrical mining engineers published during the past month was one by E. A. Hailwood, of Morley, near Leeds (No. 18,415 of 1910), for an electrically lighted safety lamp. The lamp vessel is provided with a wick tube, which carries a sliding sleeve. This sleeve has a boss with a threaded aperture, which engages with a similar thread on the exterior of a metal tube passing through the vessel. The tube has an enlarged headpiece knurled on the exterior. Inside an insulator is placed provided with an electric igniting pin and snuffer arm. The bottom of the pin terminates in a button, and is kept down by a spring fixed between the button and insulator head. Adjustment is obtained by turning the headpiece and moving the sleeve up and down the wick tube.

Specification No. 21,080 of September 10th, 1910, by W. E. Gray, of London, describes a portable safety lamp. A battery with projecting contact lugs is placed in a case with a hinged cover, which, when closed, can be locked by means of a hinged slotted clasp secured by a rivet or other fastening device to a lug on the case. A non-conducting base plate is fixed on the cover, into which two metal studs are screwed, passing through the base plate and cover. In the ends of these studs metal plungers are screwed, so that when the cover is closed electrical contact is made with the battery terminals. A glow lamp is mounted on the cover between an upper and lower conical reflector, the bases of which rest upon a circular metal disc and the non-conducting base respectively. One wire of the glow lamp is connected to the lower reflector, while the other is taken to one of the studs on the base plate. The electrical circuit is opened and closed by means of a milled-headed metal screw, which makes and breaks contact between the lower reflector and the second metal stud. A glass cylinder, enclosing the glow lamp and reflectors, is placed between the circular metal top disc and the cover. The disc and cylinder are secured to the cover by a number of bolts and nuts.



Specification No. 27,804 of 1910, by C. W. Speakman, of America, describes an insulator and means for supporting it in mines. The end of the pin of the insulator, which is driven into the roof or wall, is split and tapered, and a series of short, bevelled prongs extend from it to hold it more securely. The insulator is keyed on to the pin. The part of the pin under the insulator has a vertical groove to form a conduit for removing any water that may accumulate on the top shoulder of the insulator. The cable is placed in an angularly disposed groove on one side of the insulator, and the binding wire, which holds it to the insulator, is mounted in a transverse groove on the opposite side.

A NEW CONTROLLER FOR INDUCTION MOTORS

THE type of reversing controller for induction motors which has been hitherto mostly favoured for colliery and similar work is the one in which a revolving drum is employed on which is carried various contacts. In designing the new type of contactor controller described below, Messrs. Dick, Kerr & Co., Ltd. (Abchurch Lane, Cannon Street, E.C.), the manufacturers, have endeavoured to obviate the use of contacts rubbing on a slowly moving drum, in order to ensure that, however severe and exacting the conditions may be, the maintenance shall be much lower than that of the more ordinary drum pattern. An arrangement is adopted

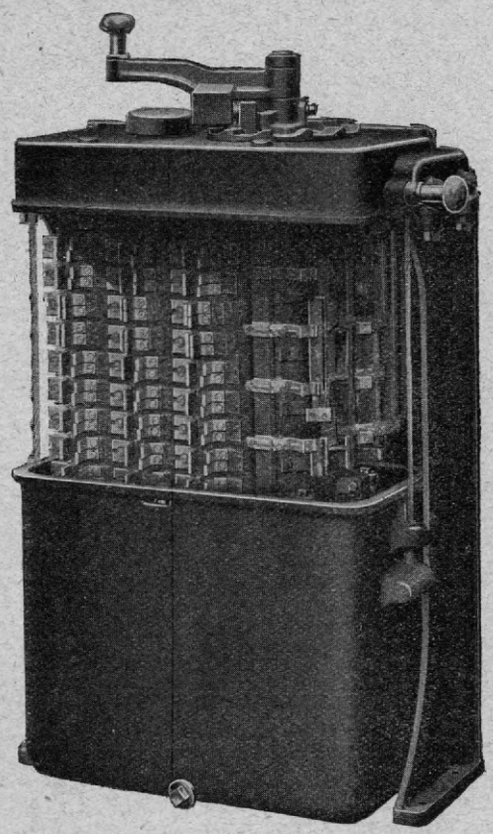

FIG. 1.—CONTROLLER WITH OIL TANK LOWERED.

similar to the contactor system, which gives quick break and make, and maintains the surfaces smooth and clean, and at the same time has a minimum of wear on the contacts.

Describing the apparatus more in detail, the general arrangement is shown in Fig. 1, and it will be seen from Fig. 2 that there is a fixed frame on which is carried the spindles

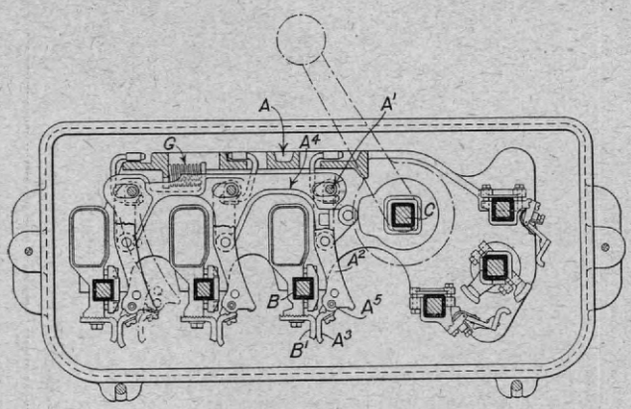

FIG. 2.—SECTIONAL PLAN SHOWING ARRANGEMENT OF CONTACTS.

*A*1, which extend almost the entire height of the controller. Pivoted on each of these spindles are movable arms *A*2, to which are fixed contacts *A*3, each spindle carrying the number of arms with contacts corresponding with the steps of the rotor resistance, of which there are usually nine, with one step full resistance. These arms *A*2 have a rotating movement on the spindle, and also a small lateral movement, the combination of these movements ensuring that the contact pieces shall approach one another at such an angle as to ensure a good wiping action contact. Corresponding with and registering horizontally to these contacts *A*3, are the same number of fixed contact pieces *B*1 mounted on vertical standards *B*, but insulated from same by mica. Each of the movable contact pieces is held extended to the left by means of a spring, the movement being limited by blocks *A*5. This addition ensures that in each case when contact is made between the two contact pieces *A*3 and *B*1, and that any wear or unevenness of alignment relative to one another will not cause sparking, as, in the closed position, perfect contact is made against the full compression of this spring. Each main operating pillar is actuated by means of the controller handle, and carries a number of cams, each appropriated by one of the movable cradles *A*4, on which are pivoted the movable contact arms *A*2. In addition to this the operating pillar has at the top just below the handle another cam, by which on the first operation of the handle the stator circuits are closed. At this point the motor is connected to the line and with all resistance in the motor circuit. The succeeding notches actuate the movable contacts, and an automatic notching device is also attached to the handle which prevents it from moving forward more than one notch at a time, and ensures a pause at each clip. The handle can, however, be brought rapidly to the "off" position, the whole of the speeding up action being reversed, the stator connection being broken last.

For starting up the motor in the opposite direction the handle at the side is used to raise or lower the reversing drum, so that the stator connections are reversed. The reversing handle is locked in position by the first movement of the controller handle, and the controller handle is locked by the reversing handle in any intermediate position of the latter.

Easy access to the contacts is ensured by the way the casing moves vertically up and down in guides, with the whole of its weight, including the oil, taken by a counterweight.

These controllers are usually supplied with ten positions in either direction, and can be supplied for three- or two-phase wound rotors.

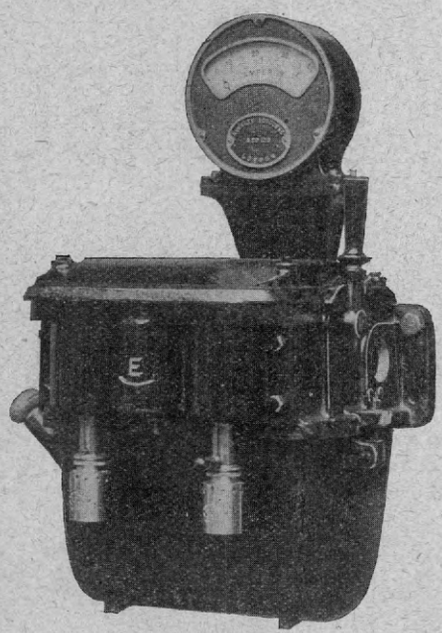
A USEFUL EARTH PLATE

THE earth plate sketched below has been designed by Mr. John Bentham, electrical engineer at the New Sharlston Collieries, near Normanton, where it has been put into use. Its object is to comply with the Home Office requirements, and to ensure at all times a permanent and durable earth connection. The whole of the earth plate and cable terminals is one solid casting weighing 11 cwts., and is made of cast iron 4 ft. 6 ins. square to point of teeth, and 1¼ ins. in thickness. It will be seen that the cable connections are above ground, so that there is no danger of the cable becoming detached from the earth plate through corrosion, and as inspection is easy, constant testing is unnecessary.

The cast-iron terminals to take cables are 9 ins. in height from top of plate, and 4 ins. diameter, having a hole bored in the centre of each terminal 2 ins. in diameter and 6 ins. deep.

The earth plate at the Sharlston Collieries is fitted with three terminals, one for the 220 kw. generator, one for the 550 kw. generator, and one for the earth cable for the mine; it is fixed in a vertical position in the ground in the usual manner, just outside the power house. The full length of cast-iron terminals remain above ground. It is so arranged that the water from the exhaust pipe of the engine flows constantly on to the earth plate, the whole being protected by a small brick cabin with door. The earth plate is also bonded to the water main by means of copper tape ¾ in. wide and ⅛ in. thick, two pieces of this being used. Their ends are put into the cast-iron terminals of the earth plate.



In fixing the cables to the earth plate, the insulation is taken off for about eight or nine inches, and after the terminals have been made hot by means of blow lamps, &c., the copper cable is pushed down to the bottom of the terminal and then run in solid with white metal. When the terminals have cooled off the bare part of the cables may be finished off with insulation and black varnish.

POLICE COURT PROSECUTIONS

MINE managers are apparently becoming more alive to their responsibilities in the case of breaches of regulations, and are occasionally following the course of prosecuting careless employés who are guilty of neglect of the rules for their own safety and that of their fellow-workmen.

In the Falkirk Sheriff Court on August 7th, a machineman belonging to the Craigend Colliery was summoned for failing to have the earth wire of an electric coal-cutting machine connected to the gate end box. There had evidently been a leakage, as he had received a shock which necessitated his being off work for three weeks. The prosecution was doubtless instituted to give greater publicity to the case, and to serve as a warning to others, as the man's punishment would appear to have been sufficient without the additional infliction of the fine of 5s. to which he was subjected.

Another case—a more serious one—was heard at the Manchester County Police Court last week. It appears that a haulage lad employed at the Newtown No. 2 pit of the Clifton & Kersley Colliery Co., had interfered with the electric cable which ran along one side of the main haulage road. A hammer had been found on the top of a girder, and it was alleged that the defendant had acted in such a way as to make both the girder and the hammer alive with electricity. The pressure was 220 volts. A fine of 10s. was imposed.

MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

The Coal Famine.

SIR WILLIAM RAMSAY, the President, delivered his Address at the opening of the meeting of the British Association for the Advancement of Science on Wednesday last week at Portsmouth. This address, the concluding part of which was devoted to the question of the early exhaustion of our coal supplies, was reported in our last issue, and has excited a great deal of comment, not only in engineering circles, but also among the general public and in the daily Press. Sir William Ramsay has pointed out clearly the disastrous effect upon the industries of the country which would be the result of the exhaustion of our coal supplies, and has shown that actual estimates of the amount of coal available and of the annual increase in the quantity mined, point to the complete exhaustion of our coalfields in 175 years. Long before the end of this period is reached, however, the country would feel the effect of a rise in the value of coal, and, as no other practicable sources of energy are available to take its place, the outlook is certainly serious. Sir William Ramsay certainly does not understate the case when he predicts "the near approach of famine and misery" if the Government does not take almost immediate steps to prevent the enormous and unnecessary wastage which is going on by the continuance of the employment of uneconomical methods for its combustion.

In the Engineering Section (Section G) on Thursday. Prof. Biles, the President of the Section, delivered his Address, which, however, did not deal with any electrical engineering subject. A discussion then followed on rail corrugation; this is referred to in our Electric Traction Notes on a later page.

The Use of Electricity in Steel Production.

In the Chemical Section (Section B), a report by Prof. Andrew McWilliam on "The Present Position of Electric Steel Melting" was presented. The author himself was absent, and the report was not discussed.

Prof. Andrew McWilliam explained that the melting of steel by means of electricity had become a commercial process by means of which steel was manufactured for the market. The general impression which he has gathered from much conversation with users is that the arc furnace product from slightly impure materials, purified to Swedish standard, just about takes its place by Swedish open-hearth and Bessemer steels, and that the induction furnace product skilfully made from pure materials equals anything but the very highest qualities of crucible steels. The special feature of the Héroult and Röchling-Rodenhauser types is that with an oxidising purification phosphorus can be eliminated to almost any extent that will pay, and after removing the slag, and forming another, by a reducing purification suphur can similarly be removed. The Kjellin induction furnace acts as a melter of materials much after the manner of the crucible, and has one advantage over the crucible in that there is no absorption of sulphur during melting. He endorses the conviction quoted in an article on the subject in our issue of August 17th, that the electric furnace will not make good steel automatically, but the same metallurgical skill required by the older processes must be expended on the proper killing and finishing of the steel, by whatever type of electric furnace it is being melted, and the fact that in electric as in other furnaces bad steel may be made from good materials increases the difficulties of finding the exact place of any steel in the world's work.

The successful application of electric power to the production of charcoal pig-iron allows of a much reduced consumption of charcoal, and the rapidly increasing price of charcoal in Sweden, owing, among other causes, to so much of the wood being used for making wood pulp for paper-making, is quite a serious situation which the application of electric power derived from waterfalls may help to relieve.

A brief description of the various types of electric furnaces was then given:—

The *Stassano* furnace is an independent arc furnace. Three carbon electrodes are used, between which arcs play, and the heat from the arc is merely used for heating the charge, partly by direct radiation and partly by reflection from the dome of the furnace.

The *Héroult* steel-melting furnace is a direct arc type, in which the charge forms one pole of the arc. Two vertical carbon electrodes come through the roof of the furnace and two arcs play, one between each electrode and the molten metal or slag beneath it.

In the *Girod* furnace one or more electrodes of like polarity are maintained above the bath, and soft steel pieces embedded in the hearth of the furnace are in direct contact with the molten metal for the negative electrode. These lower pole-pieces are water-cooled. Large quantities of ferro-silicon, ferro-chrome, &c., as well as of ordinary carbon and special steels, are made in this furnace.

The *Keller* furnace is very much like the Héroult, but the two electrodes come into separate cavities which are joined by the molten material of the bath.

In the *Grönwall* furnace the current enters by two electrodes through the roof, and when once the bath is heated, so that the lining becomes a conductor, the current from both electrodes passes through the lining to a graphite block underneath, and hence to a common wire.

The *Nathusius*, like the Grönwall, is a combined arc and resistance furnace. It contains three vertical carbon electrodes, arranged at the apices of an equilateral triangle, and three steel electrodes similarly arranged in the bottom of the furnace but covered by refractory material. Three-phase current is used.

In the *Kjellin* induction furnace the metal charge is placed in an annular hearth, almost like a steel-melting crucible in section, but in the form of a ring. The primary coil of twenty-four turns is placed in the centre round a core of laminated iron. The bath or ring of metal acts as a secondary circuit of a single turn, and the heat is thus produced in the charge itself without contact with electrodes.

In the *Frick* furnace the primary coil is above the crucible, and in the *Colby* round the outside of the crucible.

The *Röchling-Rodenhauser* furnace is based on the Kjellin principle, but has an important addition. In its simplest form for single-phase current there are two grooves or heating channels corresponding to the annular crucible of the Kjellin, but these join to a central open-hearth, the whole hearth forming a kind of figure 8. In the central open-hearth all the distinctly metallurgical operations take place, so that this form can be used for refining work, for which the Kjellin is not very suitable. Not only so, but a distinct secondary winding is provided in which a secondary current is induced, and these windings are jointed to steel terminal plates which are embedded in the refractory material of the furnace at the ends of the central hearth. At high temperatures the refractory material becomes a conductor of electricity, and thus the currents induced pass through the bath in the central hearth, heating it still further.

The loss in melting is an important point, and the author has been informed that this amounts to about 1½ per cent. in the Kjellin, about 4 to 5 in the Röchling-Rodenhauser, and 7 to 8 per cent. in arc furnaces.

About June, 1910, there were about 118 furnaces of all types, of which 70 were in use, 10 not working, and 38 being built. The majority of these were between 5 and 80 tons per charge capacity, but there is one at Domnarfvet, Sweden, for the production of 2,500 tons of pig-iron per annum, and one in Norway, and another at Trollhättan, Sweden, both in course of construction, and each designed to produce about 7,500 tons of pig-iron annually.

Of the induction furnaces, the Kjellin furnaces erected totalled fourteen with 35 tons capacity, the Röchling-Rodenhauser fifteen, with 30 tons in work, 1 ton not in work, and 17 tons capacity being built, all others about 18 tons in work. That gave a total capacity of about 250 tons for the arc furnaces and 100 tons for the induction, or a grand total of 350 tons per charge for all electric steel-melting furnaces.

Since June, 1910, however, there has been a continued development; for instance, in June, 1910, there were twenty-nine Héroult furnaces with a capacity of 80 tons in work and 50 tons in course of erection, 130 tons in all, whilst about June, 1911, there were forty-three furnaces, with a total capacity of about 242 tons.

The output of electric steel in Germany, the United States, and Austria-Hungary in 1910 amounted to almost 112,000 tons, which is an increase of 63,000 tons over the figures for 1909, and the increase will probably be more than maintained in 1911, as more than thirty new furnaces of various types should be

Hosted by Google

started during the year. Before the beginning of the present year the Héroult furnace at Edgar Allen's in Sheffield was the only arc one in England in steady operation. In January three Héroult furnaces were commenced in England, at Vickers', and Thos. Firth & Sons', in Sheffield, and at Lake & Elliott's in Braintree, Essex. A Grönwall furnace, for demonstration and manufacturing purposes, was also started at about the same time in Sheffield, and the output of England for 1911 should amount to about 13,000 tons. A 15-ton Héroult furnace is to be erected at Skinningrove shortly, and is expected to turn out 200 tons per day. About the same period Kjellin induction furnaces have been working satisfactorily at Vickers' and Jessop's in Sheffield, and an experimental furnace at the University of Sheffield.

The electric furnace can be used either for melting scrap directly or in combination with some other form of furnace, in which case it simply acts as a refiner. The majority of the recent furnaces have been employed in this way, in conjunction either with Bessemer or open-hearth furnaces. The latter are usually of the basic tilting type, part of the charge being removed to the electric furnaces after the pig is melted and the bulk of the phosphorus removed, leaving some phosphorus and the oxygen and sulphur to be eliminated by the electric furnace. In this case the time required for the electric furnace is from one hour to two hours, according to the degree of refining required and the original condition of the steel when removed from the basic furnace. The power used varies from 100 to 300 kw-hours per ton. When cold scrap is melted the time required is about six hours, and the power consumption said to be from 650 to 750 kw-hours, but really, all in, more probably 800 to 1,000 per ton. Of the forty-hour Héroult furnaces in operation or construction twenty-one are to melt scrap, twenty to take molten steel from the basic open-hearth, one from a Talbot furnace, and two from converters.

Application of Electricity for the Propulsion of Ships.

On Friday in the Engineering Section, Mr. H. A. Mavor read an interesting Paper on "Electric Drives for Screw Propellers," in which he put very clearly the reasons for using turbines or oil engines to drive generators which supplied current to electric motors for driving the screws instead of driving direct. He also described briefly some of the vessels which are being equipped on this system.

High efficiency is associated with low rate of revolution of the propeller, while in the steam turbine high rates of revolution are essential to the most economical use of the steam. Internal-combustion engines have speeds more nearly approximating those of reciprocating steam engines, but here also there is a tendency to speeds higher than are convenient or economical from the propeller standpoint.

In addition, the draught, beam, and form of the vessel limit the area of the propeller. The traffic for which the vessel is designed influences the determination whether one, two, or more propellers are to be used, and the speed, size, and form of the vessel determine limits to the designer's choice.

All these considerations taken together frequently fix the diameter, pitch, and thrust of the propeller, and, within very narrow limits, also the rate of revolution. This rate of revolution is not always the most favourable for the engine or turbine, and the designer is in such cases compelled to resort to new expedients if he is to attain the standard of efficiency which has been set by results attained on land.

A vessel running one-day voyages, and burning 50 tons of coal, could not possibly submit to an increase in weight of machinery in excess of the coal-saving, because such increase would increase the displacement, and therefore the power necessary to drive the vessel. On the other hand, if the vessel make a 10-day voyage, and the saving in fuel carried amount to 10 tons per day, a considerable increase in weight of machinery might be associated with decreased displacement and a substantial all-round economy. The author, however, does not consider that vessels of the type of the *Lusitania* and *Mauretania* present favourable cases for electric transmission arrangements.

Various methods of making the required adaptation of generator to propeller are at present under trial. For this, mechanical gearing by toothed wheels or hydraulic transmission may be considered serious competitors with electric transmission, but, for large powers, the cost, weight, and efficiency of electric transmission compare favourably with either of the two competing methods. Power generators give their best efficiency when full speed of rotation is maintained, even when running below full power. It is therefore advantageous to keep the engine revolutions within the range of governor control while the required speed change is accomplished by electric combinations.

There are other important qualifications of electric transmission in which it stands altogether unrivalled, particularly the facility of reversing and of changing speed. Further, it provides means for applying the power of one or more engines to one or more propellers, so that the power generating units may be so disposed as to give the highest efficiency, and when they are not required they can be stopped.

The property of combining the power of more than one engine for application to one or more propellers is the special feature of the author's inventions as distinguished from the ordinary methods of electrical engineering. Engines of different types sizes, and rates of revolution can have their powers combined without interconnection of their electric circuits, and without risk of mistake or error. An oil engine at 100 r.p.m. may be running the vessel at low speed, and a steam turbine running at twenty times the speed may be jointly applied to the propellers without any complication of the electric equipment. Each unit does its own work independently.

In the case of the mechanical transmission by the tooth-gear which has been carried out by the Parsons Marine Steam Turbine Co. and by the Westinghouse Co. in America, the results at sea appear to be quite satisfactory, but Mr. Mavor says, we are still left with the necessity of providing a reversing turbine, and it remains to be proved that the gear will stand the rough-and-tumble service of a vessel where there is much "backing and filling" to do. The weight, price, and economy of the mechanical transmission gear appears to show no advantage over the electric gear. This arises from the fact that the gear ratio can be made higher.

The other competitor is the Föttinger hydraulic transmission. While less rigid than the mechanical gear, it is not so flexible as the electric transmission. For an equal range of adaptation it appears certain to the author that the electric transmission will be cheaper and more efficient, and the convenience in manœuvring is entirely in favour of the electric gear.

A few examples of application of the author's system are here presented, together with a description of a small vessel built to demonstrate and illustrate the principles of operation and to provide experience in the use of the plant. In all cases alternating three-phase currents are used, and interlocking devices connect mechanically the main reversing switches with the exciting switches, so that no change can take place in the connections while they are passing currents.

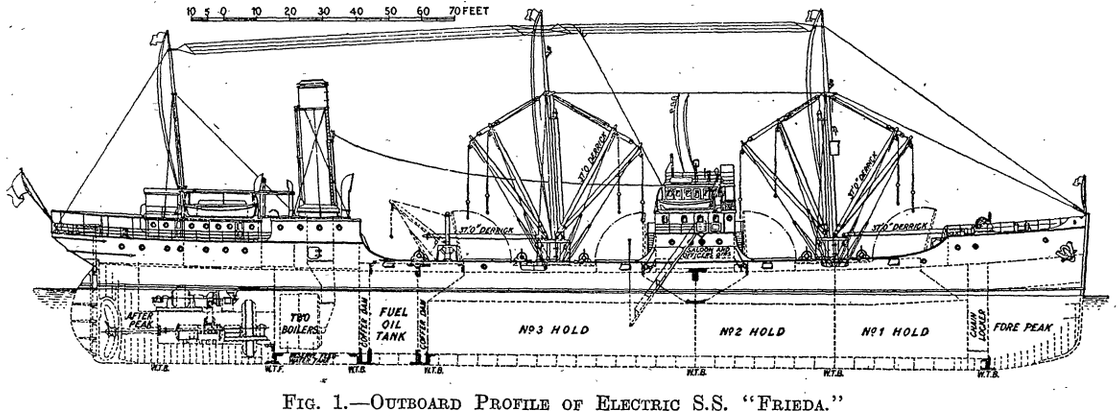

FIG. 1.—OUTBOARD PROFILE OF ELECTRIC S.S. "FRIEDA."

DESCRIPTION OF THE TURBO-ELECTRIC STEAMSHIP "FRIEDA" (FOR AMERICAN OWNERS). (See also Figs. 1 and 2.)

This vessel has been specially designed for the transport of bulk freights between the Gulf of Mexico and New York City. The vessel is to be 300 ft. long and will carry a deal weight of, approximately, 5,000 tons at a mean loaded speed of 12 knots at sea. The propelling machinery is aft, and consists of a turbo-electric outfit for three-phase 50 cycles when running at 3,000

Hosted by Google

r.p.m. The turbine is supplied with steam at a pressure of 200 lb. per square inch at the stop valve. This electric generating plant is arranged on foundations on a platform deck in the engine room and the condensing plant in the engine-room hold. The condenser is fitted with a vacuum augmentor, and is suitable for dealing with the full load quantity of steam from the turbine. The vacuum obtained will be 28½ in., with cooling water about 85° F. The condensing plant consists of a vacuum

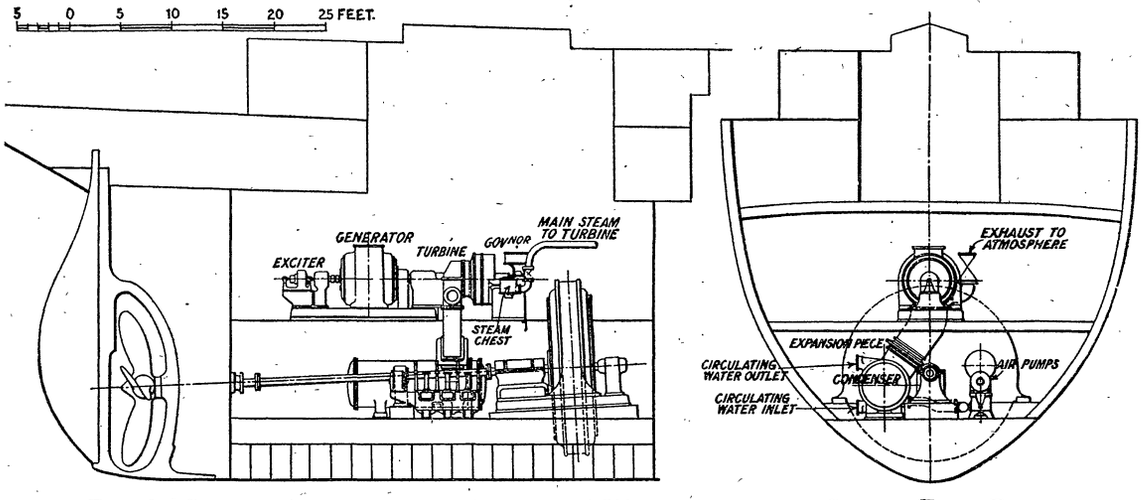

FIG. 2.—GENERAL ARRANGEMENT OF PROPOSED 1,500-KW. ALTERNATING-CURRENT TURBO-ELECTRIC MACHINERY FOR BULK FREIGHT, S.S. "FRIEDA."

condenser, three-throw air pumps, and centrifugal pumps with electric motor drives.

The current is led to a three-phase motor, which is keyed direct to the main propeller shaft, and is capable of developing 1,900 b.h.p. at a speed of about 84 r.p.m. The steam is generated in two Scotch boilers, with Howden's forced draught and liquid fuel burners.

This installation costs and weighs less than the normal equipment. The coal-saving is over 10 tons per day.

OIL ELECTRIC TANK BARGE FOR CANADIAN SERVICE.

Fig. 4 shows the application of the system to the propulsion of a 245 ft. Canadian canal type tank barge. The ship about 10 per cent. above the normal, but the carrying capacity is very largely increased.

MARINE TURBO-ELECTRIC INSTALLATION PROPOSED FOR U.S. NAVY COLLIERS.

The installation illustrated in Fig. 3 shows a marine turbo-electric installation submitted to the U.S. Navy Department for adoption in one of the four large colliers recently given out to contract.

It consists of a steam turbo-alternator of 5,000 kw. capacity with condensing plant; the current is led to two motors, one being keyed to each propeller shaft. The machinery is right aft

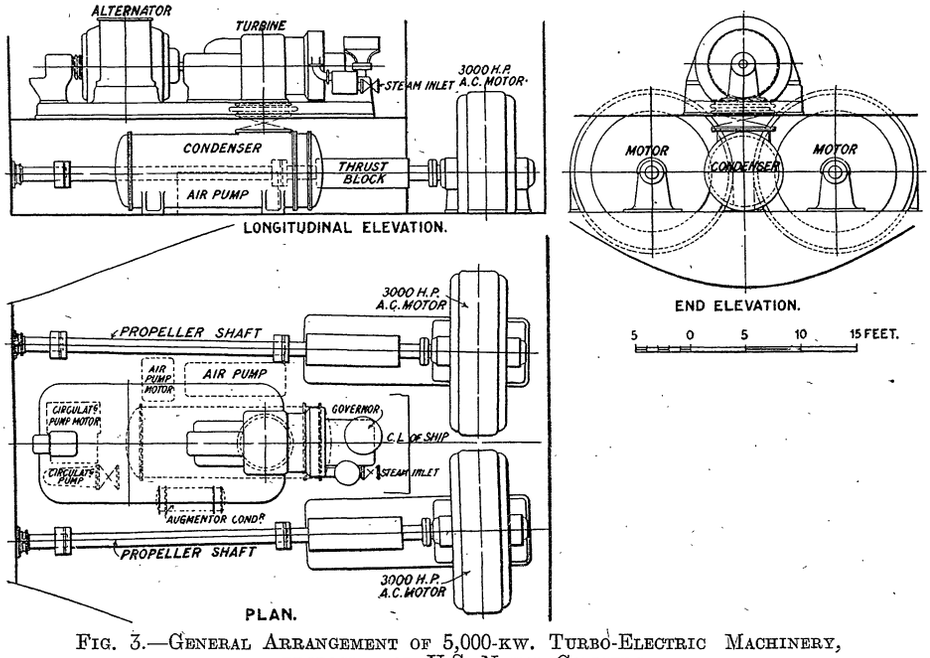

FIG. 3.—GENERAL ARRANGEMENT OF 5,000-KW. TURBO-ELECTRIC MACHINERY, PROPOSED FOR U.S. NAVAL COLLIERS.

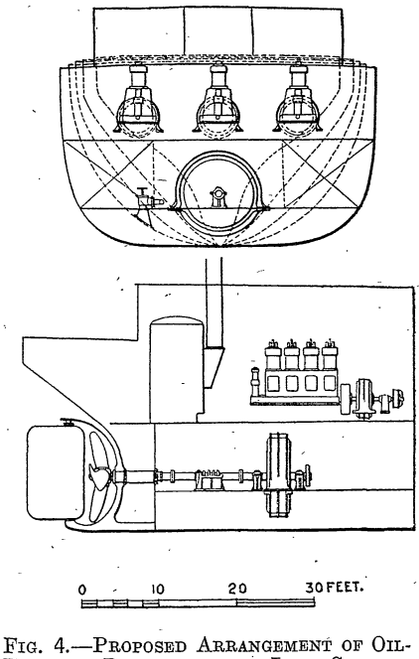

FIG. 4.—PROPOSED ARRANGEMENT OF OIL-ELECTRIC PROPULSION FOR LAKE STEAMER, 250 FT. BY 42 FT. BY 19 FT.

equipment consists of three separate units of Diesel non-reversible oil engines, each capable of developing 200 shaft h.p., and directly connected to an alternating-current generator. The currents from one or all of the units are respectively led to the separate windings of a three-phase motor keyed to the main propelling shaft and operating a single slow-turning screw.

The great advantage and economy of this system consists in being able to run at full power or at one-third power using one or three engines at full-load economy at will, thus providing for an economical operation impossible with any other propulsive system. The fact that non-reversible oil engines are used, running under governor control, greatly simplifies the maintenance and operation. The control is operated by a low-tension interlocking switch, operated by an ordinary engine-room telegraph stand located in the pilot house, so that the manœuvring of the vessel is at all times in the hands of the navigating officer. This equipment increases the cost of the in the vessel; the steam is generated by Scotch boilers. The vessels in which it is proposed to instal this machinery are 525 ft. long, and will carry a dead weight of 12,500 tons of coal, at a speed of 14 knots at sea. Here again the cost, weight, and economy are better than can be shown with the normal reciprocating-engine equipment.

An order for one of these vessels has been placed, and Admiral Cohn, of the United States Navy, intends to place an order for a second one.

Figs. 5 and 6 show the "Electric Arc" which was built by Messrs. Mavor & Coulson for the purposes of demonstration and trials. It is certified by the Board of Trade to carry fifty passengers. Its length is 50 ft. between perpendiculars, beam 12 ft., moulded depth 7 ft. 4 ins., maximum draft 4 ft. 6 ins. The power equipment consists of a 45 b.h.p. cylinder gas engine (with producers and scrubbers) coupled to a three-phase

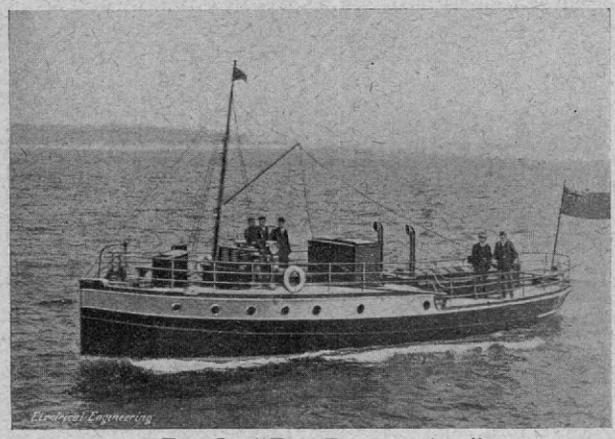

FIG. 5.—"THE ELECTRIC ARC."

generator. The propeller is directly coupled to a commutator-less motor of the "multiple-wound" type with two independent windings, and the generator is designed to give two power circuits to the motor to represent the condition which would obtain when large powers are involved, and two or more generators are in use, both used on full speed, and only one at low speed. The control of the motor is accomplished by two simple switches. One of these controls the excitation of the alternator; and the other, which is interlocked with this and can only be operated when the current is off, controls the direction of the supply to the motor in one or both of the windings,

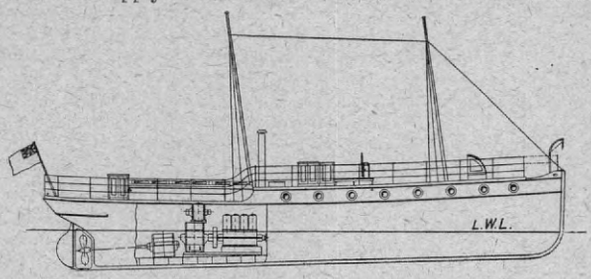

FIG. 6.—GENERAL ARRANGEMENT, ELEVATION, AND LONGITUDINAL SECTION OF "THE ELECTRIC ARC."

so as to give slow speed or full speed ahead or astern. These switches are operated directly by chain connections from the ship's telegraph on deck, so that the navigator actually performs the switching operations and the engineer below can confine his attention to the generating plant.

Prof. W. E. DALBY, who opened the discussion, asked for figures of mechanical efficiency of Mr. Mavor's system at full, half, and quarter load. He also asked for some dimensions of the motors attached to the propeller shaft, as he anticipated considerable flywheel action which would give rise to some interesting problems with regard to the strength and oscillation of the shaft.

Prof. J. E. PETAVEL pointed out that Mr. Mavor's system practically involved three sets of propelling machinery introducing greater complication and greater liability to breakdown. There were the turbine or engine, the generator, and the motor, each liable to individual defects, and the complication of the switchgear was also a disadvantage.

Sir WILLIAM WHITE, K.C.B., said the question of electric driving of ships was bound up with that of increasing propeller efficiency whilst maintaining a high rate of revolution. Any electric system, however, would have to justify itself in the eyes of shipowners. Although the British Admiralty had left it to America to undertake the first official experiments, yet we could feel quite certain that the British Navy would not fail to avail itself of any means of advance, no matter where it might come from, once it was satisfied with the new system.

Prof. G. W. O. HOWE asked for a few particulars of the windings of the motor. Would Mr. Mavor also explain how it was possible to shut down one of the generators without touching any of the switches, without any bad effects? He should have thought that by shutting down a generator whilst the other two were running, current would pump back from the motor and tend to drive the engine round. He disagreed with Prof. Petavel's view that the three links in Mr. Mavor's system of transmission were a disadvantage, as squirrel-cage motors and A.C. generators could be made so reliable that they would not introduce any weakening in the chain.

Dr. J. M. MORROW asked what type of vessel the author would suggest his system was most suitable for. There was the low-speed cargo boat, the high-speed liner, and the warship. In the former, the electric drive had to compete with mechanical drive; in the high-speed liner electricity had yet to make out a case, whilst in the case of warships the question of economy at low speeds was the determining factor. The United States Navy had discarded the turbine for the reciprocating engine, and this type of vessel might be the more suitable field for electric drive.

Mr. C. T. DYER asked, in reference to a vessel in which three oil engines are used for driving the dynamo, if the efficiency was as good as with one engine.

Mr. C. E. HANDY also asked for information on this point. He failed to see that three small engines would have a higher overall efficiency than one large engine.

Sir WILLIAM WHITE said he must correct Dr. Morrow as to the action of the U.S. Navy in preferring reciprocating engines. They had merely installed this type in one vessel built by a particular firm, owing to the very satisfactory results obtained in a previous vessel built in the same yard.

The PRESIDENT (Prof. Biles) suggested that someone should speak as to the effect upon the motors if they were "drowned out" in any way. Was any dangerous short-circuiting likely to occur?

Mr. B. P. HAIGH said he knew of a case in which motors of the type mentioned by the author had been flooded with salt water and continued in operation perfectly well. The voltage was not so high as that used by Mr. Mavor, but the effect of flooding was not such as to cause any great anxiety provided the motor was not allowed to remain in that condition too long.

Mr. MAVOR, in his reply, said he was able to use voltages varying from 600 to 2,000, the latter being with the object of keeping down the size of the cables in the newer designs. If there was any essential reason for keeping the voltage down there was no difficulty in doing so. The estimated mechanical efficiency of the boats mentioned as about to be built was 90 per cent. It was possible to increase it to 96 per cent., but in adopting a motor which would give this its properties would not be quite so favourable for the purpose in view, as, in order to push up the efficiency, the clearance between the moving and stationary parts must be reduced to very small limits. The question was whether they could afford to undergo the loss of 6 per cent. The answer was that in the case of the *Frieda* the coal consumption would be reduced from 40 to 30 tons per day. The diameter of the motor was about 15 ft.; he had found this big enough to deal with most cases. As to strains, as suggested by Prof. Dalby, in the *Electric Arc* the motor weighed about 10 cwt. in the rotating part, and there was no indication of any strain or disturbance to the propeller shaft or bearings. In the sea, the motor ran much more steadily than the engine. The electric system involved not three sets of machinery, but one, with two rotating parts. The rotor of the turbine and the generator were rigidly coupled together and formed one rotating part. The motor was rigidly fixed to the propeller shaft, and it was simpler in construction than a cart-wheel. All the other parts were stationary, and corresponded with the stationary parts of the reciprocating plant. The moving parts in both systems were precisely the same in number. An electrical engineer could not speak of the system as a complicated one. All change in the connections was made when there was no current flowing and there was no danger. He had had an opportunity of making a precise comparison with a mechanically geared ship, and there was no doubt that mechanical driving was a very serious competitor indeed in respect of mere transmission, but he was pleased to be able to say that the weight, price, and efficiency of the electric system was about the same, and in the *Frieda* the steam consumption with the electric drive would be 25 per cent. less. There was no more danger of breakdown with the electric driving of ships than there was with other forms of applying electric power upon which we depended a good deal in our daily lives. In the design of the motor, the whole question was to make the windings mutually non-inductive. The use of three engines instead of one had the advantage that one could be shut down when high speeds were not required. The boat of bulk freight already mentioned had to go at slow speed in the locks and canals, but was to be run at full speed in the lakes. Another point was that three low-power Diesel engines were lighter than one high-power engine. With regard to short circuiting, he had astonished the representatives of the Admiralty by being able to throw the motor right over from full speed ahead to full speed astern without anything happening except that the boat went astern as desired. This was where the squirrel-cage motor was a distinct advantage. As to other possibilities of short circuit, he had put a similar motor in a tank of water for a whole day and run it without trouble, although there was danger of damage to the insulation if the test were maintained for too long a period. Again, even if the cable on the boat were to be connected to the body of the ship, the generator would give out 2¼ times its normal power at low voltage, and the turbine would continue to run, but there would be no danger to anyone in the boat.

Electrical Steering.

Mr. B. P. Haigh followed with a Paper on "Electrical Steering."

He pointed out that electrical steering offers considerable advantages for steamers as well as for vessels propelled by internal-combustion engines, for the improved economy corresponds to a saving of weight in boilers and fuel. Difficulty had been experienced in obtaining a reliable system of control, capable of dealing with the power necessary to put the helm hard over in emergency in the shortest possible time, and possessing sufficient sensitiveness to enable an accurate course to be kept by moving the rudder promptly in small angles. Sensitiveness was shown by absence of "time lag" between the movement of the hand-wheel and the corresponding movement of the rudder, and in this respect electrical gears promised an improvement on steam gears, whose economy was reduced when large control valves were fitted. Sensitiveness also required an absence of undue "idle travel" of the hand-wheel, but a certain small amount was nevertheless desirable. The steering motor might be started and stopped for every motion of the rudder, but it was preferably kept running continuously, mechanical control being introduced either in the form of hydraulic transmission or in the form of magnetic clutches as developed by the author. In the latter type of gear two magnetic clutches were employed, these being fitted at opposite ends of the motor; and, as no gearing was kept continuously in motion, the wear and tear, as well as the current required, was reduced to a minimum. The clutches prevented the shock of the sea being transmitted to the electrical system, and as they had considerable flywheel effect, the current taken by the motor did not fluctuate widely under normal conditions, and the steering gear might therefore be supplied from the ship's lighting generator. To economise power it was advantageous to arrange the gear so that greater leverage was obtained when the rudder was hard over than when amidships, and by doubling the leverage in this manner a saving of 30 per cent. might be made in the motor power. Drawings were shown of a steering gear suitable for an 11½-in. rudder-post, and of a smaller gear of the same type, built by Messers. Brown Brothers & Co., Ltd., of Rosebank, Edinburgh, suitable for a 7-in. post. When tested against an artificial hydraulic load the latter gear had developed a torque of 50 foot-tons, at the rudder-post and had shown an efficiency of over 50 per cent. at half load. It had been found capable of moving the tiller through 70° in 25 seconds and had responded to motions of the hand-wheel equivalent to 1° of helm.

In a brief discussion, SIR WILLIAM WHITE said he was very much in favour of electric steering, the possibilities of which he considered very great. A difficulty with regard to them was the human element; on one yacht with such a gear, which he had designed, there was nearly a collision due to the nervousness of the operator, because he kept moving the gear without giving the hunting gear time to do its work. With all electrical systems it was essential to put a helm indicator, quite independently of the gear, so that the man in the steering position could see where the helm was. He concluded with a reference to the Hele-Shaw system of electrical steering (ELECTRICAL ENGINEERING, April 20th, 1911, p. 206).

Prof. W. E. DALBY, referring to the Author's system, in which magnetic clutches are made use of, asked as to the coefficient of friction between the fibre and the steel, and what would be the safe limiting pressure to work at in order to make sure of durability of the fibre, *i.e.*, the pressure per square inch between the fibre and the armature working under normal conditions.

Mr. HAIGH, in reply, said that at first the fibre gave a little trouble, being very hygroscopic. It was now boiled in linseed oil, which filled up all the pores and no water got in. He usually relied on a coefficient of one-sixth. In answer to a question put by Sir William White on behalf of Mr. Worby Beaumont, he said that no danger need be apprehended from the cables buried in the shaft, which supplies current to the magnetic clutches.

The Single-phase Repulsion Motor.

A long and valuable Paper by Mr. Thomas F. Wall was next presented.

In the first part of the paper expressions were deduced for the following quantities (the flux distribution in the air gap being taken as triangular or trapezoidal as the case may be):—(1) The E.M.F. induced in the stator winding due to an alternating current in that winding. (2) The E.M.F. induced in the rotor winding due to an alternating current in the stator winding. (3) The E.M.F. induced in the rotor winding when rotating in the field due to an alternating current in the stator winding. (4) The E.M.F. induced in the stator winding due to an alternating current in the rotor winding. (5) The E.M.F. induced in the rotor winding due to an alternating current in that winding.

Curves were given which had been deduced from the expressions for Nos. 2, 3, and 4, and which enable the values of these E.M.F.'s to be rapidly determined for any value of the displacement of the rotor brushes from the stator axis.

In the second part of the paper the above results were employed in developing the theory of the repulsion motor. The theory cannot be explained in a few words, but it results in the establishment of a series of simultaneous equations, the solutions of which give expressions for the speed, stator current, power factor, and power of the motor. It was shown that, if the vector of the applied pressure be drawn in the direction of the ordinate axis, the extremity of the current vector moves over the circumference of a circle which passes through the origin, and that diameter which passes through the origin is inclined to the abscissa axis at a certain angle, the magnitude of which depends upon the resistance and the leakage reactance of the rotor winding. The torque and power of the motor are respectively represented by the distance of the extremity of the current vector from certain lines. The speed is given by the intercept of the current vector on a line drawn at 90° to that diameter of the circle which passes through the origin.

In the third part of the paper the results of some tests on a 6-b.h.p. motor were given, and the agreement of the values of the stator current, the power factor, and the speed as deduced from the theory, and the values determined from the test was shown in the form of curves. The curves have been plotted with the speed as abscissa.

In the fourth part of the paper a method of calculating the open circuit characteristic of a single-phase motor was given. The applied pressure was assumed to be sinusoidal, and the effect of saturation on the shape of the current wave was taken into account.

Human Susceptibility to Vibration.

Mr. W. Pollard Digby in conjunction with Captain H. Riall Sankey presented a Paper upon this subject. Mr. Digby, in the course of his professional work, had occasion to design a portable instrument for taking permanent records of the amplitudes of vibration of steam turbines and reciprocating engines, and of measuring the effect of such vibrations on neighbouring buildings. Captain Sankey, on being shown this instrument, referred to a statement by Admiral Melville that the effect of vibration depends upon the frequency and on the actual amount of linear motion, and that the frequency multiplied by the amount of motion was a constant. Further, Admiral Melville had quoted Mallock's statement in regard to the Central London Railway cases, that vibrations rarely exceeding a thousandth of an inch, when the frequency is over 10 per second, are a genuine source of annoyance.

After discussing Admiral Melville's dictum (which one presumes applies to normal persons) the authors decided to pursue the present study. The phrase "human susceptibility to vibration" was coined to cover the range of sensitiveness of various people to vibrations of short duration of different amplitude and frequency, together with their opinions as to when those vibrations approached or exceeded the point of being a nuisance. At the time of writing this Paper only a certain number of cases had been studied. The unit of measurement adopted by the authors as a mechanical unit of intensity of vibration is a vibration having a maximum linear amplitude of one-tenth of a millimetre at a frequency of 10 cycles per second. So far the general consensus of opinion points to the degree of vibrations classed as "perceptible—just a nuisance" being reached for a mean intensity of 1 unit. The lower range for persons of delicate perceptiveness is in the neighbourhood of 0·7 unit, and the higher range for persons of coarse perceptiveness is about 2 units. The comparison of the mean value of an intensity of 1 unit as the point at which vibration just becomes a nuisance compares very strikingly with the value quoted by Admiral Melville. Converting Mr. Mallock's value of one mil multiplied by cycles per second into the authors' alternative of millimetres multiplied by cycles per second, we have 2·54 units of intensity of mechanical vibration as a genuine source of annoyance. For the enunciation of a general law the authors would like to deal with a total of 100 to 150 cases, and they invite members of the British Association and their friends to visit Mr. Digby's laboratory on either Monday or Thursday afternoons after October 1st, and to form the subjects of experiment. It is desirable from many points of view, and not least the legal one, that there should be some definition of what exact intensity constitutes a nuisance.

The Electrical Conductivity of Light Aluminium Alloys.

In 1908 Prof. Ernest Wilson reported on the exposure tests of a certain series of light aluminium alloys. The present Paper included tests on conductivity made in July, 1911. The copper series have shown that alloying commercial aluminium alone with copper to the extent of 2·6 per cent. is not to be recommended. The copper manganese specimens have not seriously deteriorated in ten years. An alloy known as a "duralumin" has been tested, and a report is made thereon. Its specific resistance is $5{\cdot}35\times10^{-6}$ ohms at 15° C., as against $2{\cdot}76\times10^{-6}$ for pure commercial aluminium.

Effect of Electricity on Plants.

Two Papers on research in connection with this subject were read in Section K (Agriculture).

In many experiments upon the electrification of plants an acceleration in growth has been reported, accompanied with an earlier attainment of maturity and consequent more rapid harvesting of such electrified crops.

This appears to indicate an acceleration of the normal vital processes of the plant, and it was thought that an increase in the rate of respiration might act as an index to such accelerated vital processes and enable some idea to be obtained as to the electrical condition most favourable to such acceleration. With this in view a long series of experiments were carried out by Dr. J. H. Priestley and Mr. R. C. Knight, the results of which are briefly summarised below. To determine the relative amounts of respiration going on in germinating seeds under normal conditions and under the influence of electricity, continuous currents varying from 0·75 to 9 milliamperes were passed through the seeds (usually peas), and a decrease in respiration on electrification amounting to 20 per cent. or 30 per cent. was observed. When the current was continually reversed at a rapid rate, 50 microamperes producing an *increase* of about 30 per cent., 150 microamperes had no effect, and 500 to 600 microamperes resulted in a 20 per cent. *decrease* in respiration. The positive pole of an electrical machine was then connected with a platinum loop above the seeds, which were themselves "earthed," and a beaker of turpentine was inserted to absorb the ozone. Increase of respiration resulted on electrification; the amount of increase varied with different sets of seeds, the largest obtained being 110 per cent. with peas.

The second Paper, by Dr. J. H. Priestley and Miss E. M. Lee, dealt with the investigation of the effect of weak currents of electricity upon micro-organisms, using the rate of production of their metabolic products as an index of their rate of growth. The organisms selected as the result of many preliminary trials were *B. Bulgaricus*, the "sour milk" bacillus of Prof. Metchnikoff. The effect on the production of metabolic products as indicated by the change in resistance of the culture treated was considerable, and seemed to be directly due to the action of the current on the bacteria. Counts of the bacteria made by the usual methods also indicated more rapid growth in the electrified culture. The maximum effect seemed to be produced by a current of about 60 microamperes. Currents of greater strength inhibit the activity of the bacteria as measured by the change in conductivity of the liquid. There was no appreciable difference between the effects produced by direct and alternating currents, so that it seems that no detrimental effect has been produced in the former case by the accumulation of the products of electrolysis in the region of one electrode.

Magnetic Testing of Iron.

W. H. F. MURDOCH contributed a Paper on "A Friction Permeameter," which was received without discussion. The instrument consists of a specimen of cylindrical section, magnetised by a solenoid excited by an electric current, and entirely surrounded by a hollow cylindrical yoke of iron. This yoke is divided symmetrically at the middle and the lines of induction act on this gap together with other attractive forces. If now the top portion of the yoke is rotated about the specimen as a vertical axis, and slides steadily on the lower portion of the yoke, then the torque may be measured, or the angular displacement between the zero and pointer be read while sliding is occurring. To eliminate the friction pull previous to magnetisation the pointer is adjusted to read zero under mechanical friction only. Consequently when the specimen is magnetised the magnetic pull is taken up on the surfaced faces and the angular displacement is due to the magnetic induction only. Therefore the magnetic induction in the test specimen can be obtained by multiplying the square root of the reading by a constant. Owing to the completeness of the magnetic circuit, tests at high inductions can be made and the results agree closely with ballistic tests besides possessing the advantage of great rapidity.

The only papers of electrical engineering interest read on Monday were two on wireless telegraphy, which are referred to in our Notes on Telephony and Telegraphy, on another page.

Owing to pressure of space, our report of Tuesday's and yesterday's proceedings is held over until our next issue.

Prof. E. A. Schäfer, of Edinburgh University, has been elected President of the Association for next year, when the meeting will be held in Dundee from September 4th to 11th. In 1913 the Association will meet in Birmingham.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The only references to wireless telegraphy at the British Association meeting at Portsmouth were the Paper by Prof. C. W. O. Howe on Monday, and a demonstration by Capt. Sankey of portable field apparatus. Prof. Howe pointed out how great had been the recent growth in the number of wireless messages transmitted, and said that on account of this the principal difficulty to be overcome in the design of modern apparatus was the prevention of interference. This has been sought in two ways: firstly, by sending out well-sustained trains of waves of one definite frequency, thus permitting sharper tuning; secondly, by giving the signals a high musical pitch, easily distinguished from the crackling noises caused by atmospheric disturbances, and also from other stations having notes of a different pitch. The sending apparatus in common use at the present day differs, however, but little in principle from that used with the earliest coupled aerials. The spark-gap is either stationary and provided with a powerful air-blast or the electrodes are rotated at a high speed, thus causing movements of the air, and at the same time bringing cold metal surfaces to act as electrodes. The production of undamped or slightly damped trains of waves by means of Poulsen or Lepel arcs has not made the revolution in radio-telegraphy which was predicted, while the quenched spark between plane metal surfaces a fraction of a millimetre apart falls far short of the long open gap in reliability. The unquenched long gap necessitates very loose coupling, and therefore very low efficiency if beats in the emitted waves are to be avoided. Although the receiving arrangements have been made very convenient for rapid tuning, no radical change has been made in the detectors employed. One has still to choose between reliability and sensitiveness. If extreme sensitiveness is not desired, the magnetic detector is ideal in its simplicity. For the reception of weak signals we have the Fleming valve, the electrolytic and various crystal detectors, if necessary, in conjunction with the Brown telephone relay. Attempts have been made to obtain selective working by tuning the reed of the relay, but the general utility of the station so equipped would be greatly reduced, to say nothing of the adjustment and manipulation required.

An installation had been erected in the room, on which the time signals from the Eiffel Tower were received, as well as weather reports from Norddeich.

Prof. Howe was followed by Captain Sankey, who showed a number of slides of Marconi portable field wireless cavalry and infantry sets. In the cavalry sets the frame of the saddle forms a stand for carrying a petrol motor and dynamo. A 60ft. aerial pole is carried, and the whole station can be unpacked and erected in nine minutes, and dismantled and packed again in six minutes. A valve receiver is used. The cavalry sets, which are carried on four pack horses, use 0·4 kw., and have a range of twenty miles over mountainous country, or fifty miles over normal country. The 1½ kw. infantry set has a range of 200 miles. The weight of the latter is 180 lbs.

The Dundee Corporation are considering what steps are to be taken in view of the serious financial loss which will accrue when the telephone system is taken over by the Post Office, owing to the discontinuance of payment of rates by the National Telephone Co., amounting to nearly £900, and the payment of wayleaves. The Corporation are considering whether they can proceed against the National Telephone Co. for not having properly safeguarded the rights of the Corporation.

The rateable value of telephone properties in the Blackburn district exceeds £3,591, and at a meeting of the Guardians for this Union on Saturday, a resolution was passed asking the Government to continue to pay local rates after the transfer of the telephone undertaking has been effected, or to pay an equivalent contribution each year, based on the amount set forth on the Valuation Roll.

Telegraphy between Rome and Constantinople was down for a short while on 29th ult., and on the 1st inst. the lines between Medan and Sabang were not working. Telegrams for Sabang and Koetaradta are sent by telephone from Pangkalanbrandan or by post from Padang or Medan. The c.s. *Minia* of the Anglo-American Telegraph Co. was recently engaged in a repair of the St. Pierre-Duxbury section, which was down about 100 miles from Halifax, N.S. Apparently nothing has been done towards the repair of the Assab-Perim cable, which has ceased working since July 8th, 1909. The Zanzibar-Mombasa cable has also been inoperative since July 11th, last, and the Kotonou-Grand Bassam cable since 23rd ult. Landlines in Ecuador to Manta, Bahia, Chone, Salango, Jipijapa, and Montecristi were down on the 2nd inst., and telegrams are being forwarded by best means. The San Thiago-Bathurst and Bathurst-Sierra Leone cables were down on 4th inst, telegrams for Bathurst being sent by best means pending repair.

LOCAL NOTES

Aberdeen: *Electricity Accounts.*—The annual report of Mr. J. A. Bell (City Electrical Engineer) records increased sales, notwithstanding continued depression of trade in the city. The total income worked out at £47,553, and the expenses at £20,634. The resulting profit, which is £1,061 more than last year, leaves, after meeting capital charges and depreciation, a sum of £1,984 to carry to reserve. The increase in the heating and cooking load was as much as 91·3 per cent., and in the power load 26·25 per cent.

A reduction in price of supply for lighting from 3¾d. to 3½d. per unit is to be made. Where slot meters are used, the charge will be 4d. per unit.

Brighton: *Changes in Tariff.*—Among the changes in the tariff of the Electricity Department announced are the abolishment of meter rents to flat rate and prepayment consumers, and ultimately to establish a common rate of 3d. per unit. The power rate is to be reduced from 1½d. to 1d. per unit.

Cavan (Ireland).—At a special meeting of the Urban Council last week, the following notice of motion was handed in by Mr. Pollock:—"That the Urban Council proceed forthwith to install an electric plant for the purpose of the public and private lighting of the town, and that a sufficient sum be borrowed to carry out the scheme."

Gorleston: *Failure of Supply.*—On Friday last a portion of the street and private lighting was interrupted for a considerable time owing to some trouble on the mains.

Handsworth: *Electricity Accounts.*—The report for the year ended March 31st gives the income as £8,320, against £7,812 for the previous year. The total expenditure was £74,152 but after meeting capital charges there was a deficit of £555 on the year's working, or a net deficit of £357 with the balance brought forward from the previous year. The increased costs are attributed to alterations in the tramway service.

Llanelly: *Electric Shock.*—An employee of the Llanelly Electric Light Co., while switching off some arc lamps on Saturday, received a serious shock, which had the effect of making him dumb, although otherwise he is uninjured.

London: *Marylebone.*—At a somewhat stormy meeting of the Borough Council, when several members aired their views as to the general management of the Electricity Department, and more particularly the Sales Department, proposals of the Electricity Committee relating to sub-letting of wiring in the case of hired installations, sale of disused thermal storage vessels in the station, and reduction of the rate for contractor showrooms from 2d. to 1d. per unit were agreed to.

Peterborough: *Electricity Accounts.*—The number of units sold have increased from 36,222 for last year to 39,938, the coal consumption per unit has also decreased, with the result that surplus of £184 has been made, as compared with last year's figure of £160. The costs per unit work out at 1·74d.

Plymouth: *Electricity Accounts.*—The annual report of the Electrical Engineer records a reduction in costs, which work out at 1·22d. per unit, excluding capital charges. The total expenses were £13,202, slightly less than last year, and the gross profit was £12,815, of which £2,987 remained after meeting capital charges. Of this £1,797 was devoted to new

Hosted by Google

meters, services, and mains, leaving £1,170 to be applied to relief of rates.

Sheffield: *Electricity Accounts.*—Mr. S. E. Fedden, in his annual report of the Electric Supply Department, gives the following summary of the position:—Increase in total revenue, £10,890; increase in total costs, £4,370; increase in debt charges, £1,067; increase in power energy sold, 3,804,486 units (56 per cent.); increase in new consumers, 399; surplus, £3,417. For the first time since March, 1908, the units for lighting have exceeded the previous year's sales, although even yet the lighting revenue is still slightly less than the preceding year, due, of course, to the use of metallic filament lamps.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bulgaria.—Tenders are invited by September 30th for an electric power station at the port of Varna. According to the *Board of Trade Journal* local representation is necessary.

Darwen.—A Local Government Board inquiry was held last week into an application for a loan of £7,600 for electricity extensions.

New Zealand.—Tenders are invited by the municipality of Dunedin for gas or Diesel engine-driven sets for 500 and 800 kw. Particulars from 73 Basinghall Street.

Wimbledon.—Sanction has been given by the Local Government Board to the loan applied for in connection with the extension of supply to the Malden and Coombe area.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Darlington.—Cottage Hospital. Architect, R. Argile, 35 Oxford Street, Ripley, Derby.

Glasgow.—Club house in Dumbreck Road; Church Hall and Offices, Dalmarnock Road.

Haslingden.—Tenders are invited by September 9th for electric lighting installations in Corporation public buildings. Particulars from Borough Electrical Engineer.

Mansfield.—Extensions to Hospital.

Merthyr Tydfil.—The Corporation invite tenders for wiring and fittings for the Mardy Hospital. Particulars from Borough Engineer. Tenders by September 12th.

Ramsgate.—Extensions to County School. Architect, W. H. Robinson, Caxton House, Westminster.

Richmond.—Alterations to the Star and Garter Hotel.

Rochdale.—New General Post Office.

Sale.—Public baths. Architect, W. H. Mitchell, 94 Market Street, Manchester.

Salford.—New infant school.

Staines.—New Hospital.

Sunderland.—A new training college is projected.

MISCELLANEOUS

Spain.—Tenders are required at Madrid for two wireless telegraph installations, one of a naval pattern, and the other suitable for a landing party. A deposit of about £80 is required, and local representation is necessary.

Sweden.—Electric windlasses are required for the harbour at Nörrköping. Particulars at 73 Basinghall Street.

The Institution of Mining Engineers.—The annual meeting of the Institution of Mining Engineers will be held on Wednesday, Thursday, and Friday of next week at Cardiff. The papers to be read and discussed do not bear directly on electrical working in mines, but among the many visits arranged for in the neighbourhood there is much of electrical interest. Among them may be mentioned that to the Cardiff Corporation Electricity Works on the Wednesday, and visits on the Thursday to the Bargoed, New Britannia, and Penallta Collieries, and the alternative visit on the same day to the Great Western and Ferndale Collieries. At Bargoed gas engines are used in the generating station, and electric power is extensively used for high lift pumping. At the New Britannia pits there are two large Ilgner winding plants and motor-driven air-compressors in use for sinking operations. Steam-driven electric generating plant will also be inspected at Penallta. The chief attraction at the Great Western Colliery is the winding plant on the Westinghouse converter equaliser system, and at Tylorstown the Lahmeyer winding plant on the Ilgner system of one of the Ferndale group of collieries and the power house supplying the whole group will be on view. Many other attractive excursions are planned. The arrangements for the meeting are being made by the South Wales Institute of Engineers.

TENDERS RECEIVED AND ACCEPTED

New Zealand.—The British General Electric Co., Ltd., Harbour Street, Wellington, have secured the contract for the electrical plant, switchboards and motor pumps for the Gisborne Borough Council. The company have also supplied the Wellington City Council with a quantity of 1,000 c.p. Osrams the largest lamps introduced into the Dominion.

Peterborough.—The tender of Messrs. Crompton & Co. for an electrically driven condensing pump (£90) has been accepted.

Stockton.—A contract has been placed with Messrs. Richardsons, Westgarth & Co. for a mixed pressure turbine coupled to a Siemens continuous-current, 500-kw. generator (£2,932). The extension scheme also includes enlargement of the existing cooling tower by the Klein Engineering Co., a superheater installation by Messrs. T. Sugden, Ltd., and a switchboard by Messrs. Drake & Gorham.

APPOINTMENTS AND PERSONAL NOTES

A battery mechanic used to Tudor plates is required for South Africa. (See an advertisement on another page.)

Mr. Frederick Swarbrick has been appointed engineer and manager of the Galway Electric Co., in succession to Mr. Percy A. Spalding, who has been appointed engineer of the Dundalk scheme.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 (last week £58 to £58 5s.).

Bankruptcies and Liquidations.—Creditors of the Solium Electrical Co. (in liquidation) are required to send in their claims to E. Harlow, 23 King Street, Nottingham, before September 30th.

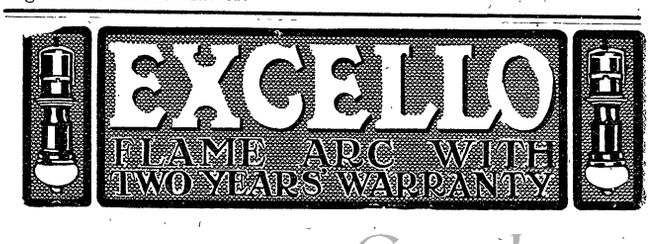
A receiving order has been made in the bankruptcy of T. G. Poole, electrical engineers' salesman, of Hale, Cheshire. The first meeting will be September 13th at 3 p.m., at the Official Receiver's Offices, Byrom Street, Manchester, and the public examination is fixed for 10 a.m., at the Court House, Quay Street, Manchester.

A first and final dividend of 11d. in the pound is announced in the bankruptcy of J. D. Carlmark, of West Bromwich, electrical engineer.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

South Metropolitan Electric Light & Power Co.—Warrants for dividends on the company's 7 per cent. cumulative first, and 6 per cent. cumulative second, preference shares, for the half-year ended June 30th, 1911, have been posted.

Oxford Electric Co.—A dividend at the rate of 6 per cent. for the half-year has been declared.



Sao Paulo Tramway, Light, & Power.—A quarterly dividend at the rate of 10 per cent is announced.

British Electric Transformer Co.—An interim dividend at the rate of 6 per cent. has been paid.

Electric Lighting at Westminster Abbey.—The electric lighting installation which was put in in the nave of Westminster Abbey for the Coronation has been retained for permanent use now that the Abbey has been re-opened.

The Electrical Exhibition at Olympia.—The Management of the Electrical Exhibition will be happy to send any contractors pictorial posters of the Exhibition on hearing from them, and on consideration of such contractors exhibiting these bills in their windows they will be entitled to two complimentary tickets to the Exhibition.

"C.S.S."—The *Evening News* on Monday published a paragraph giving particulars of a movement for a "Citizen State Supply" service for the purpose of assisting in the maintenance of communications and food supplies during a general strike. It was stated that the movement is being "organised by members of the Institutions of Civil, Mechanical, and Electrical Engineers," but inquiries which we have made at these Institutions have elicited the information that none of them have any cognisance of the matter.

SUMMARY

We publish an important announcement regarding the reorganisation and enlargement of the field of action of the National Electrical Manufacturers' Association. (Page 508.)

Our monthly article on new electrical supplies and accessories opens with an illustrated description of the magnetite arc lamp which is being introduced to this country by the British Thomson-Houston Co. Particulars are also given of the sizes of Mazda wire lamps now available, and other novelties described include some new designs of lampholders, and a regulator for A.C. cinematograph lamps. (Page 509.)

The Shoreditch Borough Council are recommended to abolish gas for street lighting in the whole of the district north of Old Street, and to lay mains at an estimated cost of about £8,000. (Page 510.)

Our report of the electrical engineering features of the meeting of the British Association last week is concluded in this issue. On the Tuesday three Papers were discussed together, dealing respectively with superheated steam, gas, and oil engines. In the first Paper Mr. W. J. Marshall claimed efficiencies up to 1·21 lbs. of coal per b.h.p. hour for superheating locomobiles, while in the second Mr. W. A. Tookey voiced the claims of the gas engine to the highest thermal efficiency. The third Paper, by Mr. C. Day, gave interesting details and results of tests of Diesel engines. The conditions under which the economy of the last-mentioned can be taken full advantage of were referred to in the discussion, and suggestions were thrown out as to the possibilities of a combined superheated steam and internal combustion engine. Mr. E. Kilburn Scott contributed a description of some of the processes in use for the electrical production of nitrates from the atmosphere, and the possibility of fixing a new standard of smoke emission from factory chimneys was discussed by Dr. J. S. Owens. An original note was struck by Mr. W. Y. Lewis' description of his proposed system of continuous transport, in which the vehicles are driven by a continuously running screw thread of varying pitch. Among the proceedings of the Mathematics and Physics Section was a Paper by Prof. N. E. Dorsey on the work of the American Bureau of Standards on absolute current measurement, and the presentation of the Annual Report of the Committee on Electrical Standards. (Pages 511 to 514.)

Under "Telegraphy and Telephony (including Wireless)," we report that the Marconi Wireless Telegraph Co. has obtained a contract for the erection of a wireless station in Ceylon, and give some technical details of the proposed installation. The Marconi Company has also a proposal before the Portuguese Government. The British Government are now considering the details of the scheme for linking-up the Empire by means of wireless telegraph stations. We refer to the experiments in wireless telephony by Mr. H. G. Matthews, to which much prominence has been given in the daily press, and also experiments by the U.S. Navy between shore stations and aeroplanes. (Page 514.)

In our "Electric Traction Notes," we refer to the Board of Trade inquiry into the circumstances of the overturning of an L.C.C. tramcar in Lewisham Road on September 2nd. The evidence showed that the car was running upon the wood paving, and that the overturning was due to the wheel striking the tramrail. We correct the rumour that a man was killed upon the electrified section of the L.B. & S.C. Railway, and among other matters mentioned are the proposed extensions of the trolley system at Bradford, the accounts of several traction companies, and a statement that the passenger cars on the Prussian railways are to be lighted by electricity instead of gas. (Page 515.)

Hosted by Google

AN incandescent lamp with two or more filaments, one of which can be cut out until required through failure of the other one, has been devised by G. F. Richardson and R. J. Crowley. A novel equipment providing a gap in an overhead trolley wire, bridged by a spring gate, allows the collector of a railless trolley omnibus to pass through at right angles by deflecting the gate. The omnibus wires are mounted just above on a bow-shaped frame. Another specification published by the Patent Office last week describes a method for supporting metallic filaments, in which two rings are mounted loosely on the central rod and connected by crinkled ties. The British Thomson-Houston Company has protected a method of ventilating rotors by means of channels extending from one portion of the periphery to another, and arranged with the ends at different angles to the radial lines. (Page 516.)

THE British Consul at Kobe (Japan) calls attention to the increasingly severe competition there for electrical machinery.—Applications have been received by the Tata (Bombay) Hydro Electric Power Co. for power supply amounting to 34,000 h.p.—Schemes for reduced charges for power supply have been formulated in Shoreditch and Brighton.—The Stourport Council have at last decided to allow overhead wires to be erected for electric supply purposes.—Electric pumping is to be substituted for the existing steam plant at the Farnham sewage station. (Page 517.)

THE Local Government Board have sanctioned a loan of £4,587 at Leigh (Lancs). A coal-handling plant is required at the Keighley Electricity Works; a 4,000 kw. exhaust turbo-alternator at Manchester; cables, switchgear, rotary converters and transformers by the L.C.C.; cables at Bray; six double-decked tramcars at Birkenhead; electric jib cranes at Bristol; electric lighting schemes are under consideration at Cavan and Herne Bay, and tramway extensions at Manchester, Doncaster, and South Shields. (Page 517.)

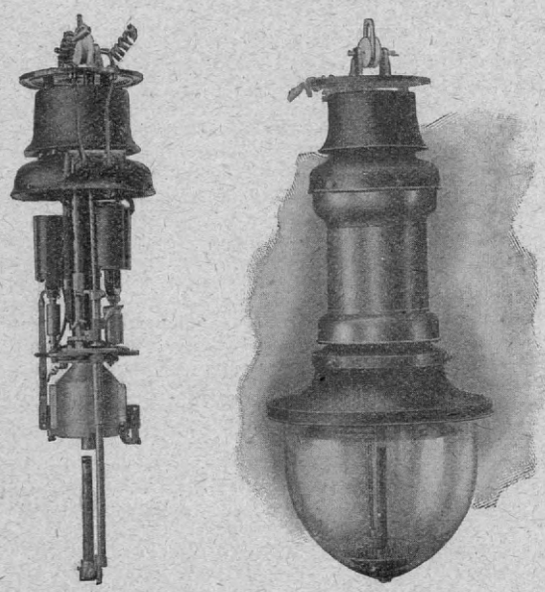
THE NATIONAL ELECTRICAL MANUFACTURERS' ASSOCIATION

THE Council of the above Association announce that the proposals for the reorganisation of the work of the Association, which have been in contemplation for some considerable time, and with the details of which members are already familiar, have now been successfully carried through, and will shortly be put into effect.

They include the alteration of the title of the Association (which will in future be known as "The British Electrical and Allied Manufacturers' Association, Incorporated"), the appointment of a new secretary, giving his whole time to the work of the Association (*vice* Mr. F. O. B. Hawes, resigned), and of a larger working staff; the leasing of commodious offices in a central position; and certain necessary amendments of the constitution of the Association to meet the new conditions, including the revision of qualifications for Members, Associate Members, and Associates; and the alteration in the bases of subscription and voting powers. The new secretary of the Association is Mr. D. N. Dunlop, who is already well known to the industry as the energetic Sales Manager of the British Westinghouse Company's Supply Department, Manager of the Publishing Department, and Superintendent of the Printing Bureau, at Trafford Park, Manchester.

Mr. Dunlop, who was unanimously elected at the meeting of the Council held on the 7th inst., has been empowered as from that date to begin the reorganisation of the Association for its new activities, the present Secretary's time being entirely engaged in connection with the forthcoming Electrical Exhibition. Mr. Dunlop, whose appointment dates as from January 1st, 1912, will undoubtedly have the hearty good will and co-operation of every member of the industry.

The present Council of the British Electrical and Allied Manufacturers' Association, and in particular Mr. F. H. Nalder (chairman) and Mr. B. Longbottom (vice-chairman), are certainly to be congratulated on their success in bringing members to realise the position of advantage which they occupy, and the immense importance of the work which by their united efforts can be done to enhance the British electrical and allied industries. In wishing the Association all success, we earnestly commend it to the attention of every manufacturer who has not yet joined.



BOY (*sotto voce*): "**Don't go too near him, Sis,** *he might be ALIVE!*"

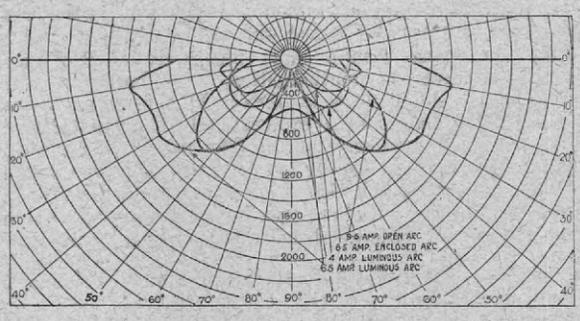
NEW ELECTRICAL SUPPLIES AND ACCESSORIES



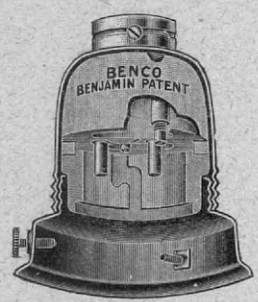
Arc Lamps and Accessories.

The British Thomson-Houston Co. (Rugby) are now putting on the market in this country a perfected form of the magnetite arc lamp, which has already proved so popular in America for lighting large areas. In this lamp the arc is formed between an upper electrode consisting of a short copper bar, and a lower electrode of a composition of which the principal ingredient is magnetite, an oxide of iron. The design of the lamp is such that the upper electrode is fixed, and all feeding and regulating is done by the lower electrode, so that the arc remains in the same focal position. This is clear in the exterior and interior views of the lamp reproduced herewith. In feeding, the lower or negative electrode is drawn upward by a pair of shunt magnets until it strikes the positive electrode; the magnets are then short-circuited by an automatic series cut-out, and allow the lower electrode

Exterior and Interior Views of Magnetite Arc Lamp (British Thomson-Houston Co.).

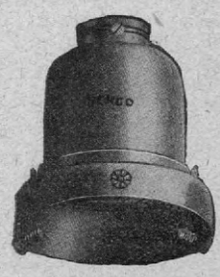
to fall back into normal position, thereby forming the arc. Thus when the lamp is operating, the steadying resistance and small series cut-out only are in circuit with the arc. The lamps give an excellent distribution of light as shown in the accompanying curves, which is maintained throughout the life of the electrodes. Inside the globe and directly above the arc is a reflector 11 in. diameter, made of sheet steel and of the inverted concentric type. With the magnetite arc most of the light is emitted by the arc stream proper in a horizontal direction. By placing a reflector above

Curves showing Distribution of Light from Magnetite or "Luminous" Arcs compared with other Arc Lamps.



the arc, part of the light is concentrated directly beneath the lamp so that the maximum light and a very even distribution is obtained on the working plane. Special reflectors can be furnished to throw the maximum light in either a horizontal or a vertical direction. The magnetite arc lamp is one of the most efficient lighting units, and, because of its long electrode life, the maintenance cost per candle-power is as low, if not lower, than that of any other unit. At 4 amperes, the efficiency is ·758 watts per mean hemispherical candle-power, and at 6·5 amperes it is ·493. The cost of the upper electrode can well be considered negligible, as it has a life of between 6,000 and 8,000 hours at 4 amperes, and 1,000 to 2,000 hours at 6·5 amperes with a comparatively small renewal cost. In trimming, only the lower electrode requires renewing, and as this has a life of from 175 to 200 hours at 4 amperes, and 100 to 130 hours at 6·5 amperes, the expense of trimming is relatively low. The lamp is suitable for continuous circuits only, and is made in two sizes for 4 and 6·5 amperes respectively. They can be run singly on 100/120 volts, two in series on 200/150 volts, or five in series on 500 volts.

Incandescent Lamps.



An interesting pamphlet has been issued by the British Thomson-Houston Co., Rugby, giving full particulars of the new drawn tungsten wire Mazda lamp, the manufacture of which was described in some detail in Electrical Engineering, August 24th, page 469. The lamps of standard style are now listed in sizes ranging from 14 to 360 c.p. for 100 to 135 volts, and from 32 to 600 c.p. for 200 to 260 volts; a few sizes are also made for 150 to 155 volts, as well as low voltage lamps for pressures in the neighbourhood of 25, 50, and 80 volts. Most of the sizes can be supplied forthwith, and the complete scale will be available by October 1st. Mazda drawn wire filaments are also applied to twisted, plain conical, and plain olive-shaped candle lamps in many useful sizes.

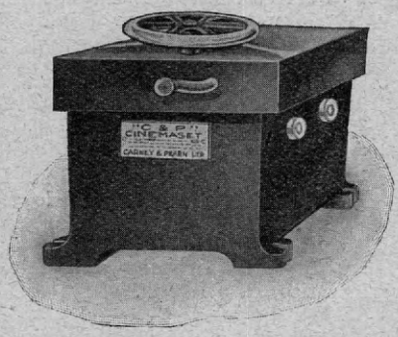
Fittings and Accessories.

The Benjamin Electric, Ltd. (117 Victoria Street, London, S.W.) has brought out the "Benco" lampholder for use on high voltage circuits with lamps of high candle-power in one-light fittings. They are also adapted for conduit work, tram or railway service, and for outlining buildings, as they are weatherproof. The interiors are made in two pieces of vitreous china, covered by a metal casing of aluminium or brass. These are made with bayonet cap

Sectional View of "Benco" Lampholder.

"Benco" Lampholder equipped with gallery.

(Benjamin Electric, Ltd.)



and Edison or Goliath screw holders. A sectional view of this holder is shown. They can also be equipped with shade galleries of aluminium or brass, as shown in the illustration. A modified design for mounting on strips, borders, ceiling blocks, or casings is known as the Benjamin holder. The outside diameter of the base is $2\frac{1}{4}$ in. and of the barrel $1\frac{3}{8}$ in. A rubber ring is provided to prevent moisture entering the lampholder.

Miscellaneous.

A special regulator choking coil for alternating-current cinematograph lamps has been put on the market by Messrs. Carney and Pearn, Ltd. (Nutsford Vale Works, Longsight, Manchester) in the form illustrated here. This set consists of a regulating choking coil with a suitable step-down transformer permanently connected up and enclosed in a substantial ventilated cast-iron box. The use of the transformer at the lamp renders possible a reduction in the size of the cable for the wiring. Compared with the use of series resistances, the saving in running costs is in the same proportion as the saving in the wiring. There are only four terminals (all inside); two for the mains and two for the leads to the lamp. These connections are never disturbed, all the regulating being done on the choker simply by turning

Hosted by Google

the handwheel, which can be locked in any position by the lever provided for the purpose; there are no nuts to be undone before adjustments can be made. For supply voltages up to 300 volts, the transformer is of the Auto type, above

A.C. CINEMATOGRAPH REGULATOR.
(*Carney & Pearn.*)

300 volts, only insulated secondary transformers are used. In a new list from the firm describing this piece of apparatus, particulars are also given of an extensive range of auto and balancing transformers, as well as independent secondary transformers for all purposes.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

TWIN CABLES.—The India Rubber, Gutta Percha, and Telegraph Works Co., Ltd. (Silvertown, London), have sent us list 40A of their twin, concentric, and high-tension vulcanised cables, and flexible cords. Full details are given, with prices, for grades of 300, 600, 2500, 5000 megohms, and a price-list is also included of their flexible conductors.

ALUMINIUM.—A leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, London, E.C.), illustrates the torsion sleeve joints for aluminium overhead transmission lines.

GLASS SHADES.—A new list from the British Thomson-Houston Co., Ltd. (Rugby), gives particulars of the latest designs of Mazda-Holophane shades and reflectors suitable for domestic use.

IRONCLAD SWITCHGEAR.—Oil switches of a pattern suitable for building up with other accessories into complete ironclad units, form the subject of a further interesting pamphlet among those just issued by the British Thomson-Houston Co. Their type O switch is specially designed for this class of work up to 3,000 volts, and can be fitted with time element and other releases for overload, or no voltage, provided with ammeter and voltmeter, and the whole can be made up as a wall or pedestal switch, with the means of access interlocked with the switch itself. For complete motor panels, starting rheostats can be added in addition to isolating switches and cable boxes, and complete ironclad switchboards can be built up from an assemblage of appropriate units made up in this way. Full particulars are given of a variety of the combinations available.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

RADIATORS.—Another new leaflet describes the British Thomson-Houston Co.'s special designs of non-luminous radiators, which include some attractive vertical and horizontal patterns, suitable for small offices, studies, &c., as well as larger radiators for public buildings, halls, &c., and forms intended for ships' staterooms, cabins, tramcars, and shop window heating.

SWITCHES AND RESISTANCES.—We have received a copy of a list of knife switches, rheostats, &c., which are supplied by Messrs. W. Mickelwright & Co. (Sicilian House, Southampton Row, W.C.). The knife switches, which are made up as single and double pole, and also as change-over switches up to 100 amperes, have a specially quick break, and an ample partition is provided between the poles in the double pole forms. The rheostats, with or without regulating switches, are of the open wire type, mounted on very substantial frames, with the coils well spaced apart.

BUSINESS LITERATURE.—We have received from the Ironmongers' Federated Association a copy of a publication which should be of use to those in the hardware and allied trades, containing forms for filling in with statistics of such a business, and explanatory notes. The work has been translated from a German original prepared by Mr. C. Schmahl, of Mayence, President of the Hardware Merchants' Union of that town, by Mr. R. H. Smith, general secretary of the Ironmongers' Federated Association (Apsley House, Fitzroy Road, Sheffield), from whom it can be obtained for 1s. 6d.

METAL FILAMENT LAMPS.—We have been favoured with a copy of an effective new showcard from the Brush Electrical Engineering Co., Ltd. (Loughborough). The chief feature of the design is a representation of a large "metallum" lamp suspended from an aeroplane and lighting up the country beneath.

TURBO-COMPRESSORS.—Plant of this description is described and illustrated in a well-illustrated pamphlet which has been issued by the A.E.G. Electric Co., Ltd. (133-135 Oxford Street, London, W.). In these compressors, the gas to be compressed is conveyed in radial paths through the rotors, which are provided with a series of impellers varying in number from 1 to 26, fastened in groups of 8 to 12 on one shaft, and are run in a suitably formed casing, with guides directing the air from each impeller to the centre of the nest. The turbo-compressor is coming into increasing use in collieries, forges, foundries, and other works, where large quantities of compressed air are required.

FLASH LAMPS, TORCHES, &c.—A pamphlet from W. & R. Jacobs (39c King William Street, London, E.C.) describes a series of pocket flash lamps and leather-covered hand torches, &c., at various prices. Electric bells, switches, pushes, and dry cells are also included, as well as small electric novelties of a miscellaneous nature.

GLASSWARE AND SHADES.—A list of lamp-shades of every description is before us from G. Braulik (8 Lambeth Hill, Queen Victoria Street, London, E.C.). These can be had in glass and enamelled iron, and we understand that a good stock of all these is ready for immediate supply.

SWITCHES, FUSES, MOTOR STARTERS.—A price list from Johnson & Phillips (Victoria Works, Charlton, Kent) deals with oil switches for pressures from 500 to 30,000 volts, besides many other types for the switchboard. Potential and current transformers, ammeters and voltmeters, fuses, distribution boards, and circuit breakers are also included. Amongst the many types of motor starters is one, which has been patented, to control both the rotor and stator circuits with automatic overload and no-voltage releases, so that a separate main switch is not required. Other types are the two- or three-phase auto-starter for squirrel-cage motors, the liquid starter, and the star-delta type for three-phase squirrel-caged induction motors.

ELECTRIC STREET LIGHTING IN SHOREDITCH

THE Electric Lighting Committee of the Shoreditch Borough Council have made an important recommendation that electricity shall be substituted for gas in all the streets in the borough north of Old Street. The number of burners now illuminated by gas in this district is 1,055. In making the recommendation it is pointed out that in the majority of streets there are a large number of factories which warrant the supposition that a demand will arise for electricity for electric lighting and power purposes. About fourteen miles of cables will be required in the 160 streets affected by the proposed change, and mains of sufficient size to meet any reasonable private demand, in addition to the street lighting load, will be laid at an approximate cost of £8,385. The cost of converting the existing posts for electric light is estimated at £665.

The Central.—The Old Students' Association of the Central Technical College have issued the September issue of their journal. It opens with a short biography of Professor O. Henrici, professor of mathematics, who has just retired, having joined the college in 1884. This is followed by an account of the banquet to Professor H. E. Armstrong, held at the Hotel Cecil on May 13th. The use of reinforced concrete is described in an article on slipways for launching lifeboats, and there are also some notes upon modern bridge construction. The number closes with some old students' notes and a few reviews of books recently published.

Failure of Supply in the Blackwall Tunnel.—Owing to a serious short circuit on the L.C.C. feeders which supply the lighting of the Blackwall Tunnel, on Monday last the tunnel was in darkness from 7.0 p.m. until 11.0 p.m. Great inconvenience was caused to traffic, and the police eventually had to close the tunnel. Some difficulty was also caused to the fire brigade, who were called to a fire in Greenwich, and had to drive through the tunnel when the lights were out. We understand that the engineers of Poplar Electricity Department were on the spot, and gave valuable assistance, although the supply to the tunnel is given by the L.C.C. through a special sub-station independently from the Poplar Borough Council system.

MEETING OF THE BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

THE proceedings up to Monday last week (with the exception of a Paper on the absolute measurement of electric currents which we mention later) were reported in our last two issues.

Superheated Steam, Gas and Oil Engines.

On Tuesday, in Section G, three papers upon economical and reliable power generation by overtype superheated steam engines, suction gas engines and producers, and Diesel engines respectively, were discussed together.

Mr. W. J. Marshall, the reader of the first Paper, said that the overtype superheated steam engine on the Wolf principle had now a fuel economy on a par with that of the internal-combustion engine. It consists of a special tubular boiler with the engine mounted on the top of it, the boiler forming the foundation or bed-plate for the engine. A superheater is placed in the smokebox, and forms an integral part of the plant, as also do the air-pump, condenser, &c., when such are fitted. The result of this arrangement is that steam-pipe losses are reduced to a minimum, and the full value of the superheated steam can be employed. The cylinders can also be jacketed with high-pressure steam from the boiler without any loss due to drains or steam traps, as the cylinder casing forms a portion of the steam space of the boiler. Particulars of exhaustive trials on one of these engines were given, showing that 1 b.h.p. can be obtained with a consumption of 1·21 lb. of steam coal per hour. A detailed description of the type of Wolf engine developed by Messrs. Richard Garrett & Sons, Ltd., was given, with drawings and photographs showing actual installations of some of these engines in various types of factories. Particulars of results obtained in regular work were added, and comparisons drawn between these and those obtained with other types of prime mover. The relative importance of the different items which go to make up the cost of power in a factory was discussed, with especial reference to that of reliability.

Mr. W. A. Tookey, in his Paper on Suction-Gas Engines and Producers, spoke of the difficulty of obtaining figures recording actual performances with regard to fuel consumption, cost of maintenance, cost of repair. The author has, however, collected from his own tests and those available from various sources, representative performances of suction-gas plants of various sizes when under test, not only when the power can be determined by means of some form of brake dynamometer, but when generating electric current—so taking into account the efficiency of the combined gas-electric set—and also when raising water under different "heads," indicating the comparison between fuel consumed and foot-pounds of work performed in such circumstances. Moreover, as "test" figures are usually obtained under what must be admitted to be abnormal conditions—no account being taken of standby losses, wastage of coal in charging, in removal of ashes, &c., the engine and producer being worked at a constant and regular output for but a limited number of hours—further figures were presented which enable the average performances of suction-gas plants of moderate power to be noted. These figures have been compiled from the statements of factory owners in Great Britain and in European countries. They take into account the variations of consumption due to the different grades of fuel used; they reflect the influence of variations of output, of load fluctuation, of length of standby periods, as well as the effect of the variation in the "human element." Figures representing the consumption of lubricating oil were also given. The author expressed the view that although the Diesel engine was more efficient as regards utilisation of heat units available in the fuel for conversion to power, yet it required several conditions to be fulfilled before the higher economy became apparent in the pocket of the user. Similar suggestions were made with regard to the relative performances of steam engines of the high-pressure, superheated, compound, condensing, semi-stationary type, and the conclusion was arrived at that the balance of advantages was in the favour of the gas power-plant, at all events for moderate powers.

Mr. Charles Day followed with a Paper on the Diesel Oil Engine. The Paper opened with arguments against the selection of an engine being made on makers' guarantees of fuel consumption, as such guarantees cannot possibly cover all working conditions, making it quite possible for the engine which gives the best results on tests to give inferior results over a long period in normal service, when items such as wages, repairs, and maintenance are included. It was urged that the judgment must be based on records of actual working results, which include all items of expenditure, and it was pointed out that, owing to the power costs of electricity supply-stations being kept on a uniform basis, and to the great majority of them being published or obtainable, these form the best available data on which to judge the working results obtained with different types of plant. He emphasised the importance of load factor and the economies at light loads, and, in the case of the steam engine, he pointed out that in the case of steam plant it is not sufficient to consider only the steam consumption of the engine and the evaporative efficiency of the boiler, but due allowance must be made for the power to drive accessories such as feed-pumps, coal-handling plant, condensing plant, and other such accessories. At light loads the power taken by these accessories may easily represent a large proportion of the total power. The advantage of being able to start up a Diesel set at a moment's notice, without the necessity of keeping up steam in boilers, and previously warming up the engine, were insisted on.

The author agreed that the conditions of working in some factories differ considerably from those of an electricity supply-station, but claimed that loss of efficiency is largely brought about by causes which are common to all places, and that consequently deductions from electricity-station figures are applicable to the great majority of power cases.

Stations having a plant capacity exceeding 1,000 kw., *i.e.*, 1,500 h.p., were excluded from the main comparisons. In the following table the author gave comparison of results of the different types of plant in stations where the plant capacity does not exceed 1,000 kw.

The wages and repairs items include some of the costs on the distributing system.

Average Cost per B.T.U. Sold.

Engine.	Fuel.	Lubricating oil, waste, stores, and water.	Wages.	Repairs and maintenance.	Total works cost.	Load factor.
Steam ...	0·45	0·06	0·25	0·26	1·02	14·7
Gas	0·43	0·09	0·28	0·24	1·04	15·3
Diesel... ...	0·23	0·04	0·19	0·07	0·53	14·3

The following table was also given of the average results obtained from steam stations of various sizes.

Average Works Costs per B.T.U. Sold, on Steam Stations of Different Sizes.

Capacity of station not exceeding kw.	Fuel.	Lubricating oil, waste, water, and stores.	Wages.	Repairs and maintenance.	Total.	Load factor.
250	0·63	0·09	0·35	0·36	1·43	13·2
500	0·56	0 06	0·27	0·29	1·18	13·3
750	0·43	0·05	0·23	0·24	0·95	15·4
1,000	0·40	0·05	0·23	0·21	0·89	16·8
1,500	0·42	0·04	0·17	0·18	0·81	16·9
2,000	0·37	0·04	0·16	0·21	0·78	17·7
3,000	0·33	0·04	0·15	0·17	0·69	17·4
4,000	0·40	0·03	0·14	0·20	0·77	18·8
5,000	0·34	0·03	0·11	0·16	0·64	18·7
7,000	0·36	0·04	0·13	0·20	0·73	17·9
10,000	0·26	0 03	0·09	0·13	0·51	22·6
20,000	0·30	0·03	0·11	0·16	0·60	19·6
50,000	0·23	0·02	0·10	0·11	0·46	20·56

Constructional features were then dealt with and reasons given in favour of the multi-crank vertical engine, particularly for dynamo driving. For high-speed engines forced lubrication and very complete enclosing were strongly advised. He pointed out that, in the case of Diesel engines for speeds which are not slow, the multi-crank type becomes desirable, otherwise serious vibration is likely to be caused. For the same reason it is important that the distance between the centre lines of the cylinders of an engine be reduced as much as possible. In such engines he recommended the vertical construction rather than the horizontal, as it gives much better accessibility, and any unbalanced inertia forces do not tend to slide the engine about, but merely increase or decrease the weight on the foundations. The vertical design, he said, is also better from the point of view of piston wear. Multi-crank engines are also advantageous as regards speed regularity during each revolution, which is a point of importance when driving alternators in parallel. With the first few oil-engines to which forced lubrication was applied a portion of the lubricating oil got drawn up into the cylinders. Detailed improvements in construction have, however, completely overcome this, and now the oil consumption is quite as low with the forced lubrication as with the ordinary systems. For moderate speeds of revolution, ring lubricating main bearings are thoroughly satisfactory combined with centrifugal lubrication to crank-pins. With such an arrangement less complete enclosing meets all requirements of cleanliness.

Hosted by Google

The development of the Diesel cycle from the Carnot cycle was then briefly traced, and the following fuel consumptions given as every-day consumptions for Diesel engines of moderate size :—

At full	load	0·44 lb. per b.h.p. per hour.	
At threequarter	,, ...	0·45	,, ,,
At half	,, ...	0·47	,, ,,
At quarter	,, ...	0 62	,, ,,

The further advantages resulting with Diesel engines are then briefly stated as: No sparking apparatus, lamp, or burner; no carburetter or vaporiser; no back-firing or pre-ignition; no warming up required before starting; very smooth running owing to no explosion or sudden rise of pressure; cheap crude oils used; very little water used; and no ashes or offensive effluents.

In regard to the question of continuous running, a case was quoted where during four years the average running time works out at 23¾ hours out of each 24, or about 1½ hour stoppage per week.

Captain SANKEY opened the discussion by asking for a clear definition of "rated output," a term used by all the authors. In the case of the gas engine, the Engineering Standards Committee had defined the rated horse-power as 85 per cent. of what the engine could possibly do, but this definition had not been published.

Prof. DALBY said that for small steam plants the only salvation was superheating.

Mr. W. J. LEWIS said that whilst it would probably be found that the Diesel engine would carry the day for the generation of electric power in works, yet great difficulty would be found in getting it into those places where a large supply of steam was required for heating purposes. Was there any prospect of benefit in the same way from the exhaust heat from gas or Diesel engines? A few years ago an open challenge was issued to gas-engine makers by Messrs. Wolf, the locomobile builders, for tests as to the best figures for fuel consumption, but the gas people had altogether ignored it.

Mr. KILBURN SCOTT strongly championed the Diesel engine for small electricity works, and referred to the Chichester power station, where, he said, the only complaint of the man in charge was that he had not enough work to do. He looked forward to the makers being able to build them in large sizes, when the large steam-driven station would cease to exist. At present, due to patents and the small number of makers, Diesel engines cost far too much.

Mr. H. E. WIMPERIS thought we should gradually develop towards a type of engine which would neither be a gas nor a steam engine, but a combination of both; in other words, the use of superheated steam, which was a gas, in an internal combustion engine. He was often called upon to advise in cases where native labour had to be relied on, and in such circumstances he had never yet recommended the Diesel engine, as it seemed too complicated to leave in the hands of unskilled men.

Captain SANKEY, referring to Mr. Wimperis' suggestion about using steam and gas in an internal combustion engine, said he had such a proposition under consideration at present.

Mr. H. S. RUSSELL said the whole question of the low costs which could be obtained with the Diesel engine, especially in electric light stations, depended on the load factor, and the load factors which Mr. Day had mentioned in his paper, about 15 per cent., were about the average obtained in electric power stations of that size. The lower fuel consumption of the Diesel engine was brought about by the very much higher thermal efficiency of the engine and the absence of standby losses. The large amount of exhaust heat available for a steam engine only showed how inefficient it was; the efficiency was only 10 or 11 per cent., whereas gas engines gave 18 to 20 per cent. and the Diesel engine up to 40 per cent., which naturally reduced the heat available afterwards as exhaust. With regard to the difference between makers' and actual figures, he had figures which showed that, whereas Diesel figures in practice only came out to 13 per cent. in excess of the makers, with the locomobile the actual figures came out to 140 per cent. in excess. Mr. Marshall had suggested that Diesel engines were unreliable, but he had figures of a Diesel engine in an electric light works which had been running 23¾ hours a day for four years. On a battleship, too, a Diesel engine had run 800 hours continuously. Wages of running Diesel engines were not more than half compared with either gas or steam.

Prof. E. W. MARCHANT (Liverpool University) pointed out that capital charges had been omitted by the authors, and suggested that they were very important. He had been through some figures of electricity works in reference to the relation between capital and fuel charges, and found that, on the average, the capital charges were about double the fuel charges, and in some cases more, depending on the load factor.

The PRESIDENT suggested that the authors, in reply, should give some attention to the commercial side of the question, *i.e.*, the comparative cost per unit of generating electricity.

Mr. MARSHALL, speaking on the question of rating, said that with a 140–180 h.p. engine, the guaranteed fuel consumption would be the same over the whole range; it would be equally economical at either load. But they would work quite economically above and below those limits. He had no figures with regard to producing electric power, as there were no electricity works in this country using his type of engine entirely, although he could have got figures from Germany. He criticised Mr. Day's table as absolutely valueless, as the type of steam or gas engine was not mentioned; it might embrace a lot of steam engines 25 years old. The same applied to the wages figures. Mr. Tookey's figures also wanted a good deal of explanation before a useful direct comparison could be made.

Mr. TOOKEY, in a brief reply, pointed out that, unlike the other two authors, he was not an engine maker. All his figures had been compiled in the ordinary way from users. Gas-engine builders, unlike the makers of other engines, were to a large extent unanimous in their method of rating h.p.; it referred almost universally to the maximum power that could be hoped for from an engine of the particular size, running sometimes 15, 30, or 60 minutes. He, however, worked on the basis of taking the piston displacement multiplied by the number of revolutions divided by four. This gave the rated b.h.p. Generally speaking, however, the makers' ratings agreed with this within 10 per cent.

Mr. DAY also replied. Mr. Kilburn Scott, he said, was quite wrong on the question of patents. The master patents expired some years ago, and as to the number of firms making Diesel engines, he really could not count them. No less than 30 new firms started in Germany last year. He went to Hungary last year in order to open up business, but found five firms making Diesel engines in one town alone. He had a prejudice in favour of native labour; the Chinese coolie was about the best, and was far better than a skilled engineer, and did not think he could improve the machine. Dealing with Mr. Marshall's point, as to his comparative figures, he said that he had taken stations in which the steam engines were not old. He had not picked special stations, but had taken the averages of all stations of the size mentioned. As a matter of fact there was no very old steam plant in electricity works to-day.

Electrical Production of Nitrogen Compounds.

A Paper by Mr. E. Kilburn Scott described the methods of manufacturing artificial nitrates and other electrically produced compounds of nitrogen.

The Birkeland-Eyde arc furnace, in which the arc is spread out by a strong magnetic field, and the Schonherr tubular furnace, with a long spiral arc held central by a strong current of air, were fully described in ELECTRICAL ENGINEERING, June 3rd, 1909, Vol. V., p. 515, as were also the processes used for forming nitric acid and nitrate of lime from the nitrogen peroxide produced in these furnaces. The third type of furnace, the Pauling furnace, was described in ELECTRICAL ENGINEERING, November 11th, 1909, Vol. V., p. 964. The nitrate of lime produced in this way contains about 13 per cent. of nitrogen. The other principal artificial manure is calcium cyanimide, with 18 per cent. of nitrogen, which is produced by combining nitrogen, separated from air by the Linde fractional distillation process, with electrically produced calcium carbide. The author stated that nitrate of lime is usually employed as a top dressing, whereas calcium cyanimide is dug into the soil, but that, in his experience, the best result is obtained by mixing the two manures.

The nitric acid produced by the above processes is concentrated at some of the works for the manufacture of explosives, and can readily be formed into ammonium nitrate, a constituent of many modern explosives, by mixing with ammonia liquor from gas-works. This substance can also readily be manufactured from electrically-produced calcium cyanimide. In this connection, the author pointed out that this country is largely dependent on oversea supplies for the manufacture of explosives, and that it would be advisable to establish factories for the electrical manufacture of such nitrogen products in this country and other parts of the empire, so as to ensure an efficient supply in time of war, even if the products could not compete in price with existing supplies. Another product of these factories is sodium nitrite, which is used in the manufacture of azo dyes. The former method of reduction of Chile nitrate with lead has practically ceased, and the whole demand is supplied from factories using the electrical method. Various compounds of ammonia are made by treating calcium cyanimide with superheated steam, a sulphate of ammonia of very high quality being produced in this manner.

Turning to the cost of production and the possibility of the electrical manufacture of nitrogen products in this country, the author said that the power used at Notodden to manufacture nitrates is said to cost only 0.045d. per kw. hr., and that at Niagara the price charged to electro-chemical consumers is 0·133d. per kw. hr. There is every reason to believe, he said, that waste heat power stations in this country could sell power at this latter figure with 100 per cent. load factor. He had heard of cases where 0·25d. per kw. hr. was charged to consumers with a 33 per cent. load factor, and, working from this figure, the price should be 0·168d. per kw. hr. on a 100 per cent. load factor. This referred to a plant with steam raised from coal, and power could be supplied at a lower figure from a waste heat plant. Thus, whereas a capital cost of from £10

Hosted by Google

to £12 per kw. installed was a fair figure for an ordinary steam plant, the cost of the generating plant used in a waste heat station was about £6·5 per kw. installed. Very few water-power plants were constructed at as low a cost as £10 per kw. installed.

The discussion was opend by Sir WILLIAM RAMSAY, who believed that the future of the country lay in establishing chemical works in the neighbourhood of the collieries. He looked upon this as largely a Governmental question. There was very little doubt that a policy of this sort would largely lengthen the coal supply, and cheapen commodities.

Dr. E. ERKHARDT said that the time was not yet ripe for the full development of the electrical manufacture of nitrates in this country. They had already entered into negotiations with regard to establishing works on the Birkeland-Eyde system, but the final conclusion come to was that it would be better to wait at least for several months. The Notodden works was earning well, and at Ruckhardt, in Norway, a big plant was being erected which would have a final capacity of 250,000 h.p. At present four-fifths of the plant was on the Schonherr process, and one-fifth on the Birkeland-Eyde process, but, as the result of their experiments, it was quite possible that these proportions would be altered later on. With regard to Mr. Scott's remarks concerning explosives, he thought that if the British Navy could not protect the Chili saltpetre fleet in time of war, it would not appear that they could do much for the food supply of the country, which was a much more serious problem. However, he did not think the British Admiralty took this view, and for that reason did not think they would be able to induce the Government to take up one or other of these processes. Naturally, he would be only too pleased if they would.

SIR WILLIAM WHITE, after speaking appreciatively of the work done in the direction of cheap power distribution on the Tyneside, expressed the opinion that although it might not be absolutely essential to produce the materials for the manufacture of explosives, yet it was a great advantage to have the means of doing so in our own hands, and every encouragement in this direction should be given, quite apart from the sufficiency or efficiency of the Navy.

Mr. H. E. WIMPERIS said that three years ago he had had to investigate the amount of power running to waste in this country from blast furnaces, gas and coke ovens, and the result showed about 1,000,000 h.p. continually going to waste. At that time he suggested the possibility of utilising this power in the way suggested by the author, but on the Tyneside it was being used for ordinary electric power purposes.

Mr. E. KILBURN SCOTT, in reply, said he felt very strongly that we were lagging behind in metallurgical processes, and sincerely hoped the Government would step in, if private enterprise was not given the necessary facilities. He recalled the fact that the manufacture of carbide of calcium was started a few years ago, and a factory erected next to the Yorkshire Electric Power Co.'s power station. A very low price was offered on the condition that the power company had a right to cut off supply during peak time, which, as a matter of fact, was never done. The manufacture of calcium carbide, however, was in the hands of a trust with headquarters on the Continent, and after a while they came to the conclusion that there were too many factories, and subsequently shut down the Yorkshire works.

Smoke Abatement.

Dr. J. S. Owens next read a Paper on the possibility of fixing a new standard of smoke emission from factory chimneys.

He suggested a standard of maximum density for maximum time of emission. By density, he explained, he meant the amount of soot per unit volume of flue gas, and he described an instrument which he has devised by which the density of smoke is matched with that of calibrated smoked glasses, each glass representing a certain density of smoke in a column of unit thickness. The final figure for comparison is obtained by dividing the density represented by the glass by the diameter of the chimneys.

There was very little discussion upon this paper, but some amusement was caused by the vehement remarks of a gentleman (who subsequently turned out to be a boiler-setting expert) expressing the opinion that all manufacturers allowing smoke to be emitted from their chimneys should be put in prison and kept there until the nuisance was abated. He also remarked upon the impossibility, at any rate in provincial towns, of getting smoke nuisance convictions, as he said all the magistrates were manufacturers, and were themselves the biggest sinners in allowing smoke emission from their chimneys.

Continuous Transport.

The final Paper in Section G on Wednesday was by Mr. W. Y. Lewis, who described the Adkins-Lewis system of continuous transport.

The principle upon which this system is worked is that of the continuous lift. In shallow subways a spirally threaded shaft driven by electric motors would be installed, this shaft extending throughout the whole route and rotating at constant speed. A large number of small cars would be driven by this shaft, engagement with which is by means of a roller. The pitch of the spiral on the shaft is graduated. Thus to give slow speed at the stations, the pitch would be close, and to enable high speeds to be obtained between stations, the pitch would be six or eight times greater, acceleration and deceleration being practically unnoticeable, due to the graduation in the pitch. Another feature of the system is the return to the circuit of about 80 per cent. of the kinetic energy of the cars during deceleration. The spiral is designed to give a speed of three miles per hour whilst passing through the stations, a speed which it is contended would enable passengers to board the cars or alight without the necessity for them to stop. The drivers, brakes, and signalling apparatus would all be dispensed with. Electric motors for driving the shaft will be inserted at intervals of a quarter of a mile, and although the inventors admit that the system will adapt itself more readily to straight and more level routes, yet they have arrangements for dealing with curves. A full-size line has been erected at Messrs. Ransome & Rapier's works at Ipswich, and Mr. H. M. Hobart, now consulting engineer to the General Electric Co., of America, has made a report upon the system, in which he expresses the opinion that it is based upon thoroughly sound and practical principles, and that, both as regards capital and operating costs, results could be obtained much more cheaply than with present electric trains. Mr. Hobart lays great stress upon the safety to the travelling public of this system, and points out that each car is positively under the control of its driving thread, and as the successive cars were always the same number of convolutions apart, they need never touch each other, unless required to. Captain H. Riall Sankey has inspected the experimental equipment at Ipswich, and expressed his surprise at the small amount of power required and at the large amount of energy, of the order of 80 per cent., returned to the circuit by the retardation of the cars. He experienced no difficulty in getting on and off the cars, and could stand up easily whilst the car was accelerating and decelerating at the average rate of 4·5 ft. per second per second.

In the course of a short discussion, Professor Dalby, who had examined the system closely, spoke highly of the engineering skill which has been put into it during the seven years it has been developing. In answer to a few questions, Mr. Lewis said that the efficiency of the spiral thread was about 90 per cent., and that the shaft would need to have a diameter of 2 ft. for a railway dealing with a traffic like that of the District Railway.

Absolute Measurements and Practical Standards.

Before Section A (Mathematical and Physical Science) on Monday last week, Professor N. E. Dorsey read a short Paper on the work done at the Bureau of Standards on the absolute measurement of electric currents.

A balance of the type used by Lord Rayleigh was employed. Coils of square cross section are wound bifilarly on enamel insulated wire upon brass forms. A novel feature of the fixed coils is the provision in the forms and the back of the windings of a channel through which water can be pumped, so as to maintain the coils at the constant temperature.

Three tiers of fixed coils (two 50 cm. in diameter and of 36 layers each of 18 double turns, and one of 40 cm. diameter and 28 layers of 14 double turns each) and two moving coils (one 25 cm. in diameter and of 12 layers of six double turns, the other 20 cm. in diameter and of 14 layers of 7 double turns) were used in the final work.

The distance between the two fixed coils was always such that the sum of the forces which they exerted upon the moving coil was a maximum. Under this condition, a maximum force for a given current depends solely upon the ratios of the diameter of the moving coil to those of the fixed coils. Consequently the actual distance between the fixed coils need not be measured—a great advantage.

The ratios of the diameters of the coils were obtained by a modification of the electrical method used by Lord Rayleigh.

Observations give the average value for the E.M.F. of the mean Weston normal cell (as defined at the Washington Conference) at 20·00 degrees C, in terms of the international Ohm and the Bureau Standards balance, as 1·018224 volt. The maximum deviation from the mean was 9×10^{-6}. This value, 1·01822, differs from that obtained at the National Physical Laboratory by 4 in 100,000.

The instrument was designed by Professor E. Rosa, and the entire work has been done under his strict supervision.

The Committee on Electrical Standards presented their annual Report on Wednesday.

Further satisfactory progress has been made with the Lorenz apparatus. Preliminary experiments have shown that it is uninfluenced by changes in the earth's magnetic field, and that the

Hosted by Google

thermal E.M.F.s at the brushes on the two discs very nearly balance.

The construction of new mercury standards of resistance in accordance with the specification of the London Conference is being proceeded with, and some of the standards will be completed this year. Similar work is in progress in France, in Germany, in Austria, and in the United States. In the latter country four standards have had all of their constants determined, and the resistance unit so obtained is in very close agreement with that obtained from the old National Physical Laboratory standards.

In the Committee's Report for 1908 it was shown that many manganin resistance coils—some of which were purchased by the Committee in 1895—were very changeable in resistance, and in consequence frequent comparison with mercury standards was necessary. In 1908 it was shown at the Bureau of Standards, and confirmed at the National Physical Laboratory and at the Reichsanstalt, that these changes were largely due to the effect of moisture on the shellac covering the wire. To eliminate this source of trouble, many of the coils were hermetically sealed in 1909, and it is satisfactory to record that they are now much more constant. The importance of this hermetical sealing is so great when manganin resistances are to be sent to such places as cable stations in the tropics that the attention of instrument manufacturers is drawn to the matter. Standard coils are readily sealed and boxes of coils may be sealed in metal cases.

The results of the experiments made at the National Physical Laboratory upon the effects of different septa, such as silk, filter paper, porous porcelain, &c., in a silver voltameter, indicate that a septum of any kind is usually a source of trouble, and may produce secondary reactions during the electrolysis which affect the weight of the silver deposit. Fortunately, voltameters have been designed which render a septum unnecessary.

The reproducibility and constancy of the Weston normal cell are still being carefully examined. The chief anomaly is the hysteresis effect mentioned in last year's report. With ascending temperatures the E.M.F. changes in close agreement with the temperature—E.M.F. formula, but with descending temperatures the E.M.F. changes too rapidly, corresponding to values at temperatures lower than the temperature of the cell, by from 3° to 15°. For this effect an explanation is much needed, as probably it would enable cells to be made so as to remain even more constant in E.M.F. than at present.

The Electrical Exhibition at Olympia.—The Management of the Electrical Exhibition will be happy to send any contractors pictorial posters of the Exhibition on hearing from them, and on consideration of such contractors exhibiting these bills in their windows they will be entitled to two complimentary tickets to the Exhibition.

Faraday House Journal.—The September issue of this journal is to hand. The papers contributed include the electrification of the Randfontein Central by T. P. E. Butt, and a method of finding the neutral point in continuous-current machines by J. T. Chapman. We are pleased to hear that several new affiliations have been added to the already long list, and these include the British Westinghouse Electric and Manufacturing Co., Ltd. (Trafford Park, Manchester), Brown, Boveri & Co. (Baden), Metropolitan Borough of Hornsey, Rawtenstall, and York Corporations. A time-table for the first and third year's courses has been added at the end of the journal.

"Tilling-Stevens" Petrol Electric Omnibuses.—As a result of the successful running of the new "Tilling-Stevens" petrol electric omnibuses in London service, Messrs. Tilling have decided to adopt that type for all their future omnibuses, and are constructing a fleet to replace their present horse-drawn vehicles. Messrs. Tilling have designed the chassis and body, which are being built at their works at Peckham. The electrical transmission is supplied by Messrs. W. A. Stevens, Ltd., of Maidstone. The design is generally similar to that described in ELECTRICAL ENGINEERING, Vol. VI., page 678. An agreement has been entered into between the two companies in which Messrs. Tilling have secured the sole rights of use and sale of the "Stevens" patent electrical transmission for use in omnibuses and mail vans in the Metropolitan Police Area; Messrs. Stevens to have the sole rights of manufacture and sale of the complete "Tilling-Stevens" petrol electric chassis outside the Metropolitan Police Area, and also inside the Metropolitan Area for vehicles other than omnibuses or mail vans. The same construction will be adopted in the chassis for use either inside or outside London. The "Tilling-Stevens" petrol electric vehicles are the result of exhaustive experiments carried over a period of four years under public service conditions in London. The first vehicle, which is still in service in excellent condition, and was described in ELECTRICAL ENGINEERING, Vol. III., page 83, has run over 120,000 miles.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

An account of a series of investigations made by Lieut. J. O. Mauborgue on the operation of inductive tuners in wireless-telegraph receiving sets is given briefly in the *Electrical World* of New York. The tests described included use of the inductive tuner alone, and with variable air condenser in secondary, in series with the primary, and in parallel with the primary. From characteristics shown by curves plotted between wave-lengths and coupling ratios, the author concludes as follows: Varying the coupling varies the wave-length. Regardless of coupling used, apparatus is always tuned to two wave-lengths at same time. This double periodicity was illustrated by pulling out the secondary coil to a particular position, when the equipment is tuned to both a 1,355-m and a 490-m wave. Use can be made of this double frequency in avoiding a station operating in the lower register while continuing to listen to the desired station by changing primary inductance. In tuning with an inductive tuner alone the longest wave-length is obtained with the primary and secondary inductances at a maximum and the coupling as close as possible. With a variable condenser in series with the primary inductance, loosening the coupling causes a rapid drop in the wave-lengths of the higher curve and a similar rise in the lower curve, enabling the operator to eliminate an undesired station with a short wave-length. In conclusion the author declares that the most selective device would be an inductive tuner having its primary variable by single turns, and with a variable condenser capable of being connected in either parallel or series with the primary, and a variable condenser of small value around the secondary.

The annual report of the Meteorological Office states that 3,955 wireless weather reports were received from Atlantic liners last year. Reference is made to the great value of these reports in enabling warnings to be sent to various districts in advance.

The Marconi Wireless Telegraph Co., Ltd., has recently obtained a contract from the Crown Agents for the Colonies to erect a radio-telegraph station in Ceylon. It will be capable of transmitting normally a wave length of 600 metres, and with wave lengths between 1,000 and 2,000 metres, it will also be able to communicate with ships within 450 miles. The generating equipment will consist of a 5-kw. alternator and exciter, driven by a 10-h.p. 100-volt, 60-cycle, single-phase motor, connected to the supply mains. The machines will be protected from injurious effects induced by the high frequency circuit by means of shunting resistances. A high-tension transformer will step up the voltage suitable for a battery of condensers. These will be of the glass plate type placed in galvanised iron oil-tight tanks, and suitable arrangements will be made for adjusting the coupling to produce various waves. An inductance of the adjustable type will be inserted in the condenser circuit for tuning the high-frequency primary circuit to the aerial circuit, while the low-frequency primary circuit, and the spark frequency, will be tuned by means of an inductance in the form of an iron core. The discharger will be of the disc type, and designed to produce a musical spark so as to distinguish between signals and atmospheric disturbances. There will be two aerial tuning inductances, each consisting of a multiple solenoid winding of stranded conductor. The manipulating gear will include a Morse key, which will actuate a relay key in the transformer primary.

One part of the receiving apparatus will comprise a magnetic detector and a multiple tuner, which will provide a highly syntonised circuit for waves between 100 and 2,500 metres. A switch will also be furnished for changing from a "tuned" to an "untuned" position, ready for picking up waves of other lengths. The other part of the receiver will have a detector of the valve type, suitable for wave lengths of 1,600 to 4,000 metres. There will be two masts, each 270 ft. high. One earth system will be used, consisting of iron plates arranged in a circle with radial conductors to the central apparatus. This will be supplemented by radial wires underneath the transmitting aerial.

A few months ago we announced that a wireless telegraph station would be erected at Spitzbergen. This station and one at Hammerfest, with which it will communicate, will probably be completed this autumn. Telefunken apparatus is being used, with aerials about 200 ft. high. Each station will have residential accommodation for the staff, and will be under the control of the Norwegian Government.

Hosted by Google

The *Times* Lisbon correspondent states that the Portuguese Government have decided to adopt the Marconi system of wireless telegraphy, and that stations are to be erected at Lisbon, another on the Portuguese coast, and a third at Cape Verde. The Portuguese Government, it is stated, have been offered the same terms as those which have been accepted by the British Government.

Some stir has been caused among journalists in search of sensations by announcements that a Mr. H. G. Matthews has accomplished feats of wireless telephony hitherto considered impracticable. According to some accounts he was shut up in a strong room with his transmitter, and communicated thence to an operator in another part of the building. Tests from Chepstow to Tintern, between which a considerable amount of rock intervenes, and other places in the neighbourhood, have been carried out, and an attempt is to be made between Cardiff and Chepstow, for which the aerials will be of such a size as to necessitate man-lifting kites for their support. Technical particulars of the system are not yet available. Mr. Matthews' name will be familiar to some in connection with a music-hall turn in which a wirelessly-controlled airship took part.

On the 5th inst. the line between Sabang and Kotaradja was restored, and on the 7th inst. the lines between Bagdad and Bassorah were down.—By reason of faults, &c., telegrams for Casablanca, Mogador, and Rabat are subject to long delay, and can only be accepted at sender's risk. Telegraphic lines in the interior of Ecuador have now been repaired, and on the 9th inst. the Bagdad—Bassorah line was in good working order.—We understand there is some trouble with the Eastern cables, and that they are diverting their traffic.

The report of the Pacific Cable Board for the year to March 31st, 1911, shows a gross profit of £29,334, but the interest and sinking fund charges amount to £77,544. The difference between the two sums has to be met by the contributing Government. The gross profit was £11,378 more than was available in the previous year. The net traffic receipts increased by £24,677. The result for the year is arrived at after placing £30,000 to renewals fund, which now stands at £264,236. The statement is made that there is every prospect within the next few months of messages being accepted in plain language to be sent at half the existing rates, subject to the condition that they may be delayed for a period not exceeding twenty-four hours.

It is stated that the Government are now considering the details of the scheme for linking up the Empire by means of wireless telegraph stations, which was proposed and carried at the Imperial Conference in London. The outline of the proposal is that there shall be one station in England, one at Gibraltar or Malta, and one each at Cyprus, Aden, Bombay, Singapore, and Australia. The ultimate aim of the scheme is to enable the British Admiralty to direct the movement of every unit of the Navy at any moment.

ELECTRIC TRACTION NOTES

The Board of Trade inquiry into the circumstances of the accident upon the L.C.C. tramway system at Lewisham on Saturday, September 2nd, was held on Wednesday last week. Col. von Donop conducted the inquiry. It will be remembered that a four-wheeled top-canopy car left the rails on a curve, after descending a short steep incline, at the junction of Shardeloes Road and Lewisham High Road, and overturned, one passenger being killed and over 30 injured. The evidence was very similar to that given at the coroner's inquest. It all went to show that the magnetic brake and the car generally was in good order. Mr. W. Crawford, assistant permanent-way inspector, said he found the track in good condition after the accident. The rails on the curve had been in use since February, 1910, and he put their life at ten years. In answer to the inspector, witness said he noticed a mark on the inner side of the near rail where the flange on the wheel, then running on the wood paving, had struck the check of the rail. The inspector expressed the opinion that this was the cause of the car overturning. As to the cause of the car leaving the rails, we have to await the inspector's report. In connection with this latter point, it is reported that other car derailments have recently taken place upon the curve running from Malpas Road into Lewisham High Road, only a short distance away from the scene of the fatal accident on September 2nd. Indeed, one account refers to the derailments at this spot as "a common occurrence." At present, special attention is being paid by the L.C.C. engineering staff to the Malpas Road section in order to ascertain the cause of the derailments.

A rumour was current on Monday that a fatal accident had occurred on the electrified section of the L.B. & S.C. Ry. It appears, however, that the facts of the case are that a fireman, when watering coal in a tender at the Crystal Palace Station, accidentally touched the overhead wire with his shoulder, receiving burns and a shock which caused him to fall and sustain cuts. His condition is reported as not serious.

At the half-yearly meeting of the Aberdeen Suburban Tramways Co. a dividend at the rate of 2½ per cent. was declared.

There is considerable opposition to some of the proposed tramway extensions in Glasgow, referred to on page 497 in our last issue, and the Corporation have agreed that the discussion of the whole matter shall be postponed for another week. It is proposed to borrow £180,000 in connection with this scheme.

The London County Council have received the Board of Trade's sanction for an experiment in running two double-decked tramcars linked together on the Euston Road and Hampstead route during the busy hours night and morning.

The accounts of the Dumbarton Burgh & County Tramways Co. show a profit of £8,468 for the year to July 31st, and after meeting the 6 per cent. preference dividend and adding £1,200 to the sinking fund for redemption of debenture stock, the balance of £2,768 is carried forward. The traffic receipts were about £1,000 in excess of those in the previous year.

According to the Frankfort correspondent of the *Financial News*, the passenger cars of the Prussian railways are to be lighted by electricity instead of gas. It is also stated that the Rosenberg system will be adopted.

After meeting the preference dividend, the accounts of the United Electric Car Co., Ltd., for the year to June 30th last, show a profit of £2,482, which it is proposed to carry forward. The directors regret that there has been a great stagnation in the car-building trade, but report that the works are now well employed. The Hadley & Trafford Park works have been disposed of at a loss of £46,171, which amount it is proposed to transfer from general reserve and depreciation reserve.

The accounts of the National Electric Construction Co., Ltd., for 1910 show an available balance of £7,353. The directors propose to transfer £1,550 to debenture redemption fund, and after setting aside £644 as depreciation on free-wired installations, the balance of £5,156 is to be carried forward.

The trolley omnibus system at Bradford has proved such a financial and technical success that the Tramways Committee has decided to extend the system by some 11 miles.

The tenth annual conference of the Municipal Tramways Association will be held in Glasgow on September 27th, 28th, and 29th, at Glasgow, under the presidency of Mr. J. Dalrymple (General Manager, Glasgow Corporation Tramways). After the Presidential Address on the Wednesday, Councillor C. W. Nelson will read a Paper on the "Common Good" of the City of Glasgow and its relation to the tramway undertaking. In the afternoon a Paper by Councillor J. H. Rodgers on "Tramway Finances and Policy" will be discussed. A Paper will be discussed on the following day on "Tramcar Meters" by R. G. and J. C. Cunliffe, and a report on "Tramway Track," embodying experience at Glasgow, Manchester, and Leeds, will be considered. An attractive programme of visits and excursions has been arranged.

The *Board of Trade Journal*, quoting from the *Japan Mail*, states that the Government have sanctioned the application of the Tokio municipality for the taking over of the electric tramways of the city as from August 1st. A thorough investigation has been ordered by the municipal authorities with a view to the speedy completion of the unfinished lines and the improvement of all the rolling stock. It is proposed to abolish thirteen or fourteen miles of the existing lines, and to construct five new lines, three of which were especially ordered by the Government to be completed by July 31st, 1916. An endeavour is to be made to finish the whole of the lines by the end of 1914. It is also proposed to build about 500 new cars, divided into two classes. Cheap, uncovered cars are also to be built for the use of workmen.

It is proposed to construct an electric tramway from Mödling (Austria-Hungary), either direct to Vienna or to Wiener Neudorf, to join the Vienna-Baden line. It is also proposed to construct a trolley omnibus system there.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 7, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

27,725/10. **Tramway Motor Supports.** THE BRUSH ELECTRICAL ENGINEERING COMPANY, LTD., and S. LEECH. Brackets are secured to the side frames of the truck, and screwed nipples are threaded into both ends of the spring attached to each bracket, those at one end being provided with means for attachment to the motor beams. An extension piece with a large hole is fixed to each bracket, through which the motor beam passes, with plenty of clearance, to the nipple. In this way the springs can act either in compression or tension, and owing to the flexibility of the springs the motor beams can vary their position within the limits of the clearance in the bracket extension. Three figures.

28,179/10. **Condensers.** G. GILES (*Switzerland*). To avoid the needle effect which takes place along the margin between the ends of the coatings of a jar-shaped condenser, instead of thickening the dielectric at the edge of one of the coatings, the latter is formed as one closed surface, a part of which rests on the dielectric, so that this coating offers no sharp edges. Six figures.

29,505/10. **Metallic Filament Supports.** ALLGEMEINES CHEMISCHE LABORATORIUM, OSKAR H. ARENDT, and C. SCHLESINGER. Two rings are mounted loosely on the central rod, or one can be rigidly fixed. These are connected by ties of suitable material running in the direction of the rod, and are crinkled to give elasticity between the rings and the filament. The rings have the usual radial arms for supporting the filaments. Two figures.

30,933/10. **Rotor Ventilation.** BRITISH THOMSON-HOUSTON Co. (*General Electric, U.S.A.*). Ventilating spaces are provided with channels extending from one part of the periphery to another. The ends of these channels are arranged at different angles to the radial lines, so that the forces tending to throw the air out of the rotor are different at the two ends of the channels. By this method it is claimed that the windage losses are avoided, and the rotor diameter reduced. Two figures.

1,907/11. **Incandescent Lamp.** G. F. RICHARDSON and R. J. CROWLEY. A lamp in which two or more filaments are used, has one end of each connected to a common contact plate at the bottom of the lamp, which is insulated from two other contact plates, to which the other ends of the filaments are attached. A bridge piece, half of which is insulated and half conducting, is rotatably fixed in the lamp-stem, making contact with the two plates, so that the filament which makes contact with the insulated part of the bridge piece is cut out of circuit. It can, however, be switched in by rotating the bridge. The plungers in the lamp socket are always in contact with the common contact plate and the bridge when the lamp is in position. Four figures.

4,397/11. **Overhead Trolley Wires.** OESTERREICHISCHE DAIMLER-MOTOREN A.G. A construction to allow a railless trolley omnibus to cross the original wire of the ordinary overhead tramway is supported by a bow-shaped frame, which is inserted in the original wire, forming a gap or gate. This gap is bridged by two movable strips placed in line with the trolley wire, which are kept in position by means of springs. The railless trolley to which a pendulum is attached runs on a line mounted above in the bow of the frame, so that when it wants to pass this point, the pendulum simply brushes the strips apart, which are returned to their original position by the springs attached. Two figures.

6,983/11. **Lug Joints for Accumulator Lids.** P. J. BROWN. The lug projects through a porcelain sleeve, which extends above and below the lid to within a short distance of the electrolyte. Both the sleeve and the lid have a grooved hole to take a rubber ring, which holds the lug central, and makes a flexible joint. There is also sufficient clearance round the lug for the gases to escape. Three figures.

Opposition to Grant of Patents

28,210/09. **Advertising Device.** A. W. LEONARD. This patent has been granted in spite of opposition. It comprises a series of discs, carrying advertisements, which are revolved by a motor fixed in a non-transparent casing with apertures, through which the revolving signs are shown.

18,969/10. **Reduction of Organic Bodies.** H. HIGGINS. Opposition has been entered to the grant of this patent. It relates chiefly to the reduction of the unsaturated fatty acids, and employs a special catalysing agent, composed of the oxide or hydroxide of cobalt or nickel, or a mixture of the two. This is used in the cathode compartment of an electrolytic cell.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: PÉREZ, 11,275/11.

Distributing Systems and Insulating Materials: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Insulating compounds] 176/11; LAKE (*United States Light and Heating Co.*) [Automatic regulators for electric circuits] 5,490/11.

Dynamos, Motors, and Transformers: BERRY [Transformers] 12,355/10; SIEMENS BROS. DYNAMO WORKS [Rotary field induction generators] 223/11; CRAWSHAW, and PHŒNIX DYNAMO MANUFACTURING Co. [Motors] 1,543/11; SIEMENS BROS. DYNAMO WORKS, and SCHUPP [Controllers] 9,606/11; ELECTRIC and ORDNANCE ACCESSORIES Co., GARNER and MUELLER [Controllers] 14,867/11.

Electric Ignition: HARPST, 11,811/11.

Incandescent Lamps: MOND [Supports for filaments] 23,404/10; WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK GES. [Decarbonising metallic filaments] 24,637/10.

Instruments and Meters: WESTON [Wattmeters] 17,091/10 and [Vibration dampers for precision instruments] 5,268/11; CARPENTIER [Measuring relation of two currents] 5,961/11.

Switchgear and Fuses: LIDDLE (*Rudolf Buderer and Co.*) [Time switch for lighting circuits] 22,760/10; CRESWICK and BENTHAM [Flame-tight fuse and switch boxes] 9,037/11.

Telephony and Telegraphy: QUERTIER [Transmitting signals, &c.] 19,701/10, and [Transmitting, indicating, recording, and printing apparatus] 19,703/10; IRWIN [Selective signalling] 29,206/10; MURPHY [Signalling] 29,798/10; DELANY [Telegraphy] 55/11; GIRARDEAU [High-frequency alternator for radiotelegraphy] 3,948/11; BENNETT [Telephone mouthpieces] 12,200/11.

Traction: W. R. SYKES INTERLOCKING SIGNAL Co., SYKES, and TARRANT [Mechanism operated by train for actuating switches] 23,933/10; SCHEITHAUER and KLICHE [Operating points and switches] 4,611/11; J. STONE & Co. and DARKER [Hot-air system for railway carriages] 17,537/10.

Miscellaneous: KALLMANN [Resistance] 19,993/10; ALLEN, WEST & Co. and MOGGRIDGE [Collectors for cranes] 20,107/10; BROWN [Fire indicator] 24,183/10; ALTHER and GILL [Annunciating apparatus] 25,368/10; SELVATICO [Chest-warmer] 1,481/11; ROTHWELL, ROBERTS, and ROBERTS [Miners' safety lamps] 4,562/11; SCHWERIN [Electric Osmose treatment] 11,626/11; SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Relays] 12,295/11; WALKER and R. WAYGOOD & Co. [Lift control] 15,933/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Cables and Wires: NOBLE [Insulating wire machines] 18,674/11.

Incandescent Lamps: DEUTSCHE GASGLÜHLICHT AKT.-GES. (*Auerges*) [Drawn filaments] 1,161/11.

Traction: ALLGEMEINE ELEKTRICITÄTS-GES. [Locking the high tension gear of electric vehicles] 17,304/11.

The following amended Specifications can now be obtained.

LYSAGHT, LTD. and BEDDOE [Zinc condensers] 4,667/09; HANSEN [Block-signalling] 25,129/09; BOULT (*Ruzicka*) [Ignition] 18,946/10; BIGGE and BUTT [Electro-medical photographic apparatus] 25,670/10.

Amendment

16,017/10. **Power Handle for Controller.** W. R. SHAW and G. H. GREEN. As a result of the extended investigation under section 8 of the Patents Act, a disclaiming note has been inserted in this specification. It relates to a detachable power handle designed to prevent excessive sparking at the contacts. An abstract appeared in ELECTRICAL ENGINEERING, July 6th, 1911, p. 389.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors and Transformers: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) 11,828/07; SIEMENS BROS. DYNAMO WORKS and M. KLOSS [Field magnets] 12,050/07.

Switchgear: T. VON-ZWEIGBERGK [Switches] 2,751/07; W. H. SCOTT [Circuit-breakers] 11,814/07; A. G. CHARTERS and J. G. JONES [Cut-outs] 11,952/07.

Telephony: H. W. LAKE (*J. S. Stone, U.S.A.*) [Relays] 11,823/07.

Miscellaneous: E. A. CAROLAN (*General Electric Co., U.S.A.*) [Lightning arresters] 11,649/03; CROMPTON & Co. and C. CROMPTON [Fans] 10,928/05; SIEMENS BROS. & Co. and H. WRIGHT [Valve Control] 12,216/06.

Hosted by Google

LOCAL NOTES

Austria-Hungary: *Electric Lighting.*—The "Allgemeine Oesterreichisch-Ungarische Gasgesellschaft" has purchased the Mödling gasworks for £100,000, and has made an offer to the Communal authorities to set up in Mödling an electric generating plant for lighting and power purposes. According to the *Board of Trade Journal*, the communal authorities have appointed a committee to consider the matter.

Bath: *Electric Lighting Accounts.*—The accounts of the Electric Lighting Department for the year to March 31st show a net profit of £1,196, compared with a loss of £580 for the previous year.

Brighton.—Mr. J. Christie, Borough Electrical Engineer, recommends the abolition of meter rentals, and the reduction of the charge for power purposes from 1½d. to 1d. per unit. He also proposes to do away with the cut-out period for power supply, which now operates between 5.30 and 8 p.m. in December and January. It is anticipated that the abolition of meter rentals will mean a reduction of £1,200 a year in revenue, whilst the second reform will cost a further £400, but Mr. Christie argues that the reforms will simplify the tariffs, and bring on a larger number of consumers, which will counterbalance these losses. Before committing themselves to the recommendations, the Council are to have a report from the Borough Accountant on the financial aspect.

Constantinople: *Tramway and Lighting Undertaking.*—According to the *Financial Times* an international company, to be known as the Consortium of Constantinople, is to be formed under Belgian law, with a share capital of £1,800,000 and debentures bringing the total available sum of £3,600,000, to acquire and control tramway, tube railway, and gas and electric lighting enterprises in the city, including the construction of a tunnel connecting Pera and Galata.

Farnham: *Electric Pumping.*—The Public Works Committee propose to substitute electric pumping at the sewage station for the existing steam power. The proposal to use suction gas plant has been put on one side in order to discuss the electric proposition with the Farnham Gas & Electricity Co.

Ilkley: *Electric Lighting Extensions.*—The Council have decided to apply to the Board of Trade for an electric lighting Provisional Order for supplying electricity in the urban district of Ilkley and the districts of Myddleton and Wharfedale.

India: *Bombay Supply Scheme.*—It is stated that the Tata Hydro Electric Power Co. have received applications for power supply to the full limit of their present plant, viz., 34,000 h.p.

Inverness: *Fire at Electricity Works.*—The works of the North of Scotland Electric Light & Power Co. in Inverness were badly damaged by fire last week. The main generating machinery, however, was not injured, although the damage is estimated at £1,000.

Japan: *Electrical Competition.*—The British Consul at Kobe reports that competition for the supply of electrical machinery into Japan is becoming increasingly severe. British manufacturers secured most of the orders for the first power stations that were erected there, but Continental manufacturers have been cutting prices so drastically that they have secured a number of very important contracts. In addition, native manufacturers are becoming formidable rivals, and an instance is mentioned of an electric cable factory in Kobe which, both as regards price and delivery, holds its own easily against foreign competition. The British Consul points out that, in spite of the fact that the English language is generally adopted in Japanese business circles, there is a lack of British commercial travellers there, and the hope is expressed that British firms will make strenuous efforts to retrieve their losses throughout.

London: *Shoreditch: Charges for Power and Factory Lighting.*—The Council have adopted the Electric Lighting Committee's recommendation of a flat rate for supply for power purposes of 1¼d. per unit, for not less than 1,250 units per quarter, with a load factor of at least 10 per cent. A scale of discounts, varying from 5 per cent. to 20 per cent., according to the quantity taken beyond 1,250 units per quarter, is included in the scheme. A new flat rate, ranging from 2½d. to 3¼d. per unit for factory lighting, has also been adopted. In addition, electrical contractors are to be offered electrical energy at 2½d. per unit for the lighting of their showrooms, whilst the supply for street arc lighting is reduced from 1·9d. per unit to 1·5d. per unit. This will show a saving to the general rate of £1,292 per annum. This new scale of charging will come into force after the September meter readings.

Shoreditch: Electric Lighting Accounts.—The net profit on the electricity undertaking for the year to March 31st was £6,811, against £6,432 in the previous year. The sum of £5,000 is carried to reserve for renewals, £1,614 to change of pressure account, and the balance is carried forward.

New Zealand: *Water Power Development.*—Mr. E. Parry, the recently-appointed Electrical Engineer to the New Zealand Government, has inspected the Lake Coleridge water power area with a view to its utilisation for electric power generation. This scheme has been gone into in some detail, but reports are being obtained regarding other water powers. It is anticipated that the scheme at Christchurch will be completed within two years.

South Africa: *Oudtshoorn.*—The Municipal Council propose to borrow £33,000 to purchase the undertaking of the Oudtshoorn Electric Light and Power Co.

Generating Costs on the Rand.—It is reported that the working expenses at the Kleinfontein station work out at 0·74d. per unit, but it is anticipated that further increase of load will bring this down to 0·4d., or even less.

Stourport: *Electric Lighting.*—After some discussion the Council have agreed to allow the Kidderminster & Stourport Electric Power Co. to distribute electricity by means of overhead wires. Negotiations between the Company and the Council referring to this matter have considerably delayed the introduction of electric light into Stourport.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Atherton.—Larger transformers are to be installed.

Bray.—The Council's Electricity Department invite tenders for 2,500 yards, in 440-yard lengths, of 7/18 S.W.G. concentric paper-insulated and plain lead-covered cable for 2,000 volts pressure. Tenders by 19th inst.

Bridlington.—Mains extensions are contemplated at a cost of £1,500.

Herne Bay.—The Council are considering what steps to take with regard to putting their Electric Lighting Order into force.

Holmfirth.—A ratepayers' meeting has approved of the Council's electricity scheme.

Ireland.—An electric lighting scheme is under consideration by the Cavan Council.

Keighley.—A coal-handling plant is required at the electricity works. Particulars from Borough Electrical Engineer.

Leigh (Lancs.).—The Corporation has received sanction from the Local Government Board to borrow £4,587 for an engine, dynamo, condenser, and switchboard.

London: *L.C.C.*—The London County Council invite tenders by Oct. 24th for (1) overhead travelling crane; (2) high-tension cables; (3) low-tension cables; (4) rotary converters and static transformers; (5) high-tension and low-tension switchgear. (See advertisement on another page.)

Manchester.—The Manchester Electricity Committee require a 4,000 to 4,500 kw. low-pressure exhaust type turbo-alternator. (See an advertisement on another page.)

New Zealand.—The Dunedin municipal authorities require a 500 b.h.p. Diesel or gas engine for rope drive to motor generator running at 500 revolutions per minute, and a Diesel oil engine for driving an 800 k.w. continuous-current generator at 550 volts. Tenders to Town Clerk by Nov. 1st. Specifications, &c., at 73 Basinghall Street, E.C.

Russia.—The *Board of Trade Journal* states that the Archangel municipal authorities are negotiating for a loan of £105,000 for electric lighting and other public services.

OSRAM·LAMPS

Hosted by Google

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Arbroath.—Reconstruction of infirmary.

Birmingham.—Extensions to Birmingham telegraph stores. H.M. Office of Works, London.

Bridlington.—Alterations and additions to the North Eastern railway station. Architect, W. Bell, York.

Colchester.—Electric lighting of new wing at infirmary.

Colwyn Bay.—New concert hall.

Dover.—Girls' school, Barton Road. W. C. Hawke, Borough Engineer, Maison Dieu House, Biggin Street, Dover.

Dublin.—New printing works in Boyne Street, for Messrs. Browne & Nolan, Ltd. Architects, Messrs. Doolin & Butler, Dawson Chambers, Dublin.

Durham.—An electric lighting installation is required at the new stores of the Sherburn Hill Co-operative Society, Wheatley Hill. Architect, J. W. Taylor, St. John Street, Newcastle-on-Tyne.

Falmouth.—A committee has been appointed to consider the cost of wiring the workhouse for electric light.

Finchley.—New elementary school for 1,000 children on the Great North Road.

Glasgow.—Post office extension. Office of Works, G.P.O., Glasgow.

Huddersfield.—New post office.

Ilkley.—Proposed winter garden.

Leeds.—Hostel and training college. Architect, W. P. Schofield, Park Row.

Llanrwst.—Extensions to county school. Architect, W. D. Wiles, 42 High Street, Wrexham.

Manchester.—The Markets Committee invite tenders for electrical plant and wiring at their Cold Air Stores, Elm Street. Particulars from Superintendent, Markets Department, Town Hall, and tenders by September 25th.

Redditch.—Biscuit factory. Mr. B. H. Clark, Crabb's Cross, Redditch.

Sale.—Public baths. Architect, W. H. Mitchell, 9A Market Street, Manchester.

St. Helens.—Extensions to school in Elephant Lane. Architects, Messrs. Biram & Fletcher, George Street.

Wakefield.—Additions to Normanton school. Education Architect, County Hall, Wakefield.

Wigan.—Additions to sanatorium. Borough Engineer, King Street West.

MISCELLANEOUS

Birkenhead.—Six double-deck tramcars are required by the Tramways Committee. Particulars from the Electrical Engineer and Manager, and tenders by Sept. 26th.

Bristol.—Tenders are invited by the Docks Committee for one 10-ton and eight 2-ton electric jib cranes for the Royal Edward Dock. Particulars from Docks Engineer, Cumberland Road, Bristol.

Doncaster.—The Corporation have decided to extend their tramway system on the Balby route to Warmsworth.

Durban.—The Corporation require six miles of 95 lb. steel tramrails with fish plates, bolts and nuts, tie bars, and copper bonds. Particulars from Messrs. Webster, Steel & Co., 5 East India Avenue, Leadenhall Street, E.C., and tenders by Sept. 25th.

London: *Hackney.*—Tenders are to be invited for 100,000 pairs of white open type arc lamp carbons.

Manchester.—The Corporation propose carrying out important extensions of their tramway system in Didsbury, and also to extend the Alexandra Park lines along Alexandra Road South to Chorlton-cum-Hardy.

Mexico.—We understand that the tramway system of San Luis Potosi, Mexico, has been sold to Messrs. Hooghwinkel, Anthony Brown, & Partners, Consulting Engineers, of London. The system includes 14 miles of track in the city and suburbs. The line will now be electrified.

Russia.—The *Board of Trade Journal* states that the Archangel municipal authorities are negotiating for a loan of £105,000 for the construction of electric tramways and other municipal services.

South Shields.—The Tramway Manager is preparing a report upon extending the tramways from the Pier head to Mowbray Road.

Electric Smelting.—It is stated that a large electric smelter is to be erected at Kenora, Ontario, in connection with the iron deposits there.

TENDERS RECEIVED AND ACCEPTED

Gateshead.—Messrs. Chamberlain & Hookham, Ltd., have received an order for the equipment of the whole of the Council's cars, viz., 140, with meters.

Lewes.—The tender of the Lewes & District Electric Supply Co., Ltd., for lighting 127 street lamps was discussed at the last meeting of the Council, and was referred back to the Highways Committee for further consideration. The tender represents a saving of about £147 per annum over the price now paid for gas.

London: *Battersea.*—The Council have accepted an offer by Mr. Haydn Harrison to purchase a number of arc lamps which have been displaced in connection with the public lighting conversion scheme. The following tenders have been accepted at schedule rates :—British Insulated & Helsby Cables, Ltd., for 315 ironclad fuse-boxes; W. T. Henley's Telegraph Works Co., Ltd., for 45 two-way switches; Messrs. Lucy & Co., for 45 fuse-boxes and 70 pairs of porcelain bridge fuses.

Manchester.—Tenders for 20,000 tons of best washed slack at 9s. 9d. per ton, and 10,500 tons at 9s. 10d. per ton, were accepted by the Manchester Corporation last week. The interest attaching to these contracts is that at the previous meeting of the Council contracts were recommended with the firms in question, but were referred back as many members of the Council urged that the price should be lower. Since then, however, the market price has gone up, and the Committee have been forced to pay 5d. per ton more than they would have done had their original recommendation been adopted.

Nelson.—The tender of Messrs. Davidson & Co., of Belfast, has been accepted for the supply of a 40 in. induced draught fan for the electricity works stack.

Stockton.—A contract has been placed for a mixed pressure turbine coupled to a Siemens direct-current 400 to 500 kw. generator at £2,923. It is anticipated that the completion of this extension will effect a saving of about 20 per cent. in fuel consumption.

Wolverhampton.—The following tenders have been accepted by the Electricity Committee :—Two motor-driven boosters, the Phœnix Dynamo Mfg. Co., £1,538; battery switchgear, the Electric Construction Co., £1,058 9s.; 400 kw. motor converter and control apparatus, Bruce Peebles & Co., Ltd., £1,060.

APPOINTMENTS AND PERSONAL NOTES

The Hackney Electricity Committee recommend an increase in the maximum salary of Mr. T. Dawby, Works Superintendent, from £200 to £250 per annum. The salary of Mr. E. Matthews, Testing Engineer, is recommended for increase from £130 to £160 per annum by yearly increments of £7 10s., and that of Mr. E. Wilkinson, Deputy Generating Engineer, from £117 to £125 per annum.

An electrical engineer seeks an appointment as representative of a firm of good repute at the Olympia Electrical Exhibition. (See an advertisement on another page.)

In announcing that the secretaryship has now been filled by the appointment of Mr. D. N. Dunlop, the Council of the British Electrical and Allied Manufacturers' Association (Incorporated) beg to return their best thanks to all those gentlemen who were good enough to respond to their recent advertisement inviting applications for it.

There are two vacancies for junior assistants in the Civil and Mechanical Engineering Department of the City and Guilds Engineering College, London. Salary, £150 per annum. (See advertisement on another page.)

Re-union of Old Cromptonians.—A few of those associated with Messrs. Crompton & Co. in the earlier days have arranged to hold a dinner of Old Cromptonians in London on October 14th next, with the object of giving those who were at one time closely associated, and have since drifted apart, an opportunity of renewing friendships, and of spending a pleasant evening. The arrangements are in the hands of a committee consisting of Messrs. W. A. Chamen, S. Dobson, E. J. Fox, H. M. Leaf, W. L. Pakenham, C. Peel, and A. H. Pott, and already some seventy-five old members have indicated their intention of being present at the dinner. Colonel R. E. B. Crompton, C.B., has accepted the committee's invitation to preside at the dinner, and Mr. W. A. Chamen will act as vice-chairman. Anyone who has been associated with the firm, and has not already received notice of the dinner, can obtain full particulars by applying to the Honorary Secretary, Mr. E. J. Fox, Winchester House, Old Broad Street, E.C.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 5s. to £57 15s. (last week, £57 15s. to £58).

Fire.—The Imperial Lighting Company of London inform us that the fire which occurred at their premises at Pocock Street was practically confined to the packing department. The damage was confined to a large number of electrical signs and illuminating material for the Delhi Durbar.

Feld Bros. & Co., Ltd.—This firm have removed to more commodious offices and stores on the ground floor of 25 Budge Row, Cannon Street. Their new telephone number is 1501 London Wall.

Glover's Glasgow Offices.—Messrs. W. T. Glover & Co., Ltd., of Manchester, have removed their Glasgow offices and stores to 158 Hope Street, Glasgow. The Telephone Number has been changed to 3856 Douglas, Glasgow, and the Telegraphic Address remains as before, viz., "Conductors," Glasgow.

Bankruptcies.—The last day for receiving proofs in the bankruptcy of G. V. Barker, Electrical Engineer, of Leeds and Harrogate, is Sept. 23rd. The trustee is Mr. D. S. Mackay, The Red House, Duncombe Place, York.

The trustee in the bankruptcy of J. W. Barnet, Electrical Engineer, 25 Waterloo Road, Burslem, Staffs, has been released.

Electric Ambulances in London.—The Port of London Authority will shortly have delivered four electric ambulances, similar to those at present being used by the City of London Corporation, and which were described in detail in ELECTRICAL ENGINEERING, Vol. I., p. 654. It is proposed to use these vehicles for the Victoria and Albert, Surrey Commercial, London, and the West India dock areas. The estimated cost of the maintenance of this service is put at £4,000 per annum.

Forthcoming Book.—Messrs. Rentell & Co., of 36 Maiden Lane, Strand, will shortly publish a new book by Mr. W. Perren Maycock, entitled "Small Switches, &c., and their Circuits." This will deal exhaustively with various types and forms of small switches and other accessories, and with their connection to lamps, motors, heaters, &c.

NEW COMPANIES

GROSSART & KAY, 196 St. Vincent Street, Glasgow. Capital £1,000. Private company. To carry on electrical engineering business, &c., formerly carried on by W. J. Grosart, trading as Grosart & Gray.

CURTIS & CO.—Private company. Capital, £2,000. To carry on business of electrical engineer, &c., formerly conducted by W. Curtis at 24 York Place, Portman Square. Office, 101 Leadenhall Street.

ORIENTAL M.T.C.—Capital, £10,000. Financiers, electrical engineers, &c. To adopt agreement with Radio & Electric Power Co. Private company. First directors, W. J. van Hoytema and A. C. Grover. Registered by A. J. Greenof & Co., Bush Lane House, Cannon Street, E.C.

BERG, SHEPHERD & CO.—Capital, £1,250. To acquire business of J. Berg carried on at 128 East Road, London, and to adopt agreement with J. Berg and F. H. Shepherd. Private company. Registered by Jenkins, Bakers, Reynolds & Co., 38 Old Jewry, E.C.

INGLEBY & CO., Elland Road, Leeds. Capital, £10,000. To take over an existing electrical engineering business.

PHŒNIX TELEPHONE & ELECTRIC WORKS, 6 Chatsworth Road, Brondesbury. Capital, £50,000. Manufacturers of electrical machinery and telephonic apparatus and appliances. H. O. Oppenheimer, of the above address. is chairman and managing director.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Oxford Electric Co.—Interim dividend for the June half year at the rate of 6 per cent. per annum less discount.

The L.C.C. School of Building.—The London County Council, in sending us the prospectus of the L.C.C. School of Building, Ferndale Road, Brixton, S.W., call our attention to the increased facilities that are now being given for the study of reinforced concrete construction. An elementary as well as an advanced evening course is given by Mr. H. Kempton Dyson (Secretary of the Concrete Institute), assisted by Messrs. R. G. Keevill and A. E. Crabbe.

ACCIDENTAL DAMAGE,

whether caused to persons or things, is quite one of the greatest of life's tribulations. Proper care will avoid a great part of the damage which would otherwise occur, through sheer lack of consideration of the difficulties to be encountered.

The waiter in the illustration might, with care, have avoided the pitfalls which lay at his feet; the engineer can as easily provide for contingencies resulting in damage or breakdown to parts of the installation under his care or supervision by the adoption of suitably designed and constructed fittings.

In factory and mill work this is especially the case. Obviously it is necessary in such situations to provide that lamps (especially when metallic filament lamps are used which are valuable) shall not be accidentally broken by careless employees, or that the wiring itself shall not become unduly exposed to risk of mechanical injury.

One of the firms which have taken this phase most seriously is undoubtedly Simplex Conduits, Limited, if it is possible to judge from the complete manner in which they have dealt with the question.

It is not possible for any single firm to place at the disposal of their customers a more complete range of watertight mill and factory fittings. One typical example is illustrated.

To outward appearances there would seem to be no substantial difference between it and any fitting of the type (which, when all is said and done is well known) of the same nature manufactured (in one or two cases) and factored (in most cases) by other people.

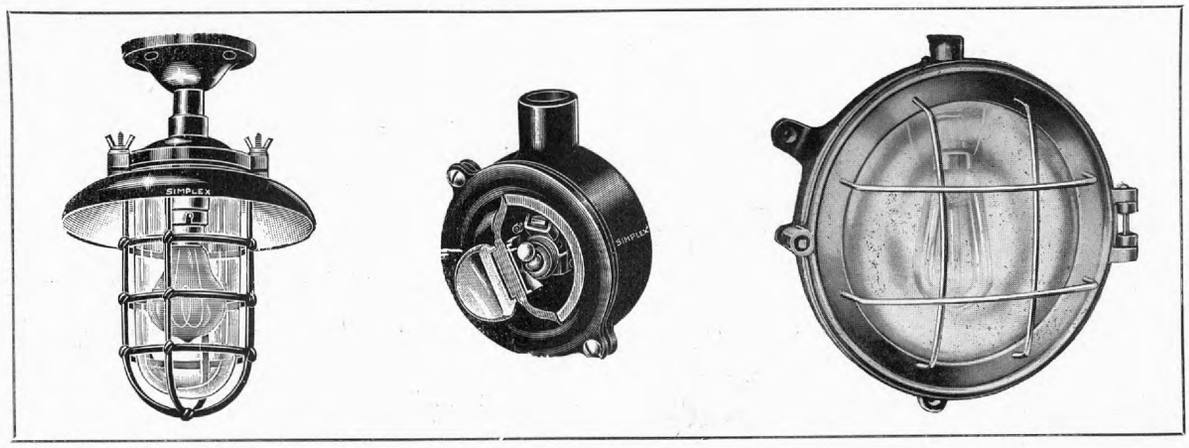
But examination of the construction of the fitting demonstrates where the difference lies. In those supplied by Simplex Conduits, Limited, the quality of the casting would reflect credit on any foundry, whilst there is that about the general finish, weight of the brass parts, and assembling that leaves the observer without any doubt whatever of the fact that there has been no attempt to "scamp" the fitting in a vain endeavour to reduce price.

Price, however, has none the less been considered. There are instances where it is of necessity the deciding factor, and, on the other hand, where quality tells. Simplex Conduits, Limited, are well able to fill the bill in either case. There is to be seen at their exhibit a range of cheap cast-iron fittings, listed at a figure calculated to compete everywhere, and another range made of malleable iron, with vitreous enamelled reflectors and various adjuncts which go to make a high quality article.

These fittings may be had plain or with shade and wire guard and with plain down tube or bent arm for use as a bracket lamp. When head room is limited a useful pattern is shown in which the lantern portion of the fitting is part of the box into which the conduit directly screws. This type affords special protection for the conductors against mechanical injury or damage by moisture.

Space permits no more than a mere reference to the wide range of fittings of a similar type manufactured for the reception of high candle-powered lamps or clusters of lamps and of various designs to suit the many tastes and requirements of electrical engineers.

These include both cast-iron and spun metal fittings, outside lanterns for attaching to street posts, cargo fittings for ship and colliery work, and so on. In all cases suitable bracket arms for supporting these fittings either with a spigot, a double-pole switch box for going on top of a post, or with a metal band for attaching to a pole are available.



In watertight switches and wall-plugs some excellently designed fittings are put on the market and exhibited at stands Nos. 148 and 163 at the Electrical Exhibition.

Type No. 7484, illustrated herewith, is unique in that it has the smallest projection of any watertight switch on the market. The switch is actuated by a quarter turn of the brass milled head, and so arranged that a perfectly quick break is assured. The design gives such perfect watertightness that the switch may be safely operated even under water.

No article dealing with the manufacture of watertight fittings would be complete without reference to those suitable for shipwork. Simplex Conduits, Limited carry out brass-casting work of the same high quality that characterises their iron fittings. As requirements vary so largely it is impossible for the Company to show more than one or two typical patterns, of which one is illustrated below.

Careful examination of the actual fittings just described will carry the conviction that each one is calculated to fulfil its object, *i.e.* the prevention of ACCIDENTAL DAMAGE. Factory and mining engineers should not fail to visit

STAND Nos. 148 and 163.

THE ELECTRICAL EXHIBITION OF 1911

IT may be regarded as a foregone conclusion that the Electrical Exhibition which will be opened at Olympia (London) next Saturday will be a success. Its two primary objects will be fulfilled: to bring home to the general public the enormous strides that have been made in electric lighting and other applications of electricity during the last few years, and to draw together into closer touch the various sections of the electrical industry. So far as the first of these objects is concerned, it must be remembered that it is six years since a great electrical exhibition has been held in London. During those six years electric light has ceased to be a luxury. Thanks to the development of the metal filament lamp it has become the most economical method of illumination, not only for large buildings, shops and warehouses, but also for the average dwelling house. The Londoner will not come to the exhibition merely to inspect the latest advances in this fascinating branch of applied science; he will regard the display at Olympia from a more personal point of view, and will visit Olympia largely for the purpose of informing himself of the most recent improvements so that he may derive, as a consumer of electricity himself, a direct benefit from his knowledge of these. He will be able to see that electric cooking has now passed far beyond the experimental stage, and that electric power can serve him not only as applied on tramways and railways and for industrial purposes, but also for such homely uses as the working of vacuum cleaners, boot brushes and the domestic laundry. At the Manchester Electrical Exhibition in 1908, one of the most conspicuous features was the great improvement that had been made in the design of motors, control gear and accessories for power distribution in workshops, which appealed greatly to the industrial public in the Midlands. In London this year such exhibits will not be lacking in number, but we predict that it will be the domestic applications of electricity which will attract the larger proportion of the public.

We are also confident that the second object of the exhibition will be attained, namely, the bringing together of the various sections of the industry. The exhibition has been organised by the British Electrical and Allied Manufacturers' Association—by which name the National Electrical Manufacturers' Association is henceforth to be known—but the chief officials of the electric supply authorities have taken an active part, and the Electrical Contractors' Association is also represented. There is no doubt that the exhibition will be a common meeting ground for the manufacturer, factor, and the contractor, as well as an exhibition for the consumer, and that one of its effects will be to improve the cohesion and solidarity of the different branches of the industry, and generally to increase its efficiency as one great organisation for enabling the public to derive the utmost advantage for the application of electricity.

THE COMMITTEES, ADMINISTRATION, AND MANAGEMENT

THE President of the exhibition is Sir William H. Preece, K.C.B., F.R.S., who will formally open the exhibition at 2 p.m. on Saturday, and who will preside at the inaugural dinner on the previous day. An Honorary Advisory Committee consists of 56 members, including the engineers-in-chief to the various supply authorities in London, several consulting electrical engineers and other prominent men. The Executive Committee is constituted as follows, under the chairmanship of Mr. H. W. Butler:

H. BERRY (Berry, Skinner & Co.).
H. BEVIS (Pirelli, Ltd.).
JOHN CHRISTIE (Borough Electrical Engineer, Brighton, and President of the Incorporated Municipal Association, 1910-11).
A. C. CRAMB (Borough Electrical Engineer, Croydon, representing the Associated Municipal Electrical Engineers of Greater London).
JAMES DEVONSHIRE (Electrical Federation).
D. N. DUNLOP (British Westinghouse Electric & Mfg. Co., Ltd.).
T. E. GATEHOUSE.
T. J. GRAINGER (Sunbeam Lamp Co., Ltd.).
B. LONGBOTTOM (Electromotors, Ltd.).
P. A. LUNDBERG (A. P. Lundberg & Sons).
W. M. MORDEY (Past President of the Institution of Electrical Engineers).
F. H. NALDER (Nalder Bros. & Thompson, Ltd.).
H. OPPENHEIMER.
W. R. RAWLINGS (representing the Electrical Contractors' Association, Incorporated).
H. C. SIDDELEY (Lancashire Dynamo & Motor Co., Ltd.).
F. J. WALKER (General Manager of the St. James' and Pall Mall Electric Light Co., Ltd., representing the Conference of the Chief Officials of the London electric supply companies).
S. D. WHITE (General Electric Co., Ltd.).

Consulting Electrical Engineer:—ALBION T. SNELL.
Honorary Consulting Electrical Engineer:—S. G. CASTLE RUSSELL.

The Business Management and Organisers of the exhibition are the International Trade Exhibitions, Ltd., whose manager, Mr. H. L. Benjamin, has been working in conjunction with Mr. F. B. O. Hawes, secretary of the British Electrical and Allied Manufacturers' Association, both of whom have been indefatigable in dealing with the innumerable details which an exhibition of this character involves. As was the case at Manchester, the actual exhibitors themselves are to participate in the profits of the exhibition—a benefit which, we believe, the exhibitors derive in no other trade exhibition of this character. After organisation and administration expenses have been deducted from the gross profits, the balance goes to the British Electrical and Allied Manufacturers' Association, who will doubtless allocate sums to the benevolent funds connected with the industry, as has been done in previous years, and this year it is not inconceivable that a part of the profits will be retained towards the cost of extending the scope of the Association before the balance is distributed.

SOME OF THE FEATURES OF THE EXHIBITION

While the main attractions at the exhibition, at any rate to the large body of our readers, will be the exhibitors' stands, mention may be made of some of the other features. A large electric sign, erected by the Imperial Lighting Co., will cover the whole front of the building. It will be in the form of a very large "Union Jack," in the centre of which will be the words "Electrical Exhibition, September 23 to October 21." The letters will be 3′ 6″ high, and will be fitted with metallic-filament lamps, and on both sides there will be coloured electric lamps on "fairyland" strip, with fairyland reflectors. At each end of the frontage there will be a 100-ampere searchlight, throwing the light on the dome of the building, and adjacent

Hosted by Google

to these searchlights will be a large imitation electric fountain. Between the imitation fountain and the centre of the building will be representations of lightning flashes with a controller to make the lamps light in quick succession until the point of the flashes is reached, when an electric sign consisting of the words "Heating, Cooking, Lighting, Power" will immediately light up. After a short interval these words are extinguished, and the lightning flashes recommence. The total current consumed will be about 230 amps. at 220 volts, the searchlights working two in series.

In addition to the signs on the exhibitors' own stands, some fine signs will also be shown on the gallery rails. The British Thomson-Houston Co. will have on the gallery over the entrance to the exhibition a sign 32 feet long and 3 feet 6 inches high. It will contain nearly 3,000 Mazda lamps, and, by means of a flasher at ten-second intervals, seven different changes of wording will be shown.

Siemens Bros. Dynamo Works are also erecting a 32-foot sign on the gallery balustrade at the end of the hall, and on this their "focus" tantalum lamps will be employed. It will have in all 200 25-c.p. lamps of this pattern, and will be totally enclosed in a plate-glass covered case. The letters are of bevelled wood and gilt; they are 3 feet high, and each letter is wired separately. Messrs. Siemens have also an illuminated sign over their stand, and two other signs of a new type on the gallery at each side of the hall.

Two working electric lifts will be shown. R. Waygood & Co., Ltd., will have a full-sized passenger lift for conveying passengers to the gallery. This is operated by a car switch with self-centring detachable handle in the cage, the gates being fitted with electrical and mechanical locks to prevent the lift being worked while any gate is opened, and to prevent the gates being opened unless the cage is opposite the floor. The second passenger lift in operation is by Marryat & Place. It is erected in a steel tower about 40 feet high, and is fitted with special safety features, a two-speed arrangement, and an automatic floor-levelling device.

Electric cooking will be much in evidence. Several firms are showing cooking apparatus on the ground floor, and cooking demonstrations will also be carried on in the gallery.

An exhibit of great interest to the general public as well as to the electrical engineer visitors will be the Marconi apparatus. The Marconi Co. is erecting a station on the gallery and another on the main floor, and wireless messages will be sent between the two stations. The telewriter will also be shown at a stand on the ground floor. A historical Post Office exhibit on the gallery will, we understand, be even more interesting than on previous occasions, and the Exhibition telephone exchange will be in the building itself, on the ground floor.

An interesting negative feature at the Exhibition, if we may use the term, is that there will be no band. At the Manchester Electrical Exhibition three years ago there was an excellent band every day, but this was not an entire success; those who desired to listen to the music were disturbed by the loud electric bells, hooters, and the noise of moving machinery shown by the exhibitors, while the exhibitors near the band gallery frequently found it hard to talk to their visitors, and were also embarrassed by the crowd who came to hear the music, and prevented access of others to the stands near it. Not only will there be no band, but, with the exception of the electric piano in the electric home, there is to be no mechanical piano or orchestrion, and we anticipate that phonograph and gramophone exhibits will not be numerous.

No public lectures have been arranged on this occasion in connection with the Exhibition; the entertainments of this character will doubtless be sufficiently well provided by the exhibitors themselves. It is anticipated, however, that several electrical and allied societies will hold meetings at the Exhibition, but the details have not yet all been arranged. The Junior Institution of Engineers will visit the Exhibition on Tuesday next, and it is anticipated that there will be an attendance of over seventy members; and the Electrical Contractors' Association has also decided to have a meeting there, the date of which has not yet been fixed.

THE ELECTRIC HOME

The whole width of the gallery at the opposite end of the hall to the main entrance will be occupied by a suite of rooms which have been erected by Messrs. John Barker & Co., Ltd., of Kensington, in which the application of electricity to domestic purposes will be shown in its entirety. The exterior of this suite will be decorated in the French Renaissance style. The dining-room will be Georgian, with Queen Anne furniture; the drawing-room Colonial Adams, with panels filled with Rose du Barry wallpaper, the furniture being Adams; whilst the bedroom will be decorated in the simple Adams style, with Sheraton furniture. The hall will be broad and simple in treatment, with rough surfaced walls. There will also be a bath-room, kitchen, scullery, and laundry.

Current for this suite of rooms will be generated by a 4-h.p. paraffin electric lighting set, generating at 50 to 70 volts. Owing, however, to the Exhibition regulations, which prohibits the running of such a paraffin engine, a motor supplied from the Exhibition mains will be connected direct on to the shaft of the engine, and the set will be worked by this means. There will also be a 50-volt, 27-cell, E.P.S. battery, which will not, however, be charged, but will be shown as forming one of the necessary items of a country-house plant. An electrically-driven pump will also form part of the equipment. The engine-room, which will be ventilated by an electric fan, together with the battery-room and laundry, will be in a house separated from the living rooms by a garden. Practical demonstrations will be given of laundry work, using electric irons and other apparatus. The hall will be lighted by five-light Georgian ceiling fitting, with a handsome cut-glass bowl, and there will also be an electric hat pad, cigar lighter, and an electric log-fire. The equipment of the dining-room will include electric kettles, hot plates, coffee machines, plate warmers, &c., whilst the lighting will be by means of a six-light candelabra in the centre, and four three-light brackets. There will, of course, be an electric radiator. The special feature of the drawing-room will be the concealed lighting, by means of 66 lamps in the cornice. There will also be a number of floor standards, bronzes, &c. Demonstrations of electric massage treatment will be given in the bedroom, whilst one of the best-known lady cooks in London has been engaged to give cooking demonstrations in the kitchen. An electric light bath is fitted in the bath-room, and there will also be an entirely new water-heater, which Messrs. Barker are showing for Messrs. Eastman & Warne. A Therol water-heater is included in the equipment of the scullery.

OPENING OF THE EXHIBITION

An inaugural banquet will he held on Friday at the Trocadero, 7 p.m., at which the President, Sir W. H. Preece, K.C.B., F.R.S., will preside. All the exhibitors have been invited to this, in addition to the Honorary Advisory and Executive Committees, and a number of other distinguished patrons. Sir William Preece will formally declare the Exhibition open on

Saturday at 2 p.m. It should be noted, however, that the doors of the Exhibition will actually be opened to the public at 10.30 a.m. on Saturday, and we desire to impress on all exhibitors the desirability of having their stands absolutely complete by that time.

ELECTRIC LIGHT AND POWER SUPPLY AT THE EXHIBITION

IT is only natural that the possibilities of electric light and power are being taken advantage of extensively at an electrical exhibition, and a few notes on the arrangements made for an adequate supply of current to exhibitors and for the general purposes of the exhibition will be of interest.

The whole of the supply for light and power, with some very small exceptions, where exhibitors are providing their own generating plant, is obtained from the electricity works of the Hammersmith Borough Council at Fulham Palace Road, and Mr. H. H. Bell, the Borough Electrical Engineer has made special arrangements to ensure continuity of supply by the provision of two separate direct feeders always fed respectively from completely separate and unconnected generating plant in the station. This supply is given to the New Olympia Co. at 2,000 volts two-phase 50 cycles, and inside the building is dealt with by the company and the exhibition authorities in the following way:—First of all there is a single-phase distribution all over the building for ordinary lighting and for the use of exhibitors at 220 volts. This is obtained from two separate sets of permanent transformers, one for each incoming main placed in different parts of the building so that the two supplies are distinct throughout, and the lighting is grouped on the two circuits so that the failure of one will throw no part of the building into darkness.

Three-phase and continuous current supplies will also be available throughout the exhibition from a special substation, itself forming an exhibit and situated on the east side of the main hall at stand 241. Here, within a red-brick building with armoured glass inspection windows, will be for the three-phase supply a group of transformers manufactured by the British Electric Transformer Co., arranged according to the Scott connection to transform from 2,000 volts two-phase to 220 volts three-phase, and capable of an output of 150 kw. In the same substation will be the plant for giving the continuous current supply. For this purpose first of all, a rather larger group of transformers, also arranged in the Scott connection, convert to three-phase at about 650 volts, and the supply is further transformed to six-phase in another transformer at a suitable voltage for the supply to a special rotary converter. This machine, which has been made by Messrs. Vickers, Ltd., has an output of 300 kw. at 220 volts continuous. A small induction motor is provided for starting up, and the machine, situated on the stand outside the transformer house, will form an attractive exhibit. It should be mentioned that the controlling switch-gear for the rotary converter was supplied by Messrs. Ferranti, Ltd., while Messrs Johnson and Phillips are responsible for the switch-gear on the high tension side of the transformers.

In addition to the 300 kw. obtainable from the rotary converter a further continuous current supply of 150 kw. is also available from two motor generators in permanent substations on opposite sides of the building, one conected to each of the main feeders from the Hammersmith Electricity Works, and thus taking full advantage of the duplication of the supply.

The distribution about the exhibition does not call for special remark; substantial steel conduit tube is used throughout, and there will be junction boxes at convenient points in the floor of the main hall, under the galleries and in the roof of the annexe. The exclusive contract for the meters, main switches, &c., on the actual stands was given to Messrs. Ferranti, Ltd.

As mentioned already, a few exhibitors will generate current by generating plant on their stands. The plant in question will include gas and oil engines, but there will be no working steam plant and no boilers of any kind in the exhibition.

The charges to exhibitors are according to the following schemes: Alternating current for small demands can be obtained for fixed inclusive sums of £2 2s. up to 0·28 kw., £3 15s. up to 0·56 kw., or £5 5s. up to 0·84 kw. maximum demand. Single- or three-phase supply by meter for larger loads will be charged, whether for lighting or power, at 2½d. per unit, and continuous current at 3½d. per unit, in addition to terminal charges, varying from £3 3s. for 2 kw. up to £20 for 20 kw., which include meters, &c. In the case of three-phase supply an extra amount will be charged for hire of distributors, which have to be specially run from the substation.

These charges will seem at first sight high as compared with those in vogue especially for power elsewhere, but it must be remembered that exhibition conditions are not favourable to cheap power supply. Not only has plant to be maintained at the generating station, which is only called upon during a small part of the year, but within the exhibition considerable sums have to be spent in temporary plant mains and connections which has only four weeks in which to recoup itself.

An excellent set of rules has been drawn up as regards the installations on the stands themselves, the rigid enforcement of which should eliminate all fire risk. Restrictions are placed on the capacities of the branch circuits, and certain requirements are imposed as regards switches, fuses, and conductors. "Fairyland" and similar strips are allowed, but unless the holders are metal backed, must be mounted on fireproof material. E.L.B. strip is only allowed in iron cases with glass fronts. Special regulations apply to the number of lamps for circuit in illuminated signs, and adequate precautions regarding fireproof construction are insisted on. Equally reasonable regulations apply to arc lamps and motors.

The whole installation is being carried out under the supervision of Mr. Albion T. Snell, consulting engineer to the exhibition, while Mr. S. G. Castle Russell is acting as hon. consulting electrical engineer. Many of the detailed arrangements are due to Mr. F. B. O. Hawes, upon whom, as secretary of the executive committee, much work is devolving, and we must express our thanks to him for courteously putting information at the disposal of our representative at a time of great pressure of work.

BOOKSELLERS AND TECHNICAL BOOKS.

There are few booksellers, if any, who are in a position to keep in stock a complete library of the latest and best technical books. It would be an enormous convenience to engineers and students who wish to obtain a book on any particular subject if they could go to a bookshop with the confidence that they can immediately be shown there the latest, best, and most up-to-date books which treat of it.

Arrangements have been made by the Kilowatt Publishing Co., Ltd., to afford this facility to electrical engineers who are visiting the Electrical Exhibition at Olympia.

At Stand No. 152, which bears in bold letters the legend "Electrical Engineering," there will be open to inspection and purchase almost every good book on electrical and allied subjects. These have been selected under the guidance of the editorial and reviewing staff of ELECTRICAL ENGINEERING, which includes eminent specialists in all branches. The stand is situated near the centre of the hall, slightly to the right of the main avenue.

For Notes on Exhibitors' Stands, see p. 8.

For Key Plan and Alphabetical List of Exhibitors, see pp. 12 and 15.

Hosted by Google

THE EXHIBITORS' STANDS

We have already mentioned some of the leading features at the Exhibition, and we append some notes giving the chief contents of the stands of some of the principal exhibitors. To avoid any invidious distinctions, we have arranged the firms in alphabetical order, and not in order of magnitude.

THE ADAMS MANUFACTURING CO., LTD.—Motor-controlling apparatus, many in action, and an example of the application of their metallic theatre dimmer.

JOHN BARKER & CO., LTD.—Completely furnished electric home, of which particulars are given on another page.

THE BASTIAN ELECTRIC HEATING SYNDICATE, LTD.—Heaters of various descriptions employing the Quartzalite resistance element. Electric irons and cooking appliances.

THE BASTIAN METER CO., LTD.—Electrolytic meters.

THE BENJAMIN ELECTRIC, LTD.—New forms of lampholders, cluster fittings, &c., not requiring internal wiring, special reflectors, window lighting fittings, &c.

THE BERRY CONSTRUCTION CO., LTD.—In addition to an electric cooking demonstration in the gallery, the company will exhibit their latest forms of "Tricity" cookers, &c., on their stand in the main Hall.

G. M. BODDY & CO.—Wire-drawn tungsten filament lamps.

THE BRITISH ALUMINIUM CO., LTD.—Samples of aluminium as used in the electrical industry. Cables, transmission line material, switchboard connections, and coils for railway motors.

THE BRITISH ELECTRIC TRANSFORMER CO.—Transformers of various kinds, and auxiliary apparatus connected therewith.

THE BRITISH PROMETHEUS CO., LTD.—High class electric cooking appliances and apparatus in action.

THE BRITISH THOMSON-HOUSTON CO., LTD.—An important feature of this exhibit will be the display of Mazda drawn-wire filaments lamps for all purposes. B.T.H.-Edison and Gem lamps will also be exhibited, and Holophane and other special shades and reflectors will be shown in conjunction with Mazda lamps. Other exhibits on the stand will include motors, instruments, heating and cooking devices, rheostats, and regulators, and automatic contactor switches in operation, as well as Tirrill regulators, transformers, arc lamps, and other examples of switchgear plant and apparatus forming a comprehensive display.

THE BRUSH ELECTRICAL ENGINEERING CO., LTD.—A Brush-Parsons combined action and reaction mixed pressure turbine, with continuous-current generator. A small generating set with reciprocating engine, motors, hoists, grinders, &c., and a demonstration of the collector gear of the Bremen system of railless trolley traction. Metallum lamps.

THE BRIMSDOWN LAMP WORKS.—Brimsdown metal filament lamps manufactured in Great Britain by the colloid tungsten process. An entirely new reflecting illumination strip.

C. W. BURTON GRIFFITHS & CO.—Machine tools.

CALLENDER'S CABLE & CONSTRUCTION CO., LTD.—Underground junction boxes, feed pillars, a special colliery winding-drum, samples of special alloys, preservative paints, and insulating materials. The company will also exhibit the "Fors" accumulator, which they manufacture for Messrs. Richard Pape, Ltd.

DRAKE & GORHAM, LTD.—Frisby's patent mechanical current gauge, magnetic clutches, quartz heating apparatus, Price's heaters for greenhouses, &c., Holophane glassware, vacuum cleaners, decorative fittings, arc lamps, and accessories.

DUNCAN, WATSON & CO.—Prominent features will be a vacuum cleaner mounted on a rotating platform over the stand, and an electric fountain.

THE DUSSEK BITUMEN CO.—"Trinidite" joint-box compound, refined Trinidad bitumen, resin oil, bituminous preservative paint, grease, &c.

EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD.—Metal filament and carbon incandescent lamps, arc lamps, switches, instruments, and fittings.

THE ELECTRICAL APPARATUS CO., LTD.—Prepayment and other meters, motor control gear, including slow-motion, automatic, and single-phase starters. A new induction speed controller, switch-fuses, and cinematograph resistances.

ELECTRICAL ENGINEERING (Kilowatt Publishing Co., Ltd.).—Copies and bound volumes of ELECTRICAL ENGINEERING. Framed technical illustrations and cartoons, and a carefully chosen selection of books (which will be on sale) on all branches of electrical engineering and allied subjects.

ELECTROMOTORS, LTD.—Representative sizes of a specialised range of continuous-current motors, with demonstrations of their application to the driving of various types of machinery. Pipe-ventilated motors, ship-lighting sets, electric pumps, hoists, fans, &c.

EVERETT, EDGCUMBE & CO., LTD.—The Luxometer (described on another page), water-tight ammeters and voltmeters, dynamometer type instruments. A new tramcar speed-indicator. Recording instruments of a penless pattern, relays, electrical engine-room telegraphs, tachometers, &c.

EVERSHED & VIGNOLES, LTD.—Ammeter and voltmeter testing sets, including the latest patterns of Megger and Ducter water testers, ship telegraphs, recording instruments, speed indicators, electric soldering irons, &c.

FERRANTI, LTD.—An exhibit arranged in very original style. Large quantities of apparatus will be shown, disposed in an unusual and extremely practical manner, and one of the features is switchgear in a pit to give a sub-station "atmosphere." A new form of continuous-current motor starter will attract considerable attention. Among other apparatus shown are contactless shunt and lamp regulators, switches, fuses, meters, time switches, and electric cooking apparatus, as well as a comprehensive collection of high and low tension switchgear, instruments, &c.

FOSTER ENGINEERING CO., LTD.—Enclosed arc lamps, small and large transformers, and other specialities, including alternating-current bells. A display of Foster metal filament lamps will also be given.

THE GENERAL ELECTRIC CO.—This firm's exhibit will cover considerable range, and will include representative dynamos and motors from the Witton works, oil engine country house generating sets, Butt magazine and other arc lamps, Witton-Kramer electric drills, grinders, &c., fans, switchgear in great variety, switchboard and testing instruments, Osram and Robertson lamps, the latter in course of manufacture; motors, fittings, heating and cooking apparatus, telephones, fire alarms, bells, medical apparatus, wires, cables, and conduits, and a complete display of Aron electricity meters.

MESSRS. GENT & CO., LTD.—Electric clocks, intercommunication telphones, bells, and indicators, water-level indicators, &c.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD.—Cables and cable accessories in great variety, including gutta-percha, paper, and vulcanised bitumen cables, jointing materials, joint-boxes, and feeder pillars. Samples of cables made for special purposes will be shown, and an important feature of the exhibit will be an entirely new surface wiring system.

THE HOFFMANN MANUFACTURING CO.—Ball bearings and demonstrations of their use.

RICHARD HORNSBY & SONS, LTD.—A suction gas plant and engine, generating sets driven by petrol and oil engines.

W. & R. JACOBS.—Glass shades and fittings, pocket flash lamps, torches, &c., and electrical novelties.

THE JANDUS ARC LAMP AND ELECTRIC CO.—The latest patterns of Jandus regenerative arc lamps.

JOHNSON & PHILLIPS, LTD.—Metroflam and other arc lamps, V.I.R., paper-insulated and lead-covered cables, vulcanised bitumen cables, a motor generator, searchlight apparatus, remote control high-tension switchgear, switches, fuses, service boxes, crane plugs, lightning arrester resistances, &c.

LAING, WHARTON, LTD.—A 100,000-volt transformer in operation, high-tension switchgear, insulator circuit-breakers, relays, fuses, and lightning arresters.

THE LANCASHIRE DYNAMO & MOTOR CO., LTD.—Typical examples of dynamos, motors, and other electrical machinery.

THE LONDON DECORATIVE METAL WORKS.—Decorative switch-plates, door fittings, &c.

THE LONDON & RUGBY ENGINEERING CO.—Mechanical stokers, coal-conveying plant, and the Rugby metal filament lamp.

A. P. LUNDBERG & SONS.—A complete series of small switches, plugs, and sockets, &c. Two-way, intermediate, twin, and other special types of switch for particular purposes.

MAJOR & CO., LTD.—Insulating varnishes, &c.

MARCONI'S WIRELESS TELEGRAPH CO., LTD.—Two working wireless telegraph stations.

MARRYAT & PLACE.—Electric passenger lift.

MIRRLEES, BICKERTON & DAY, LTD.—A four-cylinder, 160 h.p. Mirrlees-Diesel oil engine, coupled to a dynamo, to demonstrate running on variable load.

NALDER BROTHERS & THOMPSON, LTD.—Ammeters and voltmeters of the soft iron, moving coil dynamometer and recording types, portable instruments. The Ohmer insulation testing set. Thermal limit switches and electrical thermometers.

W. T. NICHOLSON & CLIPPER CO., LTD.—Belt fasteners, tool handles, &c.

THE NATIONAL TELEWRITER CO., LTD.—Demonstrations of the Telewriter writing telegraph apparatus.

OLIVER ARC LAMP, LTD.—Magazine and other arc lamps, and samples of a new light aluminium alloy known as vanalium, claimed to withstand corrosion by sea water.

BRUCE PEEBLES & CO., LTD.—Examples of Peebles motor-converters (La Cour patents), split-pole converters, A.C. and D.C. motors. Mining, crane, and traction motors.

ABOUT METERS IN GENERAL

★

Our new Meter Catalogue is a beautifully illustrated volume dealing in detail with the design and methods of manufacture of all our meters, and concluding with some practical notes on testing. (*Vide* "Electrical Engineering," Aug. 31, 1911.)

It is BETTER to USE OUR METERS than to spend your time in vain repinings . . .

It is no use CRYING OVER SPILT MILK. It is just as useless to sigh over LOST UNITS. Get rid of your troubles by using OUR METERS.

INTERESTING PROBLEMS
concerning the sale of electricity occur every day.
WE CAN help you to SOLVE THEM.

WHITTAKER'S BOOKS

PRACTICAL TESTING OF ELECTRICAL MACHINES. By L. OULTON, A.M.I.E.E., and N. J. WILSON, M.I.E.E. Pocket size, with 90 Illustrations. **4s. 6d.** net.

PRINCIPLES OF DIRECT CURRENT ELECTRICAL ENGINEERING. By JAMES R. BARR, A.M.I.E.E. With 294 Illustrations, several of which are coloured. Medium 8vo. **10s.** net.

TRANSFORMERS FOR SINGLE AND MULTI-PHASE CURRENTS. A Treatise on their Theory, Construction and Use. By Professor GISBERT KAPP, M.I.C.E., M.I.E.E. Second Edition. Entirely re-written and enlarged. With 219 Illustrations. **10s. 6d.** net.

ARMATURE CONSTRUCTION. A Practical Treatise for Electrical Engineers. By H. M. HOBART, M.I.C.E., M.I.E.E., and A. G. ELLIS. With 420 Coloured Diagrams and Illustrations. **15s.** net.

CENTRAL STATION ELECTRICITY SUPPLY. By A. GAY, M.I.E.E., and C. H. YEAMAN, A.I.E.E. Second Edition. Rewritten and Enlarged. With 278 Illustrations. **10s. 6d.** net.

POLYPHASE CURRENTS. A Practical Treatise for Electrical Engineers. By A. STILL, A.M.Inst.C.E., M.I.E.E. With 108 Illustrations. **6s.**

THE INSULATION OF ELECTRIC MACHINES. By H. W. TURNER, Mem.A.I.E.E., and H. M. HOBART, M.I.E.E. With 162 Illustrations. **10s. 6d.** net.

ELECTRICITY IN HOMES AND WORKSHOPS. A Practical Handbook. By S. F. WALKER, M.I.E.E. Fourth Edition, Revised and Enlarged. With 205 Illustrations. **5s.** net.

SINGLE-PHASE COMMUTATOR MOTORS. By F. PUNGA. Translated from the German by R. F. LOOSER, A.M.I.E.E. With 81 Illustrations. **4s. 6d.** net.

Whittaker's Publications may be seen at the Exhibit of "Electrical Engineering," Stand No. 152, at the Electrical Exhibition, Olympia.

WHITTAKER & Co., 2, White Hart St., Paternoster Sq., LONDON, E.C.

LEWIS'S CIRCULATING SCIENTIFIC LIBRARY

Comprises a large collection of Scientific and Technical works dealing with Electricity, Engineering (Electrical, Mechanical and Civil), Metallurgy, Chemistry, Geology, Physics, etc., etc.

The library is invaluable to Electrical Engineers desiring to consult works on their own or allied subjects.

Annual subscription Town or Country from one guinea.

Reading Room open daily to subscribers.

Lewis's Quarterly list of New Books and New Editions added to the Circulating Library, with nett prices and postages, will be sent post free on application.

H. K. LEWIS,
SCIENTIFIC & GENERAL BOOKSELLER,
136, Gower Street & 24 Gower Place,

ELECTRICAL EXHIBITION OLYMPIA . .

Do not fail to visit us at Stand 104/111. We are showing the Latest Improvements in Modern Electric Installation practice and the only conduit system which is entirely free from condensation troubles:—
The KALKOS SYSTEM.

Hosted by Google

OZONAIR, LTD.—Apparatus for the production and utilisation of ozone for industrial and commercial applications, ventilating plant, &c.

PHŒNIX DYNAMO MANUFACTURING CO., LTD.—Special motors for mining work, a new plating dynamo, an automatically-controlled electric pump, electric portable tools.

PINCHIN, JOHNSON & CO., LTD.—Vacuum impregnating apparatus, insulating varnishes, &c.

POOLEY & AUSTIN.—Dynamos and motors manufactured by Messrs. Mawdesleys, Ltd. (Dursley). Switchgear instruments, &c., manufactured by Spagnoletti, Ltd., and heavy ironclad motor control gear manufactured by Engineering Instruments, Ltd. (Darlington), oil-engine generating sets, electrically-driven pumps, &c.

POPE'S ELECTRIC LAMP CO.—Metal filament lamps for every purpose.

HANS RENOLD, LTD.—Steel driving chains and wheels for the transmission of power.

A. REYROLLE & CO., LTD.—High- and low-tension ironclad switchgear, motor starters, fuses, and accessories.

SIEMENS BROTHERS & CO., LTD., AND SIEMENS BROTHERS DYNAMO WORKS, LTD.—An important display will be made by the Siemens firms, comprising cables and accessories, including braiding machines and Stannos wires and fittings, telegraph and telephone apparatus, railway signalling appliances, arc lamps, electro-medical apparatus, fans, heating and cooking apparatus, fuses, motors, examples of special designs of mining switchgear, controllers, and starters; batteries, line material, testing instruments, tantalum and one-watt lamps, and a display of fittings, signs, &c.

SIMPLEX CONDUITS, LTD.—Examples of the well-known Simplex conduit tubes and fittings, heating and cooking apparatus, including kettles and toasters, artistic fittings, special fittings for holophane glassware, electric radiators, and connectors, distribution boards, bi-metal and other fuse wires, &c.

SPAGNOLETTI, LTD.—High- and low-tension switchgear, instruments, &c., the Bowie miner's safety lamp relighter.

THE STERLING TELEPHONE & ELECTRIC CO., LTD.—"Parlyphones" for connecting to ordinary bell wires. Intercommunication telephones of several patterns. Central battery wall and table sets. A new table branch switchboard, bells, fire alarms, and blasting apparatus.

THE SUN ELECTRICAL CO., LTD.—The Kalkos conduit system of wiring, including special iron joint-boxes, electric signs, and flashers, as well as fittings and accessories, fans, and heating and cooking apparatus.

THE SUNBEAM LAMP CO., LTD.—Carbon and metal filament lamps, including a new type of the latter with continuous wire filaments. Lamps for special purposes, fittings, and accessories.

THE SUNDERLAND FORGE & ENGINEERING CO., LTD.—Steam engines, electric winches, continuous- and alternating-current motors.

BERTRAM THOMAS.—An automatically-controlled electrically-driven air compressor, automatic and other starters and regulators, representative switchboard panels, electric ovens and cooking distribution boards.

UNION CABLE CO., LTD.—Cables of all clases, junction boxes, &c.

VICKERS, LTD.—Rotary converters, D.C. and A.C. motors and motor generator control switchboard, centrifugal and propeller fans, motor starters, controllers, &c., switches for various purposes, heating and cooking apparatus, arc and incandescent lamps and lighting accessories, samples of the new alloy, duralumin, roller bearings, &c.

WALKER, HORROCKS & CO.—Automatically controlled petrol-driven generating sets.

THE WANDSWORTH ELECTRICAL MANUFACTURING CO., LTD.—Switches and switchboards, including some fitted with their patent earthing attachment to comply with Board of Trade regulations.

R. WAYGOOD & CO., LTD.—In addition to the passenger lift to the gallery, the company are showing a push-button goods lift, and working models of hand-power goods lifts and push-button electric passenger lifts.

WESTERN ELECTRIC CO.—Telephones and exchange switchboard apparatus.

THE WESTINGHOUSE BRAKE CO., LTD.—Oil engines, driving chains.

THE WESTINGHOUSE COOPER HEWITT CO., LTD.—Mercury vapour lamps and converters, fluorescent light transforming reflectors.

ELECTRIC LIGHTING CASING. Special clean white 1½ in. at 22/6, 2 in. at 35/6 1,000 ft. Refuse foreign. Support BRITISH industry. We compete, own make. All sizes in stock, also cable troughs for underground, woodwork all description. Send trade card. JENNINGS & Co., 955 Pennywell Road, Bristol.

THE HOFFMANN MANUFACTURING CO., Ltd., CHELMSFORD.

The coming of pure Tungsten drawn wire filaments

There is not the slightest doubt that the public will ask for Mazda Lamps with drawn wire filaments this coming lighting season. We intend that the full significance of the drawn wire—the greatest lighting advance since the introduction of the metal filament lamp—shall not be misunderstood. Our vigorous advertising campaign which starts immediately will tell the public of this great improvement, and all it means to them. AND THE PUBLIC WILL UNDERSTAND—and they will WANT

Mazda Lamps

with drawn wire Filaments. We hope that *you* are prepared to supply their demands. Write to-day for our contract terms if you've not already had them.

SUMMARY

WE issue to-day the first of five special supplements dealing with the Electrical Exhibition at Olympia (London), which will be opened on Saturday, and will remain open until October 21st. The formal opening is on Saturday at 2 p.m., but the exhibition will be open to the public from 10.30 a.m. onwards, and will be open each day from 10.30 a.m. to 10 p.m. The price of admission is 1s., except on Tuesdays, before 6 p.m., when the price has been raised to 2s. 6d. This week we publish a complete list of exhibitors, a key plan showing the positions of their stands, and brief notes on the apparatus &c. which some of the chief exhibitors are showing. Among other features will be an "electric home," showing applications of electric lighting, heating, cooking, and power. This will include a working electric kitchen in charge of one of the best lady cooks in London, and a working electric laundry. Two Marconi wireless stations, on the gallery and ground floor respectively, will be in intercommunication. We also mention a few particulars concerning some of the electric signs that are being erected. On the exhibitors' stands a great number of novelties will be shown. An article in the supplement also gives details of the arrangements that have been made for the electric light and power supply to the exhibition.

A VERY compact form of portable photometer with which candle-power and illumination measurements can be made has been brought out under the name of the Luxometer. (Page 523.)

A SHORT article describes a particularly simple form of arc lamp lowering gear. (Page 523.)

METALLISED carbon filament lamps, with an efficiency of about 2·8 watts per candle-power, are being put on the market in this country. (Page 524.)

A CONVENIENT form of vibratory rectifier, permitting of the charging of small accumulators, &c., from alternating current supply, is described in an illustrated article. (Page 524.)

AN electric boot polisher is illustrated on page 525.

THE Shoreditch Borough Council on Tuesday decided to adopt the scheme put forward by the Electricity Committee for the substitution of electricity for gas for street lighting throughout the whole of the Borough. (Page 525.)

A LETTER from Messrs. A. P. Lundberg & Sons suggests a simple means of obtaining control of lights from two points without any disturbance of the wiring. (Page 525.)

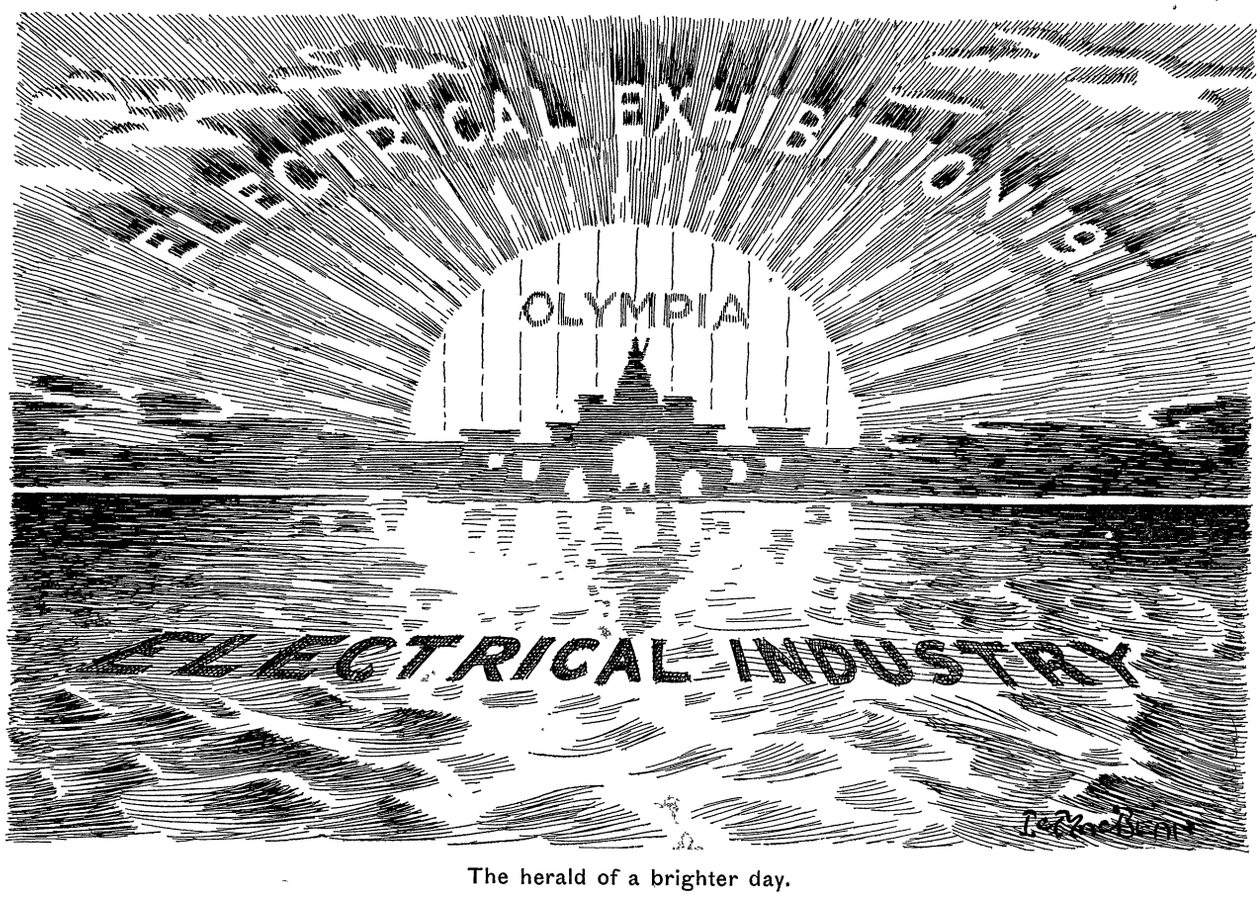
THE BRITISH THOMSON-HOUSTON Co. have introduced an insulating compound by using reclaimed rubber, which is mixed with a dry oil and heated until a reaction between the materials takes place and a cement is produced. This can be thinned by mixing with a solvent. Another specification published by the Patent Office last week relates to supporting wires for metal filaments by A. Mond. Sir Oliver Lodge has amended certain claims in one of his patents on wireless telegraphy, the conditions on which Mr. Justice Parker recently granted an extension of seven years. The following patents expire during the current week after a full life of fourteen years:—One provides a lattice grid for secondary batteries, by S. H. Hart; another by T. Sloper refers to telephone switch-hooks; and a third, by the British Thomson-Houston Co., relates to wattmetres which are made astatic to be independent of stray magnetism. (Page 526.)

Hosted by Google

IN our Electric Traction Notes, we refer to the fact that the Board of Trade have issued a new model form of regulations and bye-laws regarding electric tramways, and we note the more important changes made.—The Sheffield Tramways Committee have transferred £26,541 to relief of rates from last year's profits, and the Ayr Tramways Committee £1,083.—Dividends are declared by the Metropolitan Electric Tramways and the Gateshead and District Electric Tramways Co.—Among other matters referred to is the large increase in tramway traffic in Buenos Ayres and the further consideration of the Glasgow tramway extension scheme. (Page 527.)

UNDER Telephony and Telegraphy (including Wireless) we refer to the scheme of the United States Naval Department for wireless communication between shore stations and aeroplanes. We also give particulars of the working arrangement entered into between Atlantic Cable Companies. (Page 527.)

THE Hammersmith Council have agreed to lend Messrs. Gwynnes a large quantity of electric motors, the Company entering into a five-years' agreement for supply.—The Winchester Corporation have taken over the undertaking of the local company.—It is stated that water-power rights equivalent to 592,000 kw. have been granted in Japan.—A street lighting scheme is under discussion in Carnarvon.—The Ayr Electricity Committee have now paid off £6,767 borrowed from the rates during the early years of the undertaking. (Page 529.)



FIVE 5,000-kw. turbo-alternators are required by the New South Wales Tramways Department; a motor-driven air pump, and an electrically-driven circulating pump, &c., are required at Brighton; a scheme of electrically-controlled lighthouse signals is to be prepared by the Londonderry Harbour Commissioners, and a loan of £5,250 has been sanctioned at Torquay. The telephone system at the Hackney workhouse is to be extended.—A year's supply for electrical accessories is required at York. (Page 529.)

THE accounts of Messrs. Dick, Kerr & Co. for the year to June 30th show a net profit of £25,934, and the June half-yearly accounts of the Yorkshire Power Co. a net profit of £4,950. (Page 530.)

British Association Committee on Practical Standards.—Mr. A. P. Trotter informs us that his name has been attached to the Report of the British Association Committee on Practical Standards for Electrical Measurements, without his authority, and doubtless as the result of a mistake. But it compels him to state that he withdrew from the Committee in July, 1910, because he strongly disagreed with some of their resolutions, and with the mode in which their business was conducted.

Electrical Engineering Courses in London.—The prospectus of the South Western Polytechnic Institute for the coming Session gives particulars of the day and evening classes held in electrical engineering in the premises in Manresa Road, Chelsea, S.W. Special arrangements can be made for students engaged in central stations so that they can attend the day classes when they are on night duty. The evening as well as the day courses are suitable for the City and Guilds of London examinations, or as a preparation for the engineering degree of the London University. Another prospectus to hand is that from the Northern Polytechnic, Holloway. It gives details of the London University day and evening classes, and special courses which are arranged for the matriculation, and for the Intermediate Science and Engineering Degrees.

The Northampton Polytechnic Institute, St. John's Street, London, E.C., have also issued their syllabus, giving full details and equipment for all the courses in the coming session. There are day and evening classes in electrical engineering and electro-chemistry, and automobile work and radio-telegraphy are included in the former. Lectures on illuminating engineering are given in the evening courses. The new generating station, which was opened last winter, is now available for senior students. The day classes commence on October 2nd, and the evening classes on September 25th.

The herald of a brighter day.

THE LUXOMETER

THE widespread interest now being taken in the measurement of illumination, both interior and exterior, has led to a demand for an inexpensive instrument, which, while not claiming to be a standard in the same respects as such instruments as the Trotter Portable Photometer (see Electrical Engineering, Vol. I., page 849), could yet be relied upon to give results of ample accuracy for most purposes, and which was, at the same time, not only light and thoroughly portable, but above all easy to use, and it is with the object of supplying such a want that Messrs. Everett, Edgcumbe & Co., Ltd. (117, Victoria Street, Westminster) have brought out the instrument described in this article, known as the Luxometer.

The principle is similar to that of the Trotter Photometer, but the parts as seen in the illustration are differently arranged. A screen illuminated by a standard lamp within

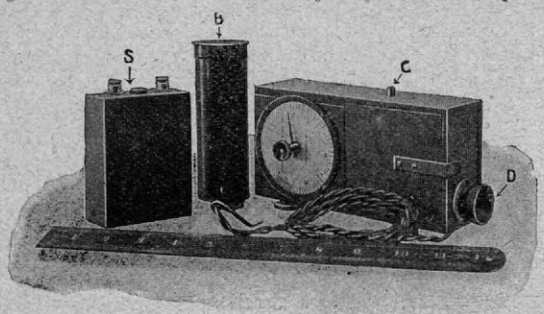

Fig. 1.—Luxometer Outfit Complete.

the instrument is viewed at an angle which can be varied till the effect balances that of a fixed external screen illuminated by the source to be measured, and the result is read off direct from the pointer attached to the head by which the internal screen is rotated.

The extreme compactness of the apparatus is strikingly shown in Fig. 1, which shows the complete outfit, including the Luxometer (C) itself, the battery (S) supplying the standard lamp, and the daylight attachment (B), the use of which is mentioned below. It may be added that the weight is only 1¼ lbs. An open direct reading scale is provided, about 6 in. long, and in standard instruments this is graduated up to 10 or 20 foot-candles, as preferred, with two ranges. It is specially opened out at the lower part, so that great accuracy is possible, even when measuring feeble illuminations. When in use the instrument is held in the hand, no stand or other support being required. For transport, both the photometer and the battery can be carried in the pocket, or they can be supplied fitted in a small leather case with shoulder strap if preferred. Illumination measurements can

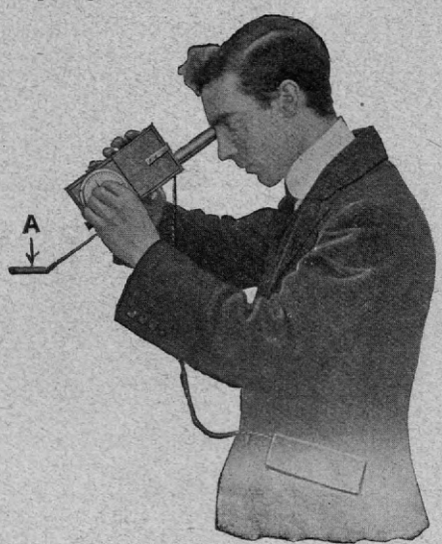

Fig. 2.—The Luxometer in Use.

be made at any angle, and they are practically independent of the colour of the light. Candle-power as well as illumination measurements can be readily made, and the surface brightness or intrinsic brilliancy of any surface can be instantly measured by viewing it through the instrument instead of the fixed screen (A). For this purpose, a simple attachment can be provided whereby what is spoken of as the "window efficiency" of a room can be determnied. Merely to state that the illumination observed in a certain room lit by daylight was so many foot-candles is meaningless, depending as it does entirely upon the state of the sky. By means of this attachment, on the other hand, a definite figure can be obtained for the ratio of the actual illumination at any particular point in the room to the daylight illumination outside. The value of the daylight outside is for this purpose measured by attaching the daylight tube, which is so proportioned that the illumination from one thousandth part of the hemisphere of the sky reaches the instrument, the instrument being pointed at the clear sky.

Mr. P. J. Waldram, to whom the development of this method is mainly due, has made a number of measurements in this way, and the following figures obtained by him will be of interest :—

	Window efficiency.
Patent Office Library, centre	... 0·005
British Museum Reading Room ...	... 0·007
Ordinary offices (centre of room) ...	... 0·001
Speaker's Chair, House of Commons	... 0·0009
Woolsack, House of Lords	... 0·0006
Charing Cross Station, Booking Hall	... 0·0001 to 0·0003
Surveyors' Institution (centre of library)	... 0·0015

In order to simplify the adjustment, a yellow-tinted external screen is provided, and should be used when daylight observations are being made in place of the white screen. By this means the colour of the daylight illumination is reduced to something near that of the standard lamp inside the instrument, so that an accurate balance is easily obtained. No allowance need be made for the colour of the screen, owing to the fact that the same colour is used both inside the room and in obtaining an outside reading, so that its effect cancels out.

Of all the standard lamps which have been tried with portable photometers the electric lamp has proved itself to be by far the most satisfactory, and some recent investigations by Mr. A. P. Trotter show that such a lamp, worked off a portable accumulator, fulfils all requirements. The cell supplied with the Luxometer is of a special "non-spillable" type contained in a celluloid or ebonite case, so that it can be carried in the pocket without fear of spilling.

ARC LAMP LOWERING GEAR

AN attractive new list from the London Electric Firm (George Street, Croydon) deals with very great completeness with arc lamp suspension and lowering gear of every class, a subject in which the firm have for some time specialised. The most important feature of their apparatus is the "one working part" suspension device, which in one of its simpler forms is illustrated here. As will be seen, the self-sustaining and disengaging qualities are obtained by means not depending in any way on springs, levers, balls, catches, or clutches, while the whole is of remarkable simplicity. This is used in conjunction with a substantial self-sustaining winch, also entirely without ratchets or springs. Several types of the suspension are made, with and without contact gear for various conditions of service, and a special feature of the series is the collection of special fittings for span wire suspension, such as that illustrated in Electrical Engineering, December 22nd, 1910, page 805, in connection with the lighting of Cheapside. Several counterweight systems have been devised, and considerable ingenuity has been expended on arrangements for adapting lowering gear to ordinary arc lamp standards. The catalogue contains numerous illustrations of installations of this apparatus, and a very complete series of accessories is included. Very large numbers of these gears are in use by over 100 corporations and supply companies, as well as Government departments, railway and dock companies, etc.

"One Working Part" Arc and Metal Filament Lamp Lowering Gear.

Hosted by Google

THE GEM LAMP

THERE is a considerable field for something less expensive than the metal filament lamp, but more efficient than the ordinary carbon. This want is now met by the B.T.H. Gem lamp, with its metallised carbon filament, giving an improvement in efficiency equivalent in one step to that obtained in the previous 20 years' development of the carbon filament lamp. The "Gem" filament is produced by subjecting the ordinary carbon filament to the intense heat of the electric furnace. This process removes the residue of

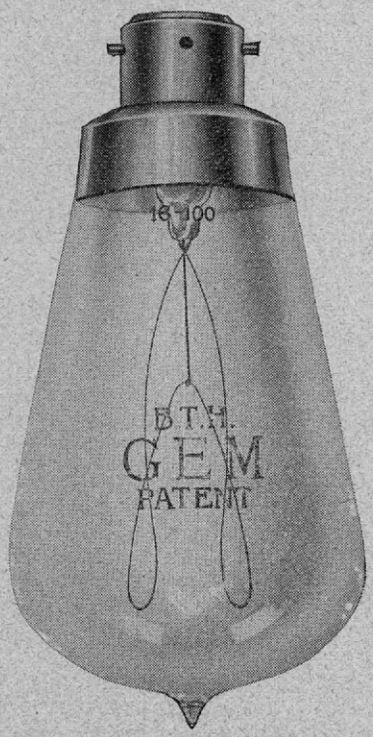

FIG. 1.—"GEM" LAMP.

ash and hydro-carbons, and renders the filament capable of withstanding much higher temperatures, and therefore of operating at a much higher efficiency than the ordinary carbon filament of equal life. The practical result of this is the production of a 16 c.p. lamp consuming only 45 watts (efficiency 2·8 watts per candle). This gives a saving of some 15 watts over the ordinary carbon lamp. The "Gem" filament is also less susceptible than ordinary carbon lamps to variations of voltage, as it has a resistance characteristic

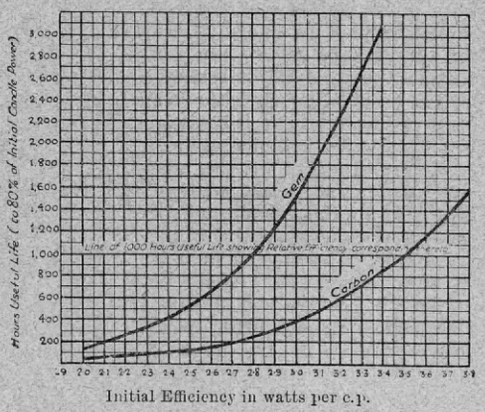

FIG. 2.—COMPARATIVE CURVES FOR GEM AND CARBON LAMPS, SHOWING LIFE IN HOURS GIVEN BY A 50-WATT LAMP WITH CARBON OR GEM FILAMENT OVER THE LIMITING RANGE OF EFFICIENCY FOR EACH FILAMENT.

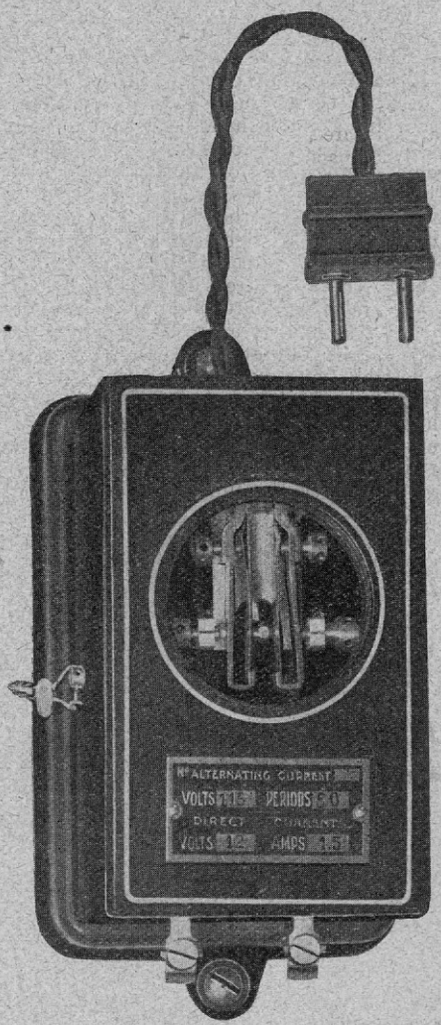
similar to that of metals, increasing with increase in temperature, contrary to the ordinary carbon filament.



Although a relatively new development in this country, the "Gem" lamp can hardly be described as untried, for 8,000,000 of these lamps are already in use in the United States. It is interesting to note that the "Gem" lamp has been adopted by the leading lighting supply stations in New York, Chicago, and other large American cities as the standard supply lamp in place of the regular carbon lamp.

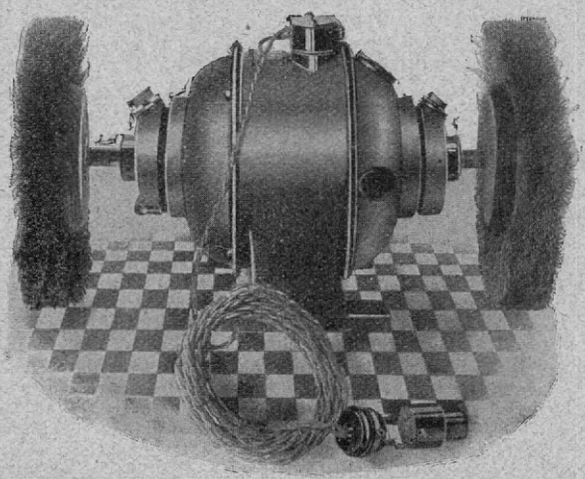
The new list issued by the British Thomson Houston Co. describes the new lamp and gives a table showing the saving effected thereby. The lamp can be supplied in the 16-c.p. 45-watt size, with a life of 1,500 hours, or in a 20-c.p., 50-watt size with a life of 800 hours. The voltage at which the present lamps are made is from 100–130 volts only. The lamp can be used in series in 200–250 circuits, and will be found to give a more brilliant and better quality of light than the ordinary carbon lamp.

The field of use for the "Gem" lamp practically covers that at present held by the ordinary carbon filament lamp. It can be satisfactorily employed in all classes of service to which the carbon lamp is adapted, and where for various reasons it is not desirable to employ the more expensive metal filament lamps. There are many situations where a low-priced, durable, and yet more economical lamp than the ordinary carbon is desired, and it is in this field that the "Gem" lamp has special application.

A VIBRATORY RECTIFIER

A CONVENIENT piece of apparatus designed to convert from alternating to continuous current for such purposes as the charging of small accumulators has been put on the market by the Adnil Electrical Co., Ltd. (Adnil Building, Artillery Lane, E.C.). A form of the instrument for giving continuous currents up to 1·5 amperes at 12 volts, when connected to a 115-volt, 50-cycle single-phase circuit, is illustrated here. The apparatus consists essentially of a trans-

THE ADNIL VIBRATORY RECTIFIER.



former with vibrating contact. A stray field in the transformer operates the armature and contact system of the rectifier at the zero points of the alternating current curve, producing a rectified current. By this system of operating the vibratory contacts by the transformer field, perfectly synchronous working can be adjusted by mechanical means, such as small brakes, springs, etc., without the use of auxiliary apparatus. The efficiency on load and on open circuit corresponds to that of transformers

Hosted by Google

of similar output. The direct current generated is suitable for charging accumulators, for lamps, and other non-inductive applications, and with the additions of condensers it can also be used for inductive loads such as small motors, etc. The use of all auxiliary apparatus as required in other rectifiers is dispensed with. In the event of no voltage on the alternating current line, due to interruption or short circuit, the accumulator cannot discharge through the rectifier, as it is automatically switched off. Larger sizes are also made for electro-plating and similar work up to 40 amperes at 6 volts. Another important feature is that when arranged for connection to three-phase circuits, a practically continuous current without pulsations can be obtained from the secondary terminals.

AN ELECTRIC BOOT POLISHER

We illustrate here a useful domestic appliance in the shape of an electrically driven boot polisher, which Simplex Conduits, Ltd., have recently put on the market. These are made in various styles and sizes with motor suitable for

Simplex Boot Polisher.

alternating current single or three-phase, as well as for continuous current. The motors are from $\frac{1}{8}$ to $\frac{1}{3}$ h.p., and run at from 1,400 to 2,750 r.p.m. The apparatus is supplied complete with flexible lead ready for connection to either a two-pin socket or a lamp-holder by means of a special adaptor.

ELECTRIC STREET LIGHTING IN SHOREDITCH

Gas to be entirely Superseded

THE Shoreditch Borough Council, at their meeting on Tuesday, adopted the important recommendation of the Electric Lighting Committee, set out on page 510 of our last issue, that electricity shall be substituted for gas in all the streets in the Borough north of Old Street. When this scheme is completed there will be no street lamps in Shoreditch.

In moving the adoption of the Electricity Committee's report, the Chairman of the Committee stated that it was only intended to deal with the district in sections, and that the whole of the work of conversion would occupy about three years. Nevertheless, the Committee desired the Council to accept the principle of the complete use of electricity in the streets, in order that they might be free to go ahead with the work as time and circumstances warranted. The saving to the rates would be about £230 per annum, compared with the present gas charges when the new scheme is in full operation, whilst the advantage to the electricity undertaking in having mains in every street for the supply of energy for power and lighting must weigh with the Council as a most important factor. The proposed charge is 37s. per 50-c.p. lamp per annum, including lighting and maintenance, compared with the present price for gas of 40s. 3d. per lamp per annum.

There was little opposition, although one or two speakers desired the Electricity Committee to deal with the matter piecemeal, and to be continually coming to the Council for sanction to add a few further streets to the electrical scheme. On the other hand, however, several Councillors mentioned the fact that they were being approached repeatedly by ratepayers asking when electricity would be available in their district, and in view of the large number of small cabinet-making factories which exist in Shoreditch, it was evident that the ideas of the Electricity Committee were not intended to be seriously challenged. The net result of the discussion was that an amendment to refer the recommendation back to the Committee in order that a smaller scheme might be prepared was withdrawn, and the Committee's recommendation was carried unanimously.

The new scheme will be continued on the lines of that already working, viz., by the replacement of the incandescent gas mantles in the existing lamps by 50 and 100 c.p. metal filament lamps. The existing lanterns have been adapted in a very simple manner, the hole at the top of the existing reflector being covered by a plate, and the lamp-holders suspended from this. Water-tight switches are used in each lantern with the usual knock-over lever arrangement which the lamp-lighters switch on and off.

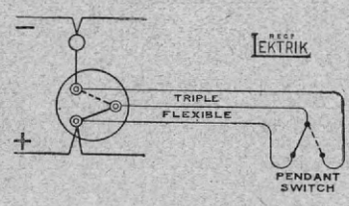
CORRESPONDENCE

To the Editor of Electrical Engineering.

Sir,—In effecting the *maximum* reduction in the initial cost of electric light installations, the *minimum* amount of control is left to the user. This lack of convenience is most often found in bedrooms, staircases, passages, etc., and such becomes painfully apparent to the "unsatisfied consumer" as he becomes better acquainted with his installation, and meets friends who have been lucky enough to have had theirs better carried out.

What can be more exasperating, for example, than to find in a bedroom that control of light is obtainable at the door only, this necessitating getting into bed in the dark, and having to get out of bed before light can be obtained again.

It is not an uncommon occurrence to find houses where the only switch control of the hall and staircase light is provided at the front door, the lack of control from the upper floor necessitating the use of the time-honoured candle to go upstairs to bed by, or when descending again during the night.



These are but two cases, and many others might be cited.

Had greater conveniences been provided, we think that the "unsatisfied consumer" would have been a satisfied one instead, and proud of the conveniences of his installation, which he would point out to his friends on all occasions, and thus indirectly prove a good canvasser for electricity as a lighting medium, to the benefit of contractors generally, and his own contractor in particular.

As it is, however, when noticing these weak points in his installation, he interviews a contractor with regard to having an improvement made, but is usually informed that the alteration will mean pulling his walls about and upsetting the decorations, etc. Consequently the desired addition is seldom effected, or else postponed for attention when the next decoration upheaval takes place, he meanwhile having to make shift with the installation as it stands.

It is a simple matter to convert the present single-way switch control to that giving control from two points, without any disturbance of the wiring. The conversion simply involves the substitution of a two-way surface switch for the single-way one.

A hole is bored in the wood block and a triple flexible led off from the switch on porcelain buttons, or through insulated screw eyes, to the desired extension point consisting of a two-way pear switch for bedroom use or one of surface pattern for ordinary use.

The simplicity of the adaptation is clearly shown in the diagram attached, *where it will be noticed that the leads are not interfered with in any way when making the change*, and that, contrary to usual custom, the "common" terminals of the two two-way switches are inter-connected.

To leave the switch point as it was originally is a simple matter, the two-way switch being made to act as a single-way one by short-circuiting two of the terminals, the flexible and extension switch being disconnected. This provides for the case of the obstinate landlord who requires the installation left as it was found.

We think that this simple method, if commonly known, would assist in providing the contractor with some genuine friends amongst his clients, whose recommendations, following their own satisfaction on the improved conditions, would extend business in the neighbourhood.

We are, Sir,

Yours respectfully,

A. P. Lundberg & Sons.

477 to 487, Liverpool Road, Islington,
September 12th, 1911.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 14, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

23,404/10. **Supporting Wires for Metal Filaments.** A. MOND. These are made of thin nickel or carbon, and are covered with a layer of a chromium compound, which is then heated to incandescence by a current and decomposed into an oxide of chromium.

24,637/10. **Metallic Filaments.** WESTINGHOUSE METALLFADEN GLÜHLAMPENFABRIK G.M.B.H. (*Austria*). After the decarbonising process, filaments containing traces of carbon are purified in hermetically sealed vessels, in which a high degree of exhaustion is produced by a vacuum pump. The vessel is heated to a temperature of 1,200° C. to 1,300° C. until all the carbon is eliminated.

176/11. **Insulating Compound.** THE BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) A drying oil, such as linseed oil, is heated with waste rubber until a temperature is reached at which an exothermic reaction takes place, when a cement is produced. After cooling this can be thinned by mixing it with asbestos and sulphur, then pressing it, and finally vulcanising the compressed mass.

Amendment

11,575/97. **Wireless Telegraphy.** SIR OLIVER LODGE. Following Mr. Justice Parker's order, in extending this patent for another seven years, this specification has now been amended by striking out claims 3, 4, 5, and 8, and renumbering the other claims accordingly. A full report of the judge's decision appeared in ELECTRICAL ENGINEERING, May 4th, 1911, p. 234.

Opposition to Grant of Patents

11,591/08. **Rotary Fans.** J. KEITH. This patent has been granted in spite of opposition. It describes a fan wheel which is in the form of a truncated cone internally and externally, the blades of which are tapered and scooped. These are connected by a disc at their deeper ends, and at the shallow ends by a ring. The straight inner and outer edges of the blades lie on conical surfaces differently inclined to the spindle axis of the fan.

12,289/09. **Table Fan.** J. KEITH. The Law Officer has confirmed, on appeal, the decision of the Comptroller to grant this patent. The specification was abstracted in ELECTRICAL ENGINEERING, March 10th, 1910, p. 172.

18,969/10. **Reduction of Organic Bodies.** H. HIGGINS. As a result of opposition, the right to grant on this application has been surrendered. The specification (abstracted in ELECTRICAL ENGINEERING, September 14th, 1911, p. 516) relates chiefly to the reduction of the unsaturated fatty acids.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: KÖRTING and MATHIESEN AKT.-GES. [Alternating current] 10,290/11; SIEMENS BROS. DYNAMO WORKS, 14,685/11.

Cables and Wires: ALFRED WISEMAN, LTD., and HARRIS [Attaching wires to insulators] 29,114/10; CARR [Cable couplings] 744/11.

Dynamos, Motors, and Transformers: STIRK [Shunt regulators] 19,863/10; BRITISH THOMSON-HOUSTON Co. and MARTIN [Induction variable speed] 25,683/10; AKT.-GES. BROWN, BOVERI, ET CIE [Periodicity transformers] 600/11.

Electric Ignition: HERZ [Sparking-plug insulations] 25,539/10; ROBERT BOSCH (*Firm of*) [Interrupters] 7,632/11; MOORE and AMBROSE, SHARDLOW, & Co. [Terminals for] 12,984/11.

Electrometallurgy: SAVELSBERG [Sintering iron, and other ores] 20,133/10; NIBLETT and ELECTROLYTIC APPARATUS SYNDICATE [Bleaching apparatus] 28,277/10.

Heating: BERRY, 18,115/10; ELECTRIC and ORDNANCE ACCESSORIES Co. and MORRISON, 21,469/10.

Switchgear: MCLEAN and MADGEN [Switches] 24,994/10; SCOTT [Switches] 25,756/10; MCFARLANE [Switch quick-make and break] 27,825/10.

Telephony and Telegraphy: MARCONI'S WIRELESS TELEGRAPH Co., and ROUND [Receiving apparatus] 20,441/10; BOULT (*Mills*) [Call recorders] 28,368/10; ELLISON and THORROWGOOD [Single-wire telephone system] 3,730/11.

Traction: BLACKALL and JACOBS [Railway block telegraph indicator] 21,554/10; SIMONET [Actuating signals and recording passage of trains] 7,674/11; MCCOMB [Automatic brake and power control attachment] 10,665/11.

Miscellaneous: WALKER, and R. WAYGOOD & Co. [Lift control] 20,118/10; EBORALL, and BROWN, BOVERI, & Co. [Ring spinning machines] 20,249/10; Soc. Anon. "Phi." [Electro-magnets] 23,831/10; JUSTICE (*Wilkinson*) [Timing and signalling devices] 26,620/10; ADAMSON, RAMSBOTTOM & Co., and RAMSBOTTOM [Hoists, winches, &c.] 27,299/10; CURTIS [Miner's head lamp] 2,485/11; J. HALDEN & Co., and WATTS [Photographic printing] 10,701/11; BAILEY [Submarine signalling] 12,575/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Transformers: SIEMENS SCHUCKERTWERKE GES. [Boosting] 18,868/11.

Electric Ignition: CAMBESSÉDÈS, 19,025/11.

Electrochemistry: SCHEITLIN [Furnaces] 18,804/11.

Fuses: SANTO, 19,120/11.

Telephony: STEINBERGER [Mouthpieces] 14,591/11.

The following amended Specifications can now be obtained.

AKT.-GES. BROWN, BOVERI, & Co. [Spinning machines] 7612/08.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

21,704 of September 22nd, 1897. **Secondary Batteries.** S. H. HART. This patent describes a lattice plate or grid, which is cast in a metal mould and retains the maximum amount of active material, and it is arranged to withstand buckling or distortion due to mechanical strains or rapid electrolysis. The grid has an alternate cellular structure, with diagonal truss bars intersected by lateral bars. The projections which are left on each side of the grid after casting are pressed inwards, forming claws for retaining the material.

21,974 of September 25th, 1897. **Telephones.** T. SLOPER. A switch hook is so arranged that when the receiver is on the hook a current entering the home line rings a bell to call attention. When it is taken off, the bell circuit is disconnected, and the circuit containing the microphone, induction coil, and receiver is closed by means of two contacts, which are connected by the switch when the receiver is removed from the hook.

22,216 of September 28th, 1897. **Wattmeters.** THE BRITISH THOMSON-HOUSTON Co. (*H. W. Pratt, U.S.A.*). The armature is wound in two sections, arranged one above and one below a **U**-shaped field coil. This acts on both sections, and produces rotation in one direction, and any stray magnetism acts upon them differentially. In combination with the armature and field coil there is a damping device, in which two conducting discs and magnets are arranged so that the stray magnetism weakens the effect of one disc and strengthens that of the other, thus balancing the damping effect.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: G. WEGELIN [Carbons] 12,184/98; J. O. GIRDLESTONE, 12,223/07; A. H. BRZESKI and A. COLLIN, 12,369/07.

Distributing Systems and Cables: C. TURNBULL [Regulation] 12,290/02; LANCASHIRE DYNAMO & MOTOR Co. and W. STANSFIELD [Distribution] 12,420/07; G. DAVIS [Cables] 12,711/07.

Dynamos and Motors: H. H. LAKE (*General Electric Co., U.S.A.*) [Alternating current] 12,294/02; BRITISH THOMSON-HOUSTON Co. (*Allgemeine Elektricitäts-Ges.*) [Collecting-rings; commutators] 12,334/04; H. W. LAKE (*W. Hallock, New York*) [Field magnets for inductor alternators] 12,374/07; S. GRIFFIN, 12,402/07.

Electric Ignition: F. R. SIMMS, 12,433/98 and 11,135/05; R. CARPENTIER, 12,539/07.

Instruments and Meters: F. CONRAD and W. M. BRADSHAW [Meters] 11,036/05 and 11,036A/05; A. LEHMANN [Battery voltmeter] 12,368/07; A. BARR [Dynamometer for measuring torsion] 12,495/07.

Switchgear: J. S. RAWORTH [Switches] 11,614/05; L. HARRIS [Starting switch] 12,895/06; J. S. and A. RAWORTH [Machine switches] 12,443/07; E. LAWLEY-PINCHING and W. H. WALTON [Switch] 12,462/07.

Telephony and Telegraphy: J. KITSEE [Submarine telegraphy] 12,748/06; J. BURRY [Type-printing telegraph receivers] 12,342/07; H. A. YARNELL [Transmitters for wireless tleegraphy] 12,389/07; T. A. SEDGWICK [Signalling, transmitter] 12,406/07; A. J. GRANT (*G. A. Haggarty*) [Clutch for rotating transmitter] 12,407/07; L. MAICHE, 12,529/07.

Traction: BRITISH THOMSON-HOUSTON Co. (*Allgemeine Elektricitäts Ges.*) [Signal and point control] 12,238/07; J. G. CARR [Signal contacts] 12,435/07.

Miscellaneous: O. IMRAY (Mechernicher Bergwerks-Actien-Verein) [Magnetic separators] 9,968/00; J. TATLOCK and A. G. HORNE [Fire alarms] 12,172/07; J. HAAR [Recording sounds] 12,259/07; S. STEPHANOW [Lantern signalling] 12,356/07; H. TURNER [Plug couplings] 12,531/07; C. C. COTTON and W. C. KENNEDY [Spinning] 12,690/07; L. B. MILLER [Current rectifier] 12,712/07.

ELECTRIC TRACTION NOTES

The Board of Trade Model Form of Regulations and Bye-Laws regarding electrical power on tramways has been slightly modified. A sub-clause has been added to Regulation II., providing for the use of trailer cars for the conveyance of salt, sand, and other stores for the purpose of the tramway undertaking, without the consent of the Board of Trade, and this renders necessary a few consequential alterations in III. and IV. relative to head and rear lights. The note to V. to the effect that, unless specially favourable circumstances exist, a speed of eight miles per hour is generally prescribed, has been taken out. Regulation VII. is amended in order to make it clear that the minimum height of top of the trolley wire from the road surface does not apply where the lines pass under bridges, and it is made clear that Regulation XI., which aims at preventing trolley standards from becoming electrically charged, does not apply to the trolley base on the top cover of double-deck cars. Two new regulations have been added, as follows:—XIV. "Every guard wire shall be bonded to the rails through its support at each end and at intervals of not more than five spans." XV. "Every pole supporting a gas-lamp bracket shall be efficiently bonded to the rails."

The Sheffield Tramways Committee was able to transfer £26,541 to the relief of rates out of its profits for the year to March 31st last.

The profits from the working of the Ayr tramways last year enabled £1,963 to be added to depreciation and renewals fund, and £1,083 to be transferred to the relief of rates.

An interim dividend has been declared upon the ordinary shares of the Metropolitan Electric Tramways at the rate of 6d. per share, less tax. The Gateshead and District Tramways Co. have declared an interim dividend on the ordinary shares for the June half-year at the rate of 5 per cent. per annum.

The Glasgow Tramways Committee returned their scheme of extensions to the Council in the same form that it was referred back to them a week ago. There was originally some opposition to the considerable extensions of the tramway undertaking outside the city boundaries, but the Tramways Committee, having constituted themselves the tramway authority for an area having a radius of about eight miles, decided to persist in their scheme for giving these districts a tramway service. At the Council meeting on Thursday a number of the proposed extensions were again sent back to the Committee.

The General Assembly of the Province of Nova Scotia, says the *Board of Trade Journal*, have passed an Act authorising the subsidising of companies proposing to construct electric railways in Nova Scotia.

The number of passengers carried by the Buenos Ayres tramways during the June half-year shows an increase of nearly 20,000,000 over the corresponding period of last year.

There was a gross profit of £13,642 on the Leith Tramways last year, but after meeting capital charges there was a small deficit, bringing the total debit balance to £1,993. Although the costs per car mile were the lowest of any tramway undertaking in the country, they have shown a further slight decrease during the year, but the manager points out that he regards the expenses as being at their lowest, and looks forward to a tendency to an increase in the future. The life of parts of the track and overhead line, he points out, is approaching the time when it will be necessary to renew them, and this will involve a considerable expenditure.

Having unsuccessfully approached the Halifax Corporation with a view to tramways being constructed from Halifax to Elland, the Council of the latter place have now made overtures to the Huddersfield Corporation.

Death from Electric Shock.—An employee of the British Insulated & Helsby Cables, Ltd., was engaged on the top of a tramway pole upon the Newcastle tramways last week connecting up trolley wire when he accidentally came into contact with a live trolley wire, and fell to the ground. The medical evidence was to the effect that the man had received an electric shock, and the jury returned a verdict to this effect.

Royal Engineer Cadets (2nd London Division).—Recruits are wanted for this Corps, and youths between the ages of 13 and 18 years having a knowledge of electricity or telegraphy are asked to send in their names. The officer in command of the Corps, which, by the way, is not the same as the London Electrical Engineers' Corps, is Captain Beeman, R.E., and the headquarters are at the Duke of York's School, Chelsea, S.W.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The *Board of Trade Journal* states that a cable has been laid between the Westmann Islands and the mainland of Iceland. It is expected to be connected with the land telegraph system by the middle of September.

Efforts are being made by the Navy Department in America to perfect a system of wireless communication between shore stations and aeroplanes. According to the American *Electrical Review* and *Western Electrician*, experiments are to be carried out to ascertain whether or not the frame of an airship will act as an earth for the type of wireless apparatus used by the navy, and allow communication with the shore. Models of aeroplanes will be suspended by insulated ropes between smokestacks at the navy yard, and an effort will be made to send a message to the wireless stations at San Francisco and Yerba Buena. A point to be decided, is whether the aerial wires should be erected on top or suspended from the bottom of the aeroplane. Aviators think that, in the latter case, the wires may interfere with the propeller.

The official announcement has been made of the working agreement between the Anglo-American Telegraph Co., the Western Union Telegraph Co., and the Direct United States Cable Co. The effect of this is that the English companies pass into the control of the American concern under a lease of 99 years, at a rental of £262,500 per annum, which has been computed to meet the 6 per cent. preference dividends, 3¾ per cent. on the ordinary shares, and 1½ per cent. on the deferred shares. The combined capital of the three companies is no less than £26,400,000.

The Direct Spanish Telegraph Company are once again in difficulties, for on the 12th inst. their Falmouth-Bilbao section was temporarily down.—On the 16th inst. communication between Rome and Constantinople was interrupted, and on the 18th a failure occurred in the Bagdad-Bassorah lines, which were put in order again on the 19th inst.

Mr. Grindell Matthews has been continuing his wireless telephone experiments near Calais, whither he removed from Chepstow last week. It had been originally intended to communicate with the tug which was to have followed Wolffe on his attempt to swim the Channel, but on this being abandoned, successful experiments were conducted between Sangatte and Barraques, which were to be followed by attempts to communicate with Dover. Box kites were used to support the aerials.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

METAL FILAMENT LAMPS.—A most ingenious card from the Brimsdown Lamp Works (Kingsway House, W.C.) depicts first of all a gentleman endeavouring to read in a bad light. By pulling a tab, however, he is shown seeing things in the better light of a Brimsdown Lamp.

ALUMINIUM.—A list of sizes of aluminium tubes is contained in a leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.).

MERCURY VAPOUR LAMPS.—The Westinghouse Cooper Hewitt Company, Ltd., in a leaflet which they have issued concerning their system of lighting, make the plea that the light of these lamps is better than daylight. The various stages of the textile trade are discussed in which their lamps can be used to advantage, and each is illustrated with pictures, every one of which tells a story.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

DRIVING ROLLER CHAINS.—A pamphlet from Hans Renold, Ltd., Manchester, gives a description of their chain gear, which has replaced the belt drive at the works of Messrs. Christie & Co., Tilbury. The chain used is a ¾ in. pitch bush roller. The driven wheel has 50 teeth, with a speed of 680 r.p.m., and the driving wheels have 13 teeth, while the jockey wheels have 25 teeth. This gives a speed of over 2,000 ft. per minute. We understand that by this conversion the machine turned out as much work in just over an hour as was previously done in from 1½ to 2 hours, and that complete satisfaction has been given.

ADVERTISING DESIGNS.—We have received from Messrs. Marcus Heber Smith an attractive new circular outlining their sphere of activity, to which we have already made reference in ELECTRICAL ENGINEERING, Aug. 17th, page 466.

LOCAL NOTES

Australia: *Sydney Trams.*—The N.S.W. Tramways Department have decided to erect a new power station, in order to meet the rapidly increasing demand owing to the development of the electric tramways system. The station will ultimately contain ten 5,000-kw. alternators, of which five are to be erected in the first instance.

Ayr: *Electricity Accounts.*—The electricity accounts for last year show a net profit of £2,256, of which £1,146 has been handed over to the rates. This sum represents the final instalment of £6,767, to which extent the rates were drawn upon in the early years of the undertaking.

Bath: *New Plant.*—A Local Government Board inquiry was held last week concerning a loan of £7,900 for electric lighting purposes. It is proposed to instal a Diesel engine and generator, a motor alternator, and a booster. The generating set, which includes a Dick Kerr dynamo, will be supplied by the Diesel Engine Co., at £5,451. The engine will be of the three-cylinder type of about 350 h.p. per cylinder.

Bournemouth: *Electric Lighting.*—The Poole Rural District Council are offering no objection to an application by the Bournemouth and Poole Electricity Supply Co. for an extension of time for putting into operation the Wimborne and District Electric Lighting Order granted in 1905.

Carnarvon: *Street Lighting.*—The Electricity Committee have been discussing the question of street electric lighting with the National Electric Construction Co., who are working the Council's electricity undertaking. One scheme, involving 20,000 c.p., will mean an increase in the rates of a 1d. in the £; whilst another, in which 9,000 c.p. would be used, which is double the present gas illumination, will mean no extra burden on the rates. A special meeting is to be held to consider the matter in detail.

Hove: *Proposed Pier Tramway.*—Particulars have appeared in the daily papers of a proposal to construct a new pier at Hove. The scheme includes the construction of an electric tramway. The matter is at present under the consideration of the Town Council.

Japan: *Electric Power Supply.*—Reporting upon the trade of Japan for 1910, the British Acting Commercial Attaché states that last year witnessed a steady progress in the extension of water-power generation of electricity. In October the Kinugawa Hydro-Electric Power Co. was formed with a capital of £1,378,000 for the purpose of supplying the City of Tokio with electricity generated by the waters of the Kinu river. This Company was originally projected as a joint Anglo-Japanese concern, but the British capitalists subsequently withdrew, owing to their unwillingness to accept the conditions which the Japanese authorities attached to the charter. In April a Government Commission was appointed for the purpose of examining and making a report of the water-power resources of the country. The water-power for use of which charters have been granted is estimated at some 592,000 kw.

Kilsyth: *Electric Lighting.*—A London Company have intimated their intention to apply for an electric lighting Provisional Order.

Llandilo: *Condition of Electricity Works.*—Mr. J. Bowen, the Council's Consulting Engineer, has presented a report upon the condition and the future working of the electricity undertaking. He recommends the Council to continue working the electricity plant as now until the end of the present financial year, and then to undertake a re-arrangement of the plant, probably by the installation of a Diesel engine. By these methods he anticipates considerable savings.

London: *Hammersmith: Supply to Messrs. Gwynnes.*—In November, 1907, the Council agreed to lend Messrs. Gwynnes one 50-h.p., four 30-h.p., one 18-h.p., and three 10-h.p. motors, in addition to a spare motor and a motor generator, subject to an agreement to take from the Council a supply of energy for five years and pay not less than £1,000 per annum for the supply. Messrs. Gwynnes now propose to put down large additions to their electrical plant, and after negotiations the Council have agreed to lend the Company the necessary motors in consideration of a further agreement for five years upon similar terms to the previous one.

Portsmouth: *Electric Lighting Profits.*—The recommendation of the Electric Lighting Committee that £3,500 of the

SILVERTOWN

RUBBER INSULATING GLOVES

IT is of the utmost importance that **every glove** used in handling conductors working at high tension should be tested with a still greater tension under **working conditions**, so that all faults due to grit or bad joint in the seams, &c., may be detected. Realising the danger that might arise if this precaution were not taken, and the test carried out only superficially, we have for many years made it a practice to test all gloves in a thorough manner, either at 5,000 or 10,000 volts, and each glove we supply for use on electrical work is sold with a label certifying this test.

WHERE REQUIRED THESE GLOVES ARE FACED WITH LEATHER AS A PROTECTION AGAINST MECHANICAL DAMAGE.

Supplied in Sizes 7, 8, 9, 10, & 11.

Prices on Application.

Dynamos: Compound Wound, Shunt or Series, for Electric Light and Power.

Motors: Belt or Direct Drive, for all classes of Service.

Cables: Electric Light, Telegraph, Telephone, Submarine.

Wires: Insulated India-Rubber or Gutta-Percha, Cotton and Silk Covered.

Instruments. Batteries. Carbons.

PRICE LISTS ON APPLICATION.

The India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.

HEAD OFFICES: 106, Cannon Street, London, E.C.

WORKS: Silvertown, London, E.

Hosted by Google

electricity profits for last year should be carried to the relief of rates has been adopted by the Corporation after some discussion.

Winchester: *Electric Lighting.*—The Corporation have now taken over the electrical undertaking from the Winchester Electric Light and Power Co. The transfer was celebrated by an inspection of the works by the Mayor and Council. Mr. R. Ayton is City Electrical Engineer.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia: *Melbourne.*—Tenders are invited for the supply of 8,000 yards of three-inch fibre conduit suitable for laying underground in concrete, and to be used for containing lead-covered cables. Particulars from McIlwraith, McEacharn & Co., Ppty., Ltd., Billiter Square Buildings, London, E.C.

The New South Wales Tramways Department are calling for tenders for five 5,000-kw. turbo-alternators in connection with the new power station which is being erected. Tenders close on October 30th.

Brighton.—The Electricity Committee recommend the reconstruction of No. 5 Turbine at the electricity works by the British Westinghouse Co., at a cost of £4,980. This machine is the oldest of the original machines in the power station. It is also proposed to spend £635 on a motor-driven air pump, £229 for an electrically-driven circulating pump, and £656 upon the necessary alterations to cables, foundations, steam-piping, &c.

Burnham.—The Council are recommended to apply for an electric lighting Provisional Order.

Columbia.—The *Board of Trade Journal* states that the municipal authorities of Kiosucio have signed an agreement with Mr. G. Gartner authorising him to construct an electric power station for the supply of electricity for general purposes in that district.

Douglas (Isle of Man).—Messrs. Handcock & Dykes, of London, have been appointed Consulting Engineers to the Council in connection with a proposed scheme for public and private electric supply.

Great Harwood.—Mr. J. W. Speight has prepared an electric lighting scheme for the Council.

Hawes (Darlington).—The Council have decided to consider the question of lighting the streets by electricity.

Russia.—Quoting from the report of H.M. Consul at Warsaw on the trade of Poland in 1910, the *Board of Trade Journal* states that in the Lodz district there is a good opening for steam turbines, and other electrical machinery generally. Very important orders for this class of machinery are consequently being placed in Germany, and it is very seldom that an English-made steam engine is heard of. The report adds that this state of affairs is not by any means due to the question of price.

Torquay.—The Local Government Board have sanctioned a loan of £5,250 for additional plant at the electricity works.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Belfast.—The Markets Committee invite tenders for the wiring for light and power of the new abattoir in Stewart Street. Particulars from Town Clerk, and tenders by September 26th.

Dumbarton.—Secondary school at Clerkhill. Architect, A. C. Denny, Dumbarton.

Edinburgh.—Ice skating rink at Murrayfield. Architects, Messrs. W. M. Anderson & Co., 102 Union Street, Glasgow.

Failsworth.—The Lancashire Education Committee are inviting tenders for a new elementary school. Architect, Mr. H. Littler, 16, Ribblesdale Place, Preston.

Glasgow.—Buildings at north-west corner of Park Street and Sussex Street.

Hall and offices at the corner of Harvie Street and Dalmarnock Road. Architects, Messrs. M'Kellar, Davies and Gunn.

Hastings.—Tenders are invited for the electric wiring of the workhouse premises at Ore. Particulars from the Acting Clerk, Union Offices, 11 Wellington Square, and tenders by October 18th.

Kendal.—Tenders are invited for additional works and considerable alterations and repairs at the workhouse. Architect, Stephen Shaw, Kendal.

Liverpool.—Tenders are invited for electric lifts, and the electric lighting at the Brownlow Hill workhouse. Tenders by September 30th to Vestry Clerk, Borough Offices, Brownlow Hill.

Paisley.—Conversion of skating rink into a cinematograph theatre. Architect, C. J. M'Nair, Glasgow.

Stockport.—New central library. Architects, Bradshaw and Gass, 19, Silverwell Street, Bolton.

York.—Tenders are invited for a twelve months' supply of arc lamp carbons, carbon brushes, electrical accessories, carbon filament lamps, meters and time switches, and motors and starters. Particulars from City Electrical Engineer, and tenders by September 23rd.

MISCELLANEOUS

Aldershot.—The National Electric Construction Co. will shortly take in hand the construction of the Aldershot light electric railway at an estimated cost of £78,500.

London: *Hackney.*—The Guardians invite tenders for the extension of the telephone systems at their establishment at Homerton. Particulars from the Clerk, Sidney Road, Homerton, and tenders by September 27th.

Londonderry.—The Harbour Engineer is to prepare a detailed report upon the proposed installation of electrically-controlled signals on certain lighthouses on Lough Foyle.

Manchester.—The Tramways Committee invite tenders for special track work. Particulars from the General Manager, and tenders by October 3rd.

Portsmouth.—A large scheme of tramway extensions has been passed by the Council.

TENDERS RECEIVED AND ACCEPTED

Australia: *Melbourne.*—According to the *Australian Mining Standard*, two important additions are about to be made to the electric light and power plant of the Melbourne City Council, tenders for which have recently been accepted. The more important is a battery, which is being supplied by Messrs. Siemens Bros. Dynamo Works, Ltd., at a cost of £16,487. The battery will have a capacity of 4,000 ampere-hours. The other addition to the plant consists of six 60 k.v.a. transformers, which are being supplied by the A.E.G. Electrical Co., of South Africa.

Mr. C. M. Webster, of Bradford, agent in the United Kingdom for the Compania Frabril de Carbones Electricos, Barcelona, has received an order from the Melbourne City Council for about 700,000 feet of flame arc lamp carbons.

Sydney.—The City Council are recommended to place an order with Messrs. Dick Kerr & Co. for two 4,000-kw. generating sets, at £17,285.

Belfast.—Messrs. Sharman Neill, Ltd., of Belfast, have received the order for an installation of electric clocks on the ss. *Vandyke.*

London: *Hammersmith.*—An order has been placed with Messrs. Hobdell, Way & Co. for covering the new Stirling boilers at the electricity works with non-conducting composition.

The tender of the Corona Lamp Works, Ltd., has been accepted for the lighting and stage effects at the Queen's Theatre, Shaftesbury Avenue.

We give below a list of some important orders recently received by the British Westinghouse Electric and Manufacturing Co., Ltd. :—L.C.C., 100 sets controllers, etc., and

OSRAM·LAMPS

Hosted by Google

10 magnetic brakes; Metropolitan District Railway Co., one 1,200-kw. rotary converter, transformers, and switchgear; British Insulated and Helsby Cable Co., one 200-kw. rotary converter, transformer and switchgear; Port of London Authority, three 300-kw. rotary converters; Underground Electric Railway, one 1,500 kw. rotary converter and three 550-kva. transformers; National Telewriter Co., 50 1,406 G. double gear machines; Con. G.F. of S. Africa, one 275-kva. and one 940-kva. steam sets; Para Construction Co., lighting accessories; Thos. Barlow & Sons, two 312-h.p. slip ring motor, pulley transformer, and switch pillar; Powell Duffryn and Co., Elliot pit pump ventilation; Daimler & Co., switchgear and transformers; City of Santos Imp. Co., spare parts for equipments supplied; Metropolitan Railway Co., one 1,200-kw. rotary transformers, switchgear, etc.; Stalybridge Trams, transformers; West Ham Corporation, transformers and switchgear; Strain and Robertson (Alianza Co., Ltd.), transformers and switchgear.

The Synchronome Company, of 32 and 34, Clerkenwell Road, inform us that among other important contracts for electric time services which they have in hand at the present time are the following:—London & North Western Railway stations at Harrow, Pinner, and Bushey, and new offices at Euston; Webb Orphanage, Crewe; Royal Military College, Sandhurst; Vickers, Ltd., Westminster; Exchange Telegraph Company; Lever Bros.' new offices, Royal Liver Buildings, Liverpool; Temple Press, Rosebery Avenue; Manchester Municipal Girls' School; Sheffield Training College; Farrington's Girls' School, Ltd., Chislehurst; County School for Boys, Bromley, Kent; St. Felix School, Southwold; New Putney Hospital; Crawford Municipal Technical Institute, Cork; Coronation Clock Tower, Wednesbury; Liebig's Extract of Meat Co.'s new offices, Queen Street Place; S.S. *Laconia* for the Cunard Steamship Co.; The Royal Naval Barracks, Shotley.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. Pilling has been appointed manager of the Accrington electric tramways, at a salary of £200 per annum, in succession to Mr. James Wilson, who retires.

Mr. H. Vickers, Assistant Electrical Engineer in the Wolverhampton Tramways Department, has been presented with a gold watch from the staff and men, on the occasion of his leaving to take up the appointment of Electrical Engineer to the Bournemouth Tramways.

Mr. Philip Kemp, M.Sc.Tech., has been appointed Lecturer in Electrical Engineering at the East London College (University of London) in succession to Mr. L. Murphy, who has resigned to take up the position of Managing Engineer to the Perry Barr Fan Works, Birmingham.

The Junior Institution of Engineers.—Mr. G. Marconi has been elected President of this Institution for the forthcoming session, in succession to Sir J. J. Thomson, F.R.S. Arrangements have been made for a party of members to visit the Olympia Electrical Exhibition on Thursday evening next.

International Congress for the Applications of Electricity, Turin.—At the opening meeting on Sunday, 10th September, the following were among those appointed to offices in connection with the Electrical Congress held last week at Turin:—As Vice-Presidents of the Congress: Mr. Alexander Siemens and Dr. S. P. Thompson, F.R.S. As President of the Section of Telegraphy and Telephony: Major W. A. J. O'Meara, C.M.G., Engineer-in-Chief to the Post Office. As Vice-President of the Section for Accumulators and Electrochemistry: Mr. W. Duddell, F.R.S.

Tax on Electric Light in France.—Included in a new series of taxes put forward by the French Minister of Finance is a general tax on electricity and other forms of light. Lighting for public or industrial purposes will not be subject to this tax, but private electric lamps will be charged from ½d. (10 watts) to 1½d. (300 watts) for carbon filament lamps, with double this tax on metal filament lamps. A special tax of 2s. 6d a yard upon the tubes used in connection with mercury vapour lighting is also to be imposed, according to the *Standard* Paris correspondent.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5, Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 5s. to £57 15s. (last week £58 to £58 10s.).

Metal Filament Lamps.—Messrs. G. M. Boddy & Co., who have now removed from 15, Gray's Inn Road, to 8, Leadenhall Street, E.C. (Telephone, Central 10,503), in continuing to follow the latest developments in incandescent lamps, have now adopted as a successor to the well-known lamp formerly known as the "Metalik," the Mazda wire-drawn filament lamp, the manufacture of which has been fully described in ELECTRICAL ENGINEERING (August 24th, page 469).

The Wandsworth Electrical Manufacturing Co., Ltd.—We understand that the agreement between this firm and Messrs. Galsworthy, Ltd., is now terminated by effluxion of time. The W.E.M. Co. have therefore made arrangements to open a depôt at 165 Wardour Street, W. Their new premises comprise commodious stores, and a large stock will be carried of all their manufactures. They have appointed their South of England representative, Mr. H. Bailey, as manager of the London depôt, with Mr. A. E. Blower as chief assistant.

Cinematograph Regulators.—We are requested to state that Messrs. Carney & Pearn's regulator, described and illustrated on page 509 of last week's ELECTRICAL ENGINEERING, is provisionally protected, and that the design is also registered. The sets are being made under special trade mark.

Dissolution of Partnership.—J. T. Walmsley, E. W. Lucas, and W. Walmsley, trading as the W. & L. Electrical Engineering Co., Granville Street, Swinton, near Manchester, have dissolved partnership. W. and J. T. Walmsley will continue.

Liquidations.—The statement of affairs in the winding-up of Messrs. J. G. Childs & Co., of Willesden Green, London, shows liabilities of £30,202, of which £22,978 are expected to rank, and no available assets. The total deficiency is put at £41,060. The Company was formed in 1901 to acquire the business of Mr. J. G. Childs, an electrical engineer. The failure is attributed partly to unremunerative contracts and to excessive expenditure in carrying on the business.

The liquidator in the winding up of the Electrical Instrument Manufacturers, Ltd., Freezywater, Waltham Cross, has been released.

Bankruptcies.—The trustee in the bankruptcy of V. G. Burkitt, electrical engineer, 38 Park Row, Bristol, has been released.

A first and final dividend of 3s. 9¾d. in the £ is to be paid in the bankruptcy of W. H. Illingworth, trading as the Yorkshire Metal Filament Lamp Co., 30 Pellon Road, Halifax. The dividend will be paid on September 26th at the Official Receiver's chambers, 12, Duke Street, Bradford.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Yorkshire Electric Power Co.—The June half-yearly accounts show net profits of £4,950, compared to £2,621 and £1,069 in the corresponding periods of the two previous half-years. After meeting preference dividend, a balance of £3,000 is carried forward.

Hove Electric Lighting Co.—Interim dividend on the ordinary shares at the rate of 8 per cent. per annum for the June half-year.

Bromley Electric Light and Power Co.—Interim dividend at the rate of 4 per cent. per annum on the ordinary shares, less tax, for the June half-year.

Dick, Kerr & Co.—The report for the year to June 30th shows a net profit of £25,934, after meeting debenture interest, &c., to which is added £42,258 from the last accounts. A dividend of 5 per cent. is recommended on the ordinary shares, carrying forward £36,892. Notwithstanding the continued competition in the electrical industry, these results are a considerable improvement over those of the past two years.

Obituary.—Herr Adolph Schweiger, a director of the Siemens Schuckert and Siemens Halske Works, and well known as a pioneer of electric railways, died on Sunday at Wiesbaden from apoplexy of the heart. He was 60 years of age.

The Sale of Electric Irons in America.—It is estimated that no less than 250,000 electric flat-irons were sold in the United States and Canada last year. This approximates, according to the *Electrical Review* and *Western Electrician* of Chicago, to one iron for every eight homes.

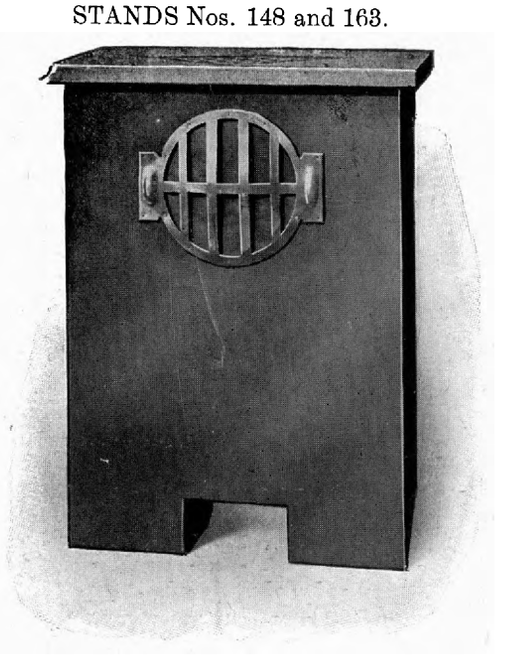
DISCOMFORT

in the home is one of the objects which the man in the street is constantly striving to avoid, and if anyone is sufficiently fortunate to be in a position to assist him in achieving his desires, then whoever it may be should regard it as a public duty to see that everyone is thoroughly acquainted with his methods of achieving this object. There are many little ways in which our little comforts might be increased and our discomforts decreased, but it is impossible to take advantage of them since no attempt is made on the part of those responsible for their introduction to distribute knowledge of their existence. Chief amongst the causes of discomfort is the difficulty of maintaining the temperature of living-rooms at a comfortable and healthy degree. The ideal manner is by means of electric radiators or convectors. Yet these types of heaters are not so frequently met with as would be the case were the benefits resulting from their adoption, in preference to other means of artificial heating, well known.

No firm apparently has paid more attention to the subject of developing electric heating apparatus on commercial lines than Simplex Conduits, Ltd. It can be no longer the charge against electric heating that it is the "advantage of the few" on account of first cost. The several designs which are exhibited at the Company's stands, Nos. 148 and 163, at Olympia, conclusively prove that at last, if after some delay, the time has now been reached when even those of most moderate means can afford to purchase either a radiator or convector, as may best suit their particular tastes. In fact, it may be said that the time when electric heating apparatus will be reduced to the level of gas in regard to cost is within measurable sight, and a great deal of this progress should undoubtedly be placed to the credit of Simplex Conduits, Ltd., to whose efforts in this direction the trade in general is indebted.

The heaters referred to are constructed throughout at the Company's Garrison Lane Works, both as regards the metal-work and the elements themselves. This particular section of the Company's business is confined to one department, and as the result considerable advantage accrues to the buyer, not only in the matter of price, but in the question of design and efficiency in working.

One big disadvantage under which electric heating has laboured up to the present moment, has been that in the construction of the finished article more than one firm, perhaps several, have had a hand, with the inevitable result that the price, having to withstand many profits, has been unduly inflated, whilst the completed appliance has not improved in its migration through several hands.



In the illustration is shown the Convector type of heater, capable of maintaining a room of the usual size found in surburban houses, at a healthy, comfortable temperature, which is retailed at a couple of pounds.

Attempts have been made, and successfully in so far as mere price is concerned, to produce electric heaters approaching these figures before, but, for the reasons already stated, the result has not been to reflect any credit upon electricity, but rather the opposite. For example, however cheap an appliance of this nature may be, the average consumer, even though he be limited in pocket to the extent of a pound or so, is not content with an article which even in the kindest spirit cannot be described as anything but an eyesore.

In the designs hitherto put before the public, low price has been effected at the expense of design and such necessary adjuncts as ornamental work to break the hard, unsympathetic lines of the black iron, a red lamp to give a cheerful glow, a switch to control the heat, have been omitted—all these, which cannot be considered other than essential, have been included in the type of convector shown in the illustration. A point which should always be emphasised in connection with electric heating is the facility with which the heat can be controlled, thus forming a ready means of economising in the current consumed, and adjusting the heat of the room required for personal comfort to a nicety.

To those who require a cheerful glow the lamp radiator is most likely to meet with favour, and the variety of designs and the range of prices illustrated in the handy little catalogue produced by Simplex Conduits, Ltd., is such as to comply with the taste of every class of buyer. One point which might be emphasised, however, in this connection, is that, wide as the range may be in certain instances where price is but a secondary consideration, the Company are in a more favourable position than other manufacturers of similar goods in that they have, on their permanent staff, several designers who thoroughly understand what is required of them, and are therefore able to get out particulars and drawings of any special type of heater which may be required to suit special decorative schemes, upon the shortest possible notice. Buyers are then satisfied in dealing with the Company that they are actually in touch with the fountain head, and that the whole of the apparatus which they may order will be made throughout in the Company's works. In the case of those buyers to whom this fact is likely to bring a feeling of comfort, they should visit

THE ELECTRICAL EXHIBITION OF 1911

(SECOND NOTICE.)

THE Electrical Exhibition at Olympia, London, was formally opened by Sir William Preece, K.C.B., F.R.S., at 2 p.m. on Saturday last. The speeches, however, were made at the inaugural dinner, which took place at the Trocadero Restaurant on the preceding evening, the report of which will be found on the next page. By now, the Exhibition is in a complete state, but at the time of the opening we regret to say that a great deal still remained to be done. This was partly occasioned by the fact that Olympia was only available for the purposes of the exhibition a bare fortnight beforehand, and in consequence the time for making arrangements for the very large supply of current was extremely short. The delay, however, was not entirely due to the electric supply, as the exhibition stand fitters seemed in almost every case to be very lax in carrying out their work to contract time. We would suggest that at future exhibitions the organisers should prepare a standard penalty clause, which they should invite all exhibitors to include in their contract for stand fitting. If this were universally done, the stand fitters would have no option but to accept it, and there is no doubt that a more satisfactory result would be obtained.

A general inspection of the stands shows that almost every exhibitor has put a large amount of individual thought into the arrangement of his exhibit. Moreover, besides the general display of standard electrical apparatus and accessories of the present day, a number of novelties are to be found at the exhibition. It is true that the specimens of the heavier class of electrical plant are comparatively few in number, but the completeness of the collection of lighter apparatus and accessories is perhaps of more importance in an exhibition of this class, which is to interest, not only the electrical engineer, but also the general public.

So far, however, the general public has not yet visited the exhibition in large numbers. Approximately the same amount of gate money was taken at the turnstiles as at the electrical exhibition at Manchester three years ago, but the total attendance has been very much less. At Manchester the distribution of free tickets by the Manchester Corporation and neighbouring local authorities owning electricity undertakings was very large indeed, and although we understand that the London electric supply authorities are distributing some thousands of tickets, yet this distribution was apparently started rather late, and the desired effect has not yet been obtained. We understand that a further large free distribution of tickets by the supply authorities is being arranged for in return for more favourable terms of purchase being granted. We trust that the Exhibition Committee will not attach too much importance to the gate money, and will be more generous themselves in the distribution of free tickets among the trade through the exhibitors. At present some exhibitors are complaining that in addition to the large amount of money they have spent in taking space and preparing an attractive exhibit, they have to make an enormous outlay in tickets at 4s. a dozen, to bring customers and potential customers to the exhibition, for no free tickets have been distributed to exhibitors except the bare number required for their own stand attendants.

At the instance of several exhibitors a meeting was held on Tuesday afternoon to discuss the question of the poor attendance on the first two days, and to urge the organisers to spend more money in advertisements in the daily papers and in other means to attract the public. We understand that no definite conclusion was arrived at, and that the subject will again be discussed in a few days' time, but in the meantime it was decided to add an attraction in the form of a Hungarian band, which performed yesterday for the first time.

EXHIBITION TELEPHONE DIRECTORY

A NUMBER of firms at the exhibition have had their stands connected to the telephone exchange, but by an unfortunate oversight no directory of telephone numbers has been included in the exhibition catalogue. At the suggestion of one of the exhibitors, we supply this need. Exhibitors can communicate with one another and with the whole of the Metropolitan exchange area.

THE INAUGURAL DINNER

THE inaugural dinner was held at the Trocadero Restaurant on Friday evening. Sir William H. Preece presided, and was supported by the majority of the members of the Executive Committee and several exhibitors. "Success to the Electrical Exhibition" was proposed by Sir Albert K. Rollitt, who emphasised the value of an exhibition such as this in spreading education, encouraging invention, and discovering geniuses. The benefits of an exhibition, he explained, were derived through organisation: religion was organised piety, politics organised public opinion, commerce organised shop-keeping, and an exhibition was a gigantic shop-window—in this case a shop-window embracing 80,000 sq. ft. of floor space, and in which some 250 firms were represented. Sir Albert's speech was punctuated with a selection from his inexhaustible stock of anecdotes; and among his digressions from the main subject of his speech was a reference to the street lighting of Oxford Street (London), Sir Albert remarking that he knew no better street lighting than this.

During his reply to the toast, Sir William Preece said that on January 1st, 1912, he would be able to celebrate his Diamond Jubilee as an engineer, as he had been in harness since 1852. He also referred to his recent visit to South Africa, where, he mentioned, there was at present great engineering activity and a large field for British manufactures. Mr. Hugo Hirst proposed the health of the electrical supply authorities at whose instigation these exhibitions were started. At the commencement they had been in the habit of asking manufacturers to send small consignments of goods, which they exposed in spare rooms or shops. The exhibitions organised by the National Electrical Manufacturers' Association were largely the result of the failure of these smaller ones. The exhibitions of 1905 and 1908 had been successes, and so would the 1911 exhibition. The question arose, however, whether future exhibitions would continue successful unless there were a change of method. He suggested that, in the future, instead of the exhibition being divided into individual stands at which every exhibitor showed every class of apparatus he made, it should be divided into sections—lighting, heating, cooking, power, &c.; each manufacturer could put his name on what he was showing, but there would be a uniformity in the display which was now lacking. Concluding his remarks, Mr. Hirst said that whatever comparisons might be made between electrical systems in this and other countries, there was no doubt that our central stations, their organisation and management, were far in advance of anything that could be found abroad.

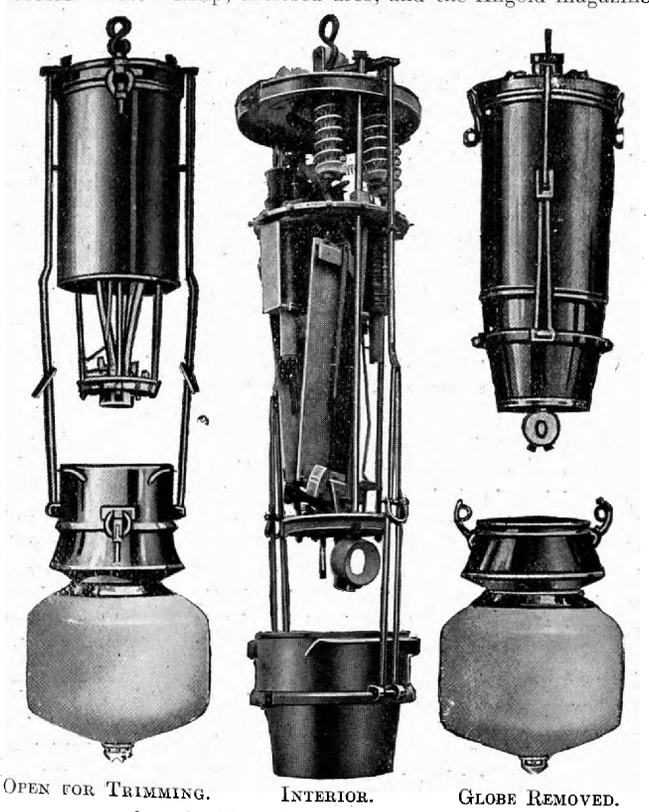
Mr. Frank Bailey (Engineer-in-Chief of the City of London Electric Lighting Co.) and Mr. Alderman Pearson (Chairman of the Bristol Electricity Committee) replied. Mr. Bailey said that the electric lighting companies controlled 14 millions of capital. During the last 14 or 15 years they had doubled their output and halved their coal consumption, in spite of the statements made by the Coal Smoke Abatement Society.

Mr. W. H. Butler proposed the Chairman's Health, to which toast Sir William Preece briefly replied. "The Press" was proposed by Mr. F. H. Nalder, and Mr. T. E. Gatehouse, of the "Electrical Review," responded. Mr. W. M. Mordey then toasted the Visitors, coupling with the toast the names of Mr. Alexander Siemens and Sir Hiram Maxim. Mr. Siemens, in acknowledging the compliment, protested at being considered a visitor in view of the large extent to which his firm is exhibiting; Sir Hiram Maxim indulged in some reminiscences of the early days of electric lighting in the United States, in which he spoke feelingly of the jealousy of the general public at that time if any other than Edison were bold enough to indulge in electrical invention.

SOME OF THE EXHIBITS

The General Electric Co., Ltd.,

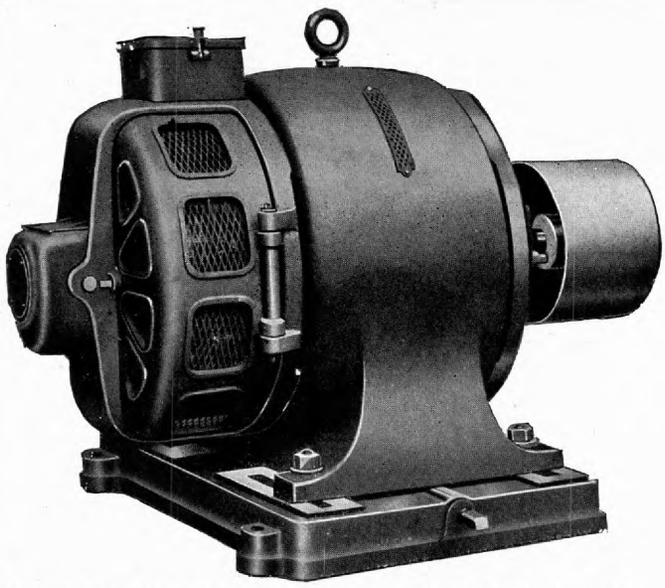
67 QUEEN VICTORIA STREET, E.C. (STAND NOS. 103, 112, 125 & 134.)



16-*c.p.* 220-*volt Osram Lamp.*—This lamp is one of the surprises of the exhibition, and it has already created considerable sensation. The lamp is already being manufactured in quantities; it is a commercial article, and not merely an experimental curiosity, and the General Electric Co. is prepared to accept orders for deliveries in quantity. Particular interest also attaches to the fact that the lamp has a wire-drawn tungsten filament wound in one length without a joint. The lamp takes 20 watts, and is considerably smaller than the 32-watt Osram, measuring $4\frac{5}{8}$ in. from the end of the cap to the trip, and $2\frac{1}{4}$ in. in diameter. Its filament is a pure tungsten wire 0·015 mm. in diameter, and it has ten turns—the same number as a 32-watt 220-volt lamp. The strength of the filament is remarkable, and it will stand the same amount of vibration as a carbon filament lamp. The new lamps are being sold at the same price as the 200-volt 32-watt lamps; as there will doubtless be a large demand for them, we advise our readers to send in their orders at the earliest possible moment.

Fig. 1.—200-volt 16 c.p. Drawn Filament Osram Lamp. About one-third size.

Other Osram Lamps.—As might be expected, since an 8-c.p. 110-volt tungsten lamp would have the same diameter filament as the 16-c.p. 220-volt lamps, this size is also being manufactured. At the present time, however, deliveries in large quantities are not possible. An interesting exhibit to show the strength of the Osram filament is two model tram-cars, upon each of which is a 32-watt 220-volt Osram lamp. The model is arranged so that the cars collide with the lamps out; they are then automatically lighted, the cars are drawn apart, and the process is repeated with the lamps extinguished. The fact that the shock occurs with the lamps extinguished and the filament cold will appeal to those who know that the filaments can stand vibration far better lighted than when cold. Other lamps are exhibited in all sizes.



Arc Lamps.—The arc lamps exhibit includes the cheap and useful "Butt" lamp, enclosed arcs, and the Angold magazine lamp. The latest pattern of the last-mentioned lamp will burn 100 hours in the 8-ampere size, and 85 hours in the 10-ampere size. Nine pairs of carbons are used, 15 in. long, and these are ordinary cheap flame carbons without metal core, so that the cost of carbons is only about 0·133 per hour. The feeding of the carbon is effected by a travelling push-bar

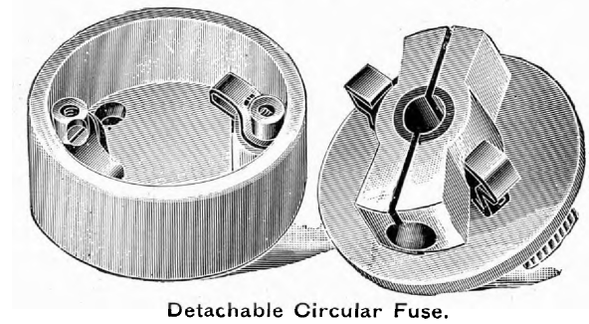
and attachments, which engage in turn with the upper ends of each pair of carbons. The push-bar has a vertical traverse of about 13 in., and when it has forced the burning pair below the level of the magazines the next pair come into position above the short burning ends. At the same time, the traverse of the push-bar is reversed, and it is carried up until above the level of the second pair of carbons, when it is again reversed and the operation repeated, the new carbons feeding down the short ends of the burning pair, ultimately ejecting them; whereupon the new pair light up. The traverse of the push-bar is accomplished by means of a reciprocating solenoid core, coupled to a phosphor-bronze rack rod, which forces the push-bar up or down, step by step, in the manner of a ratchet jack, the pressure transmitted through to the carbon being in the neighbourhood of 20 lb., which should be an ample margin for overcoming all possible irregularities in the carbon surfaces and clogging of the parts. The upward traverse is continuous, and goes on whilst the arc remains burning, but the downward feed is intermittent, according to the needs of the arc, and is controlled by a catch on the usual differential arc regulating lever.

The upper part of the case is fastened by snap catches for easy removal. It can be taken right away from the lamp whilst the lower half of the case remains hanging on its suspending links. The lower half is now distinct from the corona, and partly consists of a taper iron casting turned with a bevel seating which engages with a similar turned seating on the lamp base. The suspension of lamp consists of an iron hanger which has a certain amount of free action. When the lower case is let down the lamp hangs on the short crossbars bridging the bosses on the lamp crown, but when the lower case is pulled up into position the suspension links (which replace the usual chains) act as levers, and the whole weight of the lamp is thus lifted and sustained by the lower case, the pressure coming on the turned seatings, which are therefore kept quite fume-tight. The outlet for the fumes is at the top of the corona, and in this way a strong draught is produced, which carries the fumes away from the globe surface and keeps it quite clean. The corona is provided with a seating for the globe to ensure a watertight fit. The economiser is so arranged that it can be swung clear of the blow magnets and carbons, thereby facilitating cleaning.



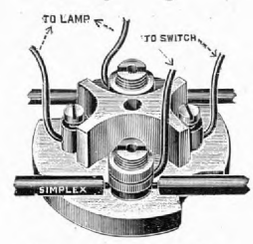
Electric Cooking and Heating.—The electric ovens and other cooking and heating apparatus made by the General Electric Co. are so well known that a detailed description is unnecessary. These appliances are exhibited in all patterns and sizes, and the radiators are exhibited in all finishes, from the cheapest to the most highly finished. Among the cooking

"Convertible" Set (Electric Iron, Kettle, Saucepan and Frying Pan.)

apparatus we may mention particularly the inexpensive and useful "convertible" set illustrated. This comprises an electric iron kettle, saucepan, and frying-pan. The separate utensils can be placed upon the upturned surface of the iron, which becomes, for the time being, an electric hot-plate. This *multum in parvo* is sold at the moderate price of one guinea.

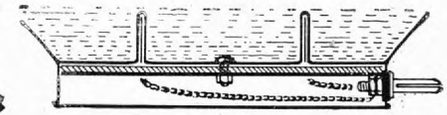
Other Exhibits.—Among the company's other exhibits is, of course, a large and representative selection of fittings. Some fine, heavy Georgian fittings will command attention, and mention must be made of an interesting series of cane fittings which are a decided novelty and of pleasing appearance. The new "Slick" switches, with their extremely small projection, are shown in all varieties of covers and finishes. The latest patterns of fuses and distribution boards merit inspection, and the detachable circular fuse which we illustrate will also be found of considerable utility. The "Kleenall" vacuum cleaner is shown in operation, as is also a parquet floor polisher, consisting of a brush and a vertical motor, which should prove invaluable for large drawing-rooms and public halls. Motor fans, and in fact practically every domestic application of electricity, are also shown. Space will not permit us to do full justice to all the company's exhibits,

Detachable Circular Fuse.



and we recommend those of our readers who visit the exhibition to set aside adequate time for their inspection of the General Electric Co.'s stand.

Simplex Conduits, Ltd.,



GARRISON LANE, BIRMINGHAM. (STAND NOS. 148 & 163.)

Conduits and Fittings.—This firm exhibit their steel conduits, and their many lines of lighting and power supplies. Among the conduit accessories in which considerable development has been made, and for which the demand has increased considerably of late, are porcelain interiors for use with junction boxes as a means of effecting a lasting and safe joint between conductors. In the majority of cases these interiors are intended for use with the smaller sizes of wire, but a number of types are also available for heavier cables up to 19 strands. Our first illustration shows a typical pattern recently introduced, designed to fit into standard Simplex circular junction boxes. There are two externally threaded main terminals carried on each side of a china divisional fillet, and these terminals have a central slot. By means of this formation it is not necessary to sever the circuit wires: all that is required is to bare the insulation about a quarter of an inch, and drop the exposed conductor into the slot mentioned, and the conductor is then clamped in position by means of a screwed ring. Two subsidiary terminals are provided for connection to the switch and to the lamps; these interiors save considerable time in making the necessary connections.

Heating and Cooking.—In the subsidiary accessories, not necessarily designed for the conduit system, the Simplex Com-

Porcelain Interior.

Arrangement of Heating Element in Kettle.

pany exhibit a considerable range, and have specialised more particularly on the better quality English-made accessories. A new 3-pint 500-watt copper kettle, which is attracting much attention, is substantially constructed, and will boil the full capacity of water in ten minutes; the price of the kettle is as low as 13s. 6d. The design of this kettle is such that the heating elements are practically surrounded by water, as seen in the diagrammatic illustration. Another useful appliance (illustrated on the next page) is a 600-watt toaster, which is sold for one guinea. It is nickel-plated all over and is capable of toasting two slices of bread at one time. The bread is placed in the removable sides, and held in position so that the minimum amount of heat is allowed to escape. The heating element is a ribbon of special resistance alloy wound spirally over strips of mica, and these are connected in series-parallel or parallel according to the voltage. It will toast two slices of bread of average thickness in about three minutes, and the consumption per slice works out at about 15-watt hours.

The Simplex Co. do not confine their heating and cooking exhibit to these light pieces of apparatus, however. Among the exhibits is a $13\frac{1}{2}$-kw. cooking range, intended to serve for a dinner for thirty people. It consists of a double oven taking $2 \times 2\frac{1}{2}$ k.w., a two kilowatt or six-chop grill, also capable

Hosted by Google

of being switched on in two halves, two regulable boiling rings taking ¾ and 1 k.w. respectively (the latter capable of boiling two pints of water in seven minutes), four vegetable boilers of from 850 to 1,250 watts, and a four-pot "bain-marie" taking 1 kw. In the ovens the heating elements are enclosed in iron plates at the sides, the grill is heated by exposed coils above it, and the vegetable boilers are fitted with coils in the bottom of each vessel arranged in a similar manner to those in the electric kettle already referred to, and so connected that the whole vessel can be drawn out of clip connecting contacts for cleaning.

Fittings and Shades.—A few months ago the company purchased the business of Jesson Birkett & Co., Ltd., and since then the fittings and art metal-work business has been steadily progressing. Examples of the products of this department form a prominent part of the exhibit. Mention should also be made of some highly artistic silk shades, which have been given the name "Mosaic," and other pat-

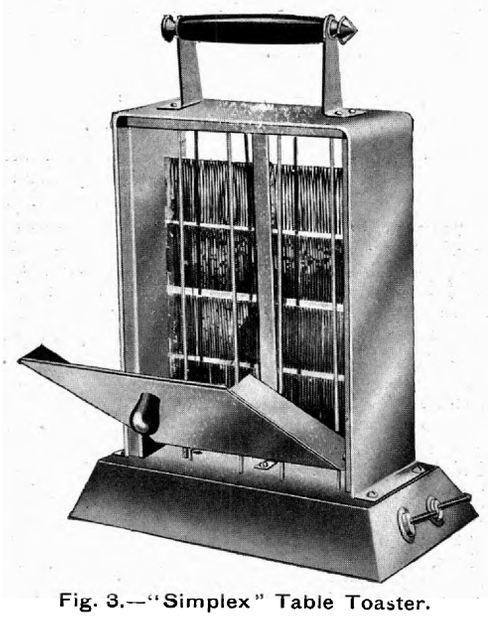


Fig. 3.—"Simplex" Table Toaster.

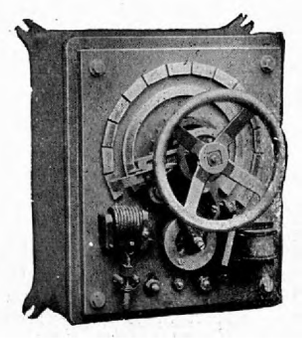
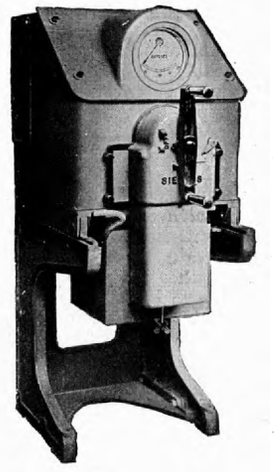
terns of silk and paper shades are shown, from "Nuremberg lanterns" to "Spookie" paper shades.

The radiators shown are mostly of the cheaper type calculated to suit the middle-class pocket, but a few specimens of fine designs, both in the case of radiators and convectors, are also shown.



Fuse Wire.—Lastly, we must note the "bi-metal" fuse wire sold by the company under Hope's patent. It consists of a copper strand surrounded by a more fusible alloy. It will carry its rated full load current indefinitely, but as soon as the melting-point of the alloy is reached, with an increase of 10 per cent., the fuse melts quickly. For very short periods, we are informed, it will carry up to six times its full load of current, which makes it particularly useful for controlling motor circuits on which there are heavy starting currents. It is also said to be free from oxidisation and consequent ageing.

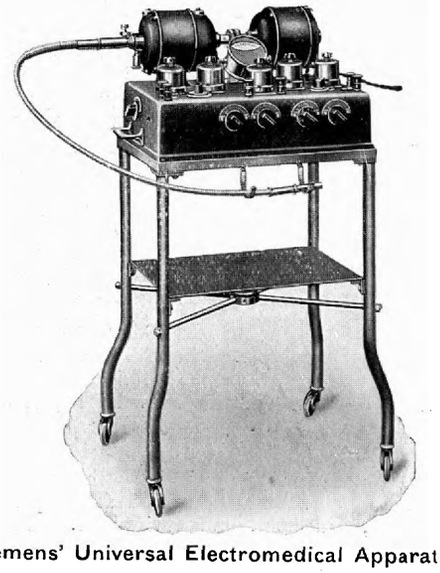
Siemens Brothers & Co., Ltd., and Siemens Brothers Dynamo Works, Ltd.,



CAXTON HOUSE, WESTMINSTER. (STAND NOS. 179, 184, 206 & 209.)

The two large and artistically designed stands of the two Siemens firms probably represent more branches of electrical engineering than any other in the exhibition.

Power Plant, Switchgear, &c.—As is to be expected from exhibition conditions, the heavy plant from the Stafford works is not as well exemplified as apparatus of a lighter nature, although a fine collection of photographs remind the visitor of the great achievements of the firm in this direction. There are some interesting items of switchgear shown. The most notable among these is a complete mining switch pillar of the draw-out type similar to that illustrated here. The pattern shown is made for voltages up to 3,300, and currents up to 75 amperes. The front portion of the case, containing the oil switch current transformer, ammeter, &c., is arranged to be drawn forward bodily, at the same time disengaging the isolating contact plugs and rendering all the drawn forward part dead, without leaving any live parts easy of access, and the interlocking arrangements not only prevent this being done unless the switch is off, but only permit of the case being opened after it is fully drawn forward. The whole is built up of units, so that a number of such panels can be connected together to form a board of any size. Other oil switches are also shown. Among the low tension switchgear are several varieties of starters and complete motor control pillars. Of particular interest is the "flywheel type" slow motion starter, in which each successive step is timed by a heavy spring oscillating balance wheel. Among the smaller switches attention should be paid to a form of tumbler switch with exceptionally quick break, well shown by a large model. Motors of a large range of sizes, from the smallest



Siemens' Flywheel Pattern Starter.

Siemens' Carriage Pattern Mining Switch Pillar.

upwards, are shown, including special forms for particular purposes, such as the spring-supported individual drive loom motor, of which over 1,800 have already been supplied to the Lancashire and Yorkshire textile districts. Motor driven drills and other portable tools are also included, and a novelty is shown in action in the electrically driven rotary pump useful for country house water supply, &c., and other similar purposes.

Siemens' Universal Electromedical Apparatus.

This is arranged with a float switch to start and stop the motor as water is required, or, in an alternative arrangement, a switch connected to the draw-off tap causes the motor to run only while water is being drawn. Other applications of the electric motor shown in action include a sewing machine and a vacuum cleaner.

Heating Apparatus, Fans, Fuses, &c.—A good show of radiators is on view, and other heating apparatus includes kettles, hot-water jugs, grillers, flat-irons, cigar-lighters, &c. Fans are also well represented, and a good deal of interest will attach to the series of examples of the Zed cartridge fuse, which is steadily increasing in popularity, and is now shown in larger sizes than before up to 160 amperes.

Cables and Wires.—Almost every class of cable made for any purpose is represented by samples from the Woolwich

METER DEPT.,
122-124 CHARING CROSS ROAD, LONDON, W.C.

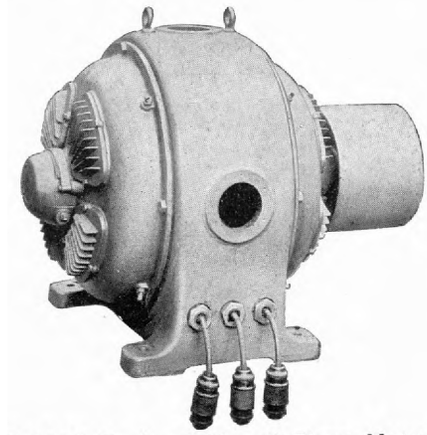
Hosted by Google

works, together with various cable accessories, jointing materials, &c., and a pair of braiding machines are shown in action covering flexible wires. Not the least interesting exhibit of this department is the board demonstrating the well-known Stannos system of wiring with metal-cased conductors of a flexibility rendering them adaptable to the most difficult situations. The details of this system, with which by now all our readers must be familiar, are extremely well thought out, and the increasingly large extent to which the system is being used shows that its good qualities are appreciated.

Batteries, Telegraph and Telephone Apparatus, and Line Material.—The well-known Obach and other dry cells made by the firm are, of course, represented, as well as various forms of fluid primary cell. Among these, attention should be drawn particularly to the Neotherm cell, in which an outer iron case lined with grid fitted with copper oxide forms the positive electrode, and an electrolyte of sodium hydrate is used with a zinc negative. With the action of the cell the copper oxide depolariser becomes reduced to metallic copper, but can be regenerated from time to time by the whole iron case being placed in a furnace to reoxidise the copper. The cell is capable of heavy discharge rates, is compact, and is specially recommended for yacht lighting and similar work. The company's special non-incrusting zincs should also be mentioned, and these are made in most sensible shapes, thickest where they are most liable to eat away. A few of the telegraph instruments for which the firm have so long been famous are shown, and an excellent display is also made of telephones and bells of a variety of forms, including specially protected telephones for use in proximity with high-tension lines, mining telephones, loud-speaking telephones, and intercommunication apparatus. Iron poles, insulators, and other telegraph and telephone line material are represented, and an interesting corner of the stand shows details of the complete system of electric railway signalling which the company have developed. Prominent among these is a signal actuated by a small motor driven by twelve large dry cells, useful where the signal is at a considerable distance from the cabin.

Instruments, &c.—Space does not permit of a recapitulation of all the patterns of instrument shown, including as it does moving iron, moving coil, and induction type apparatus, but attention may be drawn to a very compact portable testing set, in which a complete potentiometer with a standard cell is contained within the apparatus by means of which the multiple range milliampere and voltmeter may be checked at the time and place it is used for comparisons with instruments to be tested, or other accurate measurements.

Electro-medical Apparatus.—A special feature of one of the Siemens stands is the display of electro-medical apparatus. Demonstrations are given of Röntgen ray working in a special room at one end, within which is a lead-lined cabinet provided with a window and containing all the apparatus required, well screened from operator and subject. High frequency apparatus is also shown, and a particularly compact practitioner's outfit is exhibited in the Universal electro-medical apparatus illustrated opposite, which contains complete equipment for the supply of current for cautery, light, galvanisation, electrolysis, cataphoresis, ionisation, faradisation, &c., and a motor to drive a flexible shaft as required for various forms of operations and massage. Complete outfits are also shown for obtaining the high voltage high frequency currents required for the new process of diathermy, in which comparatively large currents at high voltage, rendered innocuous by their high frequency, are passed through the body to produce local heating effects.



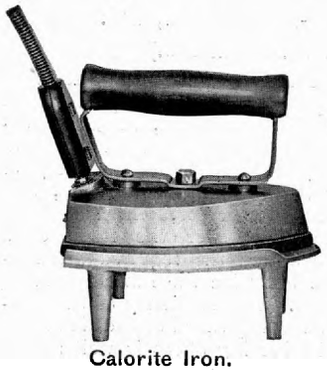
Lamps, Fittings, &c.—Arc lamps of several patterns are shown, and of course the well-known tantalum and one-watt metal filament lamps are well represented and effectively displayed. On both stands a great number of fittings are shown, including lustre patterns, cut glass electroliers, and other fittings in Elizabethan, Jacobean, Queen Anne, Georgian, Sheraton, Chippendale, and modern English styles, Dutch candle fittings, Louis XIV., XV., and XVI. and Empire styles, and examples of Oriental fittings. Fittings for marine work are also shown, as well as outside fittings for shop and street lighting, glass and silk shades of all descriptions, and the latest designs of holophane glassware. The most effective demonstration of electric lighting on the stand, however, is the completely furnished and artistically decorated little room entirely lighted by tantalum candle lamps in most graceful fittings. Over the stand is an internally illuminated sign bearing the word Siemens, and in a smaller frame the design of the famous satisfied consumer is outlined in a most effective way with miniature lamps. The company have also three large signs illuminated by Tantalum lamps on the gallery balustrade.

The British Thomson-Houston Co., Ltd.

RUGBY. (STAND NOS. 124 & 135.)

Lamps, Fittings, &c.—One of the most important features of the stand is, as might be expected, a fine display of Mazda lamps with their strong wire-drawn filaments, the manufacture of which was fully described in ELECTRICAL ENGINEERING (August 24th, page 469). They are shown in a variety of sizes, some in combination with holophane reflectors, and some with the new "Mazda-lux" reflector, which consists simply of an aluminium-spun hood over the lamp of a scientifically designed shape to obtain the required distribution of light, enamelled outside, but with the inner reflecting surface of unpolished aluminium. The efficiency of these reflectors is remarkably high, as shown by the photometric curves exhibited, and the beautiful distributing effect is well shown by the Mazda lamps in these reflectors mounted in the roof of the stand. The top of the stand is outlined most effectively by small coloured Mazda lamps, and some 3,000 Mazda lamps are included in the large flashing sign at the exit of the exhibition, which is arranged with a flasher to show at intervals of ten seconds no less than seven different changes of wording. The Gem metallised carbon lamp is also shown, and not the least interesting item on the stand is the Magnetite arc lamp, which was fully described in ELECTRICAL ENGINEERING (Sept. 14th, page 509).

Plant, Switchgear, &c.—Standard B.T.H. motors for continuous current two-phase and three-phase are on view on this stand in sizes down to small sewing-machine motors, but no large plant is shown. One of the enclosed type three-phase motors is illustrated here. There is, however, a good deal of interesting switchgear. Among this are examples of contactor panels for large motors (as illustrated in ELECTRICAL ENGINEERING, May 11th, page 251), equipped with contactors similar to those used for railway work. Separate contactors are also shown in sizes for currents from 15 to 2,500 amperes, fitted with auxiliary control contacts, causing them to close successively as the back E.M.F. rises. Solenoid type auto-



B. T.-H. Enclosed Type 3-Phase Motor.

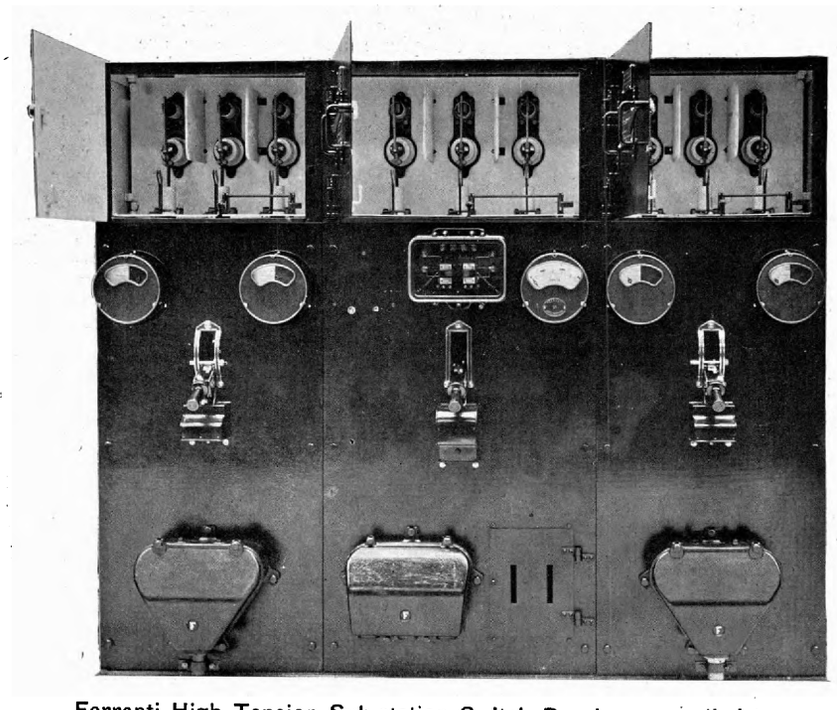
matic starters are also shown, and a remote control automatic field regulating rheostat switch. There is also a new design of large crane controller, of similar appearance to a tramcar controller, with electric braking positions. The well-known Tirrill regulator is shown in its latest form, with circular actuating magnet and three vibrating contacts in parallel, and a selection of recording voltmeter charts show its marvellous powers of regulation. A mining switch-pillar, similar to that illustrated in ELECTRICAL ENGINEERING (Mining Supplement, May 4th, page XXXVI.), will also attract attention amidst the comprehensive selection of switchgear shown. An excellent display of B.T.H. meters of all patterns is made, including the new R.S. type for alternating current, which is a particularly simple and compact form of induction meter with very few parts. Other meters shown include mercury meters of the house service, portable and switchboard types, as well as prepayment meters.

Heating and Cooking Apparatus.—The British Thomson-Houston Co. have for long specialised in electric heating and cooking apparatus, and a thoroughly representative selection of these products is to be seen. The latest developments include not only the extremely durable "Calorite" irons, but also the application of the calorite element to kettles, such as the one illustrated here. In these the heating element is

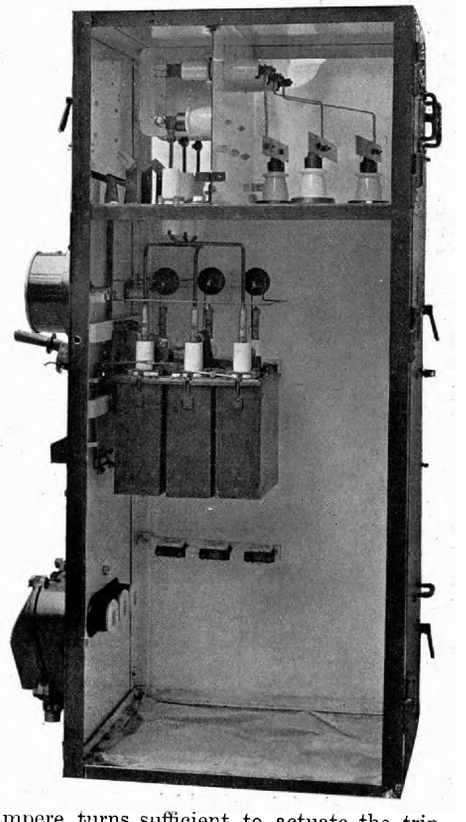
Hosted by Google

external to the kettle itself, and can be easily removed by withdrawing a few screws. New and well-finished designs of

Calorite Iron.



Calorite Kettle.



non-luminous radiators are also shown, some provided with switches for as many as six different heats.

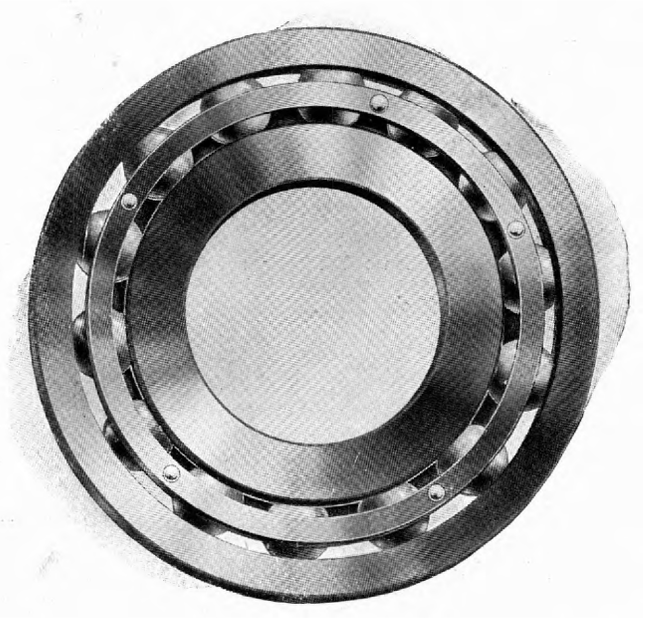
Ferranti, Ltd.,

HOLLINWOOD, LANCASHIRE. (STAND NOS. 102 & 113.)

The arrangement of this stand, which is near the centre of the hall, is as original as it is effective, and a number of most interesting exhibits are shown exemplifying the varied branches of the firm's activities and presenting several novelties exhibited for the first time. There are no pillars, signs, or roofs to obstruct the view or give a feeling of being cramped. All round the stand, behind a rail, are oak panels inclined at an angle whereon are mounted the various pieces of apparatus; inside these are ample spaces for the reception of visitors and the display of further apparatus, while in the centre is an excavated tiled pit, where, without hiding other objects, full-sized high-tension switchgear is exhibited in a way suggesting a sub-station "atmosphere."

Ferranti High Tension Sub-station Switch Panels as supplied to Birmingham Corporation.

Switchgear, Contactless Starters, &c.—Among the novelties shown, attention may first be called to a complete enclosed motor control pillar equipped with the new Ferranti tube type "contactless" starter, a regulator also devoid of sliding contacts, and pair of automatic circuit breakers in place of a main switch. These starters, which present considerable advantages over the sliding contact type, are made in a variety of forms, all of very simple construction. The essential part is an enamel-lined steel tube containing a pile of specially made hard carbon discs in the moderate-sized starters about the size of a penny, which are caused to decrease in resistance by being compressed by a plunger worked by the starter lever. All the usual releases, slow motion devices, etc., can, of course, be fitted, and the apparatus is compact, simple, and durable. The contactless or compression regulators depend in a like manner on the compression of a pile of carbon discs, although their construction is slightly different. On other panels are shown enclosed switches of the pattern in use exclusively as main switches on the stands throughout the exhibition, of which an illustration is given opposite, and a new pattern of enclosed tubular fuse with the fuses enclosed in fibre tubes and the clips fitted with guides so that a fuse tube may be replaced easily in the dark. Other items shown include action transformer starters and circuit breakers, as well as switchboard instruments, relays, current and potential transformers, etc. In the pit in the centre is a group of three panels, forming one of about 90 sets made for the Birmingham Corporation, fitted with standard Ferranti oil switches, isolating switches in a top chamber with doors interlocked with the main switch, and other necessary appliances. The trip gear on the switches is worthy of attention, in that the trip coil armature acts on the catch through a system of gearing which renders a small number of ampere turns sufficient to actuate the trip. In the pit there is also a large remote control solenoid operated oil switch, with three separate oil chambers designed for a normal load of 3,500 k.w., but capable of breaking short circuit loads up to 20,000 k.w. A control panel of the push button type is mounted at another part of the stand, with a view to demonstrating the rapidity of action of the switch. Other demonstration boards on the stand are fitted up to show the action of the Ferranti-Field balance system of protection (see ELECTRICAL ENGINEERING, Vol. V., page 599), and the Mery-Price system and compression regulators are used to show the sensitiveness of the various relays, etc.



Heating and Cooking Apparatus.—The other half of the stand is devoted to the company's heating and cooking apparatus. The basis of their system is a substantial element made up of a flat strip of a special alloy wound edgewise, with bare edges on mica separating the turns. This in some cases is covered with quartz, and the whole shines with a red glow. These units, mounted in artistic metal-work, form the remarkably attractive new form of electric radiator. In the cheaper classes of cooker the same unit is made up into a 700-watt hot-plate stove, which is put on the market as low as 30s., and is used with special flat-bottomed aluminium utensils, also made in Messrs. Ferranti's own works. The large cookers have two heats obtained by series and parallel

connection. An attractive silver grill is shown, and the large ovens, also employing heating units of the same description. Both heavy lagged ovens and light sheet-metal ovens with reflecting surface are made, and the large complete ranges comprise features which should be seen to be appreciated.

Meters.—The remainder of this large stand is devoted to the manifold forms of the Ferranti meter, most of which are too well known to need description here. One or two novelties, however, are shown, including a new and particularly simple A.C. induction house service meter, which is standardised in a stout glass case, and a new clock switch, in which the mercury switch is in an entirely separate chamber from the mechanism, and the two arms have separate tightening nuts, greatly facilitating adjustment.

The British Aluminium Co., Ltd.,

109 QUEEN VICTORIA STREET, E.C. (STAND No. 266.)

Aluminium Conductors and Joints.—On this stand, which is in the gallery, the British Aluminium Co. are showing a variety of the forms in which aluminium, owing to its price now comparing favourably with that of copper for both bare and insulated conductors (see ELECTRICAL ENGINEERING, Nov. 24th, 1910, page 749), can be economically employed in the electrical industry. One of the most extensive fields for aluminium is for overhead transmission lines, and the company are exhibiting samples of conductors for this and other purposes for currents from 2 to 2,000 amperes, and showing the various ways in which they may be jointed. For stranded aerial cables the twisted strip joint is most to be recommended, but solid conductors are more usually jointed by butt welding, and welding can also be carried out with great success with a blow-lamp on conductors in place when erecting switchboard connections, &c., to make straight or T joints to attach sockets or lugs, &c., and special tools to hold and press together the parts during welding are exhibited. Cast welded joints are also made in some circumstances, and a variety of special clamps for making mechanical joints are shown. Numerous samples of insulated aluminium cables are also to be seen.

Aluminium Field Coils for Motors, &c.—Aluminium wire of square section with rounded edges is particularly suitable for field coils of railway motors, as owing to the thin film of oxide no insulation need be used between adjacent turns in any one layer, with a gain in space factor, allowing the aluminium coil of equal conductivity to occupy no more space than an ordinary coil of insulated round copper wire. The weights, however, are in the proportion of 29 to 70, and the aluminium coils have the further advantage of better internal heat distribution and a 20 per cent. lower temperature coefficient of resistance. Crane-lifting magnet coils of edgewise aluminium strip are also shown.

Other Applications of Aluminium.—The lightness of aluminium can be taken advantage of in the construction of trolley heads, and examples of aluminium heads weighing 6 lbs., compared with 8 lbs. for bronze heads, are to be seen. A number of other articles in the manufacture of which aluminium figures are shown, as sections for bow-collector contacts, meter discs, and other instrument fittings, cooking utensils, and vacuum cleaner parts.

W. T. Henley's Telegraph Works Co., Ltd.,

13 & 14 BLOMFIELD STREET, E.C. (STAND NOS. 178 & 185.)

A New Wiring System.—Messrs. Henley exhibit some samples of enormous power cables, some specimens of historic telegraph cables, an array of large feeder pillars, and other things that will appeal by their size, but we predict that the exhibit on their stand which will attract most attention is a new wiring system to meet the present demand for methods of reducing the cost of wiring the premises of small consumers. Although this system will have to compete with others already in the field, there is no doubt that it has distinctive features which will command attention. The foremost of these is the use of a new sheathing for the wire. It is in the usual form of a seamless tube round the cable, but it is composed of a "special" metal—apparently an alloy of lead with other metals—which is sufficiently flexible to stand a considerable amount of sharp bending, and is yet considerably harder than the ordinary pure lead sheathing.

Two different arrangements of wiring are provided for. The first a concentric system for use in cases where an insulated return can be employed, and the second a twin system. The wires in both cases are made in three sizes, 1/18, 3/22, and 3/20, and they are insulated with vulcanised rubber of good quality, but not actually Association grade, although the radial thickness of insulation conforms to the standards of the Engineering Standards Committee. The insulation consists of a lap of pure rubber and two of vulcanised rubber. In the case of

The Henley Wiring System

Provisionally Protected

A new Wiring System that will enable Contractors to fit up Electric Light in small houses, where it has hitherto been impossible owing to the high cost of wiring.

The low first cost of the Henley Wiring System, and the quickness and ease with which it can be installed, will open up a large field for Wiring Contractors.

The System may be seen at

HENLEY'S STAND

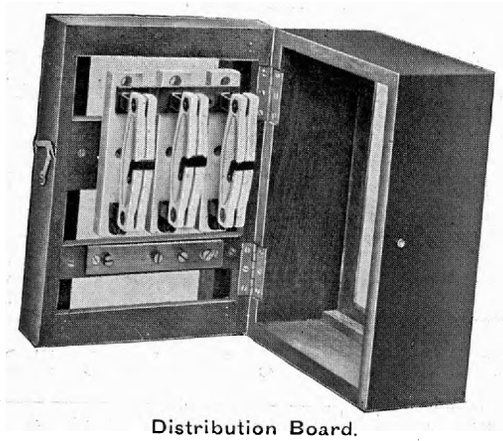
Hosted by Google

the concentric system a strip of tinned copper foil is lapped over the insulation and is immediately in contact with the metal casing, so that it supplies the additional conductivity for the return circuit. The connection to the fittings is made in an extremely ingenious manner, as seen in the illustration below. A steel wood-screw is used, the head of which is drilled and tapped to enable a steel stud $\frac{1}{5}$-in. diameter to be screwed into and to project from it from $\frac{3}{4}$ in. to 1 in. The end of the strip in the cable is then punched with a small hole by a tool resembling an ordinary ticket-puncher, and is fixed on to

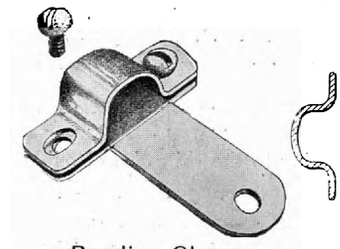


The "H.W.S." Fitting and Block.

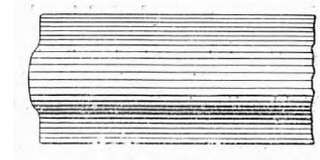
this stud by means of washers and nuts, and if other cables lead to the same point, for looping in, &c., their outers are all fixed to the stud in the same manner, thus ensuring perfect electric continuity in a very simple manner. A spring washer is used underneath the top of the nut to overcome liability of the connections to be worked loose by the alternating current. Finally, the block is fixed to the wall by a conical nut, which screws to the stud and fits into the countersunk hole in the centre of the block.

In the case of the twin system no foil is used under the outer sheathing, and the latter is bonded by means of the clamp shown in the illustration opposite, the lug of which is screwed on to the stud behind the block in a similar manner to the strip in the case of the concentric system. These clamps are nicked so that when required for back entry they can be bent at a right angle. We also illustrate the simple protective covering, which can be used to hide the wires or to protect them when there is a risk of severe mechanical damage. It is made in six foot lengths.

Another illustration shows the simple distribution board



Distribution Board.



which is employed. The sheathing is connected up to the earthing bar seen at the bottom.

Cables.—A large number of cable samples are shown. Among these is a twin high-tension cable which has been tested to a pressure of 130,000 volts. It is made for Marconi's Wireless Telegraph Co., Ltd., for use at their high-power stations at Clifden (Ireland) and Glace Bay (Canada). The conductors are 0·02 sq. in. section. These are insulated to a radial thickness of $\frac{1}{4}$ in., with impregnated manilla paper. They are then laid up together and covered with a further $\frac{1}{4}$ in. of similar insulation, after which they are lead-sheathed and wire-armoured. The cable is to be used to take current at 40,000 volts pressure from the power house to the transmission house, the current being generated by dynamos connected in series for charging accumulators. The specification asked for a test of 56,000 r.m.s. volts between cores and between cores of lead, but Messrs. Henley's have tested it further, having applied 115,000 volts for three minutes and 130,000 volts for ten minutes. During the test the cable was bent in two places to a radius of 17 ins. A very heavy cable made for the Powell Duffryn Steam Coal Co., Ltd., is also shown. This has three cores, each 0·8 sq. in. section, and is one of the largest ever made for a colliery. It will be used at a pressure of 3,000 volts. The cable is paper-insulated and lead-covered and wire-armoured, and has a copper tape earth shield under the lead. Its overall diameter is $4\frac{1}{2}$ ins., and it weighs 145,600 lbs. per mile. Another sample of cable shown is a three-core shaft cable 0·4 sq. in. section, supplied to the Detchmond Colliery. In this case the insulation is vulcanised bitumen, and the cable is double wire-armoured. The overall diameter is $3\frac{1}{2}$ ins., and the breaking stress 120,000 lbs. The cable is made in one 380-yard length, and was delivered on a drum 9 ft. diameter. The gross weight was 119,000 lbs.

These are only a few of the large light and power cables which are shown. Some interesting specimens of old submarine cables are also exhibited, the oldest of these being a piece of the Ceylon cable laid in 1857. Among other exhibits shown

Bonding Clamp.

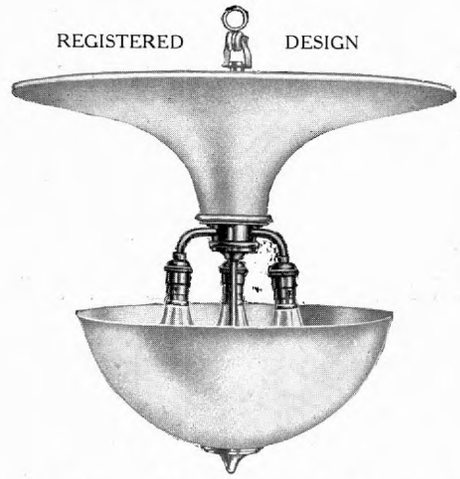
Protective Casing.

by this firm is a piece of cable with ozone-proof covering, which is enclosed under a glass cover with an ozone generator. On a part of the cable the ozone-proof covering has been removed, and the test shows how the latter protects the rubber from damage, whilst the exposed surface of the rubber is seriously attacked. A fine collection of junction-boxes, service-boxes, and fuse-boxes is shown, and also some feeder pillars. At the centre of the stand is an overhead pole, which is of the type supplied for the Bahia Blanca power transmission scheme described in ELECTRICAL ENGINEERING some time ago. This carries the 6,600-volt overhead wires, and the above pole forms the feeder pillar, in which three 3-phase underground cables are connected to the three sets of 3-phase lines which the pole supports.

The Brimsdown Lamp Works,

KINGSWAY HOUSE, W.C. (STAND NOS. 100 & 115.)

Metal Filament Lamps.—This is a large and effective stand in a prominent position, and is at once noticeable by the models of John Bull carrying a large Brimsdown lamp wherewith to "see things in a better light," which are familiar to our readers from the well-known Brimsdown poster. Lamps are to be seen showing the wide range of patterns which are turned out at the Brimsdown Works, and considerable ingenuity is displayed in the manner of their exhibition. These lamps, as is well known, are made under the "Colloid-Tungsten" patents, under which the Company possess the sole rights of manufacture in Great Britain, and the various stages of their manufacture were outlined in a special article in ELECTRICAL ENGINEERING (January 26th, p. 41), describing the Brimsdown Works. The advantages claimed for the process employed are the production of a particularly homogeneous filament of long life and high efficiency. And we are informed that the manufacturing facilities of the Brimsdown Works have been approved by the Admiralty, the War Office, the India Office, the Crown Agents for the Colonies, the London County Council, and other public bodies.



Illumination Strip.—A novelty which the Company are

ADNIL ELECTRIC CO., LTD.,

ARTILLERY LANE, LONDON, E.C.

BOOKSELLERS AND TECHNICAL BOOKS.

There are few booksellers, if any, who are in a position to keep in stock a complete library of the latest and best technical books. It would be an enormous convenience to engineers and students who wish to obtain a book on any particular subject if they could go to a bookshop with the confidence that they can immediately be shown there the latest, best, and most up-to-date books which treat of it.

Arrangements have been made by the Kilowatt Publishing Co., Ltd., to afford this facility to electrical engineers who are visiting the Electrical Exhibition at Olympia.

At Stand No. 152, which bears in bold letters the legend "Electrical Engineering," there will be, open to inspection and purchase, almost every good book on electrical and allied subjects. These have been selected under the guidance of the editorial and reviewing staff of ELECTRICAL ENGINEERING, which includes eminent specialists in all branches. The stand is situated near the centre of the hall, slightly to the right of the main avenue.

C. JENNINGS & CO. can supply woodwork of any description at short notice, Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support BRITISH Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. JENNINGS & Co., 955, Pennywell Road, Bristol.

QUALITY UNEQUALLED, ALL LATEST INGENUITIES TEMPT YOU

AT LUNDBERGS' STAND Nº90 OLYMPIA ELECTRICAL EXHIBITION.

Hosted by Google

Before deciding on an Electrical Installation consider the

KALKOS SYSTEM

It is unique among conduit systems, being entirely free from all condensation troubles. It is equally suitable for twin, concentric and three-wire systems. It is easy to erect, and when installed will give no trouble. Our guarantee should convince you as to its reliability.

But if you must use screwed conduit, why not install the Kalkos Iron Box at your switch and other points? You will find that it saves an immense amount of trouble in erection. It is the only real improvement ever made in conduit boxes.

DO NOT FAIL TO PAY US A VISIT AT STAND 104/111, MAIN AVENUE, ELECTRICAL EXHIBITION, OLYMPIA.

The SUN ELECTRICAL COMPANY LTD.

118-120, Charing Cross Road, London, W.C.

exhibiting for the first time is a reflector illuminating strip, of novel construction. Each metal unit, embodying reflector and screw-lampholder, is hinged to the next, so that the strip is flexible, and can be made up into letters or devices of any kind. The facia of the stand is entirely outlined with this strip, using small bulb Brimsdown lamps.

C. A. Parsons & Co.,

HEATON WORKS, NEWCASTLE-ON-TYNE. (STAND NOS. 203 & 212.)

Messrs. Parsons show a magnificently made model of a 6,000-k.w., 6,600-volt, three-phase turbo alternator, running at 1,000 r.p.m., capable of overload up to 9,000 k.w., as supplied to the Randfontein Estates Gold Mining Co., Witwatersrand. The model is complete with condensing plant, and the turbine represented is similar to the eight supplied to the York Road station of the Underground Electric Railways Co. of London. Parabolic search-light reflectors are also shown.

A PAVEMENT ARTIST

ON Saturday afternoon, shortly after the official opening of the exhibition, a solitary ill-clad figure of an elderly man was seen limping towards the main entrance, where he sat himself down and commenced very diligently to cleanse the flagstones. His next procedure was to start upon a drawing of an electrical lamp, having for a background a large Union Jack. Before giving any inkling of what this picture was intended to represent (although we surmised that it signified a request to support home industries), he transferred his attention to another paving stone, and after a considerable amount of juggling with multi-coloured chalks, he portrayed a silhouette of the City of London. The same electrical lamp was then drawn in on the sky. By this time, of course, a considerable number of people had gathered, and no doubt wondered what the affair was all about. The pavement man, however, was too much of artist to reveal his secret immediately, and kept the bystanders in suspense while he drew a picture of an old-fashioned candle, which drawing he termed "Past." By the side of this he again designed a metal filament lamp. Then, and only then, was the secret revealed. He wrote

A PAVEMENT ARTIST OUTSIDE OLYMPIA.

"Support Home Industries—Use Brimsdown" on the first design, on the second he wrote "After Sundown—Brimsdown," and then sketched in colours the words "See things in a better light—use Brimsdowns now—to-morrow, and all the time." He then displayed two Brimsdown show-cards with a large Brimsdown poster in the background.

The enterprising artist reaped the reward of his labours, and coppers were thrown to him by patronising electrical contractors, who, of course, by this time were able to recognise the advertisement behind the scheme. In return for the pennies thus contributed they were presented with a packet of Brimsdown playing cards, a packet of Turkish or Virginian cigarettes, a Brimsdown purse calendar, or a unique advertising novelty showing the remedy if your light is bad.

We have since been let into the secret that the decrepit old gentleman was no other than Mr. J. Conway Price, the advertisement specialist, of 151 Fleet Street. We believe that it is Mr. Price's intention to have the ninety-one coppers presented to him mounted and framed, to be kept as a souvenir, while the kind lady who flung him a sixpence will always be remembered.

ILLUMINATION: its Distribution and Measurement. By ALEXANDER PELHAM TROTTER. Illustrated. 8vo, **8s. 6d.** net.

ELECTRICITY.—"This book contains a wealth of experience and practical information, and comes at the moment when a work on the subject, by a British engineer, is much needed. From beginning to end the highest level is maintained, the cover, binding, paper, type, ink, arrangement, illustrations, references, tables and bibliography being excellent, while clear statements of facts, lucid demonstrations and descriptions, expert advice on use and application, with tolerance and impartiality grace the text."

ELECTRICAL ENGINEERING in Theory and Practice. By G. D. ASPINALL PARR, M.Sc., M.I.E.E., A.M.I.Mech.E., Associate of the Central Technical College, City and Guilds of London; Head of the Electrical Engineering Department, The University of Leeds. With 282 Illustrations. 8vo, **12s.** net.

ELECTRICITY.—"We can certainly recommend this volume as giving an immense amount of sound technical information, and its value is increased by the City and Guilds examination questions placed at the end of each chapter."

SUMMARY

Particulars of the new 16 c.p. 220-volt 20-watt drawn filament Osram lamp shown by the General Electric Co. are given in our second notice of the Olympia Electrical Exhibition, contained in a special supplement given with this issue. Some general points in connection with the exhibition are discussed, a useful telephone directory of the exhibition is given, and a report appears of the inaugural dinner, which was presided over by Sir William H. Preece. In the first instalment of our detailed account of the exhibits several novelties are described. Notable among these is the new 220-volt 16 c.p. Osram lamp above referred to. We also review the General Electric Co.'s other exhibits. Another large stand where varied products are displayed is that of Simplex Conduits, Ltd., where heating and cooking apparatus is particularly well represented. Perhaps the stands where the greatest number of branches of electrical engineering are exemplified are the joint stands of Siemens Brothers & Co., Ltd., and Siemens Brothers' Dynamo Works, Ltd. The British Thomson-Houston Co. have also a good display, and one of the finest stands, both as regards its arrangement and the products exhibited, is that of Ferranti, Ltd., whose novelties include motor starters entirely without sliding contacts, and new radiators. The British Aluminium Co. demonstrate the applications of aluminium to the electrical industry, and not the least interesting item in the exhibition is the new wiring system of W. T. Henley's Telegraph Works Co., Ltd. Other stands described are those of the Brimsdown Lamp Works and C. H. Parsons & Co.

An electric power system, involving the distribution of 20,000 kw. amongst four towns, two steel works, and several villages, will be in operation shortly near Dresden. The current is transmitted 30 miles at a pressure of 110,000 volts from a steam station at a colliery. Particulars of the plant and transmitting line, the reason for adopting the high pressure, and other interesting details, are given. (Page 533.)

The action by the Electric Contractors' Association against the Sheffield Corporation in relation to the municipal wiring department of Sheffield is expected to come on early in October.—A lively debate in relation to the Marylebone Electricity Sales Department is expected at the next meeting of the Council. (Page 535.)

A report has recently been issued on the production of iron and steel in the electric furnace in Sweden. (Page 536.)

The result of the Tantalum Lamp show card competition is announced. (Page 535.)

The inaugural dinner of the British Electrical and Allied Manufacturers' Association will be held on Thursday, October 12th. Tickets can be obtained at the Electrical Engineering stand at the Olympia Exhibition. (Page 532.)

On the Nuremberg tramways, bow collectors are being substituted for roller collectors. Among other matters mentioned in our Electric Traction Notes are

Hosted by Google

negotiations between the Hartlepool Corporation and the local Tramway Company, a proposal to electrify railways around St. Petersburg, and a tramway rail grinder, which is stated to grind out corrugations at a cost of ¾d. to a 1d. per foot. (Page 537.)

UNDER "Telephony and Telegraphy (Including Wireless)" we mention a statement that the British wireless patents of Messrs. Bellini & Tosi are being acquired by the Helsby Wireless Telegraph Co. We give some particulars of the wireless station which has been erected at the G.P.O., and mention some wireless telephone experiments by Mr. A. W. Sharman, and a dispute as to overhead wires in Southwark.

THE Marconi Wireless Telegraph Co. and J. H. Round have patented a means of reducing the effect of powerful atmospheric discharges in the receiving circuit.—A patent by the British Thomson-Houston Co. and J. Martin describes a means of increasing the range of speed variation of induction motors by arranging the three-phase stator winding for two or four poles, and the six-phase rotor winding, so that it acts as a single winding or as two three-phase windings.—Another specification published by the Patent Office last week describes a single line battery-ringing telephone system, in which the connections are arranged so that in calling part of the line is cut out. (Page 538.)

AN application has been made to the magistrate by a consumer on the St. Pancras mains for the appointment of an electrical inspector. There is a dispute as to the size of break in the switches on consumer's premises prescribed by the St. Pancras Electricity Department. (Page 539.)

THE Manchester Electricity Department are carrying out some interesting street lighting experiments with "Metroflam" arc lamps on posts, and also suspended across the roadways. Independent tests are to be made by an outside expert. (Page 539.)

THE Halifax tramways management is to be separated from that of the electric light undertaking.—The new electrical engineering laboratories at Heriot-Watt College, Edinburgh, are now completed.—A large new Canadian electric power plant has been put into operation.—The Heckmondwike Council are considering a proposal to take supply from the Yorkshire Power Co., in preference to extending their plant. (Page 539.)

A 2,000 ampere switchboard, field regulating rheostat, &c., is required at Belfast; cable, &c., at Grimsby; turbo-switchboards and parts by the Brisbane Postmaster-General; feeder pillars at Southend; electric pumps in Canada, and arc lamp carbons at Hackney. (Page 540.)

THE Cleveland & Durham Electric Power Co. show a net profit of £8,343 for the past year; no dividend is paid. (Page 541.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, SEPTEMBER 28TH.

Municipal Tramways Association.

10.30 a.m. Annual Conference at Newlands Car Depôt, Glasgow. (1) "Tramcar Meters," by R. G. and J. G. Cunliffe; (2) Report on "Tramway Track: Methods of Construction and Maintenance."

7.45 p.m. Annual dinner at Grosvenor Restaurant, Gordon Street.

TUESDAY, OCTOBER 3RD.

Faraday Society.

8 p.m. At Institution of Electrical Engineers, Victoria Embankment. (1) "The 'Paragon' Electric Furnace and Recent Developments in Metallurgy," by J. Härden; (2) "Progress in the Electrometallurgy of Iron and Steel," by D. F. Campbell; (3) "The Hering 'Pinch Effect' Furnace," by E. K. Scott.

THURSDAY, OCTOBER 5TH.

Iron and Steel Institute.

10.30 a.m. Autumn meeting at Institution of Civil Engineers, 25 Great George Street, Westminster. Among the Papers to be read is "On the Application of Electric Energy to the Manufacture of Iron and Steel in Italy," by Cav. Ing. Remo Catani.

The New General Electric Egg.

[The General Electric Co., Ltd., have now a 16-c.p. 220-volt 20-watt drawn filament Osram lamp.]

Hosted by Google

A 110,000-VOLT TRANSMISSION SYSTEM IN GERMANY

A REMARKABLE electric power system, involving the distribution of 20,000 kw., both for lighting and power, amongst four towns, two steelworks, and several villages, is now being completed near Dresden, and is expected to be in operation by November next. Although the colliery at which the power house is situated is only about 30 miles from the extreme point of the supply area, a pressure of 110,000 volts, as is used by the Ontario Hydro-Electric Power Commission (see ELECTRICAL ENGINEERING of Aug. 31st last), has been adopted.

The system is being erected by an iron and steel firm, Lauchhammer Aktiengesellschaft, the owners of a large colliery at Lauchhammer, who decided to transmit electric power from the colliery to two of their works at Gröditz and Riesa, 19 and 31 miles distant respectively. Hitherto the requirements of these works could be sufficiently well supplied from local power stations which were fired with brickettes manufactured at the colliery, but the demand has now risen to 6,000 kw. at the Riesa works and 600 kw. at the Gröditz works, and arrangements have also been made to supply three municipalities, who have decided to purchase power in bulk up to a maximum of 12,000 kw. from the Lauchhammer Aktiengesellschaft for a period of 30 years. For the transmission of the 6,600 kw. for themselves, the company had decided upon a pressure of 65,000 volts, but in view of the demand approaching 20,000 kw. in the near future, it was ultimately decided to adopt a pressure of 110,000 volts. The consulting engineer, Herr E. G. Fischinger, in describing the system in recent issues of the *Elektrotechnische Zeitschrift*, of Berlin, explains his decision as follows:—The load at the steelworks will be an excessively fluctuating one, including several electrically-driven rolling-mills, and in view of the large momentary drops in voltage which may therefore be anticipated, it was thought advisable to use the very high pressure stated, so as to keep the maximum voltage drop on the transmission line to 5 per cent. (at a load of 15,000 kw. and a power-factor of 80 per cent.). For this voltage drop a copper conductor of 0·186 sq. in. section would have been required if a line pressure of 65,000 volts had been used, and the cost of copper would have been too great. A section of about 0·11 sq. in. was thought reasonable, but this involved a pressure of 85,000 volts, for which the same special construction as would be required for 110,000-volt apparatus was necessary. In consequence, a line pressure of 110,000 volts with a copper cross-section of 0·065 sq. in. (7 wires stranded, each 6 sq. mm. section) was adopted, the extra cost of the insulators being offset by the saving in copper. Another point influencing the decision was the type of insulator to be employed, as the suspension insulator consisting of a number of small units was considered better than one large pin insulator from the point of view of reliability. One interesting result of the employment of such a high pressure with a comparatively small conductor is that the "corona" discharge will become so great on a rise of pressure that the latter will probably be limited to 130,000 volts. As will be mentioned later, however, the line is further protected against a rise in pressure.

The power station at the colliery is constructed to accommodate four 5,000 kw. turbo sets, of which three are already installed. Twelve out of eighteen boilers of the Lancashire type, each capable of raising 12,000 lbs. of steam per hour at a pressure of 200 lbs. per sq. in., have also been erected. The steam is to be superheated to 750° Fahr. A novel feature of the steam plant consists in the method of removing the ashes. These fall down the inclined floors of the ash-pits and flues, and are delivered into water-tanks (below the surface of the water), from which they can be taken without raising any dust. On account of the difficulty of providing efficient foundations, no chimney stacks are provided, but each group of four boilers is provided with its own economiser and a Schwabach suction draught plant driven by a 50 h.p. motor. Each of the three turbo sets develops 5,000 kw. at 4,740 to 5,500 volts, and 80 per cent. power factor; two were supplied by the Allgemeine Elektricitats Ges., and the third by the Maschinenfabrik Augsburg-Nürnberg and Siemens-Schuckertwerke. The guaranteed steam consumptions with 170 lbs. steam pressure, 660° Fahr. steam temperature, and 91 per cent. vacuum, are 13·34 and 13·57 lbs. per kw. hr. respectively at full load, and 15·87 and 15·1 lbs. respectively at half-load, inclusive of the power required for the condenser pumps. The very cold water pumped up from the mine is used for the condensers, but has to be supplemented with water obtained from two Balke cooling towers.

From the generators the current is taken through armoured cables, oil circuit-breakers, and isolating switches to a double set of 5,000-volt 'bus-bars. At this point some 1,000 kw. is to be taken off for the supply of the local works and colliery, for which about 1,600 kw. is already supplied by an existing station. This 1,000 kw. is supplied through transformers arranged according to the Scott connection, as the local distribution is two-phase, 1,450 volts. Four large transformers with water-cooled oil circulation and with a capacity of 5,000 kw. each, will be provided to raise the pressure from 5,000 to 110,000 volts for transmission. On each side of each of these transformers is an electrically-operated oil switch and two sets of isolating switches, one to each set of 'bus-bars. The two out-going lines are connected through oil switches and isolating switches to the two sets of 110,000-volt 'bus-bars. Instead of using flowing water resistances to lead off static charges from the lines, the high-tension windings of the potential transformers at the generating station are connected in "star" and the neutral

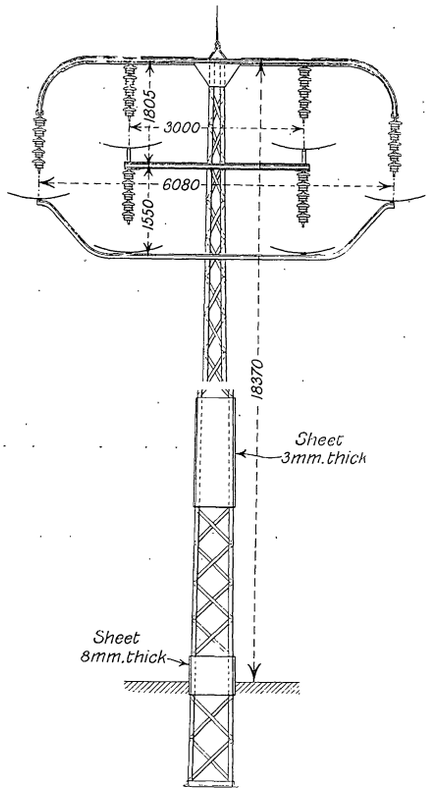

FIG. 1.—TRANSMISSION LINE TOWER AND INSULATORS.

point so formed is earthed. All the transformers and switch-gear for this station were supplied by Siemens Schuckertwerke.

The transmission line consists of two three-phase circuits on a single tower line. This construction was adopted mainly on account of the difficulty of securing wayleaves for two separate tower lines. All the towers are of steel lattice girder construction, as shown in Fig. 1, and the footings are embedded in heavy concrete bases. The conductors are spaced 5·85 feet apart only, which appears to be very close for 110,000 volts. Electrolytic hard-drawn copper is employed for the conductors. The possible saving by the use of aluminium was carefully considered, but on account of the very small proportion of the cost of the conductors to the total cost of the line, and the extra cost of the towers due to the greater sag, it was found that the economy effected in this case was so small as to make the use of copper, in the opinion of the engineers concerned, preferable. A standard span of 500 feet was chosen, but on account of the difficulty of obtaining wayleaves in certain cases, spans of 650 feet and more were often found to be necessary. The line crosses main railway lines four times and the river Elbe once. In the latter case, the span is 890 feet, requiring special towers 117 and 140 feet high on either side of the river respectively, as the conductors had to be hung at such a height as to clear

C

Hosted by Google

the masts and funnels of ships. Fortunately, the line crosses the river at a part between two railway bridges where the masts and funnels are lowered if necessary. After considering various different methods of crossing, namely, steel conductors, special cradle construction, &c., it was decided that the safest and best method was to use heavier copper conductors (7 wires of 10 sq. mm. each), with strain insulators in duplicate, and to strain up the conductors so that there would be a factor of safety of 5 even with maximum ice and

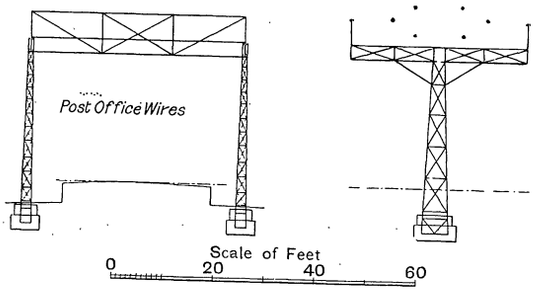

FIG. 2.—CRADLE FOR 110,000 LINE CROSSING ROAD AND TELEGRAPH LINES.

snow load. Across the railways, a special steel cradle construction is provided in accordance with the requirements of the railway authorities. Fig. 2 illustrates the steel cradle employed where the line crosses a street and telegraph wires.

The suspension insulators consist each of five of the units illustrated in Fig. 3, and were supplied by the Porzellanfabrik Kahla, Hermsdorf. The strain insulators were supplied by the Porzellanfabrik Ph. Rosenthal & Co., and consist each of six units, one of which is shown in Fig. 4. Strain insulators are used at the railway and river crossings, and also at all towers where the conductors deviate more than 5° from a straight line. The conductors are also pulled up to the towers by strain insulators at regular intervals along the line—about every mile—where the conductors are interchanged as regards position. In all, the conductors of each circuit are transposed over 30 times, and by this means not only are inductive effects on neighbouring telephone lines practically eliminated, but also the mutual induction and electrostatic influence of the two parallel circuits reduced to a negligible quantity. The particular arrangement of the conductors to effect this was especially devised by Prof. Ulbricht. It will be noticed that, by the bow-shaped form

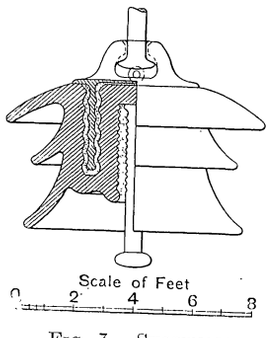

FIG. 3.—SUSPENSION INSULATOR UNIT.

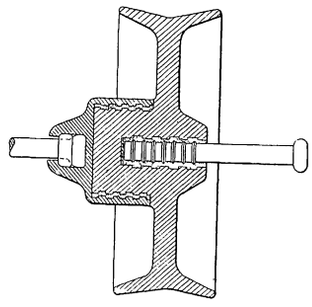

FIG. 4.—STRAINED INSULATOR UNIT.

of the upper cross-arm, the conductors are hung symmetrically, and inequality in the self-induction of the phases thus prevented. The complete set of six conductors is protected from direct lightning strokes by a single steel cable of 50 sq. mm. (0·0775 sq. in.) section, which also serves to interconnect and earth the towers, and each tower has a special earth-plate buried below the concrete foundation. To ensure the earthing of the conductor in the event of a break, steel bows are attached to the arm below the conductor, as is shown in Fig. 1. No tree was allowed to remain near the line which could touch it on falling.

The overhead lines terminate at the E.H.T. 'bus-bars in the first of the two main sub-stations, namely, that at Gröditz, a section through which is shown in Fig. 5. The conductors are pulled up to the wall of the sub-station by means of strain insulators, and connecting wires *A* lead in through the centre of plate-glass panels. Protection against direct lightning stroke or excess pressure is given by the horn-gaps *B* and electrolytic lightning arresters *C*. The duplicate 'bus-bars are shown at *D*, *E* is the choking coil to prevent pressure surges from reaching the apparatus, *F* is a 110,000-volt oil switch, and *G* is one of the oil-cooled transformers. The total capacity of this station is some 13,000 K.V.A. It should be noted that the wide spacing of the conductors and the size of the apparatus necessitates an extremely large building, in this case 155 feet long, 85 feet wide, and 72 feet high. From this station the overhead lines run again in duplicate to a similar but larger station at Riesa, with a capacity of 19,000 K.V.A. A 60,000-volt overhead ring main over 75 miles long, owned by the municipalities, runs through their district, and is fed at

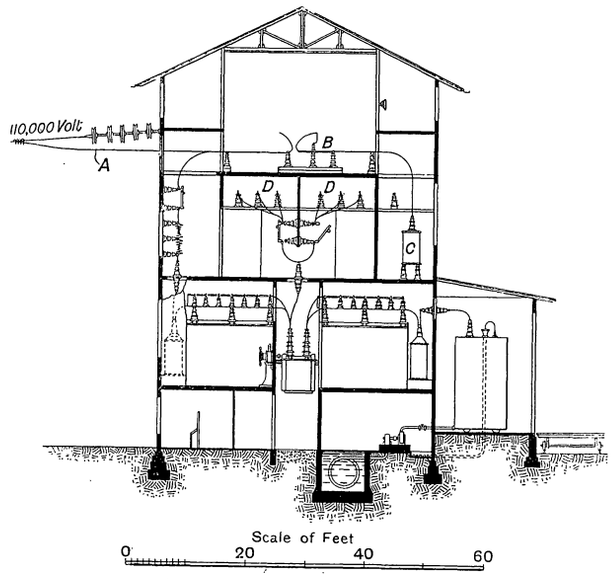

FIG. 5.—SECTION OF GRÖDITZ SUB-STATION.

each end by a single 7,000 K.V.A. transformer in each of the two main sub-stations. There are seven small sub-stations on this ring main feeding current at 15,000 volts to local sub-stations, which distribute at 220 volts. The power taken by the municipalities is measured at each main sub-station by Aron meters with maximum demand attachment.

The pressure regulation of the E.H.T. system is effected by maintaining automatically a constant pressure of 100,000 volts at a point bteween the two main sub-stations by means of Tirrill regulators in the generating station actuated by current transformers. In order that there shall be some means of regulating the pressure on the distributing networks, the municipalities have provided series regulating transformers in each of the seven 60,000/15,000-volt sub-stations on the 15,000-volt side of the main transformers, and these can produce a variation of 750 volts in either direction. It should be mentioned that the transformers and switchgear in the sub-stations at Riesa and Gröditz were supplied by the Allgemeine Elektricitäts Gesellschaft.

New High-efficiency Metal-filament Lamps.—The Deutsche Gasglühlicht Aktiengesellschaft have just put on the market in Germany a new series of high candle-power "Osram" lamps under the name of "Osram-Intensiv" lamps. These are in 200, 400, 600, and 1,000 c.p. sizes, and consume only from 0·83 to 0·87 watt per Hefner candle-power. At present they are obtainable for pressures between 100 and 160 volts only.

Tax on Electric Lamps in Germany.—The official returns of the German tax on illuminating apparatus for the year ending March 31st, 1911, are published in last week's *Elektrotechnische Zeitschrift*. Near 26 million carbon filament lamps were manufactured during the year. Somewhat over 9 million came under the tax, and produced a revenue of over 2 million marks (£100,000). Nearly 42 million metal filament and Nernst lamps were manufactured. Thirteen million were taxed and brought in 4 million marks (£200,000). The revenue from arc-lamp carbons was nearly 3 million marks (£150,000). The total revenue from electrical apparatus was 9 million marks, which, with 4 million from incandescent gas mantles, gives a total revenue of 13 millions (£650,000). This, it may be mentioned, is only just over half the revenue which was expected from this source. (See abstract of original Bill in ELECTRICAL ENGINEERING, Vol. IV., p. 678.)

MUNICIPAL WIRING

Action against Sheffield Corporation

THE long-anticipated action by the Electrical Contractors' Association against the Sheffield Corporation in respect of the municipal electric wiring department in Sheffield will come on for hearing before Mr. Justice Eve early in the next sittings of the Law Courts, which begin on October 12th. The action will, of course, be nominally brought by the Attorney-General, at the instance of a Sheffield ratepayer. Mr. P. O. Lawrence. K.C., and Mr. Maurice Drucquer will appear for the Contractors, whilst Mr. Danckwerts, K.C., and Mr. J. Sarjeant will appear for the Sheffield Corporation. It is improbable that there will be much evidence as to fact, as the existence of a municipal wiring department at Sheffield is, of course, admitted. Consequently the action will mainly take the form of arguments which in effect will be an appeal against the judgment of Mr. Justice Nevill, in the Leicester case, which was reported in ELECTRICAL ENGINEERING, Vol. VI., June 16th and 23rd, 1910. This held that it is illegal for a municipality to carry out wiring work on consumers' premises in a case such as at Leicester, where the Corporation has no Parliamentary powers other than those contained in the general Electric Lighting Acts. It will be remembered that the Leicester Corporation accepted this judgment as final, and closed down their wiring department. The position at Sheffield is complicated, however, by the fact that the Corporation in 1898 acquired the undertaking of the Sheffield Electric Light and Power Co., and £6,000 of the purchase money was paid specifically in respect of the house-wiring department. When the undertaking was taken over by the Corporation the local contractors objected to this department being continued, but the Corporation resisted their demands, and have continued the wiring of consumers' premises ever since. We understand that it is the intention of the Sheffield Corporation, in the event of their losing the action, to continue the case to the Appeal Court, and, if necessary, to the House of Lords.

The Position at Marylebone

Much activity is being displayed by the Electrical Contractors in Marylebone against the continuation of the Council's electric wiring department. The whole matter is to be thrashed out at the meeting of the Council on October 5th, and in the meantime a meeting of contractors in the district, which was held on September 6th, under the auspices of the Electrical Contractors' Association, has passed certain resolutions protesting against the methods adopted in the management of the department, copies of which have been sent to the Mayor of Marylebone, the Manager of the Sales Department, and the Town Clerk, with a request that these resolutions shall be placed before the Electric Supply Committee and the Borough Council. So far as we are at present informed, the question in the first instance is not being made one of whether the Borough Council is trading in this direction without Parliamentary powers to do so. The electric lighting accounts recently published show that the loss on the Sales Department last year amounted to £2,212, the turnover being £16,959, and the expenditure £19,171. Councillors Oswald, Lewis, and Duncan Watson, who are leading the opposition to the department, maintain that the Council have no justification in trading as electrical contractors at a loss in opposition to ratepayers in the same line of business.

On the question of law the case is taken somewhat out of the category of the Leicester case, and it really resolves itself into a question of how far the Marylebone Electric Supply Department is exceeding its legal powers. The Marylebone Borough Council, by their special Electric Lighting Act of 1904, may provide all the necessary materials for the wiring and fitting of premises, but must not themselves actually carry out any wiring work on private property except between the main of the Council and the consumer's meter. On the other hand, the London County Council's General Powers Act of 1906, gave power to all Metropolitan Borough Councils to carry out electric wiring work without any restrictions. The Marylebone Electric Supply Department, however, in order to be on the safe side, have hitherto adopted the plan of providing all the necessary materials and placing the actual installation work in the hands of a contractor, who finds the necessary labour and is paid on the basis of time. It is understood that the Electric Contractors' Association are awaiting the decision in the Sheffield case, and should that be favourable they intend to proceed against the Marylebone Council in a similar way.

SIEMENS' "TANTALUM" SHOWCARD COMPETITION

WE are informed that approximately 2,000 designs were submitted by competitors for this competition, and we have pleasure in now announcing the names of the successful competitors. It will be remembered that a first prize of £75 was offered, with a second prize of £25, together with a prize of £5 for any designs of more than average merit which the firm decided to adopt and reproduce. Owing to the large number of designs received, the task proved somewhat difficult, and eventually it was decided to bracket the two best designs as being of equal merit, dividing the £100 prize between the two artists. Therefore a prize of £50 goes to Mr. L. Sutton Wood, 3 Featherstone Buildings, Holborn, W.C., and a similar prize of £50 to Mr. Frank M. Barton, 2 Montague Road, West Ealing, W., and we congratulate these gentlemen upon their success. We are informed that Mr. Barton's design will be attractively printed in several colours. Further accepted designs were submitted by Mr. Reginald E. Higgins, 8 Grenville Place, Maida Vale, W., and Mr. F. Insall, Water Lane, Brislington, Bristol, who are the recipients of prizes of £5. The designs of non-successful competitors will be duly returned, every care being taken to ensure their arriving in good condition.

Regenerated Carbon-filament Lamps.—The Prussian State Railway authorities have recently carried out exhaustive tests on carbon-filament lamps prepared by treating old lamps by a special process. They report that the majority of the lamps tested were not satisfactory.

Resistance of Metals at Low Temperatures.—Prof. H. K. Onnes, of Leiden, announces in the *Elektrotechnische Zeitschrift* that he has succeeded with the aid of liquid helium in reaching the extremely low temperature of 2·5° Absolute, as measured by a helium thermometer. Contrary to what was expected, the resistance of pure gold was found to reach a state of practically no resistance at about 4° Absolute, and to remain in a constant state from that point. The resistance of a column of mercury was carefully taken by several different methods at a temperature of 3° Absolute, and was found to be less than 1×10^{-7} of its value at 0° C.

Welding Armature Shafts.—Particulars of a modern system of welding fractured shafts without removing any part of the armature are given in a recent issue of the *Electric Railway Journal*. The coils are protected from the heat of the furnace by a sheet-iron hood, and the space between the end of the hood and the ends of the coils is filled with a heat-insulating mixture of clay and asbestos. The armature is also protected by short square blades attached to a pair of long-handled shears, which fit closely round the shaft. In addition to this, the shaft is also encircled by a perforated U-pipe, through which compressed air passes, producing a cooling effect by its expansion. A special portable oil furnace is used, working under a compressed air draught. The stump of the fractured shaft is inserted through a small aperture in the side of the furnace, and in 10 minutes a 3¼-in. shaft can be brought to a welding heat. Altogether five heats are required. After the successive heats the armature shaft is swelled for nearly the whole of its length by a 100-lb. horizontally suspended rammer, drawn down to about half its original thickness under a steam-hammer, and split down the centre to form the V-shaped scarfs for the wedge-shaped end of the piece which is to be welded on. For the final weld the shaft stump and the axle piece are brought to a welding heat in separate furnaces, and covered with a special powder. The axle is then taken to the furnace containing the armature shaft, and the wedge is driven firmly into place by the rammer. It is stated that more than 100 welds have been made by this process without a failure. The process takes two hours from the time the protective casing is put on until the shaft is ready for the lathe, the weld costing 34s. as against £10 to £14 for the cost of a new shaft.

ELECTRIC IRON AND STEEL PRODUCTION

A LONG preliminary report on experiments commenced towards the end of last year at Trolhättan (Sweden) has been issued by the Jernkontoret, the Swedish Public Board of the iron industry. Owing to the unavoidable interruptions which prevent continuity of experiments in the early stages, no definite general conclusions are advanced, and the report simply contains an account of the work which has been done from November to April last. Investigations are being made as to the most favourable arrangements and dimensions of electric furnaces for iron and steel production, the best type and arrangement of electrodes, the energy required per ton of product of various grades, the possibilities of manufacturing steel of various compositions, the efficiency of the furnace and maintenance costs, and other questions upon which the production of iron and steel on a large scale through the agency of electricity must depend. It has already been established, as was recently reported in ELECTRICAL ENGINEERING, that the product of the electric furnace is well adapted to the manufacture of steel, and the large scale experiments at Trolhättan (in which the power supplied from the electricity works for the purposes of the research is no less than 2,200 k.v.a.) are already bearing out this conclusion.

SOME LIQUID STARTERS AND CONTROLLERS

WE have had an opportunity of inspecting some new liquid starters and controllers made by Messrs. Tetley & Co. (Falcon Electrical Works, Bedford Street, Greengate, Salford). At the time of our visit a number of 265 h.p. controllers of this type were being completed for delivery to a large mill. These are of the pattern shown in Fig. 1,, and are for 500-volt three-phase circuits. They are combined with switches and ammeters on one support; there is an interlocking arrangement which makes it impossible to switch

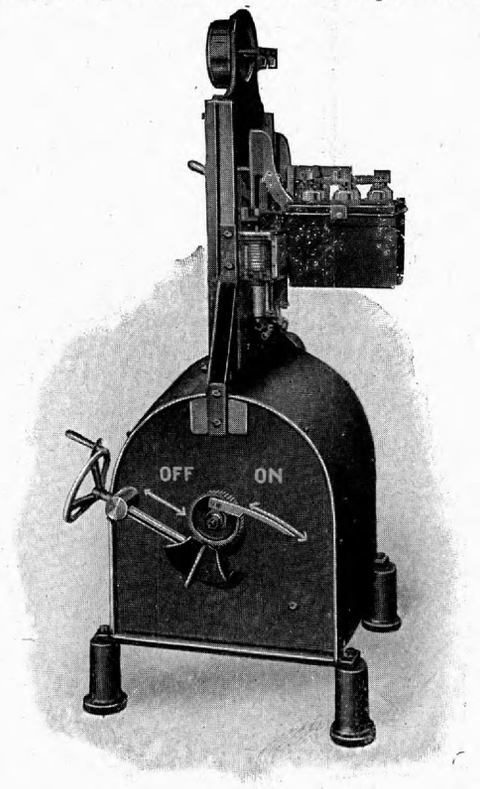

FIG. 1.—LIQUID STARTER AND CONTROLLER WITH MAIN SWITCH AND AMMETER.

on unless the blades of the liquid controller are out of the liquid, and a free handle device makes it impossible to hold the switch down if the overload or no-voltage trip coil is releasing the switch. Two overload coils are used, one in each of two of the three phases. The blades of the liquid controller are attached to a square vulcanite sleeve, which is vulcanised on to a steel shaft, and they have a peculiar shape, the result of prolonged observation and trial, enabling the current to be increased evenly and gradually. At the end of the travel of the blades a short-circuiting bar unites all three windings of the motor to one common point. The starter is strongly and mechanically made, and, we understand, compares very favourably in price with a metallic resistance starter. Particular attention has been given to ensuring that the current density in the blades is not too high, for, although they are immersed in liquid, too high a current density gives rise to rapid corrosion—a point not always realised. The liquid recommended is a solution of soda, about 6 to 10 parts of water to one of saturated soda solution.

This starter is also supplied with knife switches and fuses in place of the oil switch with tripping coils, and is also supplied separately, without switches and fuses.

Messrs. Tetley & Co. are also now manufacturing a liquid starter with automatic release, so that the blades are auto-

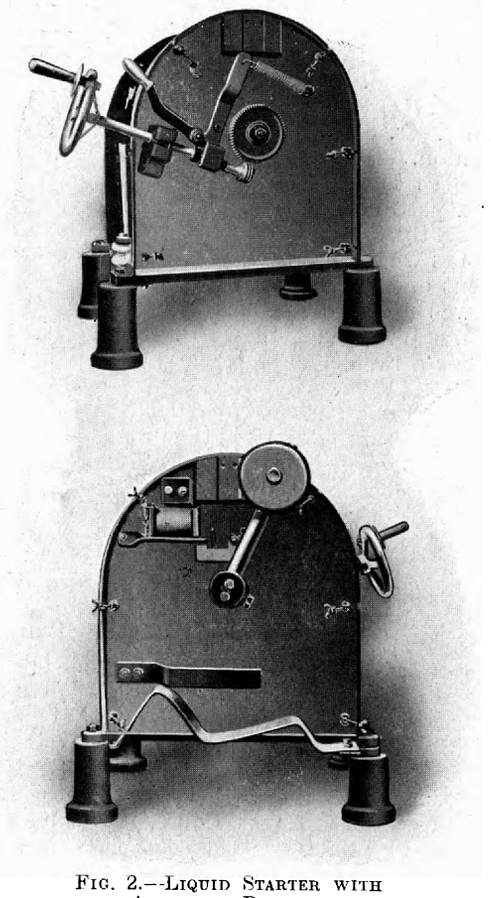

FIG. 2.—LIQUID STARTER WITH AUTOMATIC RELEASE.

matically withdrawn from the liquid on failure of current or overload. It is made in sizes from 25 to 500 h.p. Fig. 2 shows the construction. The upper figure shows the operating handle which lowers the plates into the liquid through worm gear, and raises the counter-weight seen in the lower figure. This counter-weight engages in a catch, which is released when the no-voltage or overload coil operates. The weight then falls on to the buffer springs seen at the bottom, and raises the plates out of the liquid.

The Association of Mining Electrical Engineers.—The first meeting of the Warwickshire and South Staffordshire Branch will be held on September 30th, at the Imperial Hotel, Birmingham. Mr. A. Hall will give an inaugural address. A meeting of the Yorkshire Branch will be held at the Royal Victoria Hotel, Sheffield, on Saturday at 5 p.m.

Gas Fires in Schools.—According to the *Elektrotechnische Zeitschrift*, the Berlin municipal Schools Committee (Schuldeputation) have decided to do away with all gas fires in the schools under their control on account of the frequent complaints from teachers and others of the dryness of the air and the ill effects of this upon the organs of speech. The technical officials reported that their investigations into the matter led them to conclude that gas heating is quite unsuitable for schools.

Kandergrund Power Station.—According to the *Elektrotechnische Zeitschrift*, this water-power station, the property of the Bernische Kraftwerke A.G., was opened in June last. At present only one of three pipe lines is constructed, and this supplies two 4,000 kw. turbine sets, which generate three-phase current at 16,000 volts, 40 cycles, for general power purposes. The remaining turbine sets will be installed shortly. These will generate single-phase current for the Loetschberg Tunnel railway. The turbines are of the Pelton-wheel type by Piccard, Pictet & Cie., of Geneva, and the generators were supplied by Brown, Boveri & Cie., of Baden.

INAUGURAL DINNER OF THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION

THE British Electrical and Allied Manufacturers' Association have decided that the dinner to celebrate the re-organising of this Association will be held at the Hotel Cecil on Thursday, October 12th, 1911, when it is hoped that there will be a strong muster of members of firms exhibiting and their friends at the Electrical Exhibition. Advantage will, no doubt, be taken on the occasion to make some pronouncement as to the future policy of the Association. Further details will be published later. Early application should be made for tickets by letter addressed to Mr. F. B. O. Hawes, Olympia, Kensington, W., or 36 and 38 Kingsway, W.C.

Tickets may also be obtained from the following firms:—*London*:—Berry, Skinner & Co. (78 Upper Thames Street, E.C.), the General Electric Co., Ltd. (71 Queen Victoria Street, E.C.), and Nalder Bros. & Thompson, Ltd. (34 Queen Street, Cheapside). *Birmingham*:—Chamberlain & Hookham, Ltd. (Solar Works, New Bartholomew Street), and the Electric & Ordnance Accessories Co., Ltd. (Cheston Road, Aston). *Bradford*:—The Phœnix Dynamo Mfg. Co. (Thornbury Works). *Edinburgh*:—Bruce Peebles & Co., Ltd. *Gateshead-on-Tyne*:—The Sunbeam Lamp Co., Ltd. (Park Road). *Glasgow*:—Mavor & Coulson, Ltd. (47 Broad Street, Mile End). *Manchester*:—Electromotors, Ltd. (Openshaw), Ferranti, Ltd. (Hollingwood), and the Lancashire Dynamo & Motor Co., Ltd. (Trafford Park). Tickets may also be obtained from the offices of ELECTRICAL ENGINEERING (203 Temple Chambers, Temple Avenue, E.C.), or from the ELECTRICAL ENGINEERING Stand (No. 152) at the Olympia Exhibition.

ELECTRIC TRACTION NOTES

We are informed that the Croydon Corporation have decided to increase the maximum rates of pay for motor men from 7d. to 7½d., and for conductors from 6½d. to 7d. per hour. The rates of pay of labourers and car-cleaners are also to be raised, the total increases involving about £1,633 per annum.

The Nuremberg-Fürther tramways are substituting bow collectors for the existing roller collectors, which give much trouble by jumping frequently off the trolley wire. The system has many sharp curves.

A quarterly dividend at the rate of 12 per cent. per annum has been declared upon the ordinary shares of the Winnipeg Electric Railway Co.

Sir Edgar Speyer, Bart., presided at the half-yearly meeting of the Underground Electric Railways Co. last week. He said that whilst the Company showed good progress, the dividends paid are by no means a fair or adequate return upon the large amounts invested. When the transfer of the Lots Road Power House to the Joint Committee, as authorised by Parliament, is carried out, a surplus of about £630,000 will be realised in excess of the book value of the power house.

A 2 per cent. dividend is recommended upon the ordinary shares of the Dundee Broughty Ferry and District Tramways Co. for the year to July 31st, carrying forward £388.

Negotiations between the West Hartlepool Corporation and the Hartlepool Electric Tramways Co., in regard to the running of tramways there, have reached a somewhat critical stage. The Corporation have acquired two of the Company's routes, which they propose to re-lease upon certain terms which the Company have characterised as absurd from a business point of view. Among the terms of the proposed lease are that the Company shall pay 5 per cent. on the total capital expenditure of the Corporation in respect of the lines, that they shall establish a sinking fund representing 3 per cent. per annum on the capital, and pay £150 per route mile per annum for the maintenance of the tramways, in addition to a rental.

A proposal for the extension of the Bradford tramways to Bingley is under consideration. The Bolton Borough Engineer is preparing estimates of a proposed extension of the tramways.

It is stated that the Russian Minister of Ways and Communications is preparing plans for the electrification of the railways around St. Petersburg.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The General Post Office are about to erect a wireless station at the Engineering Department's building at St. Martin's-le-Grand. The aerial has already been installed on the roof, and consists of bare copper wires supported between two masts 50 ft. high and 240 ft. apart. This will be connected with the remaining apparatus, which, we understand, will be installed in the Department's laboratory in two or three months' time. It will be mainly for experimental work in connection with new stations to be erected in the future, as well as those existing, and also with a view to keeping the Post Office wireless equipment up to date by testing, under practical conditions, the many new devices which are continually being put forward by inventors.

Mr. A. W. Sharman, the inventor of the Helsby wireless telegraph and telephone systems (ELECTRICAL ENGINEERING, Vol. VI., p. 343, May 26th, 1910), has been carrying out some interesting experiments in Pegwell Bay, Ramsgate, in marine wireless telephony. Messages have been sent between a shore station and a boat, and between two boats, up to a distance, it is said, of three miles.

It is stated that the British patents of the Bellini and Tosi Directive wireless telegraph system are being acquired by the Helsby Wireless Telegraph Co., Ltd.

A dispute between the Postmaster-General and the Southwark Borough Council in regard to whether certain telegraph wires, which it was proposed to place in the borough, should be overhead or underground, came before Mr. Hopkins, the stipendiary magistrate having powers within the district, on Monday. In order to connect up some fire-alarm posts with the fire station, the Postmaster-General desired to erect overhead wires in Hillington Street, Aldred Road, Kennington Park Gardens, St. Agnes Place, Cook's Road, and Heiron Street, but the consent of the Council was refused. The Solicitor for the Post Office stated that the cost of the wires if placed overhead would be £90, whilst an expenditure of £339 would be entailed if they were placed underground. There would be fifteen poles, and the wires were intended to be connected with some overhead wires already sanctioned by the neighbouring Lambeth Council. It was pointed out for the Southwark Council that there were no overhead wires on public property in the borough, and that the Council had always objected to overhead wires.

On the 20th inst. the cable between Medan and Sabang was in working order again, followed on the 21st inst. by the re-entry of the cable between Zanzibar and Mombasa on the active list. The cable between Gibraltar and Tangier, however, failed on 22nd inst., and communications seem to be following the example of those during the Morocco troubles, and giving out at a time when their use is most urgently needed.—The 23rd inst. saw the re-establishment of the submarine cable link between Santhiago and Bathurst, and on the succeeding day the Gibraltar-Tangier cable was restored.—Telegraphic conditions to Casablanca are now again normal, while there is still delay in messages to Mogador.—There is delay in telegrams to points north of Sitka owing to the lines to Alaska being down.—The inland lines of Hayti have been put into order again.—It is a long time since we have had so many items to report, but, as is well known, events never come singly, and one cable going down gives the signal to others.

Iron and Steel Institute.—The autumn meeting of the Iron and Steel Institute, which was to be held in Turin next week, has had to be abandoned owing to a variety of circumstances. Arrangements have, therefore, been made for the meeting to be held at the Institute of Civil Engineers, Great George Street, Westminster, on October 5th, at 10.30 a.m. If necessary, the meeting will be resumed in the afternoon. The only paper of direct electrical interest is by Cav. Ing. Remo Catani (Rome), "On the Application of Electric Energy to the Manufacture of Iron and Steel in Italy."

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 21, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

20,441/10. **Wireless Telegraphy.** MARCONI WIRELESS TELEGRAPHY Co. and J. H. ROUND. To reduce the effects of powerful atmospheric discharges, a variable conductor and a receiver in the form of a Fleming valve, both of the unidirectional type, are connected in opposition and in parallel as shunts to the receiving circuit. The variable conductor only operates when acted upon by powerful oscillations, so that when the circuits are in tune signals can be received as long as they are not strong enough to affect the conductor; but, on a discharge taking place, the two valves become equally operative, and, being in opposition, no sound is produced. The filaments of the valves are rendered incandescent by current from two batteries, one in each circuit, adjusted by resistances. Potentiometers are also provided for varying the voltage across the valves, so that the sensitiveness of the variable conductor can be adjusted. Two figures.

25,683/10. **Induction Motors.** BRITISH THOMSON-HOUSTON Co. and J. MARTIN. To increase the range of speed variation, the stator is provided with a 3-phase winding, which can be connected for two or four poles. The rotor is fitted with a 6-phase winding, and can operate as a single winding for one number of poles, or as two distinct 3-phase windings for double the number of poles. The speed of the motor is controlled by a 6-phase star resistance connected to the slip rings. Two figures.

25,756/10. **Switch.** M. D. SCOTT. This invention relates to a device to prevent sparking in the case of a solenoid switch for opening one circuit and closing another. The moving contacts, in the form of rollers, are mounted, in one form, on arms pivoted to turn about the end of the solenoid spindle, and are acted upon by a helical spring. The stationary contacts, on which the rollers press, are placed close together on each side of the spindle, so that as the contact rollers move from one to the other they momentarily bridge the gap between the contacts and close both circuits. Three figures.

3,730/11. **Single Line Telephone System.** C. H. ELLISON and W. J. THORROWGOOD. In a battery ringing system in which several stations are connected in series, the relays of the calling bells are shunted by condensers. The calling switches are inserted between the line and the station batteries, which are connected between the line and earth. By this arrangement, while the stations are in series for telephonic currents, part of the line is cut out from the ringing circuit, namely, that between the battery connection of the calling station and the end of the line away from the station which is being called. One figure.

600/11. **Periodicity Transformers.** BROWN, BOVERI, ET CIE. In one method of transferring power at one frequency from a primary set of mains to another set of mains at a different frequency, two induction motors with slip rings are used, coupled to the same shaft. A stationary winding connected to two sets of brushes is also provided either as a separate machine or on the same shaft as the induction motors. The stator of one of the latter is connected between the primary mains and its rotor to one set of these brushes, while the stator of the second motor and the other set of brushes are connected to the secondary mains, the rotor being short-circuited. The power supplied by one machine is transmitted to the mains at half the frequency, partly through the slip rings and partly by the machine acting as generator, the machines having the same number of poles and running at the same speed. The energy can be varied by altering the excitation of the winding. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: SIEMENS BROS. DYNAMO WORKS and BRADLEY [Twin projectors or searchlights] 23,636/10.

Cables and Wires: NIELD [Contact clips for] 21,408/10.

Electric Ignition: BALTRUSCH, 23,030/10.

Electrometallurgy and Electrochemistry: LEVOZ [Production of steel] 20,594/10; SERPEK [Revolving furnaces] 29,715/10; HELBERGER [Furnaces] 419/11.

Heating and Cooking: ELECTRIC & ORDNANCE ACCESSORIES Co. [Ovens] 21,468/10; POWNALL [Heaters] 6,374/11.

Incandescent Lamps: WEBER, 1,210/11; HOUSKEEPER [Filaments] 17,480/11; KNIGHT [Filament supports] 17,482/11.

Storage Batteries: DRAKE, WADDELL, and D. P. BATTERY Co. [Plate packing] 25,516/10.

Switchgear, Fuses, and Fittings: PERRY [Starting rheostats] 20,565/10; COPLAND [Lamp holders] 25,897/10; BARNES [Lamp holder] 26,232/10; MÜLLER [Safety fuses] 27,259/10; WILLIAMS and GILLIES [Electric-light attachments] 225/11; COLLINS and COLLINS [Thermal switch mechanism] 1,900/11; TYLER and FREEMAN [Means for supporting lamps] 21,574/10.

Traction: PIACANI, PACINI, and CAPELLANO [Point-shifting mechanism] 24,524/10; JENSEN *(Witte and Litland)* [Signalling between moving trains] 2,982/11; ALBANESE [Construction of conduit and track of tramway] 3,022/11.

Miscellaneous: SMITH [Portable battery lamps] 20,378/10; HENRI, HELBRONNER and VON RECKLINGHAUSEN [Treating liquids with ultra-violet rays] 20,436/10; MEEK [Magnetic separators] 21,045/10; KUTINER [Insulating metallic coils with layers of oxides] 23,675/10; CROSSLAND and CROSSLAND [Control of coal-cutting machines] 25,426/10; CREMER [Magnetically-locked miners' lamp] 1,665/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: GES. FÜR MASCHINEN-U-METALL INDUSTRIE, 19,002/11 and 19,435/11.

Motors and Dynamos: BRUN [Reversible rotary motor] 15,579/11.

Electric Ignition: ROBERT BOSCH, 13,705/11.

Incandescent Lamps: BLOCH, 17,412/11.

Switchgear: FELTEN and GUILLEAUME CARLSWERKE [Excess current switches], 19,392/11.

Telephony: VOJEN [Receiver of radiating-field type] 17,027/11; ENGLISH, BOUKOFSKY, and LICHTENSTEIN [Antiseptic mouthpieces] 18,785/11; SIEMENS & HALSKE AKT.-GES. [Automatic exchange circuits] 19,185/11, and [Circuit arrangements for automatic systems] 19,186-7/11 and 19,230-1/11.

Amendment

25,651/09. **Turbines.** C. A. PARSONS. As a result of the extended investigation under section 8, the above-mentioned specification has been amended by way of disclaimer. It relates to gearing for turbines suitable for marine propulsion, and consists of differently-speeded turbines driving a common shaft. The main ahead and astern turbines are arranged either direct on the propeller shafts or by single or double reduction gear, while the cruising turbines are similarly geared to the propeller shaft.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Names in round brackets indicate communicators of inventions from abroad.

Arc Lamps: B. A. QUINT, 12,902/07.

Dynamos and Motors: H. R. RIVERS-MOORE [Commutators] 12,860/07; A. E. WOODHOUSE [Carbon brush-holder] 13,021/07; H. N. HICKLEY [Carbon brush-holder] 13,259/07.

Incandescent Lamps: W. L. WISE *(G. O. Squier)*, 13,207/06; T. W. LOWDEN [Exhausting] 13,152/07.

Switchgear and Fittings: M. RALLING and J. H. COLLINGS [Combined switch and cut-out] 13,082/02; E. A. CAROLAN *(General Electric Co., U.S.A.)* [Magnetic brakes] 12,954/03; ALLGEMEINE ELEKTRICITÄTS-GES. [Switch] 12,855/06; C. REES [Electroliers] 13,300/07; T. S. PERKINS and R. P. JACKSON [Motor control] 8,196/05; J. SAHULKA [Motor-control system] 13,140/07; W. ARTHUR [Motor-control system] 13,206/07; ALLGEMEINE ELEKTRICITÄTS-GES. [Motor controller] 13,265/07.

Telephony, Telegraphy, and Signalling: H. JANKELOWITZ [Antiseptic mouth and ear pieces] 12,761/07; L. NEWITT [Order telegraphs] 12,907/07; W. D. WATKINS and J. W. BOLSTER [Signalling] 13,175/07; SIEMENS BROS. & Co. *(Siemens & Halske Akt.-Ges.)* [Signalling system] 13,349/07; F. R. WEBB [Telephone insulator] 13,044/07; E. L. E. and E. L. C. WHAT ARE THE DUTIES OF AN ELECTRICAL INSPECTOR?

A CONSUMER on the Borough Council's mains has applied to the local magistrate for the appointment of an electrical inspector under the terms of the Council's Electric Lighting Provisional Order. In the course of the application it was stated that the St. Pancras Council commenced electric supply before the London County Council had general powers in the matter of appointing electrical inspectors. The Borough Council's Provisional Order provides that application must be made to a stipendiary, neither the Board of Trade nor the L.C.C. having any jurisdiction. Mr. Bros reserved his decision.

We believe that the application, which was made on behalf of the consumer through his solicitor, was made without any previous consultation with the St. Pancras Borough Council's electricity department, and, in fact, that the name of the consumer is not even known to the department. It is apparently a protest against the department's regulations as to the size of break of the fuses used on consumers' premises. Owing to these regulations not having been fully complied with, it has been found necessary in one or two cases to refuse to connect up with the supply mains until the necessary alterations had been made.

Electrical inspectors have been appointed by the Board of Trade in the case of many electrical supply undertakings, but we know of no case in which the inspector has been called in to settle a dispute with regard to the details of wiring in a consumer's premises.

STREET LIGHTING IN MANCHESTER

WE recently referred to the installation of street electric lighting in Manchester, and an official inspection by the members of the Electricity Committee took place last week. The experiment is being carried out in Portland Street, Albert Square, and Piccadilly. In Albert Square, says the *Manchester Guardian*, sixteen 6-ampere Gilbert enclosed arc lamps have been replaced by a similar number of 10-ampere "Metro-Flam" arcs made by Messrs. Johnson and Phillips. The height of the new flame arcs is 22 ft. 6 in. from the ground level, against the 17 ft. of the existing arcs. The candle-power of the new "Metro-Flams" is 2,500, against 850 for the Gilberts. In Portland Street central lighting has been adopted as far as possible by means of arc lamps suspended from duplicate cross-span wires attached to rosettes fixed on the fronts or corners of the buildings. Where this course has not proved feasible, side poles with long arms are fixed so as to bring the lamp central with the street. Provision is made for the raising or lowering of the lamps. There are 16 lamps in all, but at the important crossing of Princess Street and Portland Street two are erected on an extension of the existing tramway standards at opposite street corners. The candle-power of the lamps is 3,000. It is proposed to have tests made by an expert, independent of the Electric Supply Department.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—An interesting pamphlet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), deals generally with the uses of aluminium in the electrical industry. The progress that has been made in its use for transmission lines is recorded, views of actual lines are reproduced, and interesting details are given as to methods of jointing and erection, with illustrations of twisted sleeve and other joints, and methods of attachment to insulators. Useful tables and constants relating to the calculation of aluminium conductors, and comparing generally the properties of aluminium and copper, are included. Illustrations are also given of bar and strip switchboard connections, fuse strips, special joints for insulated cables, and a host of useful information on these subjects is given. Aluminium trolley heads, bow collector strips, and coils for lighting, magnets, and railway motor field coils.

HEATING AND COOKING APPARATUS.—Messrs. Perry and Grinell, Ltd. (182 Leopold Street, Birmingham) have sent us a leaflet giving particulars of some very moderate priced copper and tin electric kettles, with easily renewable heating elements.

SWITCH.—A leaflet from Tetley & Co. (Falcon Electrical Works, Salford) gives the dimensions and prices of a new switch for 600 volts, with a carbon break and enclosed fuses.

ELECTRIC COOKERS.—The Westminster Tool and Electric Co. (Suffolk House, Laurence Pountney Hill, Cannon Street, E.C.), have sent us an account of their electric cooking appliances. The heating element is specially constructed to withstand very high temperatures. The oven is lagged to prevent the radiation of heat. The top plate is of polished steel fitted with two boiling plates, arranged for two heats, and a grill for a single heat. In a larger size a third boiling plate is provided with three heats. A temperature of over 600° F. can be continuously maintained on the boiling plates.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

RADIATORS.—The Dowsing Radiant Heat Co., Ltd. (105 Great Portland Street, London, W.), have issued a new list of radiators. A few new designs have been added with the usual gilt lacquered frame, coppered interior, and reflector, four lamps, and two switches. A new tubular four-light type has also been included, together with a cheap combined radiator (Dowsing Huntley System), and two new convectors. The firm is also giving its attention to electric irons and cookers. These are made for any voltage, from 25 to 250. The cooker is in the form of a hot plate, and is supplied with two switches.

WATER-SOFTENING APPARATUS.—A booklet from Robert Boby, Ltd. (212 Upper Thames Street, E.C.) describes the "Neckar" water-softening and boiler-mud extracting apparatus, which combines purification of water by filtration, with softening by admixture with a reagent, and the automatic removal from the boiler of the deposit which is produced during the evaporation of the softened water.

TELEPHONES.—A new illustrated price list of telephones has been issued by G. Braulik (8 Lambeth Hill, Queen Victoria Street, London, E.C.). It includes receivers, transmitters, switchboards, magneto-extension bells, accessories, and every type of telephone, whilst diagrams of connections appear at the end.

BALL BEARINGS.—A new circular dealing with the application of ball bearings to electrical machinery is to hand from the Hoffman Manufacturing Co., Ltd. (Albion House, 59-61 New Oxford Street, London). In the illustrations given, a double thrust washer is shown in position to hold the shaft endways. The bearings are fitted with a Stauffer lubricator, so that grease can be put in now and again, to keep the ball races free from rust.

INDUCTION MOTORS.—These are described in a catalogue, which has been sent to us by C. Harding Churton & Co. (Atlas Works, Leeds). They are wound for either single, two, or three-phase currents. The rotors of the short-circuited type have the copper bars connected at the ends by metal rings, which are cast-welded direct to the bars, so that soldered or riveted joints are avoided.

LOCAL NOTES

Acton: *Electricity Undertaking.*—In connection with the acquisition of the Council's electricity undertaking, the Metropolitan Electric Supply Co. have opened a showroom and offices in High Street, where there is a good show of electric light fittings, lamps, heating and cooking apparatus, and motors. The company offer to wire premises on the hire-purchase system, and also to enter into agreements for the hire and purchase of motors. Electrical apparatus such as hot plates, kettles, flat-irons, &c., are being sent out for one month on approval.

Bury: *The New Electricity Works.*—At the last meeting of the Corporation, Mr. S. J. Watson, Borough Electrical Engineer, reported that the new Chamber Hall Power Station had been at work since Friday, August 25th. Since then a regular supply had been maintained from 8 a.m. to 6 p.m., Saturdays and Sundays excepted, the output being about 800 k.w.

Caversham: *Street Lighting.*—A very successful system of street electric lighting has been carried out in Caversham by the Reading Electric Supply Co.

Edinburgh: *Heriot-Watt College.*—The new electrical engineering laboratories at the Heriot-Watt College are now practically completed. They have been altered and refitted at a cost of about £2,000.

Glasgow: *The Olympia Exhibition.*—The Electricity Com-

Hosted by Google

mittee recently discussed a proposal to send delegates to the Olympia Electrical Exhibition. The suggestion was defeated by the casting vote of the Chairman, but the Corporation have decided to refer the matter back to the Committee for reconsideration.

Halifax: *Tramway Management.*—The Tramways and Electricity Committee have decided to separate the management of the electricity and tramways undertakings. Consequently, Mr. W. M. Rogerson has been requested to relinquish his appointment as tramway manager in order that he may confine his attention solely to the electricity undertaking. A resolution was passed thanking Mr. Rogerson for the ability he has displayed during the four years he has held the position of tramways manager. The Committee hold the view that the prospective development of the electricity undertaking demands the whole time of a skilled engineer. The tramway management is to be placed in the hands of Mr. J. D. Caird, the traffic superintendent, and Mr. J. W. Galloway, the tramways engineer.

Heckmondwike: *Electricity Supply.*—The Yorkshire Electric Power Co. have laid a scheme of electric supply before the Council. This provides for the company supplying electricity in bulk to obviate the Council putting down additional generating plant.

London: *Stoke Newington: Electric Light.*—The chief library of the Stoke Newington Council has been wired for electric light at a cost of £210. The installation has been presented as a Coronation gift by the Mayor, and the opening ceremony took place on Thursday.

Norwich: *Tramway Purchase.*—The report of the Special Committee appointed to discuss the proposed purchase of the Norwich Electric Tramways undertaking is against the proposition, and the company have been definitely informed that the Corporation do not desire to proceed further with the matter.

Portsmouth: *Electricity Assessment.*—The Electric Light Committee having protested against the proposed assessment of the electricity works at £9,785, the Assessment Committee, in order to avoid any dispute between two Committees of the Corporation, have agreed to fix the assessment at £7,785.

Stirling: *Electricity Charges.*—The Council have approved of the recommendation by the Electrical Engineer for a reduction in the lighting charge of from 4½d. per unit to 4d. per unit.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Belfast.—Tenders are invited by October 9th for a 2,000 ampere switchboard apparatus, field regulating rheostat, and change-over switch. (See advertisement on another page.)

Chester.—Mr. S. E. Britton, the Council's Electrical Engineer, has prepared a scheme for the utilisation of the waters of the River Dee for generating electricity. Mr. A. C. Hurtzig, an hydraulic engineer whom the Council have consulted, has expressed his approval of Mr. Britton's scheme, and the details are to be laid before the River Dee Board.

Epsom.—The Council have decided to appoint an expert at a fee of £25 to advise as to the installation of a Diesel or other engine in the power station.

Grimsby.—Tenders are invited for paper lead-covered cables, fuse boxes, and cast lead service boxes. (See an advertisement on another page.)

Hayti.—The *Board of Trade Journal*, quoting from the *Bulletin Commercial* (Brussels), states that the Port-au-Prince authorities have granted a concession for the erection of an electric power station for supply to electric railways, five miles long, and tramways eleven miles long.

Panama.—A concession has been granted for the installation of an electric lighting plant for private and public purposes in the town of David. The name of the concessionaire is on file at the Commercial Intelligence branch of the Board of Trade, 73 Basinghall Street, E.C.

South Africa.—The *Board of Trade Journal* reports that the Pretoria Town Council have decided to extend the municipal tramway system at an estimated expenditure of £48,000.

A scheme for the rearrangement of the street arc lighting has been prepared in consequence of the unsatisfactory condition of the present installation. It is stated that the continual occurrence of faults is due to the rubber-insulated, lead-covered cables which are laid direct in the ground being damaged by subsidences in the streets. For the last few years, says the *Transvaal Leader*, there has been an average of four faults per week, whilst in wet weather they have amounted to as many as six per day. Two schemes have been suggested to the Electric Light Committee, one being for the laying of entirely new mains for the present arc lighting system, and the other to discard the arc lamp altogether, and lay new cables for lighting the town with metal filament lamps. The cost of the second scheme is put at £8,400, and that of the first at £4,800, but whilst the annual cost of maintaining the present arc lamp system, excluding capital charges, is £10,300, the annual cost of the metallic filament lamp scheme would be £9,080; thus the extra capital expenditure will be more than wiped out in three years by this saving.

OSRAM·LAMPS

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Chatham.—Additions at the Medway Union Workhouse Infirmary. Architect, G. E. Bond, 384 High Street, Rochester.

Manchester.—Elementary school at Failsworth. Architect, H. Littler, 16 Ribblesdale Place, Preston.

Merthyr Tydfil.—Sanitorium for Guardians.

Paisley.—Church at North Croft. Architect, T. G. Applecrombie, Paisley.

Rugby.—Extensions at municipal baths.

Southampton.—Plans for the new Hartley College have been approved.

Swansea.—Warehouse and offices in Cambrian Place for Messrs. Thornett & Chivers, wholesale grocers. Architects, Messrs. C. S. Thomas, Meager & Jones.

Torquay.—New Pavilion.

Woolwich.—New Police Court.

MISCELLANEOUS

Algeria.—The Municipal Authorities at Bona invite tenders for the supply and installation of electric pumping plant, capable of lifting 55 litres of water per minute. Further particulars from Monsieur le Directeur du Service des Eaux, Hotel de Ville, Bona, and tenders by October 15th.

Australia.—Tenders are invited by November 8th by the Deputy Postmaster-General, Brisbane, for telephone switchboards and parts, and instruments. Tender forms at 72 Victoria Street, or 73 Basinghall Street, London, E.C.

Canada.—Some electric pumps will shortly be required by the Hamilton Town Council.

London: *Hackney.*—The Council invite tenders by October 17th for 100,000 pairs of white open type arc lamp carbons. Particulars from Borough Electrical Engineer.

Southend.—Nine additional feeder pillars are to be purchased at an estimated cost of £114.

TENDERS RECEIVED AND ACCEPTED

Cleethorpes.—The tenders of the Western Electric Power Co., Ltd., for cable, and Messrs. Ferranti, for meters, have been accepted.

Skipton.—The tender of the Wilson Wolf Engineering Co. has been accepted for electric fans, wiring, and motors for the Town Hall.

Popular Lectures.—Two special popular lectures will be given by Mr. Frederic H. Taylor, Assoc.M.Inst.E.E., Assoc.M.Inst.M.E., on "Recent Developments in Electric Lighting and other applications of Electricity" on October 4th and 6th next commencing at 8 p.m. each evening. Tickets may be had on application to the Secretary at the Willesden Polytechnic, Priory Park Road, Kilburn, N.W.

Ironmongers and Municipal Trading.—A circular is being sent out to its members by the Ironmongers' Federated Association, urging the importance of combating the growing practice of municipal traders where it trespasses on the rights of the private trader. It is pointed out that much can be done in this direction by voting in the November municipal elections only for those candidates who will oppose such trading being carried to unfair limits.

APPOINTMENTS AND PERSONAL NOTES

Mr. C. W. Hill, who recently resigned the general managership of the Bournemouth Corporation Tramways, has been presented by the staff with a leather writing case, whilst Mrs. Hill has been presented with two framed water-colours.

The Borough Electrical Engineer of a large Midland town has vacancy for pupils. (See an advertisement on another page.)

Messrs. Gilbert Lodge & Co., of Sydney, Australia, have been appointed Australian agents for the British Electrical Engineering Co. Mr. G. D. Moffatt, who is going to Australia, will be attached to the offices of Messrs. Lodge, at Norwich Chambers, Hunter Street, Sydney, as the Brush Co.'s engineer.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. (last week £57 5s. to £57 15s.).

Change of Telephone Number.—Messrs. Feld Bros. & Co., Ltd., have changed their telephone number to 1,051 London Wall (two lines).

Telegraphic Address.—Messrs. Marryat & Place (28 Hatton Garden) have registered the telegraphic address of "Marryat, London," and propose to drop the old telegraphic address, "Annealable, London."

Graetzin Metal-filament Lamps.—Messrs. Krufka & Jacoby (11 Queen Victoria Street, E.C.) inform us that considerable success has attended the introduction by them of the above lamp, for which they are sole agents in this country. This they attribute largely to the way in which the strong filament withstands vibration. They particularly call our attention to these lamps in "Euphos" glass bulbs, which obstruct the ultra-violet rays as a protection to the eyesight.

Johnson & Phillip, Ltd.—This firm request us to announce that, owing to representations made by some of their contractor friends, they have decided not to tender for, or accept orders for, ordinary wiring work. Should work of this nature be included in contracts for complete plant and cable installations, they propose to sublet the wiring portion.

Submersible Motors.—At the Electrical Exhibition, Olympia, at the stand (Nos. 317 & 318 in the gallery) of Submersible Motors, Ltd., 23 St. Swithin's Lane, and the J. L. Manufacturing Co.'s Works, Southall, a motor is shown under water driving a pump delivering 30,000 gallons of water per hour. The space was reserved late, and, as no entry appeared in the exhibition catalogue, we have been asked to insert the above announcement.

Liquidation.—The Reno Electric Stairways and Conveyors, Ltd., is to be wound up voluntarily. The liquidator, Mr. M. Lancaster, has been authorised to sell the undertaking to Reno, Ltd. A meeting of creditors will be held at the offices of Messrs. Thorne, Lancaster, Farey & Co., 1 Basinghall Street, E.C., on October 9th, at 11 a.m.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Yorkshire Electric Power Co.—Mr. A. J. Lupton presided at the half-yearly meeting in Leeds last week. He pointed to the general increase in the sale of energy to all classes of consumers, and to the growing importance of the Distribution Co., which now takes supply for no less than nine districts, for which they hold provisional orders. Since the issue of the report he regretted that there had been a serious breakdown in the generating plant at Thornhill, which would entail considerable expense. Temporary plant had been installed. The Chairman also referred to the difficulty with the Batley Corporation, who had refused to allow the company to lay a main through their district for the purpose of supplying other districts beyond. An application was made to the Board of Trade, and a decision was given in the company's favour.

Cleveland and Durham Electric Power Co.—The report for the year to June 30th shows a gross profit of £20,974, against £12,942 in the previous year. After providing for debenture and other interest, a net profit of £8,343 is carried forward. The connections to the company's mains now aggregate 40,464 h.p., an increase of 4,177 h.p. during the year. In addition, 12,500 h.p. have been contracted for, but not yet connected. The report contains a statement showing how the reduction of capital sanctioned by the High Courts last December has been applied to writing down assets.

United Electric Car Co.—Mr. George Richardson, presiding at the annual meeting of this company last week, expressed the directors' regret at the small net profit for the past year, viz., £4,420. Nevertheless, they considered it a satisfactory one in view of the stagnation in the car building trade. He considered the company was in an exceedingly strong position, and the prospects were better than for some years past, the order book being in a satisfactory condition.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203–6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Gas Engines." By Herman Haeder. 317 pages, 9½ in. by 7¼ in. 23 figures. (London: Crosby, Lockwood & Son.) 18s. net; abroad, 18s. 5d.

"Proceedings of the Incorporated Municipal Electrical Association, 1911." 240 pages, 8½ in. by 5½ in. 9 figures. (London: Wyman & Sons, Ltd.) 5s. net; abroad, 5s. 3d.

ART and MONEY

are rarely associated in those whose business it is to earn the one by the aid of the other, yet the artistic in the electric light fixture business is usually associated with much money. Most people (and nearly all electrical contractors) appear to labour under the impression that it is almost impossible to produce an artistic electric light fitting without considerable cost. The result is that when he has a client who requires a really inexpensive fitting and must have it, the electrical contractor's imagination can rise no higher than a three-light "spider" fitting. There appears to be no solid reason for it beyond a certain lack of initiative on the part of many of the best known fittings makers, whose limits appear to be the highly artistic at a relatively high price, appealing to the few. From the electrical contractor's point of view the trouble is a serious one, resulting in loss of profit and sometimes of a customer. He knows the demand that exists for a presentable range of artistic fittings at a comparative low figure which will appeal to the middle-class buyer and the man of moderate means, yet none the less discriminating taste.

The attitude of the fittings maker has hitherto been lethargic. A new factor has recently arisen, *viz.*, the development of a Fittings Department by Simplex Conduits, Limited, who, owing to their unique experience, are well able to appreciate the contractor's requirements and the filling thereof.

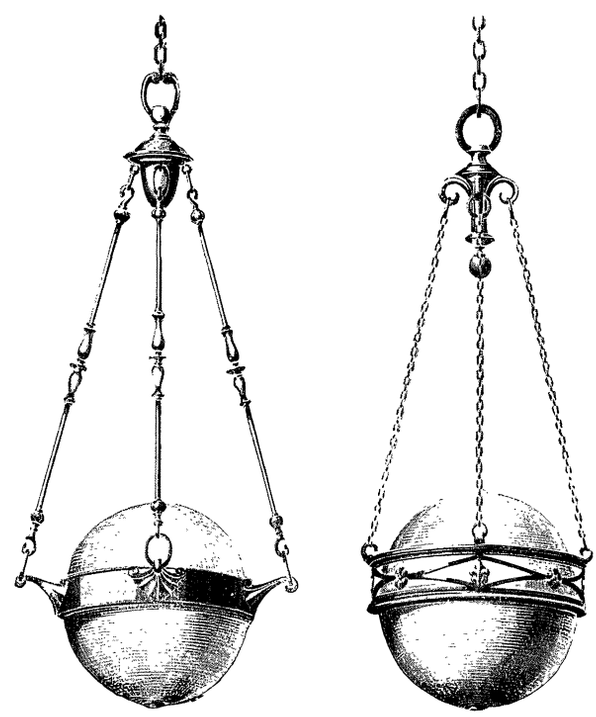
Commencing as recently as June last with the purchase of the fittings business of Jesson Birkett & Co., Ltd. (who were themselves in the forefront of decorative metal workers), this experience is rapidly bearing fruit. The splendid equipment of the Simplex Company's works at Garrison Lane, Birmingham, has resulted in the scope of the business hitherto carried on by Jesson Birket & Co. The combinations of these forces added to the fact that the services of Mr. T. Birkett (previously managing director of the firm now incorporated in the Simplex Company's business) enables this lately formed department to render considerable service to the electrical contractor in his business as it may exist now, and in the development of a fixture trade in the future.

The first step has been to produce those designs which he requires most and which are in most demand, namely, low-priced *artistic* fittings. There can be no better way for the engineer interested in this matter than to pay a visit to Stands Nos. 148 & 163 at Olympia, where the Simplex Company have a very representative display of electric fittings.

Those who are unable to do so are recommended at least to secure a copy of the new catalogue, which is a most exhaustive and complete publication.

Enough has been said to indicate the lines upon which the Simplex Conduits, Limited, are dealing with this business of the manufacture and supply of electric fittings, but the expression has been used, "the development of a fittings business in the future" in reference to the contractor's business.

These gentlemen are all very well aware that, although there is much good business to be done in the way of cheap fittings which they have no difficulty in getting, this is by no means the most profitable. It is the larger work, which for the sake of discussion may be termed "architectural," that is the real backbone and without which no fittings business can ever be really remunerative.



Up to the present the average contractor has little or none of this. Obviously he cannot have the facilities for tackling a big job requiring technical and expert knowledge all by himself. He is to a large extent dependent on the manufacturer. With one or two exceptions fittings makers are not electrical manufacturers also; they know nothing of the contractor, probably care less, and certainly would not think of going out of their way to protect his interest.

Simplex Conduits, Limited, intend to alter all this and to work their fittings business through the contractor, and back him in every possible way. Most contractors will have painful recollections of at least one occasion when they have been "short circuited" on a fittings order by the actual manufacturer. Many have not attempted to develop a large business as a result of these disappointments. With a firm with a reputation like that of Simplex Conduits, Limited, contractors may feel safe that their interests will be not only protected but well looked after.

By the way, it should be mentioned that the Company are specialising on fixtures suitable for holophane glassware, and publish a very handy little catalogue on the subject.

Every electrical engineer would do well to think over this subject, and when visiting the Electrical Exhibition, with a view to discussing the matter further, call at

STANDS Nos. 148 and 163.

Hosted by Google

THE ELECTRICAL EXHIBITION OF 1911

(THIRD NOTICE.)

THE Electrical Exhibition at Olympia will have been open for a fortnight on Saturday next. It will only remain open until October 21st, and there must be several thousands of the men connected with the electrical industry who have still to visit it, and tens of thousands of the general public. Up to the present the attendance of both classes of visitors has been poor. We fear that the Executive Committee and the organisers have, in a way, fallen between two stools; the Exhibition is being run not quite as a trade exhibition and not quite as a popular one. In the case of a purely trade exhibition large quantities of free tickets are issued to exhibitors, with the result that practically everybody interested in the trade in question receives one. At Olympia the exhibitors have to pay a substantial sum for tickets, and the distribution is therefore not sufficiently lavish. In other respects, however, the Exhibition is a trade exhibition pure and simple. No attraction but the exhibits themselves is offered to the public, although it would not have been difficult to have devised some form of entertainment involving some applications of electricity, which would have had the effect of attracting persons not directly connected with the electrical trades except as customers. It is, however, now too late to make radical alterations in the arrangements, and we would therefore urge once more the desirability of a large emission of free tickets through the medium of the exhibitors themselves and the supply authorities of London.

While we are confident that the Exhibition would have been more successful at the start had such more or less artificial methods been employed to bring the public to it and to form the subject of the necessary initial advertisements, yet there is no doubt that the visitor who comes to the Exhibition—no matter of what class he may be—will find plenty to interest him. The efforts of the individual standholders and their competent staffs of attendants cannot be underrated. Almost without exception the representatives at the stand have a complete and detailed knowledge of every one of their firm's manufactures, and no one need leave the Exhibition without having his hunger for knowledge entirely satisfied.

EXHIBITION TELEPHONE DIRECTORY

LAST week we published a list of the telephone numbers of the Exhibitors at Olympia who are connected with the telephone exchange there. A number of Exhibitors, however, have their stands connected with the National Telephone Co.'s Kensington Exchange, and we give these below.

Name of Firms.	*Telephone Number (Kensington).*
Abbey Electric Co.	3166
Bastian Electric Heating Syndicate, Ltd.	3029
Berry, Skinner & Co.	3246
Brook, Hirst & Co., Ltd.	3374
Brush Electrical Engineering Co., Ltd.	3393
Exhibition Organising Manager	721
Elliott Bros.	3024
Escaré & Denelle, Ltd.	3392
General Electric Co., Ltd.	4224
F. B. O. Hawes [Executive Committee]	3413
London Electric Supply Companies	3245
Reyrolle & Co., Ltd.	3466

In addition there are several public call offices in the building.

The Exhibition Executive Committee.—Mr. J. Huddlestone, of Messrs. Siemens Bros. and Co., Ltd., has joined the Executive Committee of the Exhibition.

SOME OF THE EXHIBITS

Drake & Gorham,

66 Victoria Street, S.W. (Stand Nos. 61 & 62.)

Metal Filament Lamps.—Messrs. Drake & Gorham's stand is in a prominent position near the entrance. A considerable variety of apparatus is exhibited, and one or two effective demonstrations show the advances made by latest methods. Thus on one side of the stand we have groups of six 25-c.p. carbon and metal filament lamps respectively, connected up to separate meters, and a glance at the relative speeds of the revolving discs is most convincing of the relative economy of the latter. On the other side two cases of coloured ribbons, one illuminated by an Osram lamp in a holophane reflector, and the other by a carbon lamp with ordinary shade, demonstrate the greater suitability of the former for colour matching. The firm have always kept well abreast of the newest developments of metal filament lamps, of which they always hold very large stocks, and they show the latest sizes of both Tantalum and Osram lamps.

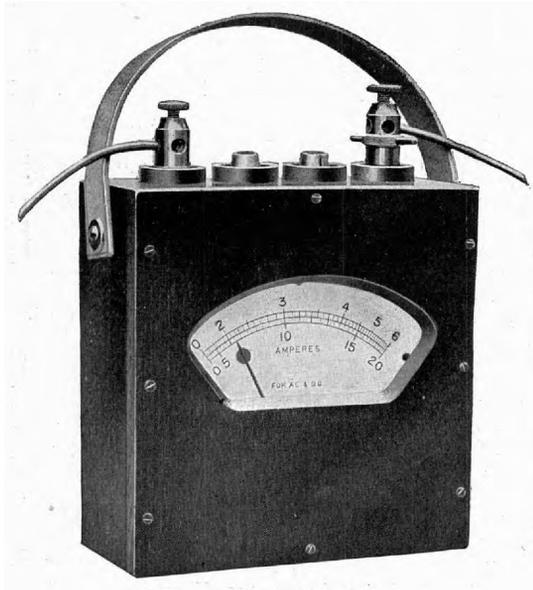
Electric Heating and Cooking Apparatus.—An excellent show is made on one side of the stand of high-class heating and cooking appliances, marking both in the design of the vessels themselves as well as in the electrical details the great advances which have taken place since the last exhibition. All this apparatus employs a standard interchangeable tubular insertion heater. Another example of electric heating is shown in the Price system for heating greenhouses, garages, etc, in which the heater is made up of large diameter tubes containing coils of nichrome wire on asbestos formers. A good display is also made of the well-known Quartzalite heaters (see Electrical Engineering, Vol. V., page 631), for which the company are agents and have supplied for use in the Royal cabins of the s.s. *Medina* on the way to the Durbar.

Switchgear, Fittings and other exhibits.—Attention should also be specially called to the display of switchgear made at the company's own works, and including a well-arranged and compact 50-volt country house lighting board with ingenious interlocked charge and discharge switches. Large switches and regulators are also shown, as well as tubular fuses, of Messrs. Drake and Gorham's own manufacture. The display of fittings is varied and extensive, including decorative fittings after the styles of various periods, special fittings for holophane glassware and exterior fittings for large metal filament lamps. Examples of the Butt arc lamp are shown, as well as many general accessories. The Frisby current gauge (described in Electrical Engineering, June 29th, page 369) may be inspected, and examples of the Drake and Gorham magnetic clutch, which we have described in connection with former exhibitions, are shown.

John Barker & Co., Ltd.,

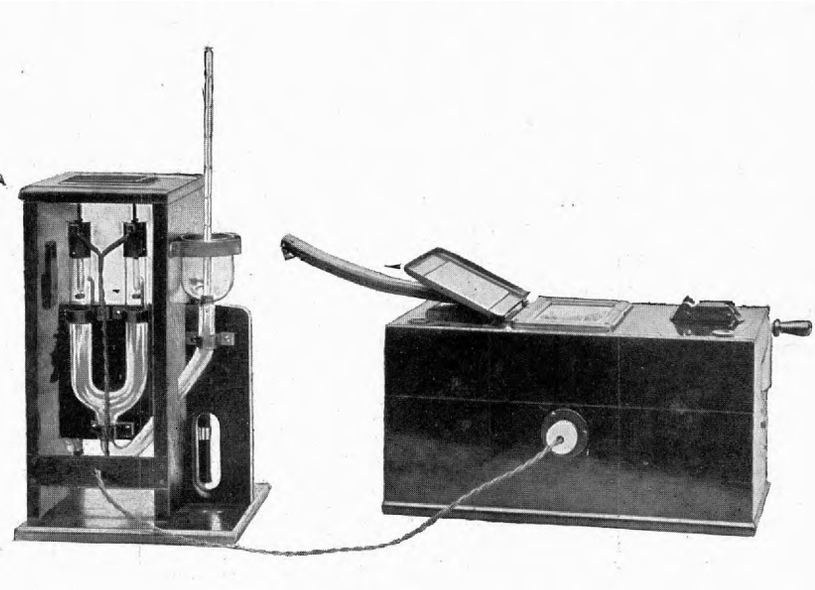
High Street, Kensington, W. (Stand No. 280.)

The Electric Home.—Messrs. John Barker & Co. have erected, decorated, furnished, and fitted up a complete house at one end of the gallery, arranged to show the many ways in which electricity can assist in domestic comfort and economy, and forming the most attractive and complete exhibit of its kind we have seen at any exhibition. Taking the rooms seriatim, we first enter the hall warmed by an electric imitation log fire, the air freshened by a self-contained electric table-fountain, with concealed motor pump, and lighted principally by a fine cut glass bowl fitting in the ceiling. Electric cigar-lighters are also provided. The whole of the lighting is by 50-volt metal filament lamps. The drawing-room to the left of the entrance, decorated in what is known as the Colonial Adams style, is a fine example of concealed lighting, with the lamps hidden in a special cornice. A certain amount of direct illumination is also obtainable from four cut glass pendants and a few standard lamps about the room. An electric radiator stands in the "fireplace," and a further luxury is a wedge-shaped electric foot-warmer. As in most of the other rooms, a small ozonair plant purifies the atmosphere, and it may be mentioned here that all the rooms are connected by an intercommunication telephone



Hosted by Google

system. There is also an electric piano in the drawing-room. Beyond this is the bedroom, the special features of which, in addition to its dainty scheme of decoration, are electric bed-warmers, including a new pattern in which a thermal switch cuts off the current when the desired temperature is reached, hair-dryers consisting of tiny motor-driven fans delivering electrically heated air, curling-iron heaters as well as curling-irons themselves containing heating elements, and an electrically driven sewing machine with the motor controlled by a foot-switch giving four speeds. In the bath-room we have a new circulation heater in the form of a cylinder 30 in. long, capable of raising the temperature of 20 gallons of water from 60° F. to 100° F. in fifteen minutes. This is provided with switches allowing as much as 9 k.w. to flow, or reducing this in nine stages to about 1 k.w. On the other side of the room is a large electric light bath, or soliarium, and demonstrations are also given here of electrical vibratory massage with apparatus supplied by the International Vibro-Massage Co. A considerable variety of appliances are shown, and we are informed that they form the only apparatus of this nature that is entirely British made. Coming now to the rooms on the right of the entrance, we have the handsome Georgian dining-room, where particular attention should be paid to the fine chandelier over the table, the electrically lighted table centre, and the display of plate-warmers, grillers, coffee-pots, kettles, toasters, and other heating devices on the sideboard. Perhaps the most interesting room however, to many visitors, will be the kitchen, where electric cooking demonstrations are given at frequent intervals by a lady expert. The equipment is rather larger than would be required for a house of this size, and the principal item is a complete outfit, or range, of which Messrs. John Barker & Co. are making a speciality. This comprises a large oven with neat white-enamelled exterior, capable of taking the largest joints, with the heat controllable in three steps, a plate-warmer, and on the top three hot-plates, suitable for heating a variety of different utensils, each also arranged for three degrees of heat. There is also a smaller oven of a different make, and a good show is made of independently heated saucepans, stewpans, &c., and a very convenient immersion heater in the form of a flat disc with a long handle, which can heat water in a pail or any other vessel. The room is excellently lighted by inverted semi-indirect fittings on the ceiling, and in the centre a porthole fan draws out the heated air. The new pattern of bell indicator fitted up in the kitchen should also be mentioned. In the adjoining scullery is a Therol water heater, for heating large quantities of water slowly with a small expenditure of energy. From here we cross the intervening space between the house proper and the laundry and power-house building, passing on our way exhibits of a new vacuum cleaner, with several points to recommend it, including ball-jointed nozzles, giving great freedom of angular position to the tube held in the hand, and a worm-geared knife-cleaner, which is self-adjusting to any thickness of knife, and is driven by a ¾-h.p. motor. The laundry has been fitted up by the Park Royal Laundry (90 Avenue Road, Acton, W.), and working demonstrations are shown of electric laundry ironing with special irons, all provided with regulating rheostats and flexible leads coming from overhead. Very fine examples of the work turned out are shown, such as we are assured could not be obtained by ordinary methods. An electric fan keeps the room cool. Current for lighting, &c., is obtained from the generating set in the adjoining power-house, which consists of a 2¼-k.w. 50–75-volt continuous current dynamo, running at 830 r.p.m., and coupled to a 4-h.p. paraffin engine, although on account of exhibition restrictions the set is at present being driven by a motor off the main supply. A small rotary pump, such as can be used for country-house water supply, driven by a ½-h.p. motor and capable of raising 10 gallons per minute against a head of 30 ft., is also shown in the same room. The accumulator room adjoins and contains a battery of 27 cells capable of running 125 16-c.p. lamps for 27 hours on one charge. A complete battery control switchboard in the engine-room completes this neatly arranged equipment.



Eversheds & Vignoles, Ltd.,

Acton Lane Works, Chiswick, London, W. (Stand No. 168.)

Speed Indicator.—This is one of the firm's latest manufactures. The shaft whose speed is to be indicated drives a small D.-C. generator, across the terminals of which a moving coil voltmeter is connected calibrated in revolutions per minute. The generator is fitted in a water-tight cast iron case, and special attention has been given to the design of the commutator, brush gear, and bearings. The commutator is made with an air core, and no insulation is provided between the segments, which are held in position by two slotted fibre rings surrounded by a steel ring. Rubber pads are placed behind the carbon brushes, and a spring is also attached to take up the vertical thrust and render the whole flexible. The bearings are made large and long for continual running.

3-Range Portable Ammeter.
(Eversheds & Vignoles.)

Dionic Water Tester and Generator.

Dionic Water Tester.—This instrument, which we illustrate above, is for testing water. In the illustration it will be seen to consist of a glass U-tube, which takes the water to be tested and carries electrodes in the form of short, hollow platinum cylinders. Current at 100 volts is passed through the water by means of a constant speed generator, with which is combined an ohmmeter, similar to the firm's megger, and a direct deflection is obtained, giving the conductivity in reciprocal megohms, known as units. The instrument is extremely sensitive, a trace of salt, which could not be detected chemically, greatly altering the conductivity. A fuller description was published in Electrical Engineering, November 17th, 1910 (Vol. VI., p. 735). A higher range has now been made, and readings up to 200,000 units can be taken.

Ammeters and Voltmeters.—Two types of these are shown, including a combined portable moving coil set for measuring continuous currents. The voltmeter can be made to read up to any range or multiple of ranges by means of a sliding switch. The ammeter and voltmeter are quite independent, so that power, as well as resistance on the drop of potential method, can be measured. It is contained in a teak case, and is very light, the 100-ampere range weighing about 5 lbs., while the 1,000 ampere range weighs 25 lbs.

WESTINGHOUSE

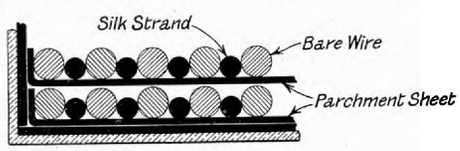
MANCHESTER

Hosted by Google

A three-range portable moving iron ammeter, which we show here, is also exhibited. It measures direct or alternating currents over a large range, from 1 to 100 amperes, without the use of a transformer. The range is changed by means of a travelling terminal, which can be very quickly unscrewed and transformed for whichever range is required. The following ranges are made: 5, 15 and 50; 6, 25 and 60; and 10, 30 and 100 amperes.

Leakage Recorder.—This is a development of an instrument for measuring the insulation resistance of D.-C. two-wire networks. The connections of the instrument are successively changed by means of a clockwork mechanism. Two resistances in series are bridged across the 'bus-bars, and the instrument is first connected between the central point and earth. Next the resistance connected to the positive bar is switched out so that the instrument is between the negative bar and earth, and the reading is inversely proportional to the insulation resistance of the positive main. Next the corresponding connection is made on the other main. These operations are performed successively, and the readings automatically recorded on a chart. A table is provided for obtaining the insulation resistances from the readings. The pen is of the Murday Patent type, carried on knife edges in a stirrup, and works on top and at right angles to the motion of the paper.

Electric Soldering Iron.—This is another novelty which is being exhibited, known as the Thermobit. A special wire is wound on a steatite cylinder fitted both inside and outside with copper, which projects beyond to take the bit, which is screwed on. These are made for voltages up to 250.



Other Exhibits.—The Ducter, for measuring very low resistances, was fully described in our issue of March 23rd, 1911, p. 149, the well-known megger for measuring insulation resistance, and the bridge-megger for either copper or insulation resistance, are also on view. The stand is decorated with pictures showing the work of the naval section, including the orders telegraphs recently installed on the *Olympic*.

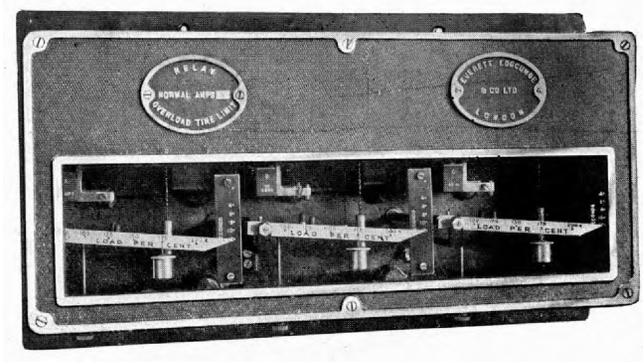
Oliver Arc Lamp, Ltd., & The Varley Magnet Co.,

CAMBRIDGE PLACE, BURRAGE ROAD, WOOLWICH.
(STAND NOS. 58 & 65.)

Arc Lamps.—The Oliver magazine flame arc lamp is too well known to require detailed description. Several sizes are shown in operation at this stand, and visitors can examine the construction in detail. A slight alteration in design has been made in replacing the mercury switch by a carbon make and break, which now reduces the period of extinction between each pair of carbons coming into action to nine seconds.

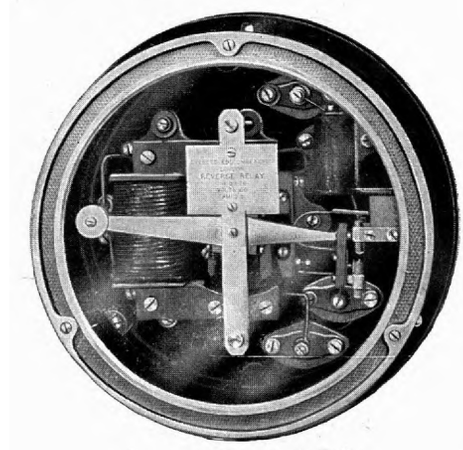
Coil Winding.—The coil winding of the Varley Magnet Co., which is a subsidiary company to the Oliver Arc Lamp Co., although largely used, might with advantage be even more extensively adopted for almost all classes of coils for electrical work. Instead of winding the coil with insulated wire, bare wire is employed, and a silk strand is wound on to the coil parallel to it at the same time. The method will be clearly understood by an inspection of the illustration. Each layer of bare wire is insulated from the one below it by a sheet of insulating material, which is inserted by the machine on the completion of each layer of wire as the feed reverses to start the next layer. The winding is done throughout by automatic machines, and the company supplies coils, wound in this way, of any size and for all purposes.

The Light Alloy Co.,



7 QUEEN VICTORIA STREET, E.C. (STAND NOS. 58 & 65.)

This is another subsidiary company to the Oliver Arc Lamp Co., Ltd. The light alloy is called "Vanalium"; it is an alloy of aluminium, and only 2 to 3 per cent. heavier than the pure metal. It is claimed to be absolutely non-corrodible, and is not liable to disintegration as are some other less stable aluminium alloys. Cast vanalium has a tensile strength of over 11 tons per square inch, and a yield point of 8 tons per square inch with 6 per cent. elongation. Rolled vanalium has double, and drawn vanalium treble the tensile strength of the cast metal. We understand that the metal flows well when casting, and that its behaviour when being machined, drilled, tapped and filed is much the same as brass. Its use is particularly suggested for ships' fittings on account of its showing no corrosion when in contact with sea water, and it obviously has a host of other applications.



Everett & Edgcumbe & Co., Ltd.,

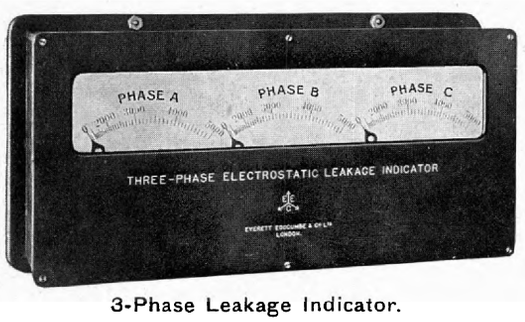
HENDON, LONDON, N.W. (STAND NO. 66.)

A.-C. Relays.—This firm is exhibiting two special types of A.-C. relays, which we illustrate in the accompanying figures. The induction over-load type with inverse time limits is so arranged that both the current and time settings are adjustable over a wide range, and the latter can be relied upon to keep their proportional settings at all overloads so that perfect discrimination is ensured. The reverse current relay, which is specified for the L.C.C. tramways, is another interesting device. In this a pressure winding is provided, the only function of which is to determine the direction of flow of the current, and not (as in almost all other reverse current relays) the magnitude of the overload required to trip the breaker which it controls. The makers contend that a reverse *power* relay is not what is required, and that a reverse relay should act or not according to the magnitude of the *current* flowing. Owing to the fact that on the occurrence of a bad short the pressure may fall very seriously, it is essential with a reverse power relay to make it extremely sensitive and set it excessively fine. For example, if such a relay is required to trip at full load current when the pressure falls to 10 per cent. of its normal value (a by no means unlikely occurrence), it must be set to trip with less than 10 per cent. of the full load current at normal voltage. Messrs. Everett, Edgcumbe & Co.'s reverse relays can be set for 50 per cent. of the full load current, and will be practically independent of the pressure.

Triple Pole Overload Time Limit Relay.

Reverse Current Relay.

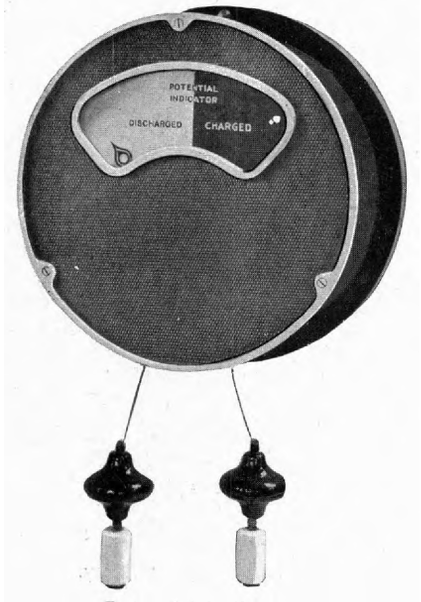
"Graphic" Instruments.—Amongst the "Graphic" (recording) instruments which we recently described in our issue of August 31st, 1911, p. 486, a new type is shown, in which the pen is replaced by a special syphon device, which gives an inexhaustible supply of ink.



Rotary Synchroniser.—An improved pattern is now made by this firm. Instead of slip-rings and flexible connections, the windings are fixed, the only rotating part being a soft iron needle attached to the pointer. It is just as sensitive as the old pattern, and makes one revolution, while the original type made only half a revolution.

Watertight Ammeters.—A numerous selection of ammeters

Hosted by Google



and voltmeters are shown, including a watertight ammeter. Glands are screwed into the terminals, and the coils are enclosed in the square compartment at the bottom, so that if the glass, which is inlaid with wire, is broken, water or moisture cannot get to the coils. We understand that these are extensively used on British battleships.

Leakage Indicator.—This should prove of great interest, especially to mining engineers. The accompanying figure shows a three-phase electrostatic high-tension combined instru-

3-Phase Leakage Indicator.

ment. Each phase is connected between the line and earth, and normally should read the same. If a fault occurs on the system, the phase in which it occurs will be seen to register less, while the others will give a higher reading. Another type of indicator is shown below; its function is to

Potential Indicator.

tell whether the bus-bars are alive or not. One half of the dial is red and marked charged, and the other half is white and stamped discharged. Connection to the indicator is made through two special condensers, so that it is not in actual connection with the high-tension circuit.

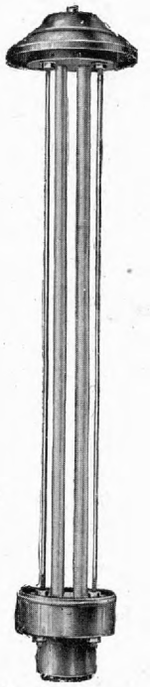
THE WHITE BUILDING, SHEFFIELD.

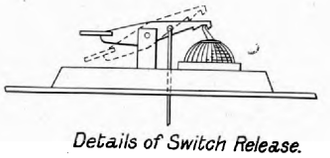
Other Exhibits.—A further novelty to be seen on this stand is a combined stop-watch and speed-counter. The watch is started as soon as the spindle is pressed against the revolving shaft. Other exhibits include a series of tachometers and tachographs which give a record of the speed variation. A neat little high-speed tachometer for separators and spinning machines is made on the governor principle. The "Luxometer" for measuring both interior and exterior illumination was fully described in Electrical Engineering, Sept. 21st, page 523.



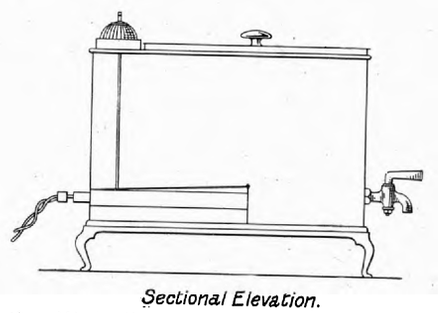
The Bastian Electric Heating Syndicate, Ltd.,

91-93 Palmerston House, E.C. (Stand Nos. 173 & 190.)

Electric Heaters.—Several types of the now well-known Quartzalite heater, in which the heating element is composed of groups of thin tubes containing wire spirals of a special alloy, the whole being proportioned to glow at a bright red heat when current is passing. The smaller rat-trap pattern of small heater is familiar to all our readers, but some new larger heaters on the stand are new, including the one illustrated here in nickel-plated frame, which, although quite



3000 watt. Quartzalite Heater with 4 Heats.



Replacement Unit.

compact, is made up to 3 kw. The same system, with rows of these quartz tubes, is applied to several other forms, and the special element also illustrated has been designed for replacing the lamps in an ordinary radiator to convert it into a Quartzalite heater. We have on previous occasions called attention to substitution elements of this nature, but the

tion" heater, which can be used at will for a variety of different utensils. The older patterns of these carried a switch on a projection of the frame, but this is now replaced by neat pin contacts, which fit into the well protected contacts of a socket carried on the flexible lead. Flat-irons containing quartz heating elements are represented on the stand. Stands consisting of cast feet and copper slides for rendering insertion units available as electric stoves or hot plates for a variety of other purposes are also shown. For some of the large types of water heater, designed to heat water slowly with a small expenditure of current, are provided with an ingenious arrangement for switching off the current when the water boils. The working will be understood from the diagrammatic sketch reproduced. Above the chamber containing the insertion heater is a light hinged metal flap, upon which bears the end of a rod connected to a catch lever holding the switch in the "on" position. The bubbling of the water when boiling commences causes the flap to rise and to release the switch. The firm have also a most interesting new development in progress with the apparatus, for which they are experimenting. This is a heat storage system for use in conjunction with windmill plant. The windmill drives a small generator with no regulating gear at a varying speed depending on the force of the wind, and the whole of its output is absorbed in resistances, which heat a form of heat accumulator, consisting of a metal mass arranged with very large surface, but enclosed in a heat-insulated chamber. When heat is required for any purpose, air is rapidly drawn through the vessel, and passing over the large surface of the hot metal readily withdraws the heat and conveys it to where it is required. We look forward with great interest to details being available of the way in which the evident difficulties of the scheme have been surmounted.

Although the firm are exhibiting the heaters, &c., of their manufacture on their own stand, the apparatus can only be obtained through their wholesale selling agents, among whom are the British Westinghouse Co., Drake & Gorham, the Electrical Co., Electrical Installations, Ltd., Gillespie & Beales, Johnson & Phillips, and the Sunbeam Lamp Co.

Nalder Bros. and Thompson, Ltd.,

34 Queen Street, E.C. (Stand No. 87.)

Thermal Limiter.—This will interest central station men who supply consumers on the contract demand system. As will be seen in the illustration, it has two iron bars with a steel wire attached to a spring contact. When the demand is exceeded, the extra current causes the wire to expand and to open a contact at the end of the spring. This puts a resistance, seen on the right of the figure, into the circuit, thus dimming the lamps, and at the same time cooling the wire so that it

Thermal Limiter.

closes the circuit, and the lamps return to their normal brilliancy. The effect is to produce a continual flickering of the lights, which ceases directly the additional lamp is switched off. A condenser is provided across the gap to prevent sparking. The whole apparatus is mounted on a china base and enclosed in a cast-iron case.

Circuit-breakers.—A new and cheap design in this line is shown. This contains the usual magnetic blow out, and has a free handle, so that it cannot be reset until the fault on the line is cleared. They are small and take up very little space.

Accumulator Switch.—A cheaper form of the firm's well-known automatic battery charging switch is exhibited, in which the solenoid coil is replaced by a U-shaped magnet.

Ammeters and Voltmeters.—A numerous selection of these appear on the stands, including a dynamometer type for measuring both alternating and direct currents.

The Henley Wiring System

Provisionally Protected

A new Wiring System that will enable Contractors to fit up Electric Light in small houses, where it has hitherto been impossible owing to the high cost of wiring.

The low first cost of the Henley Wiring System, and the quickness and ease with which it can be installed, will open up a large field for Wiring Contractors.

The System may be seen at

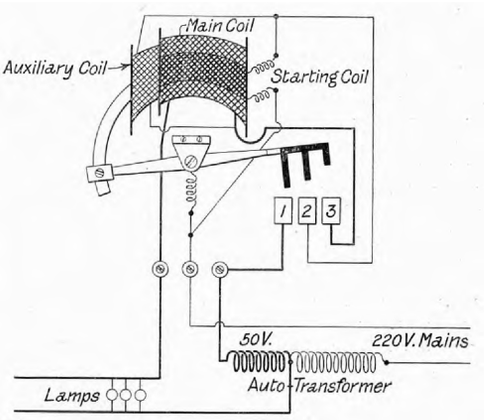
Elmers End, Kent. (Stand No. 86.)

Automatic Transformer Switch.—This is a new pattern of automatic transformer switch for use in connection with 25 or 50-volt installations connected to 200–220-volt mains through auto-transformers. When no lights are on, the main circuit of the auto-transformer is open at the mercury cup (see diagram). As soon as one lamp is switched on, a circuit is established through the coil marked starting coil, and the "auxiliary" coil and "main" coil in series, and the core seen in the two illustrations is sucked into the coil, making contacts 1 and 2. This connects the auto-transformer to the mains at contact 1, and also short-circuits the starting coil at contacts 1 and 2. When a few more lamps are in circuit, bringing the current up to 2·2 amperes, the core has been sucked in further, and contact 3 is made, short-circuiting the "auxiliary" coil and leaving the main or retaining coil only in circuit. The object of successively short-circuiting the first two coils is to diminish the voltage drop. On the lamps being all switched off, the arm falls by gravity and the auto-transformer is out of circuit.

Switch with Cover removed.



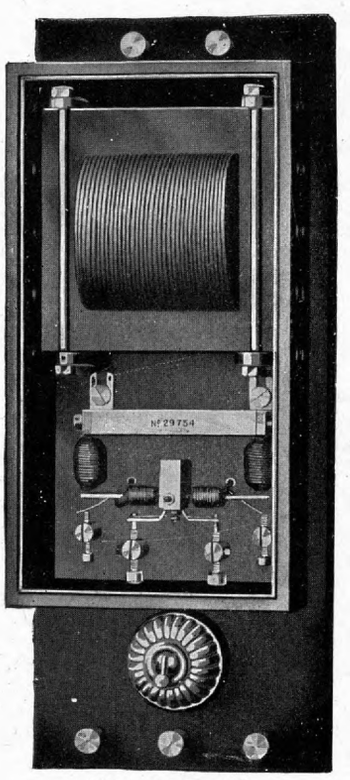


Diagram of Automatic Transformer Switch.

View of Rectifier.

Rectifier.—This is shown working. As will be seen from the accompanying figure, it consists of a transformer provided with two secondaries and a neutral point, which forms one pole of the direct-current circuit. The secondaries are connected up to the D.-C. circuit alternately and synchronously at each half phase by means of the armature shown in the centre. This vibrates between two coils connected to the A.-C. supply, so that a uni-directional current is supplied to the circuits fed by the secondaries.

Other Exhibits.—These include a portable form of testing set for copper and insulation resistance, capacity and fault testing, a potentiometer with two dials, the studs of which are made of the same material as the coils, the telethermometer described in Electrical Engineering, February 2nd, 1911, p. 59, and the Raphael fault localising bridge.

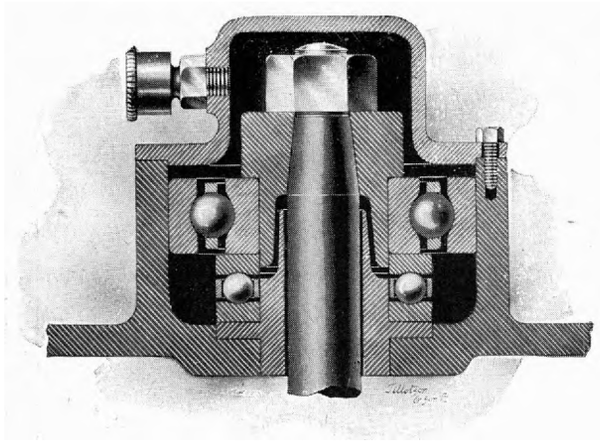
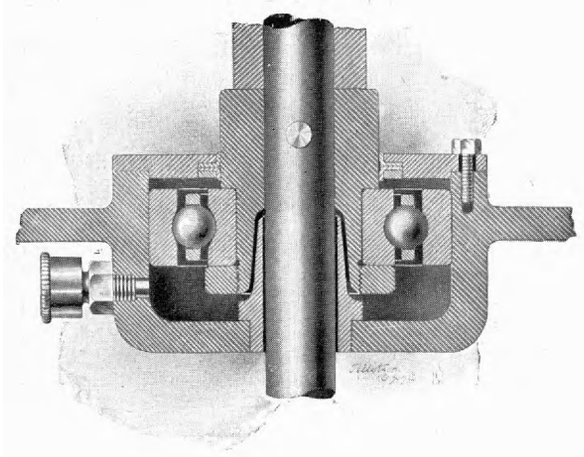
Union Cable Co., Ltd.,

Eagle Wharf Road, N. (Stand Nos. 181 & 182.)



Cables.—Samples of every class of cable supplied by this company are shown—paper-insulated, lead-covered, V.I.R., V.B., light and power cables, telephone cables, flexible, bell-wire, &c. Among the more interesting samples is one of a large cable which has just been supplied to Dundee. It has three conductors, 0·75, 0·75, and 0·2 sq. in. section, with three 7/18 pilot wires, paper-insulated, lead-covered, steel tape, armoured and served with jute and compounded. The diameter of each main core over the paper insulation is 1·23 in., and under the lead 2·82 in. The lead is 0·16 in. thick. Over the lead is a serving of jute, and then the double armouring consisting of steel tapes $2\frac{1}{4}$ in. wide and 0·6 in. thick. The complete diameter over the final serving of jute is 3·8 in. Another is a 7/14 concentric cable for 30,000 volts pressure. The radial thickness of paper insulation between conductors is $\frac{1}{2}$ in.; the outer conductor is also heavily insulated and the cable is lead-covered. Specimens of joint boxes and cable heads are also exhibited. The company is building a large works at Dagenham Dock, and an elevation of the building is shown, together with photographs showing the progress of the building during erection. Ten acres of ground have been taken, and the works will cover nearly 2 acres.



The Jandus Arc Lamp & Electric Co., Ltd.,

Hartham Road, Holloway, N. (Stand Nos. 105 & 110.)

Arc Lamps.—The visitor, after he has inspected the lamps in action and the lamps arranged to show the working mechanism in the recesses at the corners of the stand, will find within a delightful haven of rest in an artistic panelled room with most comfortable armchairs. It is, however, the lamps and not the armchairs that it is our present pleasure

to introduce to our readers. The Jandus lamp is virtually an enclosed, specially ventilated, regenerative vertical carbon flame lamp, and burns chemically treated carbons in an air-tight enclosure. The lower framework of the lamp consists essentially of two metal tubes which carry the inner cylindrical globe and the outer spherical globe, and conveys the heated gases rising through the cylinder from the arc back again to the base of the cylinder, reascending through the arc and intensifying it. The circulation of fumes is constantly going on, and thus the chemicals are used over and over again, and the carbons consume at a very slow rate, given 70 to 120 hours for a single pair of carbons. The efficiency reaches nearly 8 c.p. per watt, and with a current as low as 5 amperes 4,000 c.p. is given off at 15 degrees below the horizontal, of a rich golden colour excellent for penetrating fog; the mechanism as seen in the illustration is very simple, and a particularly useful size is the small 250-watt lamp, giving a maximum of 2,000 c.p. Further details of the Jandus lamp have appeared in ELECTRICAL ENGINEERING, Vol. V., September 30th, 1909, page 852, and Vol. VI.., November 10th, 1910, page 710. The lamps exhibited include A.C. as well as D.C. lamps, and of the latter the standard 550 and 350-watt sizes are shown, as well as the special small lamp for shop-window lighting, etc., and a special Admiralty pattern in water-tight and fume-proof case. It should be mentioned that these lamps are made entirely in London, and that over 10,000 are in use in various parts of the world.

Jandus Lamp.

Section of Jandus Lamp.

Hoffmann Ball-bearing Self-centring Line Shaft Hanger.

The Hoffmann Manufacturing Co., Ltd.,

CHELMSFORD. (STAND NOS. 149/162.)

Ball-bearings.—The Hoffmann ball-bearing is well known, but visitors will not fail to be struck with the demonstration of the small amount of friction, especially at starting under heavy loads, that these bearings have as compared with ordinary plain bearings. In one case a thrust bearing is loaded by a spring up to three tons, but a spring balance demonstrates that only a pull of some 7 lbs. at about 6 in. radius is required to start. In another case two little trucks carrying 56 lb. weights, with ball and plain bearings respectively, are placed on a tilting table, which has to attain a gradient of 1 in 55 before the plain bearing truck will start running down, whereas the ball-bearing truck starts off with only 1 in 350. In another example, journal bearings loaded with half a ton are provided with cranks that the visitor can feel the relative friction for himself. A further model demonstrates the flexibility of the Hoffmann self-aligning shaft bearing, and a ball-bearing crane hook loaded with 5 cwt. is also a striking example. A new roller bearing for heavy machinery, largely used by the British Westinghouse Co. for rotary converters, etc., similar in general features to the Hoffmann ball-bearing, is shown for the first time. This can be used when required in conjunction with ball thrust bearings. Standard ball-bearing countershafts for small machine tools with self-locking belt striking gear are also shown, and the uses of ball-bearings are further exemplified by complete examples of line shafting, train-lighting dynamos, and a selection of motors by the following makers :—Lancashire Dynamo Co., Phœnix Manufacturing Co., J. L. Manufacturing Co., and Compton & Co. A ball-bearing Kieth fan is also shown.

Pinchin, Johnson and Co., Ltd.,

MINERVA HOUSE, BEVIS MARKS, E.C. (STAND NOS. 155 & 158.)

Paint, Insulating Varnishes and Compounds, Vacuum Impregnator.—This stand is one of the best-finished in the exhibition. The firm have employed their own "Satinette" enamel for the columns and entablature of the stand, and the beautiful surface of this is its own recommendation to those who know the difficulties under which stands at exhibitions have to be erected and finished. To electrical engineers, however, the insulating varnishes and compounds and the vacuum impregnating apparatus for dynamo, motor, and transformer coils will be the most interesting. We believe that 80 per cent. of the large dynamo and motor-builders already use Pinchin & Johnson varnishes and compounds, and a good proportion of the remaining 20 per cent. will doubtless give these materials a trial if they visit this stand. In the impregnating apparatus to which we have referred, a combined vacuum and pressure pump is employed. A 28-in. vacuum is created in the vessel in which the coils are placed, and while this is being produced the compound is being heated by a steam jacket and agitated by a stirrer worked through a belt from the pump shaft. When the desired vacuum is reached, the compound is let into the vacuum chamber and pressure is applied, so that thorough penetration of the compound is assured.

Johnson & Phillips, Ltd.,

VICTORIA WORKS, CHARLTON S.O., KENT. (STAND NOS. 123 & 136.)

Arc Lamps.—The "Metroflam" lamps exhibited on this stand are flame arcs of the magazine pattern, which run about 80 hours at each trim. They carry fourteen pairs of carbons, and by an arrangement of double magazines, dark intervals as the carbons charge are avoided. Cheap carbons are used, and they are burnt down to about two inches long. The working parts of the D.-C. lamp comprise differential

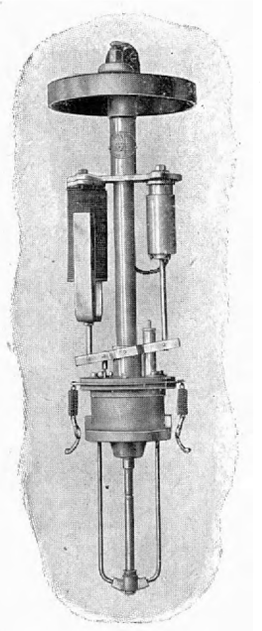
The above books, together with a wider selection from Messrs. Constable's List, may be seen on Stall No. 152 at the Electrical Exhibition, Olympia. Please also ask for full detailed List.

London—10 ORANGE STREET W.C.



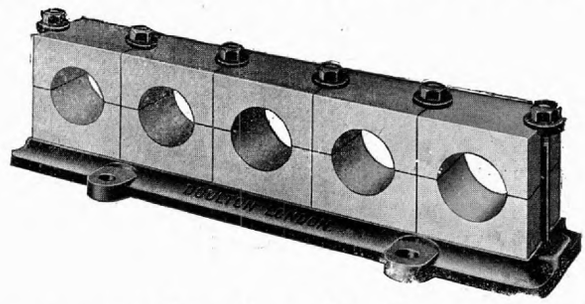
solenoids for striking and regulating the arc and a shunt coil system for feeding down the carbons, pair by pair, as they are consumed. The A.-C. lamp is built on the same lines, but an induction motor feed is employed. In the series burning lamps the auto cut-out and substitutional resistance are usually mounted within the lamp cover. A special light-diffusing globe is employed with the lamps. As mentioned in our last issue, these lamps are being used for the new street lighting in Albert Square and Portland Street, Manchester.

The "Orb," a simple single enclosed flame lamp, is also exhibited. It is of the shuntless type, a single series coil with a floating core being provided for striking and regulating the arc. A simple non-slipping clutch is fitted, together with a synchronous regulator to prevent lamps burning in series to get "out of balance," so that the light emitted from all the lamps in a group is always of uniform intensity. Both lamps have been designed by Mr. J. Brockie.

Searchlight.—A marine type searchlight forms the most prominent exhibit on this stand. The projector lantern is a light steel drum, and its primary equipment consists of a 24-inch diameter silvered glass parabolic mirror and a combined automatic and hand-feed horizontal lamp arranged for working with a current of 80 amperes. The lamp is provided with a pair of main coils for striking the arc, and an independent coil for feeding the carbons, together actuating through a ratchet gear a divided right and left hand screwed spindle and traversing nuts, which engage with the carbon carriers. The automatic gear is thrown out of action for retrimming, or when operating the lamp by hand. A blow magnet is fitted for centering the arc to obtain steady burning, and a well-shaped crater. A removable shoulder lever is fitted for rapidly tilting and turning, a focussing gear for the lamp, supporting brackets for a sighting telescope, and a spirit level for enabling the operator to keep the beam of light steady when the vessel is rolling. A spot of light from the lamp illuminates the spirit level tube, so that the bubble is always visible. The lamp is shown in operation, and is supplied with current by a motor-generator running on the stand.

"Metroflam" Flame Lamp.

"Orb" Shuntless Single Enclosed Arc Lamp.



Switchboards.—A 10,000-volt mechanical remote control panel, a 3,000-volt panel designed to Home Office requirements, and a standard traction board are exhibited. Two of the switchboards in the sub-station which supplies current to the exhibition are also of this firm's manufacture.

Cables.—A very large selection of samples of cable of almost every pattern are shown. Among those we particularly noticed was a very flexible copper-braided cable for warships.

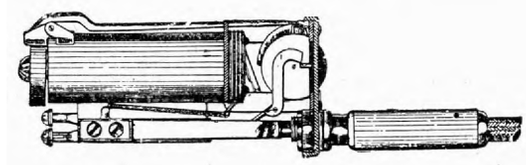
This is a vulcanised rubber cable, the armouring of which is a copper or phosphor-bronze braid, in which each strand of the braid is itself a braid formed of a number of fine wires. The result is an armoured cable of extreme flexibility.

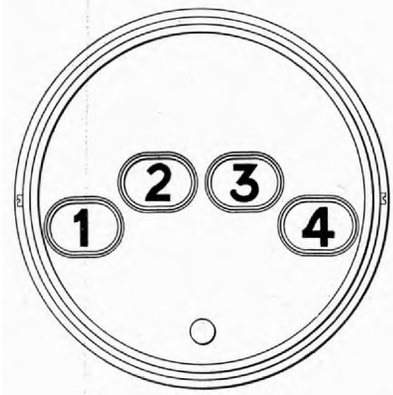
Western Electric Co., Ltd.,

NORFOLK HOUSE, VICTORIA EMBANKMENT.
(STAND NOS. 51 & 72.)

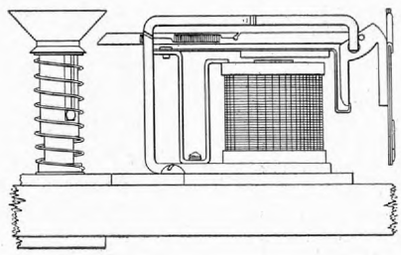


Instruments.—The tendency towards increased neatness in design is very evident on this stand. Well finished matt black japanned metal cases are now largely used instead of wood. In the company's "interphones" for interior intercommunication working, a new flush pattern has been introduced which projects only one inch from the wall instead of the $3\frac{1}{4}$ inches of the ordinary interphone instrument. The back part of the case serves as a distributing box and is sunk in the wall. An inexpensive, strong metal C.B. wall set of neat appearance also attracted our attention, and a particularly compact metal "hotel" telephone set, in which the switch-hook projects at right angles to the base. A new pattern of receiver is also shown, in which the outer case is of metal instead of being of vulcanite; this, we understand, is now being used on P.O. exchange systems. Among other instruments, the company show a "farmer's" telephone, capable of being used 30 or 40 in series on lines 20 to 25 miles long. A five-bar magneto generator is employed, and for the longest lines a 2,500-ohm ringer. In the largest sizes a condenser is employed in the receiver circuit.

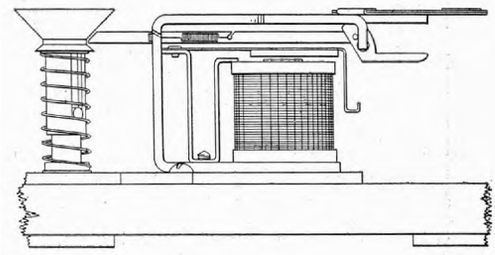
Switchboards and Exchange Material.—Several switchboards are shown. On one of these a new "eyeball" combined indicator and jack is fitted. The "eyeball" is a red sphere, which appears above the jack, and is automatically restored on inserting the plug. The construction and action are seen from the three illustrations in the next column. A point in connection with this indicator is the ease with which the coil can be removed for repair; it is only necessary to loosen one screw, and no connections need be unsoldered. Another switchboard is designed on the "unit" system, to facilitate extension by simply adding a unit more or less, as in a "sectional bookcase." The "unit" system is also employed in a pattern of lightning protector for private branch exchanges, which is very practically arranged. A device in this connection is a self-soldering heat coil. The coil will carry $\frac{1}{5}$ ampere indefinitely or $\frac{1}{4}$ ampere for 210 seconds. On the current exceeding the latter limit, sufficiently long to melt the fusible metal in the heat coil, a small star wheel whose shaft was held by the solder is enabled to turn one tooth under the action of a flat contact spring; this is released, breaking the line circuit, upon which the solder cools and the spring can be restored without using a new heat coil.



Combined Indicator and Jack. General view.



Combined Indicator and Jack (Signal Operated).



Combined Indicator and Jack (Signal replaced by Insertion of Plug).

Plan of 4-way Bell Indicator. 1/3 scale.

Elevation of Bell Indicator Movement (indicator down). 2/3 scale.

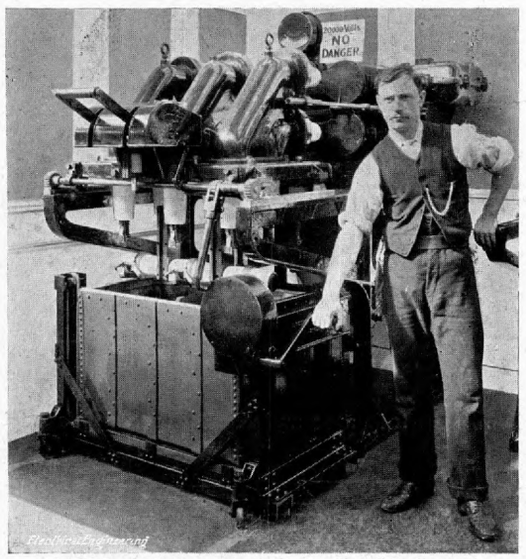
Elevation of Bell Indicator Movement (indicator operated). 2/3 scale.

A New Bell Indicator.—An interesting departure from the stereotyped pattern of bell indicator is illustrated above. We show a four-line instrument; for five lines and upwards the indicator movements are disposed in a circle. From the drawings of the indicator, which illustrates the construction very clearly, it will be seen that when the armature is attracted, the number disc springs upwards. All the discs are replaced simultaneously by depressing the button in the centre. The case is of japanned metal, and the indicator appears to be an ideal form for lifts and for hotel, office, and domestic bell installations generally.

Flush Pattern Interphone.

A. Reyrolle & Co., Ltd.,

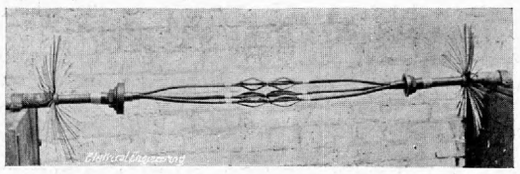
HEBBURN-ON-TYNE. (STAND NO. 147.)



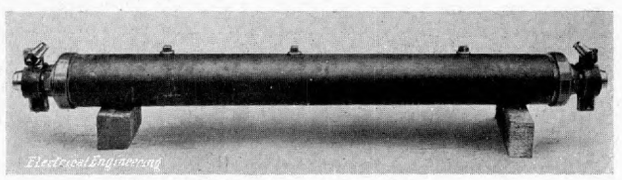
Ironclad E.H.T. Switchgear.—The most imposing exhibit on Messrs. Reyrolle's stand is a complete 20,000-volt 6,000-h.p. ironclad switch unit of a pattern of which 75 are now being supplied to the north-east coast power companies for sub-stations. This gear is generally similar to the ironclad gear for lower voltages and powers (see ELECTRICAL ENGINEERING, Vol. IV., page 24), but has some improvements in detail. The racking out arrangements for the switch carriage are better adapted for the greater weight, and there are more complete interlocking arrangements by which, for example, the switch cannot be closed till the carriage is quite home, nor can the carriage be either pushed home or withdrawn unless the switch is off. A bell signal indicates when the trip has acted, and further improvements are to be found in the gear, by which the oil tank can be lowered on to a truck.

Flame-proof Switchgear.—In the centre of the stand a switchbox has been arranged, so that it can be filled with a mixture of gas and air, and the mixture exploded to show how broad, rough-machined flanges, although not gas-tight, entirely prevent the passage of flame. The experiment is most convincing, and should be seen by all mining engineers. The principle of constructing flame-proof joints by wide flanges without packing is applied to all their mining switchgear down to the smallest lighting switches, and examples of drum type motor starters, complete underground switch

Hosted by Google



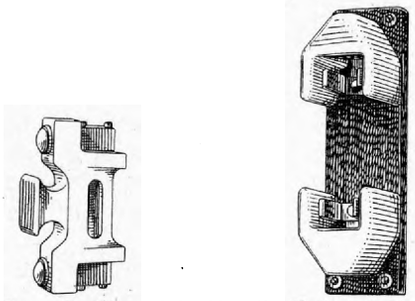
pillars, and other apparatus made in this way, can be seen on the stand. An example is also shown of the Fisher gate and box with automatic protection.



The Vernier Cable-joint.—Interest will also attach to the expansion cable-joint devised by Mr. C. Vernier, of the

20,000 Volt Ironclad Reyrolle Oil Switch.

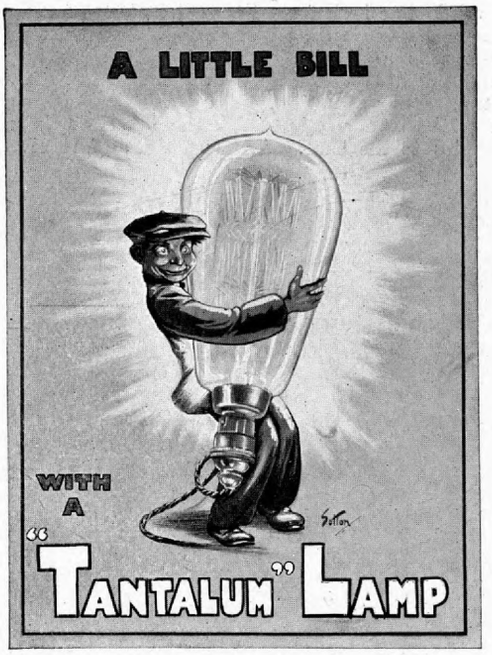
Newcastle-upon-Tyne Electric Supply Co., to permit of an endwise telescoping of each conductor to the extent of six inches to avoid trouble due to expansion. The construction is seen in the accompanying illustrations. The cable ends are cut to leave a gap of three inches, and a piece of brass tubing having flexible braids secured to it axially is slipped over the ends, and the ends of the braids are in turn secured to the cable. The cable ends are thus constrained to move



The Vernier Expansion Cable-Joint.

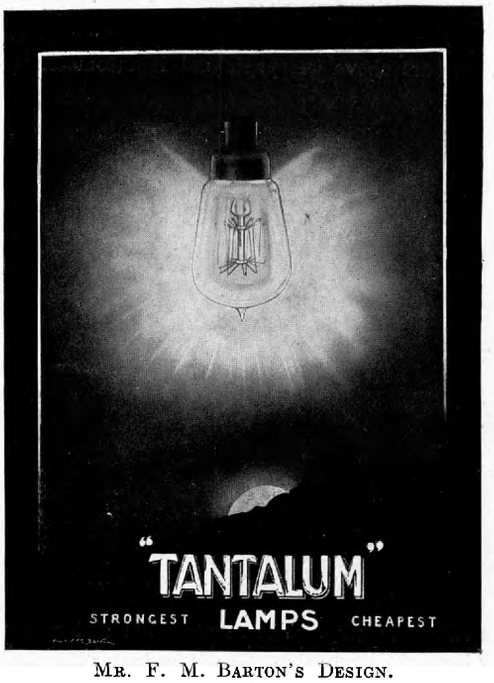
in a straight line, and the flexible braids ensure continuity of circuit. The whole joint may be enclosed either in a lead box or in a wrought iron pipe with special ends and glands for taking the lead covering and armouring.

Other Exhibits.—An effective demonstration is made of the properties of the current-growing resistances with nega-



Reyrolle Porcelain Handle Tubular Fuse.

tive temperature coefficient which Messrs. Reyrolle employ in their starters. The increase of the current can be watched on an ammeter until it reaches a value where a circuit-breaker comes into action. Apparatus for the Merz-Price protective system is well represented, and among other apparatus may be mentioned an extensive series of designs of protected wall plugs with earthing contacts, suitable for connecting to almost every class of cable. Attention should also be drawn to the new form of porcelain handle tubular fuse illustrated here, which has been designed in view of the Home Office recommendations, and particularly well shielded with porcelain both as regards the fuse carrier and the contacts on the board.



TANTALUM SHOWCARDS

ON page 535 of our issue of last week we announced the result of the Siemens tantalum showcard competition. We are now able to reproduce the two successful designs, for

Mr. L. Sutton Wood's Design.

which prizes have been awarded to Messrs. L. Sutton Wood and F. M. Barton respectively. Mr. Barton's design is being attractively printed in several colours, and makes it appeal on artistic grounds, while the prevailing note of Mr. Sutton

Mr. F. M. Barton's Design.

Wood's is humorous. The "little bill" showcard should become very popular with contractors, and will also soon be ready for issue. The ideas of the saving in money, the brilliancy of illumination, and the detail of the construction of the tantalum lamp are happily combined.

SUMMARY

The third of our series of special supplements dealing with the Electrical Exhibition now being held at Olympia is given with this issue. An addition to our exhibition telephone directory of last week is included, with the numbers of those exhibitors whose stands are connected up direct to the National Telephone Co.'s Kensington exchange. A large number of stands are very fully described, including Messrs. John Barker & Co.'s electric home. The stands of several prominent instrument makers are dealt with at length, and some novelties are described, including a thermal limit-switch and an automatic transformer switch. Illustrated particulars are given of several forms of arc lamp, and a new combined telephone indicator and jack, as well as a new bell indicator, are among the novelties noticed. An account is also given of Messrs. A. Reyrolle & Co.'s exhibit of mining and other switchgear, including their striking experimental demonstrations of the flame tight qualities of the method of enclosure they adopt.

Our monthly supplement on Electrical Engineering in Mines is also given with this issue. Two illustrated articles on colliery generating plants and electrical equipment are included, and a new electric miners' lamp is described.

At the Annual Conference of the Municipal Tramways Association last week, at Glasgow, Papers were read on tramway finance, and there were interesting discussions on a Paper by Messrs. R. G. and J. G. Cunliffe on tramcar motors, and on a collection of reports on tramway track construction and maintenance. (Page 545.)

An account of the resolutions passed by the International Electrotechnical Commission at Turin last month is given. Practically no further progress has been made in the important matter of international conventions for rating electrical machinery. (Page 546.)

A new form of small radial drill is described in a short illustrated article. (Page 546.)

A lengthy report has been issued by the Joint Committee of the Incorporated Municipal Electrical Association upon the question of charging for tramway energy supplied from combined power stations. It is recommended that the cost should be based upon the actual cost of production, and in order to arrive at this, an allocation of the "standing costs" and "running costs" is suggested. The whole question is discussed in great detail. (Page 547.)

In our "Electric Traction Notes" we state that a leading British Railway Company has given instructions for the preparation of designs for a 500-kw. Diesel-electric locomotive. The North-Eastern Railway Co. have sent their chief mechanical engineer and consulting electrical engineer to investigate the methods of handling goods traffic in the United States. We refer to a proposition for the adoption of trolley omnibuses in Ilford. (Page 548.)

Under "Telephony and Telegraphy" attention is called to some of the telephone exhibits at Olympia and a note is given expressing the opinion of a German doctor on the causes of ear trouble to telephone operators. It is stated that automatic exchange working is to be adopted in Vienna. (Page 548.)

The patent specifications published by the Patent Office last week, related among other things to electric ovens, locking lampholders, incandescent lamps and a conduit tramway system. The lamp patents were two

Hosted by Google

in number; one describes a process for welding metal filaments to the leading-in wires, in which sulphide metal compounds are used, the other is for the use of 2-phase current in the manufacture of the filaments. In a new construction of underground conduit tramway track, the conduit, and the girders supported by brackets for taking the rails are made of reinforced concrete, the whole being formed integrally. (Page 549.)

The Barrow Corporation have decided to substitute electricity for gas in a number of important streets.—The water-power scheme proposed at Chester is estimated to cost £12,500.—The Stoke Newington Council have decided to take over from the North Metropolitan Electric Power Supply Co. the management of the local electricity undertaking.—There was a net profit of £3,118 on the Bermondsey electricity accounts last year, and £1,300 at Oldham. (Page 551.)

An electric lighting scheme is under consideration at Bampton, and an agreement has been signed for the erection of electric supply works at Honiton. A Local Government Board inquiry was held at Carlisle concerning a loan of £9,755 last week, and at Belfast for a loan of £40,000. New mains are to be laid at Merthyr Tydvil, and electric lighting schemes are proposed in Bulgaria and Russia. We give the full list of accepted tenders for the new power scheme at Stoke-on-Trent. (Page 551.)

At the annual meeting of Messrs. Dick, Kerr & Co., last week, reference was made to the Company's new lamp factory, which is nearly completed. In order to avoid experimental work, the Company have availed themselves of the experience of a Continental firm. The directors of the County of Durham Electrical Power Co. have decided not to declare an interim dividend on the preference shares. (Page 552.)

ARRANGEMENTS FOR THE WEEK

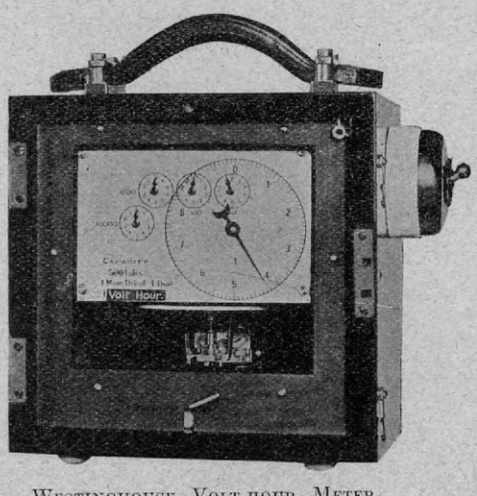
(TO-DAY) THURSDAY, October 5th.
Iron and Steel Institute.
10.30 a.m. Autumn meeting at Institution of Civil Engineers, 25 Great George Street, Westminster. Among the Papers to be read is "On the Application of Electric Energy to the Manufacture of Iron and Steel in Italy," by Cav. Ing. Remo Catani.

THURSDAY, October 12th.
British Electrical and Allied Manufacturers' Association.
2.30 p.m. Council Meeting at Olympia.
7 for 7.30 p.m. Annual Dinner at Hotel Cecil.

FRIDAY, October 13th.
Junior Institution of Engineers.
6.30 p.m. Visit to "Model Engineer" small-power engineering and scientific exhibition at Royal Horticultural Hall, Westminster, S.W.

The Fire at the Empire Palace Theatre, Edinburgh.—We have received from the British Fire Prevention Committee a detailed report of the fire at the Empire Palace Theatre, Edinburgh, on May 9th, when ten lives were lost, including that of "Lafayette." An illustrated account is given of the fire and its effects, and extracts are given of the evidence given at the public inquiry. It seems to have been established that the fire originated in an ornamental lantern containing seven 8-c.p. lamps, with windows covered by a composition known as "gelatine." The lantern was supplied by flexible cable, which according to the evidence was in good condition. It is surmised that a short circuit took place inside the lantern, due to faulty connections, but the suggestion is made by Mr. F. Newington (City Electrical Engineer, Edinburgh) that the so-called "gelatine" may really have been a form of celluloid which could easily take fire.

Electrolytic Refining of Zinc.—H.M. Commercial Attaché at Yokohama reports that a method for the electrolytic refining of zinc has been invented by Mr. Chitaru Yoshida, proprietor of the Kano Copper Mine, Iwashior Province, Japan. Hitherto zinc ore has been exported and the refined metal imported. The right of working the process in Japan has been leased to the Mitsui Bussan Kaisha.



CURATE:—And what can you tell me about the ARK?
SUNDAY SCHOLAR:—It takes about 10 amps. and 50 volts, Sir. . . . Used to be trimmed every day, now only once a week, and if it gets any worse father says he'll have to come round to you for a job.

ANNUAL CONFERENCE OF THE MUNICIPAL TRAMWAYS ASSOCIATION AT GLASGOW

THE tenth annual conference of the Municipal Tramways Association commenced at Glasgow on Wednesday of last week under the presidency of Mr. J. Dalrymple (General Manager Glasgow Corporation Tramways). In his presidential address he made a strong plea for careful detail work and control of expenditure on track and rolling stock maintenance by the tramway manager himself, and outlined various spheres of activity in which their association was busy. A Paper was afterwards read by Councillor W. Nelson on the "Common Good" of the city of Glasgow. A Paper was read in the afternoon by Councillor J. H. Rodgers (Chairman, Newcastle Corporation Tramways Committee) on Tramway Finances and Policy, in which he criticised rather severely the financial position of many of the municipal tramway systems in this country, pointing out that out of the total of 88 only 30 could be called financially sound. He attached great importance to the building up of adequate reserve and renewals funds, especially for track maintenance, where the period of loan was much longer than the life of the rails, and stated that no fewer than 26 municipal tramway undertakings had no such fund at all. He suggested taking the average life of the rails at fifteen years and setting aside £200 per mile of single track per annum. He deprecated the reckless lowering of fares that was taking place, and added a few words on the labour question.

The first Paper at the Thursday meeting was one by R. G. and J. G. Cunliffe on Tramcar Meters. These authors,

WESTINGHOUSE VOLT-HOUR METER.

who are both assistants in the Manchester tramway system, showed curves recording actual observations, which demonstrated how the cost of maintenance was related to the energy losses, and discussed the advantage of absolute over relative determinations and the working of different types of meter available, describing incidentally a long series of observations on the Manchester system, and leading finally to the following conclusions :—

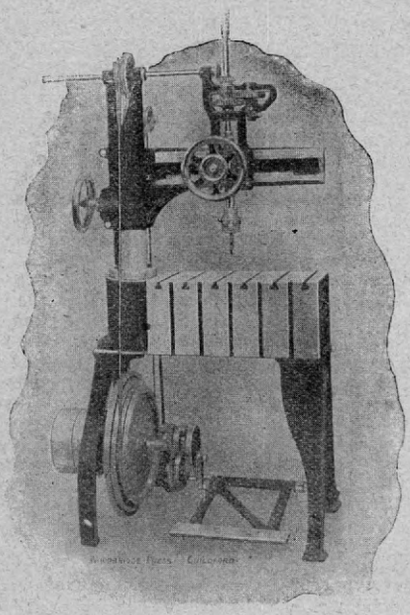
The ampere-hour meter can, with proper supervision, be made to operate with an accuracy of within 1 per cent., and that its uncorrected values may be employed for the purpose of placing motormen and cars in their correct order of merit, whilst, when corrected for variation of average voltage by the volt-hour meter, its readings give the true energy consumption. If percentage differences between the results of various men are required the corrected values must be used. The watt-hour meter, owing to its greater complexity, more fragile construction, susceptibility to lightning discharges, and greater inaccuracy, is not so desirable or valuable an instrument as is the corrected ampere-hour meter. The time-meter, although very accurate in its measurement of time, cannot be trusted to measure energy within 10 per cent., and, if used at all, should only be employed in conjunction with the energy meter for purposes of investigation, in which connection it is very valuable. The volt-hour meter is indispensable for many purposes, and ought to be employed on all tramway undertakings for the purpose of measuring average voltages. On small undertakings, with light traffic, approximately equal savings may be effected in the driving and in the detection of faulty equipments, but, as the congestion increases, the state of the equipments becomes of increasing importance, more especially as regards the feeding and distributing system where the losses are a fraction of the total energy consumption, and do not merely affect the consumption of individual cars.

The volt-hour meter referred to is an instrument which has been developed by the British Westinghouse Co. in accordance with Messrs. Cunliffe's suggestions. It is in principle a direct-current motor in its simplest form, designed so that the speed of the armature is proportional to the voltage, and is arranged to read in volt-hours; thus at the end of one hour the average voltage of the circuit during that hour is indicated directly on the dial. It can be calibrated so as to record with a high degree of accuracy, and subsequent checking and recalibration is a simple matter. The keeping of a constant check on the average voltage at various points is of considerable importance. Where the voltage becomes low, through long feeders, long trolley lines, or heavy loading, serious losses of energy are incurred in transmission and in the car equipment. Low voltage also means reduced speed, and to keep to schedule time a driver may be compelled to use energy in driving where otherwise he would be able to coast. A knowledge of the average voltage is essential with systems using ampere-hour meters on cars, as conclusions drawn from readings taken in amperes only may be misleading. Up to the present time instruments recording with a pen upon a paper chart have been used to determine average voltages, but errors result from friction between the pen and the paper, and the effect of stopping, starting, and vibration upon the pen.

The new meter, which is illustrated here, has neither pen nor paper, and therefore is free from the drawbacks indicated, and can be used in a stationary position or upon a car.

The discussion on this Paper was opened by Mr. Goodyer (General Manager, Croydon Corporation Tramways), who referred to saving on his own system of £5,000 in one year, due to the use of meters; there were considerable savings in repairs owing to the more careful driving which meters encouraged; but in Berlin £21,000 had been saved in cost of energy alone. Mr. Clough referred to the savings at Bury, but did not like the author's separate ampere-hour and volt-hour meters. Mr. Pilcher, of Aberdeen, thought that economical driving could be obtained without meters, but Mr. Baker, of Birmingham, said that meters made the men much more careful in detecting faults on their cars. Mr. Hamilton was inclined to think that the saving in current was at the expense of good time-keeping. Mr. Spencer (Bradford) held that meters made drivers less willing to help each other when cars were disabled, but at Cardiff Mr. Ellis was very satisfied with the good effected.

Reports on methods of tramway track construction and maintenance, embodying remarks on abstracts of replies to queries addressed to the tramway managers of the county, were also read on the Thursday morning by Mr. J. Grierson (Permanent Way Engineer, Glasgow Corporation Tramways), H. Mattinson (Permanent Way Engineer, Manchester Corporation Tramways), and R. B. Holt (Permanent Way Engineer, Leeds City Tramways). These contained a large amount of detailed information regarding prevailing practice in permanent way work, and recorded rather conflicting opinions on the part of different authorities.



In the discussion Mr. McElroy (Manchester) called attention to the difference of opinion regarding Thermit joints, but in Manchester they had made 7,000 such joints in five years with only 0·3 per cent. breakages. In this case the joints were made by the Thermit Welding Co.'s own men. Mr. Acland (Chesterfield) did not see why tramway-track conditions should vary in different towns any more than railway conditions. He objected to the British Standard rail section. Mr. Simpson (Preston), Mr. Knowles (Sheffield), and the President also joined in the discussion.

At the annual meeting on Thursday afternoon, the following office-bearers were elected for the next session :—*President*—Mr. H. E. Blain (Tramways Manager, West Ham); *Vice-President*—Mr. A. R. Fearnley (Tramways Manager, Sheffield); *Secretary and Treasurer*—Mr. C. J. Spencer (Tramways Manager, Bradford); *Members of Committee*—Messrs. Flint (Leicester), Rogers (Newcastle), Whyte (West Ham), Goodyer (Croydon), Hamilton (Leeds), Clough (Bury), Fisher (Dundee), and Aldworth (Nottingham). The conference is to be held next year at West Ham.

A NEW DESIGN OF RADIAL DRILL

AMONG the recently introduced patterns of machine tools made at Churchill Works, Guildford, by Messrs. Drummond Bros., is a drilling machine of moderate size for motor repairers or other light work. The drill is arranged to be driven either by foot or power, and has all the advantages of larger radial drills in the way of rigidity, quick setting into position, &c. One inch holes can be drilled at about six minutes per inch by foot power without previously putting a smaller drill through, and for small work considerable speeds are attainable. The small exertion required is largely due to the simple form of drive with a light high speed belt, this drive going direct to the bevel wheels, which have ball thrusts, and the back gearing between them and the spindle for heavy work, the key wheel giving a long leverage over the spindle, and in the anti-friction roller drive to the flywheel with direct simple connection to the treadle, and the rigidity, stability and weight of the standards and bed.

Drummond Light Radial Drill.

The general construction of the machine, with its convenient box bed for holding the work, is seen in the accompanying figure, and it is interesting to note that the mechanical transport section of the Army Service Corps has ordered eleven of these machines for their motor wagons, which are being fitted out as movable workshops.

INTERNATIONAL CONVENTIONS

THE International Electrotechnical Commission is making very slow progress. Although it may be hoped that some really useful results of their labours will be reported before the next meeting in two years' time, the resolutions arrived at at the meeting in Turin last month did not go very far. Useful work still remains to be done in connection with the framing of conventions for the rating of electrical machinery, but the only resolution passed was to confirm resolutions unofficially arrived at in Brussels last year as follows :—

1. The output of electrical generators is defined as the electrical power at the terminals.
2. The output of electrical motors is defined as the mechanical power at the shafts.
3. Both the mechanical and the electrical power are to be expressed in international watts or kw.

A Sub-Committee has been formed to carry on further this question of the international rating of electrical machinery and apparatus.

The amended list of terms and definitions drawn up in English and French was provisionally adopted. This will come up for revision and expansion at the next meeting in 1913.

The following resolutions as to symbols were provisionally adopted :—

1. Instantaneous values of electrical quantities which vary with the time are to be represented by small letters.
2. Virtual or constant values of electrical quantities to be represented by capital letters.
3. Maximum values of periodic electrical quantities to be represented by capital letters, followed by the subscript m.
4. Magnetic quantities, constant or variable, to be represented either by capital script, Gothic, heavy-faced or any special type.
5. Maximum values of magnetic quantities to be represented either by capital script, Gothic, heavy-faced or any special type followed by the subscript m.
6. The following quantities to be represented by the following letters :—

Electromotive force = E, e.
Electric quantity = Q, q.
Inductance (coefficient of self-induction) = L.
Magnetic force = **H**.
Magnetic flux density = **B**.
Length = L, l.
Mass = M, m.
Time = T, t.

The letters I, E, and R were adopted to represent current, electromotive force, and resistance respectively in the simple algebraic expression of Ohm's law.

The term "reactive power" was adopted to designate the quantity VI sin ϕ.

In the graphical representation of alternating electric and magnetic quantities, it was decided that the advance in phase should be represented in the counter-clockwise direction.

A Sub-Committee was formed consisting of one member each from Belgium, France, Germany, Great Britain, Holland, Spain, Italy, Switzerland, and the United States to continue the study of international symbols.

The next meeting will be held in Berlin in 1913 under the presidency of Professor E. Budde, but unofficial meetings may be held in the meantime. An invitation from the American Institution of Electrical Engineers was accepted to hold an official meeting in San Francisco in 1915.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

METAL FILAMENT LAMPS.—A very neatly arranged catalogue has been issued by Pope's Electric Lamp Co., Ltd. (Hythe Road, Willesden, London, N.W.). A numerous selection of lamps are illustrated on art paper, showing the bulbs full size. These can be had in various shapes. A new pattern torch flame bulb for tubular lamps, and a ribbed conical shaped bulb, for preventing glare effect, are two of the most striking of the fancy types. Besides these, many spherical and ordinary forms are included, all of which are British made, and can be had for the usual voltages and candle powers.

ALUMINIUM.—A leaflet from The British Aluminium Co., Ltd. (109 Queen Victoria Street, London, E.C.), illustrates aluminium panels, ceilings, and mouldings for railways and tramways.

FANS, MOTORS, AND DYNAMOS.—A leaflet from L'Air Electrique (38 Rue de la Folie-Regnault, Paris), gives a numerous illustrated selection of fans of all types, small dynamos, motors, and converters, as well as an electric polisher and centrifugal ventilator.

CARBON LAMPS.—A leaflet from the Sunbeam Lamp Co., Ltd. (Park Road, Gateshead), gives particulars of the carbon filament lamps manufactured by the company, calling special attention to traction lamps, flame, and other fancy lamps, radiator lamps, and turn-down lamps with live filaments.

MERCURY VAPOUR LAMPS.—The Westinghouse, Cooper, Hewitt Co., Ltd. (151-2 Great Saffron Hill, London, E.C.), has sent us another leaflet discussing these lamps in connection with engineering, in which an attempt is made, with the help of illustrations, to show that the light given out is better than daylight. The wide range of applications to which they are being put is shown by a long list of customers, which is also before us.

MERCURY VAPOUR RECTIFIER.—The same firm also send a pamphlet relating to this rectifier, which is for use chiefly with projection arcs and in connection with cinematograph work. It starts up automatically directly the carbons make contact.

CONDUIT WIRING.—A pamphlet has been sent to us by the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.), describing their Kalkos system of conduit wiring without condensation. The conduit consists of specially drawn brass tubes tinned inside and out, joined with slip sockets, and soldered. This gives a continuous metallic circuit of very low resistance, which can be used as an earth for twin wire systems, as a return for concentric systems, or as a neutral conductor for a three-wire system. The material used is a very good conductor of heat, and soon adjusts its inside temperature to that of the atmosphere, thus avoiding condensation.

CONDUIT BOX.—The same firm also send details of the Kalkos iron box, the special feature of which is its adjustment ring. This can be rotated forwards and backwards to attain the desired level at the front of the box. For extreme cases an extension ring is available. All boxes, being divided by the adjustment ring, form two compartments. The Kalkos switch used throughout was described in Electrical Engineering, January 12th, 1911, p. 16.

ELECTRICAL ENGINEERING

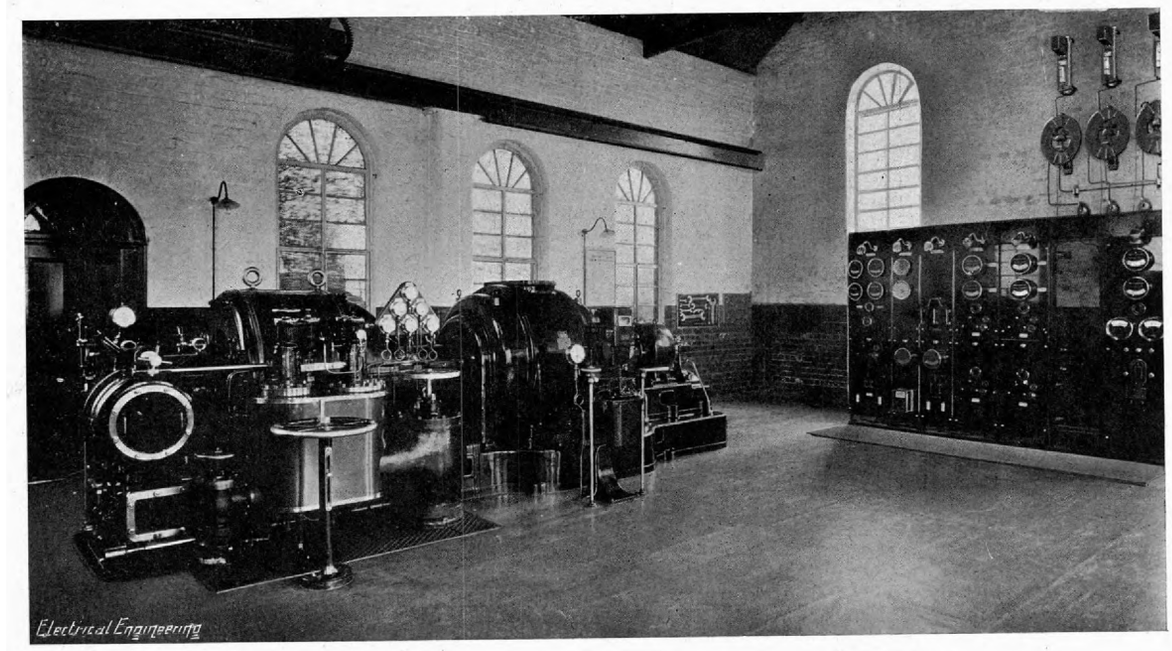
IN

MINES

ELECTRICAL EQUIPMENT OF THE CRAIGHEAD AND BOTHWELL CASTLE COLLIERIES

THESE collieries, situated near Glasgow, are owned by Messrs. William Baird & Company, who were one of the first firms in Scotland to use electricity for underground mining work. It is the purpose of this article, however, to deal with the power equipment rather than with the motors below ground.

The power house is at present situated at the Bothwell Castle Colliery, and a portion of the output is transmitted at 2,200 volts to Craighead Colliery, a distance of about a mile away, and may, at a later date, be transmitted to other collieries in the same way. The power unit at present comprises a mixed-pressure, straight-flow turbine of the Westinghouse impulse type, direct coupled to a 300-k.w. 500–550-volt, three-phase, 50-cycle turbo-alternator and exciter. The turbine takes exhaust steam from two engines, one driving a fan and the other a haulage. The amount of steam thus available is 115–180-k.w., and when this supply is insufficient to carry the load, live steam is taken from the boilers at 60 lbs. per square inch pressure, through a reducing valve. The condensing plant, which has an average duty of 12,000 lbs. of steam per hour, is of the Westinghouse Leblanc multiple jet type, and is capable of maintaining a vacuum of between 27½ and 28 inches of mercury at full load, the air circulating pumps being driven by a squirrel-cage motor rated at 47 b.h.p. at 720 r.p.m. This motor, which, with the condenser, is situated in the basement, is controlled from the engine room by a mining type control pillar comprising oil switch, oil immersed controller, and ammeter; the water and vacuum gauges are also mounted on this pillar, the whole forming a remarkably complete and accessible control system.



The current generated is used at terminal pressure at Bothwell Castle, on motors both above and below ground, but is transformed to 2,200 volts for transmission to Craighead. The line is designed for a later working at a pressure of 6,600 volts, but as all the electrical machinery has not yet been erected, the lower voltage is quite sufficient for the small amount of power at present being transmitted.

A six-panel black enamelled slate switchboard controls the generator and outgoing feeders, and comprises one high tension and five low tension panels equipped with the necessary switches and instruments. There are also three low-tension feeder panels for station supply, surface, and underground feed.

Current is taken from the high-tension 'bus-bars and led underground by a three-core, paper insulated, lead covered cable to a point clear of the Bothwell Castle Works, and thence by an overhead aluminium line, supported at intervals of about 50 yards on wooden poles to Craighead, where it is stepped down to 500 volts for use.

This line is led across country over road, and woods, finally crosses the River Clyde, at a point where it is 210 feet wide. The line was tested at 11,000 volts to meet the B.O.T. requirements, and was found perfectly satisfactory in every way. It is composed of three aluminium cables, each consisting of three No. 10 S.W.G. strands having no joint from end to end, fastened to brown porcelain insulators, tested to 22,000 volts by aluminium clips. At the Clyde, steel guard wires are fixed underneath the lines for the double purpose of taking the pull, and preventing the lines from falling in the event of a break. A high-tension telephone line connects the two mines, and is mounted on the same poles as the power lines.

Although it has been stated that the pressure is stepped down to 500 volts for use at Craighead, it should be mentioned that high-tension current will be used direct for large motors, and will also be used for transmission to other collieries where the supply will be a direct high-tension one to the motors. At Bothwell, Nos. 1 and 2 pits, 500-volt A.-C. only is used. At present there are five motors in use at the former and seven at the latter, all of the squirrel-cage

type. One of these is a 7-h.p. motor used for driving a winding equipment for hauling men up a 25-ft. blind pit. At the Bothwell Castle and Craighead pit some very neat haulages are in use, motive power being furnished by two speed squirrel-cage motors operated by oil immersed con-

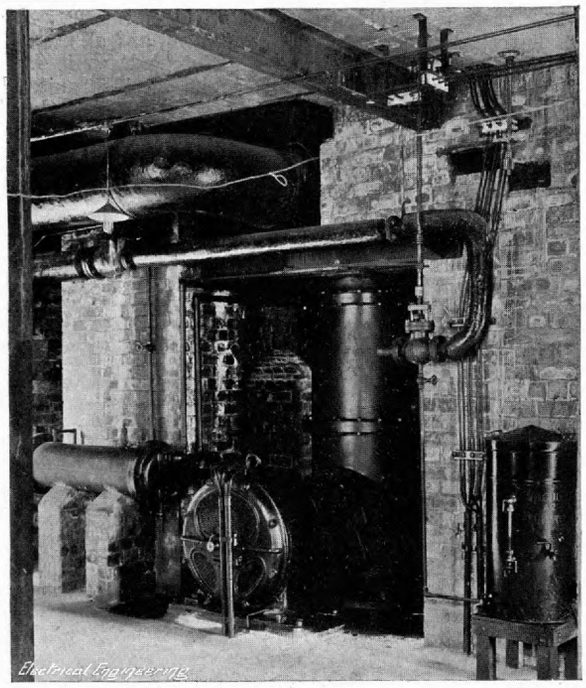

FIG. 2.—CONDENSING PLANT.

trollers and mining type oil switches. The drive is by worm gear, and the motors, which are rated at 10/5 h.p., run at a speed of 970–480 r.p.m. This variation is effected by a controller which makes the different connections of the stator winding so as to vary the number of poles, the minimum number of poles giving the maximum speed.

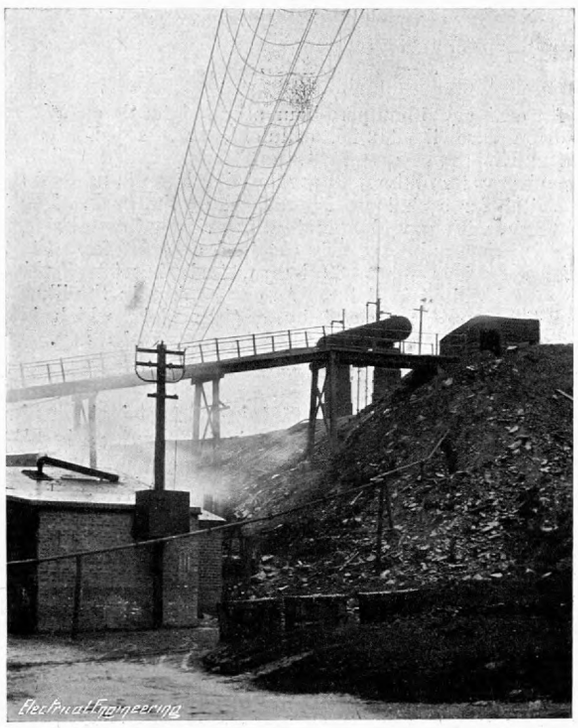

FIG. 3.—PART OF TRANSMISSION LINE, SHOWING CRADLE.

This plant reflects the greatest credit on Messrs. Stevenson & McGuffie, of Glasgow, the consulting engineers, on Messrs. William Baird, and on the British Westinghouse Electric & Manufacturing Company, Limited, who are responsible for the entire electrical equipment.

ELECTRICAL EQUIPMENT OF THE CLOCK FACE COLLIERY OF THE WIGAN COAL AND IRON CO.

THIS colliery, which was begun in 1905, started running about the end of 1906, and is situated about three miles from St. Helens.

Electricity is supplied to the two pits by two 400-k.w. Westinghouse straight-flow Parsons type turbines running on live steam at 110 lbs. pressure and 200° superheat, rod driving a Westinghouse 400-kw. three-phase 2,200-volt 50-cycle turbo-alternator. A Westinghouse Leblanc Condenser is installed capable of dealing with the whole of the steam from either of the turbines.

The switchgear controlling these units is mounted on a

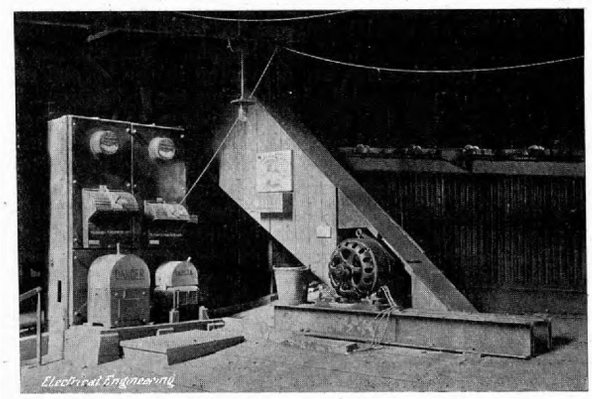

FIG. 1.—10-H.P. MOTOR DRIVING CREEPER FOR TUBS.

slate board containing two generators, two feeders, and some spare panels, separated at the back by slate partitions, and with the cubicles formed by these panels are enclosed by expanded metal doors. The bus-bars are carried overhead by porcelain insulators.

The supply is led to a 500-k.w. 2,200/500-volt three-phase 50-period transformer placed in the basement, and is taken out through the wall by two three-core bitumen cables, supported on wooden poles for about 40 yards, and thence by the wall of the winding engine-house to the pit-brow, where one cable

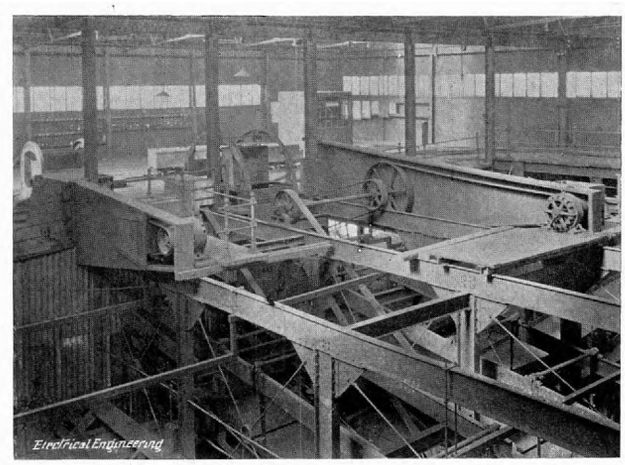

FIG. 2.—VIEW OF SCREENING PLANT DRIVEN BY TWO MOTORS.

goes underground, and the other to the screens. A 375-k.w. motor generator set is used for converting to direct current for surface lighting, the cables running on the same poles as those carrying the A.-C. cables. An engine-driven D.-C. generator is used for night lighting, and as an emergency stand-by, the engine being by Messrs. Marshall & Co., of Gainsborough.

The screening plant is built straight over the mine head some 29 feet above the ground level, and the pit cages are wound right up into it. The trucks are run from cage to tippler by gravity, and the coal automatically tips into the screens, conveyed on belts, and finally shot into trucks in one continuous operation by means of electrical power.

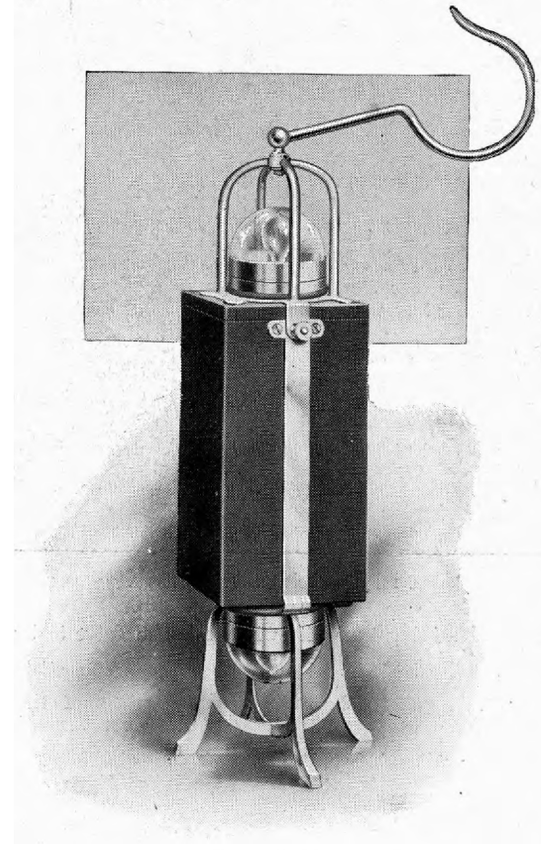
One 25-h.p. motor drives the tipplers and shakers, and a 50-h.p. motor is used for the picking belts, the lowering

Hosted by Google

ends of which being operated from a counter shaft driven by the same motor. There are two 10-h.p. motors on empty tub creepers, and one driving a full tub creeper. There is also a 25-h.p. motor driving extension belts.

At the present time the colliery is being opened out, but when the underground developments are completed it is expected that the output of the plant will be at least 1,500 tons per day.

We are informed that the whole installation, the electrical part of which was supplied by the British Westinghouse Co., is working in a very efficient manner, and is kept in excellent condition.



ELECTRICAL MINING PLANT AT THE OLYMPIA EXHIBITION

MINING electrical engineers will find a number of exhibits of special interest to them at the Electrical Exhibition, now being held at Olympia. Descriptions of all novelties in this direction are appearing in the special supplements which we are publishing during the exhibition, but it may be convenient to indicate here where some of the most interesting items may be found. No one interested in electricity in mines should omit a visit to the stand of A. Reyrolle & Co., where demonstrations are being given of the flame-proof qualities of their switch cases and a quantity of specially designed mining switchgear, including a gate end-box with the Fisher system of leakage protection, can be seen. Special mining switchgear should also be inspected on the stands of Siemens Brothers Dynamo Works, Ltd., the British Thomson-Houston Co., the Union Electric Co., and Allen West & Co. Cables and cable boxes for mining are shown by W. T. Henley's Telegraph Works Co. and Callendar's Cable & Construction Co., and among those exhibiting special flame-proof and other mining motors are Bruce Peebles & Co., Ltd., and the Phœnix Dynamo Manufacturing Co. On the stand of Everett, Edgcumbe & Co. are shown special water-tight mining instruments, and mining telephones, mine exploders, &c., are exhibited by the Sterling Telephone Co. Another interesting item is the Bowie safety lamp relighter of Spagnoletti, Ltd., on the stand of Pooley & Austin.

MINERS' ELECTRIC LAMP

THE Electrical Power Storage Co., Ltd. (4 Great Winchester Street, London, E.C.), have put a new type of electric miners' lamp on the market, known as the Up-and-down lamp. Great attention is being given to electric lamps just now by the principal mining companies, who are adopting them extensively, so a few details will be of interest. Many types have been manufactured by this firm, and all are simple in construction. In the one we illustrate a lamp is fixed at each end, so that a bottom light can be obtained quite close to the ground, or higher up, according to the work in hand.

"Up and Down" Miners' Lamp.

An ordinary 10-ampere-hour accumulator is contained in a wooden case lined with celluloid, and supplies a 4-volt, 2·5 candle power metal filament lamp, which will burn on one charge for 27 hours, provided one lamp is used at a time. A switch for each lamp is provided on the back. The safety of these, with regard to arcing, is evident from the fact that the firm has quite recently obtained an order from the South Wales Colliery for 1,000 lamps, including 50 of this type. The total weight is 5½ lbs. As can be seen in the illustration, the lamps are protected by a glass globe which is easily detached. The whole is locked by means of a key.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during September.

September 7th.—Monthly supplement on "Electrical Engineering in Mines," opening with a critical article on the New Coal Mines Bill, commenting upon the amendment suggesting that the use of electricity should be discontinued where a minute proportion of inflammable gas is present in the air, and urging that in the new Home Office Rules the regulation prohibiting the use of electricity where there is the risk of explosion should be more definite. Some other articles summarise some of the most important mining patents during August, and describe a new controller and a new form of earth plate, suitable for mining work. A report is given of some police court prosecutions relating to infringements of the mining rules.

September 14th.—Report of a discussion before the British Association on steam, gas, and oil engines.

September 21st.—First special supplement on the Electrical Exhibition at Olympia. Description of an arc lamp lowering gear.

September 28th.—Description of a 110,000-volt transmission system. Particulars of some new liquid starters and controllers. Second special supplement on the Electrical Exhibition.

Hosted by Google

EQUITABLE CHARGES FOR TRAMWAY SUPPLY

THE Joint-Committee appointed by the Incorporated Municipal Electrical Association and the Municipal Tramways Association to consider the question of the charge which should be made for electrical energy supplied for traction purposes from combined power stations, has now presented its report, which is given in full below. The report has been adopted by the Councils of both Associations.

The committee, which consisted of Messrs. J. Christie, S. L. Pearce, Thos. Roles, C. E. C. Shawfield, H. Talbot, S. J. Watson, and T. P. Wilmshurst, representing the I.M.E.A., and Messrs. H. E. Blain, J. Dalrymple, A. R. Fearnley, J. B. Hamilton, J. M. McElroy, and C. J. Spencer, representing the Municipal Tramways Association, have come to the conclusion that the following broad principles should be adopted as the basis for the charge for electrical energy supplied for traction purposes from combined stations, viz. :—

(1) That the charge should be based upon the actual cost of production.

(2) That in order to ascertain the actual cost of production it is necessary that the "standing costs" and the "running costs" should be properly separated, and the following allocation is suggested subject to the general observations subsequently made in this report, viz :—

	Standing Costs.	Running Costs.
Coal	25%	75%
Oil waste and water	25%	75%
Repairs :—		
(*a*) Building	100%	—
(*b*) Steam boilers, piping, &c. ...	75%	25%
(*c*) Engines and generating plant ...	50%	50%
Repairs of joint mains in case of high tension stations	100%	—
Wages at generating stations	50%	50%
,, ,, sub-stations	100%	—
Salaries of operating officials	100%	—
Rents, rates and taxes on joint assets (not including Income Tax)	100%	—
Management expenses (salaries of administrative officials)	50%	—
Interest in respect of all capital which is used in common for the various classes of supply	100%	—
Depreciation in respect of all assets used in common for the various classes of supply	100%	—

(3) That the tramways department's proportion of the standing costs should be the ratio which the maximum demand for traction purposes at the generating station bears to the total maximum demand on the generating station, such maximum being arrived at in the same manner in each case as hereinafter set forth.

(4) That the tramways department's proportion of the running costs should be the ratio which the total number of units delivered to feeders at the station for traction purposes bears to the total number of units delivered to feeders at the station for all purposes.

(5) That the traction maximum demand should be taken to be the mean of the figures representing : (1) The maximum traction demand at any time of the year, and (2) The average of the daily maximum traction demand (Sundays excepted) taken over a period of a month coincident with the maximum demand on the station.

The method of ascertaining the traction maximum shall be taken as the maximum observed load deducting therefrom 20 per cent.

(6) That in cases where storage batteries are in use the figure to be adopted as the traction maximum demand and used for allocating to the tramways department their proportion of the standing costs under the headings of :—

(*a*) Rents, rates and taxes, and
(*b*) Management expenses

should be the generating plant maximum plus the battery—and for the purpose of allocating the remaining standing costs—*i.e.*,

(*a*) Coal.
(*b*) Oil waste and water.
(*c*) Repairs.
(*d*) Wages at generating and sub-stations, and
(*e*) Salaries of operating staff.

the maximum demand to be adopted should be the maximum demand of the generating plant only.

That the two-hour rating of any storage battery should be deemed to be its kilowatt capacity, and that all repairs to the battery which could be used for the dual purpose of lighting and traction should be dealt with in the same manner as repairs to engines and generating plant. If, on the other hand, it is put in for purely traction purposes it should be dealt with under the heading of repairs to exclusive traction plant.

(7) That the total costs in respect of traction feeders and any other apparatus connected exclusively with traction distribution should be wholly allocated to the tramways department, such costs to include interest, depreciation, and repairs.

(8) That it is desirable as a matter of ordinary commercial prudence that there should be established in connection with electrical undertakings a suitable reserve fund for meeting any extraordinary expenditure in any year, and that the tramways department should bear their proper proportion of the annual sums to be set aside for establishing such reserve fund, but it should be an understanding that the tramways department should be a party to the fixing of the annual amounts to be so set aside.

(9) That the total actual cost of production of current for traction purposes may be summarised under the following heads, viz. :—

(*a*) Proportion of standing costs (ascertained as per Paragraphs 2 and 3).
(*b*) Proportion of running costs (as per Paragraphs 2 and 4).
(*c*) Total cost of traction feeders, &c. (as per Paragraph 7).
(*d*) Proportion of reserve fund (as per Paragraph 8).

(10) That the question as to what amount of profit (if any) should be paid to the electricity department by the tramways department is a matter which each municipality should settle for itself. The joint-committee have only endeavoured to lay down what they consider to be the correct method of ascertaining the actual cost of production, and upon which they suggest the charge should be based.

General Notes made by the Joint-Committee.

Coal allocation as between Standing and Running Costs.—The question as to the proper proportion of coal to be allocated to the standing costs received careful consideration by the joint-committee. From the evidence in their possession it would appear that the amount of coal which is consumed to make up for radiation losses differs somewhat in the various stations. The general information obtained showed that it averages from 4 lb. to 5 lb. per kilowatt of plant usefully employed per day. It is suggested by the joint-committee that each municipality should carefully go into this matter with a view to ascertaining, as far as possible, the actual figure for their particular station. If, however, it is not thought worth while in any particular case to go into this detail, it is suggested that the division suggested by the joint-committee should be adopted, viz. : 25 per cent. to standing costs, and 75 per cent. to running costs.

Oil Waste and Water.—The joint-committee after considering the allocation under this head suggests that it should follow the division proposed in the case of coal. They recognise that this may not be strictly accurate, but they think that the smallness of the figure does not justify a different allocation.

Repairs to Steam Boilers, Piping, &c.—The figures suggested as the allocation under this head are not less than 75 per cent. to standing costs, the balance going to running costs. The joint-committee suggest that the figures should be settled for each station having regard to local conditions.

Salaries of Operating Officials.—Under this head it is suggested that only the salaries of those officials should be included whose services are devoted to generation and transformation of electrical energy.

Management Expenses (Salaries of Administrative Officials).—Under this head the proposal is to include the salaries of the administrative staff as apart from the staff engaged at the generating station. It would include the salary of the chief engineer, the secretary, the accountant, and officers of that class. It will be observed that it is proposed to allocate half only of the management expenses to standing costs, the remaining half, having no connection with the traction supply, is eliminated from the calculations.

Interest and Depreciation.—The capital, it is suggested, should be that which is used *in common* for the various classes of supply, and should be ascertained by taking the total capital expenditure of the undertaking and deducting therefrom all items which are *not* used in common, e.g. :—

Traction feeders.
Lighting feeders and distributing networks and services.
Meters, &c.
Motors (for hire).
Any other plant not used for the *common* supply.

In calculating the depreciation charges it is suggested that the "lives" of the various portions of the assets should be fixed in accordance with the actual provision made by the electricity department.

Method to be adopted for accurately measuring the current supplied for traction purposes.—The joint-committee suggest that all direct current meters should be of the watt-hour type. When fixed in position where they are liable to be affected by stray magnetic fields they should be astatic, and of a type containing no iron or permanent magnets, and should not be

Hosted by Google

affected by momentary overloads or short circuits. Where meters containing permanent magnets or iron are used it is advisable that they should be shielded as much as possible.

It is further desirable that all meters should be calibrated for the temperature of the surrounding medium in which they will be located. For loads up to 2,000 amperes the total current type is recommended, and above this output the shunted type —each with its own shunt.

Where polyphase currents have to be measured, "Dynamometer" or "Induction" type of meters may be used.

It is suggested that the two-wire wattmeter method should be employed as being the most satisfactory way of metering three-phase electrical energy.

The joint-committee recommend, having regard to the importance of reliable measurements being obtained, that in all generating stations three wattmeters should be arranged in series, one meter being the property of the tramways department.

In all important sub-stations they consider that two wattmeters will suffice, one of which would also be the property of the tramways department.

Provision should be made for reference to an independent authority in the event of any dispute arising as to the accuracy of any or all of the meters installed.

RESERVATIONS MADE BY THE JOINT-COMMITTEE.

Traction Maximum Demand.—The joint-committee in Paragraph 5 have suggested a method of ascertaining the traction maximum which they are of opinion could be equitably applied to the majority of tramway undertakings in the kingdom; they consider, however, that it might not be applicable in every case where the "peaks" are accentuated or where the ratio of sustained maximum demand to average maximum demand is of an abnormally high value due to (*a*) geographical, or (*b*) service conditions. As an instance of the former they cite the case of those towns having very severe gradients on their system, and as an instance of the latter, the case of those towns having to deal with football or other abnormal rush traffic.

Capital Charges.—The joint-committee have set forth in Paragraphs (2) and (3) and further amplified in the "General Notes" what they consider is the most practicable method of treating the question of the capital charges in the ascertainment of the costs of traction supply. They are aware, however, that circumstances may arise in connection with the development of electrical undertakings which might properly justify some departure from the method suggested.

They have had under their notice the case of stations where the principle of dealing with the capital charges on the "common plant" basis, or the "pooling system" as it may be termed, would not be in the best interests of either the electricity or the tramways undertakings. They therefore suggest the following as an alternative basis which might be applied in cases which come within this category, viz. :—

(*a*) That the tramways department's proportion of the charges for interest on capital expenditure in respect of generating and transforming plant and boilers should be based upon the cost per kilowatt for such plant at the time of its installation, the amount of such plant to be ascertained on the maximum demand principle already described, plus a reasonable allowance for reserve or spare plant to be determined in accordance with the local conditions.

(*b*) That the tramways department's proportion of the interest on the capital in respect of land and buildings should be based upon the proportion which the kilowatt capacity of the traction plant bears to the total kilowatt capacity installed.

(*c*) That the depreciation charges should be determined in accordance with the paragraph under the heading of "General Notes" contained in this report.

The joint-committee cannot make any recommendation as to which of the two methods outlined should be applied in any particular instance. Each case should be settled on its merits, having regard to the local conditions, and in the event of any dispute arising, the joint-committee suggest that provision should be made for referring the matter to an independent engineer for settlement.

The joint-committee desire to take this opportunity of acknowledging the special assistance which they have received in the work of drafting the report on this difficult matter from the sub-committee, consisting of Mr. S. L. Pearce (Manchester) and Mr. T. Roles (Bradford), representing the I.M.E.A.; and Mr. J. M. McElroy (Manchester) and Mr. C. J. Spencer (Bradford), representing the M.T.A. These gentlemen have devoted a considerable amount of time to the question, and it is largely owing to their efforts that your committee are able to report at this date.

Students' Section of the Institution of Electrical Engineers.—The Hon. Sec. of the section wishes us to call the attention of those members of the Students' Section who desire to read papers to the facts that it is necessary that notice of such intention be sent to him *immediately*, in order that the announcement may be embodied in the programme of the session. Notice should be sent to Mr. D. Betts, 3 Fordwych Road, London, N.W.

ELECTRIC TRACTION NOTES

We give elsewhere in this issue the full report of the Joint Committee appointed by the Incorporated Municipal Electrical Association and the Municipal Tramways Association to consider the charges for traction supply from combined power stations. Our views upon this important question were expressed briefly in connection with Mr. R. Hammond's award in the Paisley tramways arbitration (ELECTRICAL ENGINEERING, Vol. VI., December 1st, 1910, p. 766).

Speaking at a meeting of the Society of Engineers on Monday, Mr. W. P. Durtnall stated that he has received instructions from a leading British railway company, to prepare the designs of a 500-h.p. petrol-electric locomotive, in which a Diesel engine will be used. He also mentioned that although the North British Railway Co. had been experimenting with a locomotive in which there was a steam turbine, dynamo and motors, it was not likely that this class of engine would be taken into general use.

With a view to coming to a decision as to the adoption of electric locomotives for goods and mineral traffic, the North-Eastern Railway Co. have sent Mr. V. L. Raven, the Company's Chief Mechanical Engineer, and C. H. Merz, the Company's Consulting Electrical Engineer, to the United States to investigate the various methods adopted there for operating goods traffic by electrical power.

The Glasgow Corporation have put into service a tramcar of the type designed some time ago by Mr. T. Kavanagh, of Liverpool, and which was described in ELECTRICAL ENGINEERING, Vol. II., p. 575. This car has been designed to facilitate the rapid entry and leaving of passengers, an exit and entrance being afforded at both ends.

The West Hartlepool Corporation have passed the recommendation of the Tramways Committee that the whole of the lines of the Hartlepool Tramways Co. be purchased, and that powers be sought for this in addition to the construction of further lines. This decision has been arrived at after a report by Mr. J. B. Hamilton, of Leeds, and also owing to the failure of the negotiations between the Council and Company for the latter to take a lease of the lines which have been purchased by the former.

A scheme for the adoption of trolley omnibuses has been placed before the Ilford Council.

A Sub-Committee has been appointed by the Brighouse Council to consider the proposed tramway extension to Rastrick.

An interim dividend of 3% has been declared upon the ordinary shares of the Lisbon Electric Tramways Co.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Several stands at the Electrical Exhibition now being held at Olympia contain telephone apparatus, telephone cables, &c. Descriptions of these are appearing in our special supplements on the exhibition. In this week's supplement details are given of some novelties in this direction, introduced by the Western Electric Co., including a new combined indicator and jack.

An interesting contribution to the subject of the physiological effects of the continuous use of the telephone has been made by Dr. Förster, of Charlottenburg, in the *Berliner Klin. Wochenschrift*, a German medical journal. He describes experiments from which he concludes that the ear troubles developed by telephone operators are due, not to any electrical or electromagnetic action, but to the "cracking" noise or the continuous series of sharp noises at regular short intervals. He suggests that special attention should be given to this matter in the future development of the telephone, and recommends a form of telephone designed by Herr Bähr, of Charlottenburg, in which a diaphram of mica with an iron disc attached is used in place of an iron diaphram.

According to the *Elektrotechnische Zeitschrift*, a large electrical concern is endeavouring to arrange for public telephonic communication between Berlin and St. Petersburg. It is stated that the Russian Government favours the project.

The Austrian Ministry of Commerce has decided to introduce automatic telephone exchanges into the Vienna telephone system. Three exchanges are to be constructed shortly.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Sept. 28, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

21,468/10. **Electric Ovens.** The Electric & Ordnance Accessories Co., Ltd., and J. D. Morrison. The heating elements, which consist of a series of separate resistance units, are arranged on the opposite sides of the oven, and held in place by detachable clips fitted to bars arranged at the top and bottom. They are protected by hinged shields, which fold flat and cover them up. These are, however, perforated to allow the heat to radiate into the oven, and their outside surfaces are provided with ledges to take the shelves, which, in turn, keep the shields in position over the resistances. The latter are connected up in parallel with the supply, and independently controlled by four tumbler switches, or a single three-heat switch can be used, with which various combinations of resistances can be obtained. Ten figures.

21,574/10. **Light Reflectors.** R. G. Tyler and E. H. Freeman. A continuous trough-shaped reflector is made in two parts, one constituting one side and the bottom of the trough, and the other forming the remaining side. Each part is provided with a flange, adapted so that one flange can lie on and be secured with the other to the moulding or other fixture by screws, the flanges extending to one side of the trough. Lamps of a tubular shape are connected at intervals along the troughing between insulating bridge pieces, which are supplied with terminal screws and washers for securing the leading-in wires. Heat insulating material may be placed between the reflector and lamps, and the latter may be covered with glass secured by flanges at the edges of the reflector. The reflector is intended for use with low-voltage low-candle-power lamps, mounted in series to form groups connected in parallel. Six figures.

23,675/10. **Insulating Coils with Oxides.** E. W. Küttner. This is effected by exposing the coils throughout their entire mass to the action of oxygen, producing the oxidation in the presence of warm or hot steam. This is done in conjunction with an artificially produced fall of temperature.

25,516/10. **Storage Batteries.** B. M. Drake, J. Waddell, and The D.P. Battery Co., Ltd. In order that newly-charged battery plates shall retain their charge during transport or storage, they are put straight from the charging bath into cases, which are exhausted of air and hermetically sealed. Instead of exhausting the cases, they may be filled with an inert gas, such as carbonic acid.

25,897/10. **Lamp Holder.** C. D. Copland. A locking lamp-holder in which the barrel part of the holder is slit, and provided with a recess or hole to receive one of the pins of the lamp. The entrance of the hole is closed after the lamp has been inserted by screwing the shade ring on to the barrel. This causes the slit parts to come together, securing the lamp. Six figures.

1,210/11. **Incandescent Lamps.** C. H. Weber. A process for connecting filaments to the leading-in wires consists in soldering or welding with the aid of sulphide metal compounds such as sulphide of tungsten or molybdenum. These can be decomposed at a very low temperature, and the fusing operation can take place in the open air instead of in hydrogen.

3,022/11. **Conduit Tramway Construction.** G. S. Albanese. The conduit is formed of a continuous length of reinforced concrete or cement, to which is attached one or more continuous girders of the same material. The girders which take the track rails are secured at intervals by concrete brackets, so that the conduit, girders, and brackets are all integral. Seven figures.

17,480/11. **Incandescent Lamps.** W. G. Houskeeper. In preparing filaments for incandescent lamps, the continual heating and cooling that takes place when single-phase currents are used causes the material to break. In this invention a two-phase current is used, in which one phase current traverses one-half of the filament, while the current from the second phase simultaneously passes through the second half. Since the currents differ 90° in phase, one portion of the filament is hottest when the other is coolest, so that expansion and contraction of the parts take place together, and the length of the filament remains constant. An autotransformer and lamps are provided in each phase to regulate the current. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Dynamos, Motors, and Transformers: Auvert and Ferrand [Rotary transformers] 20,948/10; Gray (*Latour*) [Commutator motors] 26,119/10.

Heating and Cooking: Macdonogh [Detachable heater for cookers] 21,557/10.

Incandescent Lamps: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Supports for filaments] 30,323/10; Moller [Manufacture of] 1,162/11; Majert and Gladitz [Device for welding metal filaments] 12,104/11.

Meters: Strelow [Meters of Ferraris type] 21,240/10.

Storage Batteries: Taylor [Secondary battery discharge] 20,906/10; Inrig and Gavan Inrig, Ltd. [Secondary batteries] 28,755/10.

Switchgear, &c.: Venner and Griesbach [Automatic switch] 14,471/10; British Thomson-Houston Co. and Wedmore [Switch control devices] 20,882/10; Railing and Garrard [Switches] 26,009/10; Woodford [Safety device for motor controllers] 15,469/11.

Telephony, Telegraphy, and Signalling: Knudsen [Impulse transmission apparatus] 13,917/10; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Signalling systems] 18,868/10; Sácek [Wireless telegraphy apparatus] 21,311/10; Aktieselskabet Hovlands Radiotelegraf [Condensers] 12,976/11.

Traction: Mawson [Mounting conductors on railways] 20,917/10.

Miscellaneous: Helbronner and Von Recklinghausen [Sterilising apparatus] 23,078/10; Sabotka [Air condensers] 24,916/10; Arnold [Illuminating signs] 29,452/10; Lake (*United States Light and Heating Co.*) [Electric regulating arrangements] 9,363/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Motors and Dynamos: Lamme [Windings for] 18,132/11; Baum [Method for cooling] 19,760/11.

Telephony: Betulander [Speaking switches for automatic systems] 19,661/11.

Traction: Siemens Schuckertwerke Ges. [Mounting overhead wires for railways] 20,031/11.

Miscellaneous: Stuart [Underground electric despatch system] 18,998/11; Betulander [Connecting apparatus actuated from a distance] 19,553/11; Appoullot [Contact devices for clocks] 20,149/11.

The following amended Specification can now be obtained.

Sir Oliver Lodge [Wireless Telegraphy] 11,575/97.

Opposition to Grant of Patents

20,900/10. **Switches.** J. H. Tucker. Opposition has been entered to the grant of this patent. It relates to switches of the tumbler kind, in which means are provided for earthing the metal parts not intended to carry current, so that shocks are avoided. One of the fixing screws is replaced by a hollow terminal, which is in electrical connection with the handle, and carries an earthed wire.

Expiring and Expired Patents

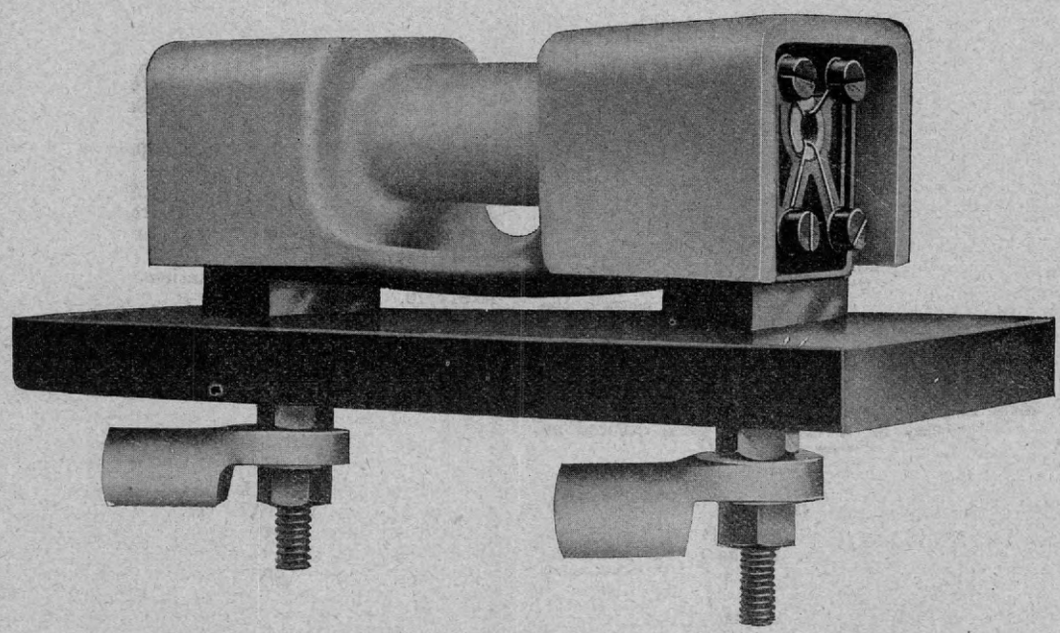
The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: British Thomson-Houston Co. (*C. E. Harthan, U.S.A.*) 13,012/98.

Dynamos and Motors: C. Ilgner [Motor-generator] 13,556/02; Electric Construction Co., W. Buchanan, and J. McMillan [Means for varying dynamo field current] 13,761/07.

Instruments: H. G. C. Fairweather (*H. M. Friendly, U.S.A.*) [Fault testing set] 13,563/07.

Switchgear and Fuses: E. Schattner [Cut-outs] 13,432/07; J. S. Highfield [Switches, cut-outs] 13,543/07.



Telephony, Telegraphy, and Signalling: Evershed & Vignoles and S. Evershed [Order telegraphs] 12,279/99; J. Kitsee [Signalling] 12,424/05; R. B. North [Signalling] 13,594/06; G. Jahr [Electrostatic detector] 13,596/07; R. B. Jentzsch [Coin-freed telephones] 13,821/07.

Traction: H. H. Lake (*T. E. Murray and J. Van Vleck* [Automatic operation of mail trains] 13,438/02; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Rail bonds] 13,275/04; Allgemeine Elektricitäts-Ges. [Overhead system] 13,697/06.

Miscellaneous: C. E. Dolbear [Electrostatic separators] 12,210/01; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Vapour electric apparatus] 13,413/06; J. H. Schoneberger and G. W. Fraser [Electrolytic apparatus for protecting ships' bottoms] 13,674/07; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Variable reactance resistance] 13,739/07; A. O. Tate [Purifying water by electrolysis] 13,891/07.

LOCAL NOTES

Barrow-in-Furness: *Street Lighting.*—The Corporation have to replace the existing gas lighting in Abbey Road and Roose Road by electric lighting, and metallic filament lamps suspended from span-wires fixed between the tram poles on either side of the road will be adopted. The total length of the road over which gas lighting is to be displaced is over two miles, and the number of electric lamps to be erected 162. This decision has been arrived at as a result of a prolonged test between the two illuminants, in which the superiority of electric lighting along roads planted on both sides with trees has been very marked.

Canada: *New Power Plant.*—The first two units of 7,600 h.p. each in the new power station of the Canadian Light & Power Co. at St. Timothy were put into operation last week. It is expected that a third unit will be in operation within three weeks.

Chester: *The Water Power Scheme.*—We are able to give a few further particulars of the scheme referred to in our last issue, for making use of the waters of the River Dee for generating electricity. The proposal is due to Mr. S. E. Britton, the Corporation's Electrical Engineer, and it is estimated that the flow of water at the old Dee Mills is about 25,000 cubic feet per minute. The cost of the scheme is put at £12,500. The Electric Light Committee have not considered Mr. Britton's report in detail, as they do not propose to proceed with the scheme until next spring.

Edinburgh: *Electric Light.*—The Electric Light Committee propose to apply to the Board of Trade for sanction to supply electricity to Craigcrook Castle, which is outside the present supply area.

Egham: *Electricity Works.*—The foundation stone of the new electric power station of the Egham and Staines Electricity Co., Ltd., was laid by the Lord Mayor of London on September 30th.

Johnstone (N.B.): *Electric Supply.*—The Council are considering the advisability of erecting electricity works.

London: *Bermondsey: Electricity Accounts.*—The accounts of the Council's electricity department for the year to March 31st. show a net profit of £3,118. The Chairman of the Finance Committee stated that as the electric light undertaking still owed the ratepayers £38,885, this would not be dealt with as a profit.

Hammersmith: Tramway Track.—The Works Committee's recommendation that the Board of Trade should be asked to appoint a referee to determine the difference between them and the London United Tramways Co., as to the necessity for reconstructing the tramway track in the borough, has been adopted by the Council. The Tramway Co. have refused to incur any large expenditure upon reconstruction, in view of the fact that the London County Council will shortly take over the lines.

Stoke Newington: Electricity Undertaking.—The Council have decided to give notice to the North Metropolitan Electric Power Supply Co. to terminate the agreement under which the Company now manages the Council's electricity undertaking. The Company at present bears all losses and takes all profits. Under the existing agreement there is a Schedule II. which the Council propose to take advantage of, by which the Company will supply the current in bulk and leave the Council to carry out the distribution themselves as a business venture.

New Zealand: *Auckland Power Scheme.*—Good progress is being made with the erection of the City Council's new electric power station, and it is expected that the first portion of the machinery will arrive at the end of the year.

Nuremburg (Germany): *Electricity Supply.*—According to the *Frankfürter Zeitung*, a company is to be formed to construct a large power station for the supply of Nuremburg and the neighbouring districts. The city of Nuremburg will hold 51 per cent. of the share capital, and the town of Fürth and the Elektrizitäts Akt.-Ges. (vorm. Schuckert & Co.) the remaining 49 per cent.

Oldham: *Electricity Accounts.*—The revenue of the electricity department for the year to March 25th, 1911, was £42,445, and the net profit, after meeting capital charges, £1,300. The number of consumers has increased during the year by 116. The Committee have made an arrangement with Sir Alexander Kennedy, the Consulting Electrical Engineer, that he shall in future only receive commission upon extensions designed and carried out under his supervision.

Retford: *Electricity Supply.*—A Special Committee has been formed to consider the advisability of applying for an electric light provisional order.

Scotland: *Fife Electric Power.*—A duplicate 2,000-h.p. Curtis turbine has been put into operation at the Townhill works of the Fife Electric Power Co.

Worthing: *Smoke Nuisance.*—Serious complaints have been made as to the emission of black smoke from the shaft of the Corporation Electricity Works. The Electrical Engineer, reporting upon the matter, states that six of the furnaces are fitted with smoke-consuming apparatus, and that under normal circumstances these work well. During the past summer, however, the seamen's strike so seriously affected the coal contractors, that coal had to be obtained from such sources as they could command. Further, in view of the general state of unrest in the coalfields, they had laid in a much larger stock of coal than they would otherwise have purchased, and this was not so suitable from the point of view of smoke as the coal usually supplied under the contract. The Engineer is now using another class of fuel, and does not anticipate any further trouble.

TENDERS INVITED AND PROSPECTIVE BUSINESS

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bampton.—Messrs. J. & W. Purvis, of Exeter and London, have placed an electric lighting scheme before the Council. There is no gas supply in the district, and it is suggested that a local electric light company should be formed.

Barrow-in-Furness.—Extensions of mains at an estimated cost of about £900 are being carried out in connection with the supply of power to Messrs. Burt, Boulton & Haywood's sawmills at Devonshire Dock, where motors aggregating about 165 h.p. are being installed.

Belfast.—A Local Government Board inquiry concerning a loan of £40,000 for the electricity department was held on Tuesday.

Bulgaria.—The Municipal Authorities of Plevna invite tenders for an electric lighting installation. Tenders will be received between the 4th and 17th of November.

Carlisle.—A Local Government Board inquiry was held last week concerning an application for sanction to borrow £9,755 in connection with the electricity works. This sum includes £1,755 for a new storage battery, and £5,000 for mains extensions. There was no opposition.

The Electricity Committee invite tenders for water-softening and purifying plant of 4,000 gallons per hour capacity, and low-tension main feeder switchboard.

Erith.—The tramway manager has been instructed to make inquiries as to speed indicators for the tramcars.

Honiton.—An agreement has been signed with Messrs. J. & W. Purvis, of Exeter and London, for the installation of an electric lighting plant in the borough.

Merthyr Tydfil.—The Merthyr Electric Traction & Lighting Co. propose to lay new main feeders to Treharris.

Russia.—The specification may be seen at the Board of Trade Intelligence Department, 73 Basinghall Street, London, of the proposed scheme of tramways and lighting for the town of Ssysran. Tenders may be sent until October 14th to Gorodskaya Uprava, Ssysran, Russia.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Exeter.—An expenditure of £15,500 is contemplated upon extensions to the sanatorium.

Leigh-on-Sea.—School for Essex Education Committee. P. Brockbank, 14 & 15 County Chambers, Southend.

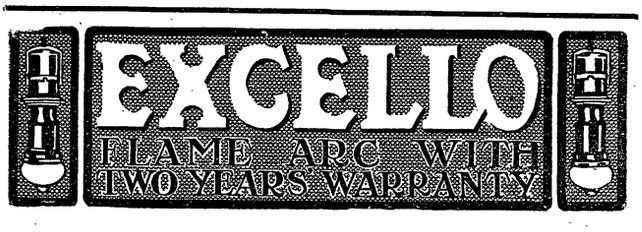
Manchester.—Baths and washhouses. City Architect, Town Hall.

OSRAM·LAMPS

Hosted by Google

Rathmines.—Library. Messrs. Batchelor & Hicks.
Torquay.—New school. Town Clerk.
West Ham.—Additions to nurses' home at Infirmary, Whipps Cross Road, Leytonstone. Architect, Mr. R. F. Sturdy, 45 Finsbury Pavement, London, E.C.
Wood Green.—New Council school. W. P. Harding, Town Hall.

MISCELLANEOUS



Bulgaria.—The Bulgarian Posts, Telegraphs and Telephones Department, Sofia, invite tenders for the supply of telephone and telegraph material. Copy of specification may be seen at 73, Basinghall Street, London, E.C.
Chelmsford.—The Council require a 3-h.p. electric motor and 3-h.p. gas engine for the cattle market. Particulars from Borough Surveyor, 16 London Road.
Dundee.—The Electricity Department invite tenders by Monday, October 9th, for overhead tramway construction in Clepington Road. Particulars from H. Richardson, Tramways Engineer. The Council also require 400 3-in. diameter circular two-way earthenware conduits, 3 ft. long. Particulars from Tramways Engineer.

TENDERS RECEIVED AND ACCEPTED

Brighton.—Messrs. Richardsons, Westgarth & Co., quoted £5,000, and the British Westinghouse Co. £4,980 for the reconstruction of No. 5 turbine. The offer of the latter has been accepted. The necessary motor-driven air-pump is to be supplied by Messrs. Richardsons, Westgarth & Co., at £635, and the electrically driven circulating pump by Messrs. Greenwood & Batley at £229. When this reconstruction is complete, it is anticipated that £1,000 a year will be saved in coal consumption.
Haslingden.—The tenders of Messrs. Ferranti, Ltd., for switchboard and accessories, and the British Westinghouse Co. for static tranformers, have been accepted.
New Zealand.—The tender of Messrs. G. Chambers & Son for Babcock & Wilcox boilers at the Auckland Power Station has been accepted at £21,844. The tender of Messrs. A. & T. Burt on behalf of Messrs. Siemens Bros. & Co. for generating plant (Bellis engines) at £34,484 has also been accepted.
Stoke-on-Trent.—All the contracts in connection with the new power scheme have now been accepted. Whereas the original estimates put the total cost at £60,000, the actual figure does not exceed £55,000. We give the list of accepted tenders below:—Turbo generators, Jas. Howden & Co., Ltd., £8,905; rotary converters, British Westinghouse Co., Ltd., £3,800; motor converters, Bruce Peebles & Co., Ltd., £2,250; motor generators, Siemens Brothers, Ltd., £2,385; mains and cables, Callenders Cable and Construction Co., Ltd., £13,093 10s. 10d.; switchgear, British Westinghouse Co., Ltd., £6,651; boilers, Stirling Boiler Co., Ltd., £5,040; cooling towers, Davenport Engine Co., Ltd., £1,053; steam pipes, &c., Aiton & Co., £1,128 12s.; coal bunkers, &c., New Conveyor Co., Ltd., £1,426; steam feed pump, G. & J. Weir, Ltd., £113; secondary battery, D.P. Battery Co., Ltd., £91; transformers, British Westinghouse Co., Ltd., £364; motor generator (D.C.), Bruce Peebles & Co., Ltd., £225; 15-ton crane, Herbert Morris & Bastert, Ltd., £229; electric feed pump, British Westinghouse Co., Ltd., £180.
Yarmouth.—The tender of Messrs. Bowers & Barr has been accepted by the Yarmouth Port and Haven Commission for an electric lighting installation on the South Pier.

APPOINTMENTS AND PERSONAL NOTES

The recommendation of the Brighton Electricity Committee that the salary of Mr. C. C. Fowler, Assistant Manager of the Department, should be increased from £350 to £400 per annum, has been rejected by the Council. It would appear that the majority of the Brighton Council have determined to set their face against any increase in the salaries of officials, at any rate for the present, and Mr. Fowler is not the only official who has suffered from this frame of mind of the Council.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 5s. (last week the same).
Hope's "Bi-Metal" Fuse Wire.—To prevent misunderstanding, we are asked to point out that this new fuse wire is Mr. Vernon Hope's invention, and the patent is owned by Messrs. Parmiter, Hope & Sugden, of Hulme Electrical Works, Manchester. The fuse wire is manufactured by Simplex Conduits, Ltd., and sold by them, under license, at the same price as the patentees.
Western Electric Telephone Number.—The North Woolwich Works telephone number of the Western Electric Co., Ltd., is now 3840 East (10 lines) in place of 1400 East.
Lacquers for Steel.—The Frederick Crane Chemical Co. (22 & 23 Newhall Hill, Birmingham) are making a speciality of lacquers for preventing rusting of carpenters' and other tools without the necessity for greasing. These lacquers may be applied by dipping, brushing, or spraying, and for the last process the company make a special machine.
The G.E.C. Athletic Club.—The G.E.C. Athletic Club opened their football season on Saturday last on their new ground at Willesden with a stirring game between Head Office (Osram F.C.) and Queenhithe Branch (Magnet F.C.). Mr. H. Hirst, the Chairman of the Company, kicked off, and a hard-fought game resulted in a win for the "Osram" team by 3 goals to 2. The Secretary will be pleased to hear from any club connected with the industry with a view to fixing up matches for the coming season.
The Lazilite Co.—One of the late-comers to the Electrical Exhibition who are unfortunately not mentioned in the catalogue is the Lazilite Co., Southampton House, High Holborn, who have a stand (No. 316) in the gallery, where a new extensible fitting is being shown.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Dick, Kerr & Co.—At the annual meeting on Thursday, the report and accounts, given in our issue of September 21st, were adopted. Mr. John Kerr, who presided, said that the development of electrical power in iron works and the textile trades had shown some progress during the year, and the greatest interest had now been awakened in these outlets for the use of electricity. After commenting upon the keen competition between home manufacturers, which he said was increased by our Free Trade system, he referred to the company's efforts in the manufacture of steam turbines. Their efforts in this direction were made with satisfactory results. In view of the enormous demand for metal filament lamps, the directors had decided to add a lamp factory, and, in order to avoid the danger of experimental work, had availed themselves of the experience of a Continental company. The factory was now approaching completion, and it was the intention of the Board to push this branch with vigour. The prospects in the future were encouraging, and as soon as the Continental international difficulties were settled, a large amount of foreign work which was held in suspense could be proceeded with. In conclusion, he mentioned that in consequence of the lamented death of Mr. G. Flett, the Board had appointed Mr. Schultz assistant managing director. As the result of subscriptions by the staff and directors, a bed had been endowed in the London Hospital to commemorate the late Mr. Flett's memory.
Drake & Gorham.—The report for the year to June 30th shows a net profit of £7,184, to which is to be added £1,242 brought forward. A dividend at the rate of 4½ per cent. per annum is recommended, and after transferring £1,500 towards writing off part of the underwriting commission, the sum of £1,301 12s. is carried forward.
Cleveland & Durham Electric Power Co.—The report and accounts, given in our last issue, were adopted at the meeting of the company last week after some strong criticisms on the part of a shareholder. This gentleman stated that he failed to see any satisfactory feature in the company's business at all. The bulk supply of electricity to the Northern Counties Co., which had been a prominent feature in the last prospectus, had failed to produce any dividend, and, whilst the gross profits were most unsatisfactory, £5,000 more would be required next year for interest. He advocated a thorough investigation of the company's business by an independent expert. The report was carried with only this shareholder as a dissentient.
County of Durham Electrical Power Distribution Co.—A circular has been sent to the shareholders, pointing out that whilst the profits of the first six months of the current year are slightly better than those of the same period of last year, the directors, in view of the disturbed condition of the labour world and the possible dislocation of local trades which may follow therefrom, do not think it advisable to declare an interim dividend on the preference shares.

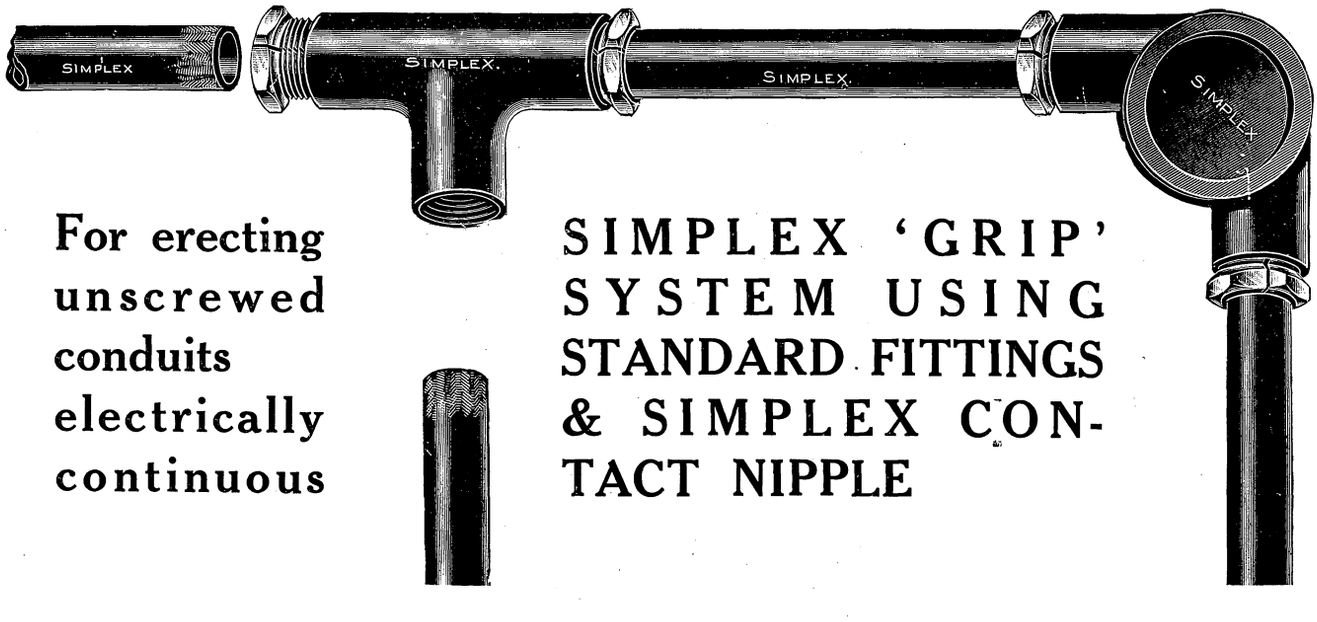
A GOOD GRIP

between the tube and the fitting is the one essential on all conduit systems which require to be erected electrically continuous. The solving of the problem of rendering a socket-joint conduit system electrically continuous depends on the efficiency of the grip. There have been dozens of different devices introduced at one time and another with a view to obtaining this grip and efficient electrical continuity, but, with the exception of the Simplex "Grip" Continuity System, they all fail (if it is possible to judge from the relative popularity enjoyed by them as compared with the Simplex "Grip" System), either owing to their being impractical or on the score of cost. The latter point, it must be remembered, is of the first importance. Any system of rendering the ordinary unscrewed conduit electrically continuous when erected, must not increase the cost of the system erected to any considerable extent when compared with an ordinary socket job. Further, all the fittings used must be standard type.

Prior to 1904, the date on which the Simplex "Grip" System was introduced, there was no satisfactory method on the market of rendering the unscrewed system electrically continuous; other devices have since been introduced, but in a large measure they have failed, and the Simplex "Grip" System is now looked upon as the best under all headings.

The Pin Contact System has been introduced to still further cheapen wiring costs, but at the same time providing an electrically continuous system. The method approximates still more closely to the simple "Socket" junction with a small addition, negligible in cost, in the form of a hardened steel pin or wedge. This is inserted in a slot in the fitting as shown in the accompanying diagram between the external surface of the conduit and the inside of the fitting, the small slot being provided in the latter to give the pin a larger contact surface. This junction forms an equally neat and efficient junction as the ordinary "socket," at practically the same cost for material and labour. The following advantages may be enumerated:—

1. Lowest costs *erected* of any system providing for electrical continuity.
2. No screwing tools required.
3. No twisting of the cables.
4. Standard conduits and fittings used throughout.
5. Permanent electrical continuity.



Designed for use with Light Gauge conduit and screwed fittings of standard pattern, it meets the object for which it was primarily designed, viz., for providing a cheap and effective method of allowing a low cost light-gauge conduit installation to be erected electrically continuous throughout. It retains the advantages of the Plain Socket System as mentioned previously. The additional accessory known as the "Simplex Contact Nipple" is manufactured from hexagon steel rod, and has a plain internal surface (similar to the interior of a nipple on a fitting when used with the socket junction) with a slightly coned thread outside. A longitudinal saw cut runs throughout the length.

The illustration shows the general application of the Simplex "Grip" System.

When erecting on this system it should be noted that the Simplex Company have made a very close study of the question of electrical continuity and conduit-wiring matters generally. Many of the developments which have taken place in the Simplex Steel Conduit System and its application to practical requirements have undoubtedly been the outcome of numerous helpful suggestions received by the Simplex Company from their clients. These suggestions have always been welcome and appreciated.

Electrical Engineers visiting the Exhibition at Olympia who have practical suggestions to make on the design or application of the Simplex Steel Conduit System should, if possible, make a point of visiting

STAND Nos. 148 AND 163.

THE ELECTRICAL EXHIBITION OF 1911

(FOURTH NOTICE.)

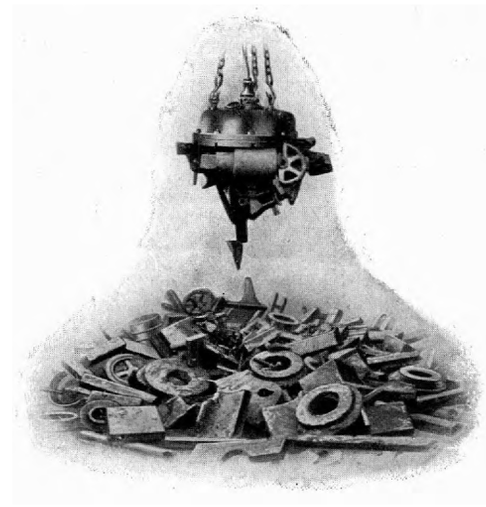
TOWARDS the end of last week the numbers visiting the exhibition somewhat increased, and on Saturday evening Olympia was quite crowded. On Monday and Tuesday, however, the exhibition was very thinly attended except by the exhibitors and their staffs, who are certainly indefatigable. Those exhibitors whose products appeal to the select few, or to the electrical engineering rather than to the general public, are expressing themselves well satisfied with the visits to their stands and the inquiries left there, but manufacturers whose goods are exhibited largely for the benefit of the general public, are still complaining that the number of visitors remains so few.

Among those who visited the exhibition on Tuesday and yesterday were central station engineers and members of electricity committees from Hackney, Kettering, Stafford, Salisbury Electric Lighting Co., Southend, Woking Electric Supply Co., Lowestoft Corporation, Newport (Mon.), and Gillingham.

To-day visits from Lowestoft, Newport (Mon.), Stratford-on-Avon, Darlington, Colne, West Ham, Ipswich, Sheffield, Hampstead, Hereford, Newcastle-under-Lyne, and Dover are expected, and Mr. Bury, of the East India Railway of Calcutta, proposes to visit the exhibition.

On Friday there will be deputations from Hammersmith (accompanied by the Mayor), Birmingham, Manchester, Perth (accompanied by the Lord Provost), Gravesend, Chester, and Merthyr-Tydvil.

On Saturday the visitors from Manchester, Merthyr-Tydvil, and Chester will pay a second visit, and there will be representatives from Govan, Shipley, Gloucester, and Colchester.



Several other supply-station engineers from the provinces have also notified their intention of coming up, in some cases alone, and in others with members of their committees. Exhibitors are reminded that the dinner of the British Electrical Manufacturers' and Allied Trades Association will be held this evening (Thursday), and we may add that Thursday and Friday are likely to be busy days at the exhibition, as several gentlemen coming up to the dinner from the provinces will be paying visits to the exhibition.

The electricity supply companies are now giving popular lectures at their stand (having engaged Mr. Borlase Matthews for this purpose), and are also holding competitions designed to appeal to the consumer.

A rumour was in circulation on Tuesday that the King intended to visit Olympia in the afternoon, but this report was without foundation.

The Witton-Kramer Lifting Magnet

SINCE the latter part of last week, demonstrations of the Witton-Kramer lifting magnet have been carried out at frequent intervals every day on one of the General Electric Company's stands. The magnet used is capable of lifting seven tons, and is 36 inches in diameter. It is supplied with 17 amperes D.-C. at 220 volts. The demonstration, which

is in the charge of Mr. H. Thomas, has attracted crowds of visitors round it, especially on Saturday.

Piles of scrap-iron, several heavy pigs of cast-iron, and bags of steel turnings are lifted by the magnet, and the current is then turned off to allow them to drop with a crash. Magnets of this class are being widely used in large engineering shops, shipyards, etc., and are found of considerable service for moving about heavy iron and steel parts of miscellaneous shapes. We understand that an order for fifteen of these lifting magnets has been placed by the Japanese Navy through Sir William Arrol.

TECHNICAL BOOKS

There are few booksellers who are in a position to keep in stock a complete library of the latest and best technical books. It is an enormous convenience to engineers and students who wish to obtain a book on any particular subject if they can go to a bookshop with the confidence that they can immediately be shown there the latest, best, and most up-to-date books which treat of it.

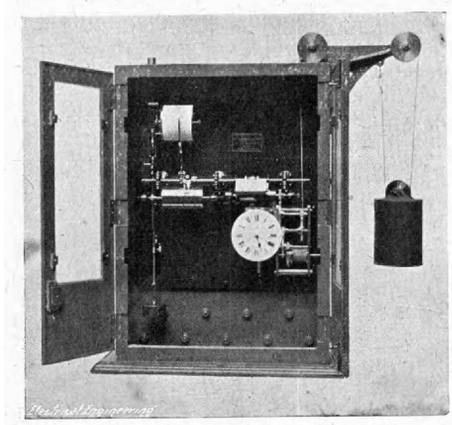
Arrangements have been made by the Kilowatt Publishing Co., Ltd., to afford this facility to electrical engineers who are visiting the Electrical Exhibition at Olympia.

At Stand No. 152, which bears in bold letters the legend "Electrical Engineering," there is, open to inspection and purchase, almost every good book on electrical and allied subjects. These have been selected under the guidance of the editorial and reviewing staff of ELECTRICAL ENGINEERING, which includes eminent specialists in all branches. The stand is situated near the centre of the hall, slightly to the right of the main avenue.

Hosted by Google

SOME OF THE EXHIBITS

Marconi's Wireless Telegraph Co., Ltd.,



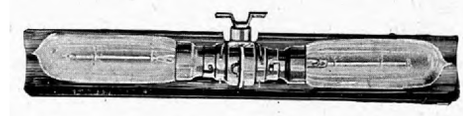
WATERGATE HOUSE, ADELPHI, W.C. (STAND NOS. 154 & 246.)

Wireless Telegraph Equipment.—On their stand in the main hall the company have erected one of their standard ship pattern 1½-k.w. wireless telegraph sets, as used upon large numbers of liners. This equipment has a working range up to about 2,000 miles, and is of the size most usual on passenger ships. In some special cases, such as the *Olympic*, larger sets up to 5 k.w. are employed, and for cargo boats, &c., a ½-kw. set has been recently developed. One of these is shown in action on the company's stand in the gallery. Both sets shown are provided with short aerials, mounted on the standard Bradfield ship insulator, so that they can intercommunicate, but distant messages are not being taken at the exhibition. In the standard ship sets as here exemplified, current is taken usually from the ship's lighting circuit, but a battery of accumulators and a coil are provided for emergency work. The D.-C. supply is first converted to A.-C. at 100 volts by a small converter set, and is then stepped up to 40,000 volts by a special oil transformer. At this pressure it is supplied to the rotary disc-type discharger, mounted for convenience on the shaft of the converter. This is constructed to give four sparks per revolution, the regular sequence of which produces a clear musical note in the receiving telephone, easily distinguishable from the effect of atmospheric disturbances. The whole of the transmitting apparatus, except the sending key, control switches, &c., is placed inside a sound-proof cabinet. The principal item of the receiving equipment is the Marconi travelling band magnetic detector used in conjunction with the Marconi multiple tuner with variable condensers, by which adjustment can be made over a great range of wave lengths. The ½-kw. set in the gallery is generally similar. The converter, however, has a vertical instead of a horizontal shaft, and the discharger is enclosed in a silencing casing ventilated by a small fan. An air-cooled transformer is used, and the condenser consists of a battery of glass tubes which are copper-plated inside and outside, carried on a metal stand and fitted with a protecting spark gap. There is thus entire absence of oil tanks for either the transformers or condensers. In addition to these two complete sets, the company show a few other examples of wireless telegraph apparatus, including their wave meter and an example of their latest receiver of the oscillation valve type mounted complete as one piece of apparatus with the multiple tuner.

The Lea Recorder Co.,

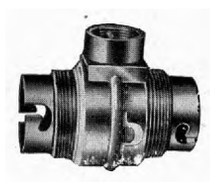
28 DEANSGATE, MANCHESTER. (STAND NO. 28.)

Water Recorders.—In addition to the standard pattern of their well-known recorders of the flow of water through a V notch, the company are showing a new pattern of instrument in which, as well as a record being obtained on a paper drum, there is also an integrating mechanism reading on



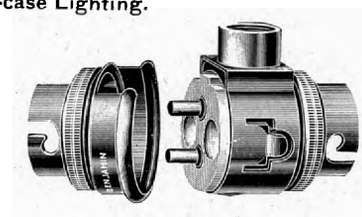
New Integrating Form of Lea Water Recorder.

meter dials. In this mechanism the counting train is put in gear with a drum, continuously driven by a clock movement, for a greater or less part of each revolution according to the rate of flow of the water at the time. This drum has teeth extending over a varying portion of its actual length, which gear into the counting train pinions as they come round. An illustration of the complete instrument is given here, from which it will be seen that the left-hand part is the standard Lea recorder, and that the integrating mechanism is worked by an extension of the same travelling spindle which carries the recording pen. The position of this is determined by the thread on the surface of the main drum driven by the float, cut in a curve corresponding to the law connecting head and flow in a V notch.



Benjamin Electric Co., Ltd.,

117 VICTORIA STREET, S.W. (STAND NO. 151.)



The large number of ingenious devices at the small stand of the Benjamin Electric Co. are attracting much attention. The "wireless cluster" fitting is well known, which takes the place of the ordinary ball fitting so troublesome to wire. Clusters of lamp-holders from two to ten in number are mounted on the fitting, which is internally connected, so that it is only necessary to bring the wires to a pair of conveniently accessible terminals. A collection of reflectors for shop-window lighting, in which this firm specialises, are exhibited: we illustrate one of these—an adjustable reflector in which the reflector itself can be rotated round the lamps so as to throw the light in any desired direction. The reflector can also be pulled off for cleaning without loosening any screws. In these double reflectors a special twin lamp-holder is now employed, shown in our next two illustrations. This, it is seen, is considerably shorter and more compact than two ordinary holders placed end on, and, in saving length, increases the available useful length of the reflector. Wiring contractors who have much shop-window lighting to do will be well advised to obtain particulars of such accessories from the Benjamin Co. Another speciality of the firm is the "Benco" weatherproof lamp-holder; the illustrations above show the construction. Another weatherproof holder made of china throughout instead of metal is shown at this stand. Besides being weatherproof it is of neat appearance and is particularly to be recommended for outside signs. Some thousands are in use at the exhibition, and it is employed on the effective sign on the Pope Electric Lamp Co.'s stand. Our last illustration is a "friction drive" screw-driver with a loose head and free swivel connection. This tool can be easily worked with one hand. During the forward rotation

ALTERNATING CURRENT METERS

The ELECTRICAL COMPANY'S SINGLE-PHASE METER has many unique features :—

It is thoroughly reliable ;

It is easy to adjust, both for low loads, heavy loads, and alterations in the power factor of the circuit ;

It runs on a ball footstep bearing ;

It has a self-oiling top bearing ;

The cyclometer dial is of our own special pattern, which experience has shown to be THE BEST ;

The coils are wound on our special machines of our own design, and the possibility of breakage of the wire, or failure of the insulation, is effectually precluded ;

Variations in pressure and frequency over exceedingly wide limits do not affect its accuracy ;

It has large overload capacity ;

It has low losses ;

The terminals are substantial and convenient for use ;

It is PERMANENTLY SATISFACTORY in every respect.

When you are tired of cut prices and cut quality, try our meter for a change. It will please you.

THE ELECTRICAL CO L^TD

Hosted by Google

the frictional surfaces between the cap and the remainder of the handle engage, and the spring in the handle releases the friction on the return motion, so that the cap does not then rotate with the palm of the hand. It is far more convenient to use than the ordinary screw-driver.

Electromotors, Ltd.,

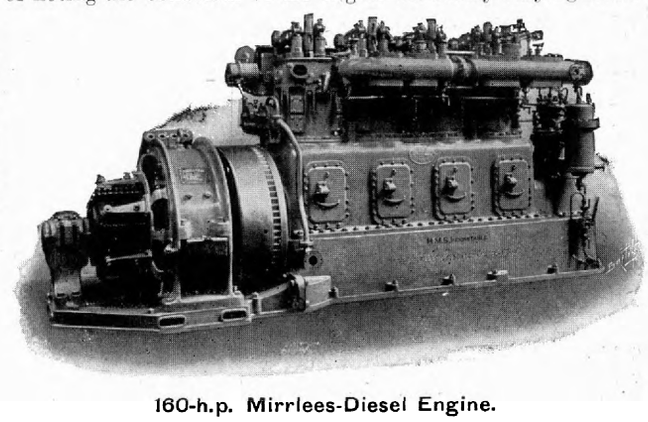
OPENSHAW, MANCHESTER. (STAND NOS. 126 & 133.)

Continuous Current Motors and Dynamos.—On this attractively arranged stand, which has no partitions, pillars, or roof to obstruct the view of the exhibits themselves, are displayed numerous examples of the high-class continuous motors and dynamos in which the firm specialise, with some examples of their applications. A representative series of standard enclosed ventilated machine, ranging from 1 to 30-h.p., is staged, and the particularly easy accessibility of the brush-gear and the several good points of the brush-gear itself, in which the brushes can readily be withdrawn and replaced when the motor is running, can be studied. An interesting machine is the 20-h.p. pipe-ventilated motor similar to the one illustrated, but provided with a weatherproof cowl over the air outlet. These motors are self-ventilating by means of a fan carried on the armature, but have the advantages of a fully enclosed motor. A small 4-kw. steam ship-lighting set is also shown, and motors are exhibited driving plunger and centrifugal pumps and fans of various patterns. Attention should also be drawn to a compact electrically-driven builders' 5-cwt. friction hoist, made throughout by the company, and a motor complete with worm-gear and electric brake, as supplied to lift makers.

Pipe Ventilated Motor (Electromotors, Ltd.).

R. Waygood and Co., Ltd.,

FALMOUTH ROAD, S.E. (STAND NOS. 75 & 97.)



Electric Lifts.—This stand is so placed that visitors can be taken by an electric lift forming one of the exhibits direct to the gallery. This is fitted with car-switch control, and is driven by a contact machine at the side with under-driven worm-geared drum, and with the motor and control board mounted on one bed-plate, all the connections being neatly arranged on a small slate panel. A very fine model of a full automatic push-button passenger lift is also to be seen on the stand, as well as a band-power goods lift. A new pattern of electric goods lift is shown at work, capable of raising ½ cwt. at about 100 feet per minute through a travel of 15 feet. This is controlled by three pushes, up, down, and stop, and has a novel arrangement of a single steel guide on one side. Numerous safety appliances are shown, both on these lifts and separately, and among these may be specially mentioned an electrically-actuated rope grip, which prevents the rope of a rope-controlled lift being pulled when any gate or door is open, and also instantly brings the car to rest should a gate be opened when it is in motion. This is equally applicable to hydraulic and electric rope-controlled lifts. Another new device, exhibited for the first time, is a partly electrical and partly mechanical gate lock, which prevents the gate being opened unless the car is at the floor in question. The usual slack cable and other devices are shown on the working lifts, and an effective demonstration of the working of the latter was made on the lift to the gallery by purposely loosening one of the ropes.

Mirrlees, Bickerton & Day, Ltd.,

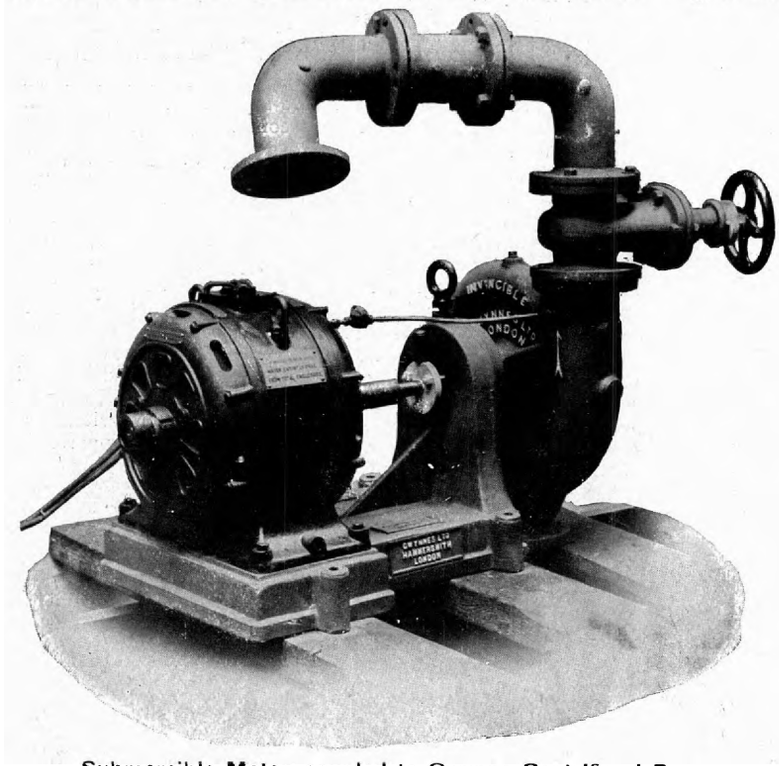
HAZELGROVE, NEAR STOCKPORT. (STAND NO. 8.)

Diesel Engine.—The only generating set of considerable size running in the exhibition is the 160-h.p. Diesel engine on this stand. It is of the four-cylinder, completely enclosed design, with forced lubrication similar to a number of engines supplied for driving dynamos on British warships, and is direct coupled to a 105-k.w. continuous current dynamo running at 400 r.p.m., made by the Lancashire Dynamo and Motor Co.

Four separate oil supply tanks containing different oils, respectively Texas, shale, gas, and paraffin oils, are connected with the engine in such a manner that the engine can be switched over from one grade of oil to another, whilst running, the object of this arrangement being to demonstrate that no alterations are necessary to enable the engine to work with widely varying qualities of oil. The dynamo is connected with a water resistance, and suitable switches are provided, so that full load or partial loads can be switched on and off as desired. Thus visitors will have an opportunity of noting the behaviour of the engine on widely-varying loads.

160-h.p. Mirrlees-Diesel Engine.

Among the special features of the engine may be mentioned the compressed air starting arrangements fitted to two of the cylinders. The starting lever lowers the fuel valve levers of the cylinders away from their cams, and puts in action the levers actuating the special compressed air valves. A two-stage air compressor of a particularly silent pattern is employed, in which the valves and valve seats are very easily drawn out for inspection. Special provision is also made for the easy removal of the main exhaust valves without dismantling other parts by the construction of the exhaust valve levers in two parts bolted together. The fuel pump has separate plungers for each cylinder, and the governor controls the time of opening of its suction valves carrying a varying proportion of oil, to be returned to the tank when the whole cylinderful is not required. The speed is governed to well within 3 per cent. The set is remarkably compact, and only occupies 8 ft. by 18 ft. of floor space.



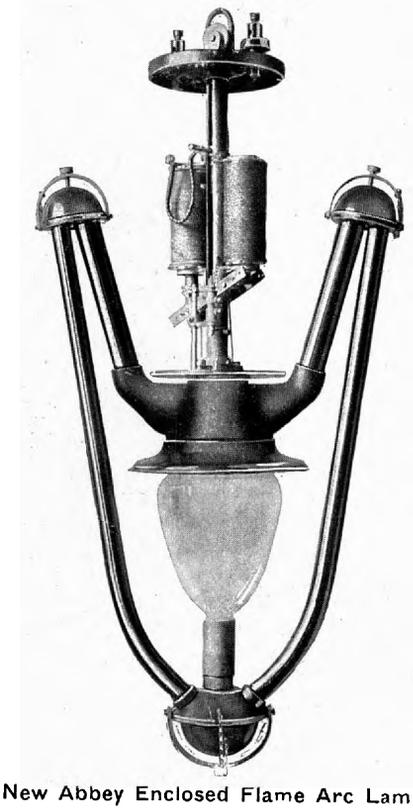
Submersible Motors, Ltd.,

23 ST. SWITHIN'S LANE, E.C. (STAND NOS. 317 & 318.)

Motors to work under water.—A striking exhibit in the gallery is that of this company, who show a three-phase induction motor of the "Macdonald" submersible type working under water and driving a Gwynne centrifugal pump, delivering 30,000 gallons per hour. These motors, the great utility of which is obvious, are made at the J. L. Works, Southall, and do not depend on being water-tight or totally enclosed, but, on the contrary, water is encouraged to circulate around and within the motor to assist in cooling; and, indeed, a greater output is obtainable submerged than in the air. A by-pass pipe, connected to the delivery side of the pump, supplies water to and forces it through the interior of the motor. This tends to keep down its temperature, and enables a greater output to be obtained from the motor when it is immersed than when it is working dry. A certain amount of work is wasted in the churning of water by the rotor, but it is stated that this is small, and that the overall efficiency of the motor compares favourably with that of motors working under more usual conditions. The stator windings are covered with a special waterproof insulation, but the rotor is not so fully protected, but relies on the fact that it is so designed

Hosted by Google

that no part differs in voltage from any other part by as much as 1·5 volts, so that the water cannot be electrolysed and acts as an insulator. The motor should have an enormous



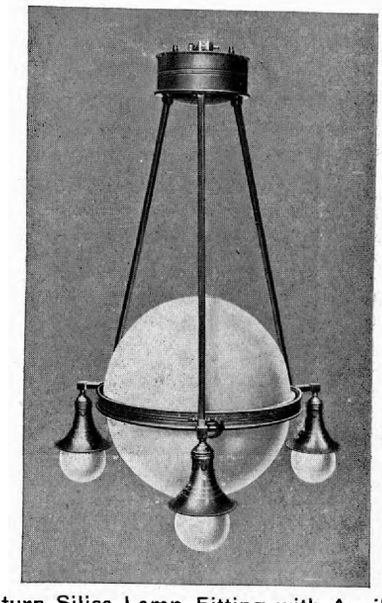
Submersible Motor, coupled to Gwynne Centrifugal Pump, as shown running under water.

field of utility in mining and salvage work, as well as for a variety of other purposes. Examples of the J. L. motor with laminated fields, special brush gear, and several other original features to recommend it are also shown.

The Abbey Electric Co.,

17 Victoria Street, S.W. (Stand No. 5.)

Arc Lamps.—A new enclosed flame arc lamp, made in the 350 to 400-watt size, and with several points of originality and



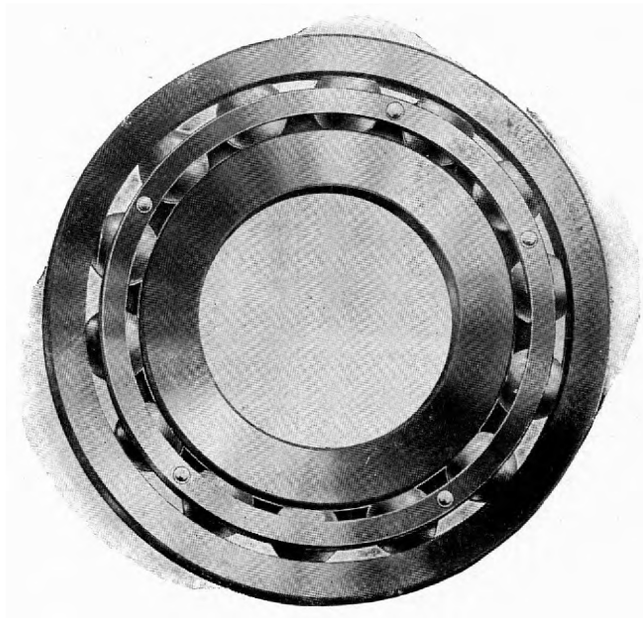
New Abbey Enclosed Flame Arc Lamp.

interest, is shown. The general arrangement of the lamp is seen in the above illustration. The tubes at the side permit of a thorough circulation and cooling of the gases, causing all fumes to condense in the tubes, thus keeping the glass clear. The covers at the elbows are easily removed, but the tubes only need to be cleaned out about every other time the lamp is trimmed. The feed mechanism is of the simplest character, with a clutch and rocking arm worked by shunt and series solenoids, and a substitutional resistance with automatic cut-in can be provided inside the case. The most interesting feature of the lamp is the special carbon employed, made by the Fluorundum Flame Carbon Company, of Brighton; this is hollow-cored and cylindrical, with the chemical composition outside the carbon. As the thickness of the chemical coating is uniform, which is not the case with fluted carbons, the arc can travel round without causing any flickering. The outside chemical material is quite non-deliquescent, so that the carbons can be kept in stock any length of time without special protection. The colour of the light they give is the pleasantest we have seen of any arc lamp, being a pale cream colour, sufficiently yellow to give good fog penetration while white enough to distinguish colours well. Several details of the lamp are well thought out, as, for example, the rubber connection to the bottom of the globe, which allows the top to make an air-tight joint even if a little out of truth. 20 to 30 hours' burning can be obtained with one pair of carbons with continuous current, but in the A.-C. lamp, where the carbons are of the same size, 40 hours' burning can be attained. An important feature of the lamp is that, contrary to the practice with some lamps of the same class, the case is insulated from both poles, and is therefore not live when the lamp is alight. Another new lamp shown is a long-burning enclosed lamp with three pairs of carbons in parallel, giving 200 to 400 hours of burning.

The Westinghouse Cooper Hewitt Co., Ltd.,

151–2 Great Saffron Hill, E.C. (Stand No. 82.)

Mercury Vapour Lamps, Fluorescent Reflectors, Silica Lamps.—The most interesting novelty on this stand is the new light-transforming reflector, coated with fluorescent material, which actually transforms some of the rays falling upon it from an ordinary mercury vapour lamp to a lower frequency, and thus, without any auxiliary light source, supplies the



Saturn Silica Lamp Fitting with Auxiliary Incandescent Lamps.

reddish rays which are otherwise wanting in the spectrum of the lamp, and gives the resulting light a pleasanter colour, making the economy of the mercury vapour lamp available over a greater range of conditions than heretofore. The ordinary long inclined glass tube lamps (see Electrical Engineering, Vol. III., January 2nd, 1908, page 19) and the newer

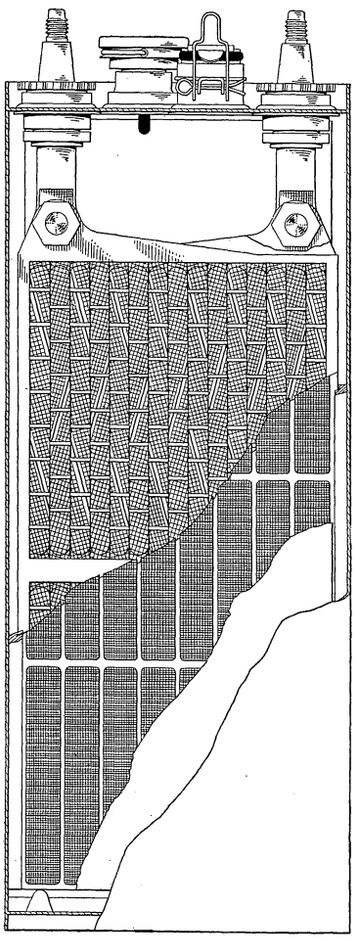
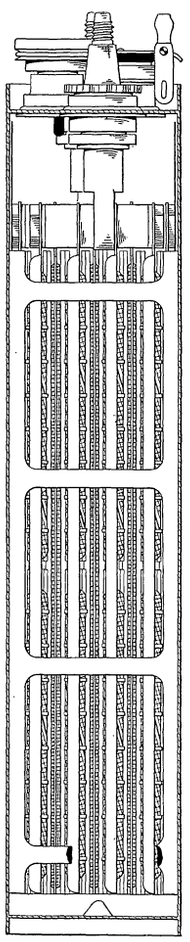
CABLE FOR ALL PURPOSES, SPECIALITIES IN ELECTRICAL SUPPLIES



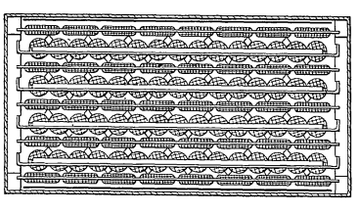
Hosted by Google

silica lamp (see ELECTRICAL ENGINEERING, Vol. VI., October 13th, 1910, page 646) are shown in various patterns. One of the new forms in which the latter now appears, combined with a few incandescent lamps to improve the colour of the light, is shown in the accompanying illustration. Mercury vapour rectifiers are also shown, as well as plant for the sterilisation of water by the ultra-violet rays emitted by the mercury arc. The mercury vapour lamp appears to be making rapid headway in this country, and is already largely appreciated in works, including printing and textile as well as engineering establishments, where well diffused illumination is desired. An efficiency of 0·33 to 0·37 watt per c.p. can be attained, and the colour objection has been proved by experience to disappear largely with continued use.

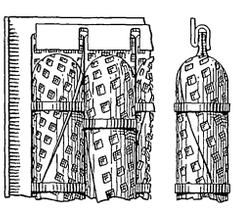


The Edison Manufacturing Co.,

EDISON WORKS, WILLESDEN JUNCTION, N.W. (STAND No. 252.)



The Edison Storage Battery.—Quite an important feature of the exhibition is the display of the long-talked-of Edison storage cells, which the above company are now putting on the market in England. The general construction of the



Sectional Elevation.

End View of Interior.

Section.

Detail of Positive Plate. (Full Size)

Details of A4 Edison Cell.

battery with its positive plates carrying rows of perforated tubes containing finely divided nickel and nickel hydrate, its negative plates with pockets filled with iron oxide, and its electrolyte consisting principally of potassium hydrate, is familiar to our readers (see ELECTRICAL ENGINEERING, May 19th, 1910, page 319). The accompanying illustration shows some of the details of one of the types. The method of preparation of the thin zinc flakes for the positive active material is of some interest. A plate about one millimetre thick is first made up of 250 alternate layers of electrolytically deposited copper on nickel; this is chopped into small fragments, and finally the copper is dissolved out, leaving the fine nickel flakes required. The claims of the battery as regards lightness are well known. Something approaching double the ampere-hour capacity of a lead battery of equal weight is claimed, but it must not be forgotten that the voltage is lower (1·7 volts), and the first cost is higher. This last is, however, offset by the greater durability of the Edison cell and its comparative immunity from evil effects of both mechanical and electrical rough handling. Most striking curves of test are shown on the stand, illustrating the way the cell may be short-circuited, repeatedly discharged to zero voltage, reversed, or left unused for long periods without apparent diminution in its capacity. The results of test after mechanical vibration and shock are equally striking. The cell is shown in sizes ranging from the A8 300 ampere-hour cell for tramcar work, &c., down to the B2 40 ampere-hour ignition cell. The latter are shown made up into sets for motor-car lighting and ignition, the set of five cells of the smallest size weighing complete 25 lbs. All are guaranteed for five years. The Edison primary and alkaline battery for telegraph and other work is also being shown on the stand.

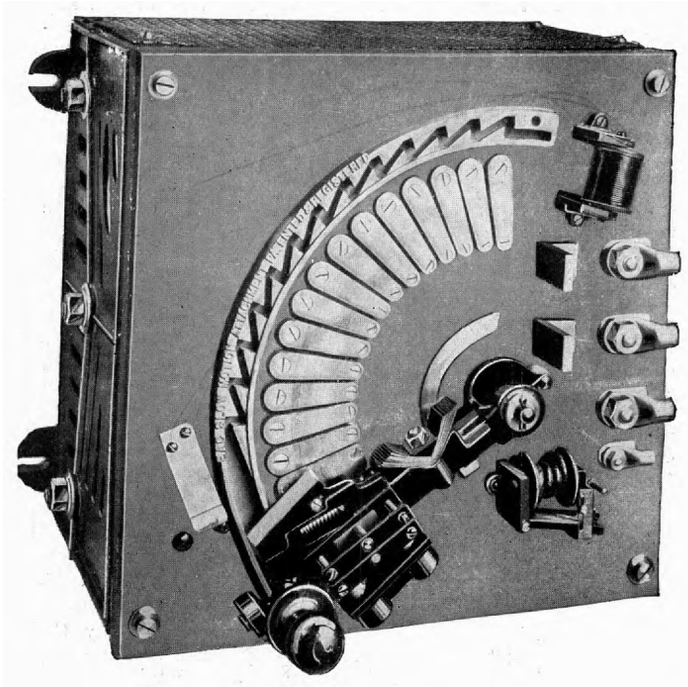
The Edison & Swan United Electric Light Co., Ltd.,

36 & 37 QUEEN STREET, E.C. (STAND NOS. 15, 16, 45, 46, 98, & 117.)

Incandescent Lamps.—At the stand represented by the first four of these numbers the company make a brave display of their well-known Royal Ediswan metal filament (tungsten) and carbon lamps. Their lamps are also further exemplified in four large signs in the hall, lighted entirely by 16-c.p. Ediswan metal filament lamps. These lamps are now made for voltages from 2 to 260, and the candle-powers range from 1 to 1,000; and we understand that the company have for some little time been turning out 200-volt metal filament lamps of as small a size as 16-c.p.

Switches, Instruments, &c.—The company's other stand is devoted to switchgear, instruments, &c. Their well-known Philatta switch is, of course, well represented, and among the large collection of switches, wall sockets and plugs, adapters, fuses, ceiling roses, lampholders, and other installation accessories, we notice one or two novelties, including combined switches and wall plugs, where the action of inserting and withdrawing the plug pushes a switch inside the socket mechanically on and off, so that there are no exposed live conductors when the plug is out; and another variety in which the shape of the plug is such that the action of removing it knocks off the ordinary tumbler handle of the switch. The special screw-holders for high candle-power metal filament lamps should also be mentioned.

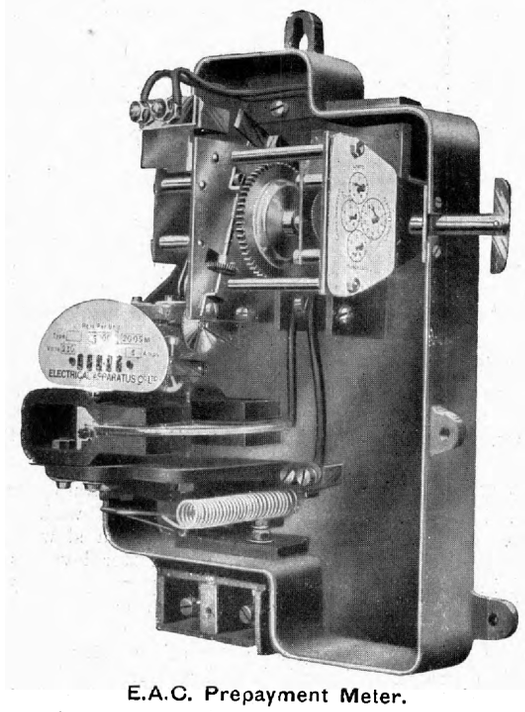
A particularly striking feature of the accessories stand is the demonstration of the company's water-tight instruments, which are shown immersed in a trough of water. Among other examples of the varying work carried on at the Ediswan factory are shown parts of the Electrelle piano, and the display of tubular fuses should also be mentioned. Among the fittings are some attractive examples of train lighting fittings considerably in advance of those usually seen for this class of work.



The Electrical Apparatus Co., Ltd.,

VAUXHALL WORKS, SOUTH LAMBETH ROAD, S.W. (STAND NOS. 24 & 37.)

Motor Starters.—On this stand is shown a group of motor starters, including some interesting patterns with special features. One of these, illustrated here, is a slow motion starter, in which a pin carried by the starter lever is constrained in a zigzag path necessitating a pause on every step forward, although the actual change from each step to the next is made rapidly. A considerable range of other types of starter are shown, including an automatic starter comprising a solenoid operated main switch and starter combined. The single-phase induction motor starter controlling both the stator and motor circuits with one handle, worked like that of a continuous current starter, which was described in ELECTRICAL ENGINEERING (June 15th, p. 331), was also shown, and another interesting piece of motor control apparatus is a reversing starter consisting of an ordinary lever starter interlocked with a separate reversing switch, so that neither can be moved unless the other is in the proper position. A particularly neatly arranged potentiometer regulator with one



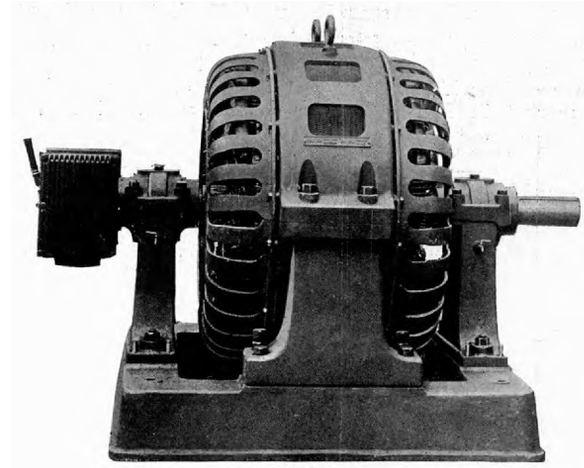
Hosted by Google

arm and one set of contacts and with a reversing switch which is knocked over by the regulator switch arm as it passes through the zero position.

Step by Step Slow Motion Starter.

Meters.—Examples are shown of the E.A.C. high torque meter for direct current, which is used by over 120 central stations in the Kingdom. It is particularly suitable for registering small currents, as, being of the commutator type, it can be made as accurate in small as in large capacities. The insulation is mica, the commutator and brushes are 18 carat gold, and the armature coils are totally enclosed in an aluminium case. The meter case is of cast iron, and the joint is packed so as to be absolutely dust proof. This meter is claimed by the makers to have a higher torque than any other

E.A.C. Prepayment Meter.



on the market. The company's new prepayment meter, which is also illustrated here, is exhibited for the first time. It comprises the same parts combined with a patent prepayment mechanism, which requires practically no extra work on the part of the motive element; the force for opening the switch is provided by the user when inserting coins.

Other Exhibits.—The company also show cinematograph regulating resistances and examples of their "Koolark" cartridge fuse, in which a liquid is liberated to quench the arc, as well as Electrostan fuse wire with a specially low melting point.

Phœnix Dynamo Manufacturing Co., Ltd.,

THORNBURY WORKS, BRADFORD. (STAND NOS. 59 & 64.)

Mining and other Motors.—One of the most notable of the exhibits on this stand is the 300-B.H.P. 3,000-volt slip ring induction motor illustrated here. This is a special type of machine for running haulages underground, and has the slip rings and all rare contacts enclosed in flame-proof boxes fitted with the Phœnix patent explosion-proof gland, and with all the insulation thoroughly moisture proof. An example of the

300 h.p. Mining Motor with Enclosed Slip Rings.

fully enclosed mining motor which has been developed by the firm is also shown, and another interesting item is a motor-driven plating dynamo. In this machine a special armature winding is employed, by means of which the designers claim that the resistance voltage is reduced to about half its ordinary value, resulting in much better wear of the commutator than is usual in heavy-current machines. A self-regulating electrically driven plunger pump for country-house work, &c., is also shown. Other exhibits include electric drills, grinders, and other portable tools.

Vedovelli, Priestley et Cie.,

PARIS. (LONDON AGENTS: LAING, WHARTON, LTD., 7 GREAT NEWPORT STREET, W.C.) (STAND NOS. 56 & 67.)

Electric Traction Material, &c.—One of the most interesting exhibits on this stand is an example of the light triangular lattice steel conductor used in Messrs. Vedovelli, Priestley's system of semi-rigid overhead construction for single-phase railways, which is one of the six systems (two constructed by this firm) now in experimental use on the French Midi Railway for a contact line pressure of 12,000 volts. This conductor is constructed in lengths of about 40 feet, connected by flexible expansion joints, and is hung from a single catenary wire. An aluminium feeder cable is carried by the steel conductor, and is bonded to it at intervals. Another traction exhibit is a sample of rail bonds welded to the rails by a special acetylene process, requiring only a small plant on a truck, light enough to be lifted from the railways when trains are passing, so that the system is suitable for working during traffic on steam railways that are being converted to electric traction.

High-tension Apparatus.—A 100,000-volt transformer is shown in operation, demonstrating the qualities of the firm's link form of suspension insulator, and special forms of 45,000-volt oil switches are exhibited, in which very rapid extinction of the arc is obtained by having the oil under pressure. Horn break-open air fuses of an easily replaceable type are also shown, as well as several forms of lightning protection apparatus.

Switches, Circuit-breakers, &c.—Among the other items which are too numerous to mention all in detail, are circuit-breakers of the laminated edgewise pattern, motor starters, with special methods of overload and no voltage release, and samples of a line of oil break switches which are being put on the market at particularly low prices.

The Foster Engineering Co., Ltd.,

MORDEN ROAD, WIMBLEDON, S.W. (STAND NOS. 194 & 221.)

Arc and Incandescent Lamps.—The company's well-known Brockie-Pell standard enclosed arc lamps are much in evidence on this stand. These lamps are made both for alternating and continuous currents, and some handsome ornamented patterns are shown. A flame arc lamp is also exhibited, as well as a special alternating current lamp for very low frequencies. The Foster metal filament lamp is, of course, well represented, and samples up to the highest candle powers

Alternating-current Bell.

Portable Testing Transformer.

are alight on the stand. An effective comparison is made by means of a pair of wattmeters of the consumption of a row of ten 16-c.p. Foster lamps and a group of carbon lamps of the same candle power. We understand that the annual contract of the Midland Railway has been placed for these lamps, and that their strong filaments have led to their increased adoption for stage lighting.

Transformers.—A considerable range of these is shown, from the small bell transformer and the auto-transformers for low voltage metal filament lamps to quite large units for power purposes. A convenient portable transformer with multiple contact switch for general testing purposes, where a number of different voltages are required, is illustrated here.

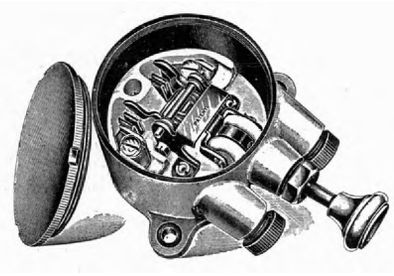
Other Exhibits.—Among other items on this comprehensive stand, attention may be called specially to the new alternating current bell entirely without vibrating contacts, which is also illustrated; this is worked off a small transformer similar to those supplied by the company for ringing ordinary bells from an alternating circuit instead of from batteries. Another convenient accessory for alternating current installations is a small lamp dimming switch, which, as it works with a choking coil, avoids the waste of energy of the resistance dimmer. Mention should also be made of the safety switch and plug, in which the plug cannot be withdrawn when the current is flowing, owing to a catch controlled by a solenoid.

The Dowsing Radiant Heat Co., Ltd.,

105 GREAT PORTLAND STREET, W. (STAND NO. 161.)

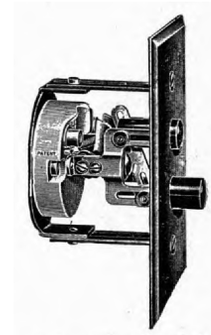
Radiators and Convectors.—Attention is at once arrested when passing this stand by the life-size figure of a servant released from the duty of grate-cleaning by the advent of the electric radiator, reproducing a well-known poster of the firm. Several new patterns of lamp radiators, convectors, and combined radiators and convectors, ranging up to 4½ kw., are shown including the "tubular" pattern with two tiers of lamps, now made in the four-lamp as well as the two-lamp size, and some designs which are put on the market at lower prices than heretofore.

Cooking and Heating Apparatus.—The company are now turning increased attention to electric cooking, and on their stand is a fine display of such apparatus, including a complete range comprising a 6-k.w. oven of substantial construction, with a special inverted griller above it and three hot-plates of different sizes on the top, with which various degrees of heat can be obtained by different combinations of series and parallel connections. Separate hot-plates and other appliances are also shown, as well as flat-irons in various sizes.



Electro-medical Apparatus, &c.—The electric light bath, or Solarium, is shown in several forms, including a cheap four-lamp bath and a high-class folding bath cabinet of solid oak lined with enamelled iron. A complete high-frequency cabinet is shown suitable for nursing homes and hospitals, and other medical apparatus includes a complete electromedical outfit in the form of a small table, known as the Multistat, for the use of practitioners, providing a small converter, running also as a motor for vibrators, drills, and other flexible shaft apparatus, and all the necessary apparatus and connections for supplying and controlling current in the various continuous, alternating, or interrupted forms as required for inspection lamps, cautery, faradisation, galvanisation, cataphoresis, &c. The whole is without any exposed connections and is most compactly arranged. Vibrators for massage are shown in several forms, and on this part of the stand are also hair-dryers consisting of small motor-driven fans delivering electrically heated air, &c.

Water Sterilisation Apparatus.—Another interesting exhibit on the stand is the latest form of Dr. Nogier's apparatus for sterilisation of water by ultra-violet rays. The water flows through a chamber with highly polished interior, in which is immersed a quartz tube mercury vapour lamp. Convenient means for tilting the lamp for starting it are provided, and a solenoid controlled valve prevents the flow of water taking place except when the current is flowing through the lamp. It is found that by this means both germs and spores which are impervious to boiling or freezing are instantly destroyed, while none of the dissolved gases are affected, so that the water retains its freshness for drinking purposes. The capacity of the apparatus shown is the sterilisation of 11,000 gallons of water with a consumption of 1 k.w.-hour, with a flow of 5,000 gallons per hour.



A. P. Lundberg & Sons,

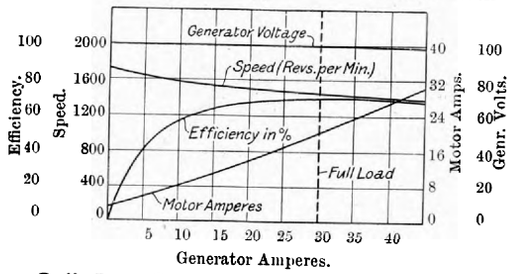
477–487 LIVERPOOL ROAD, N. (STAND NO. 90.)

Switches, Wall Plugs, &c.—The well-known specialities of this firm in tumbler and other switches for ordinary and special purposes, wall connections, ceiling roses, &c., are exhibited in great profusion, and the many special arrangements of switches and connections to obtain various degrees of control of various numbers of lights from one or several points, which have been so ingeniously contrived by the firm, can be studied by the help of a series of ready connected boards on the stand. Among the novelties we were shown an advance example of an exceptionally flat tumbler switch, which will soon be ready in quantities, measuring less than 1½ inches over all from base to knob, and a new intermediate switch of the "Marvel" type with six terminals, by which a "whole or part and off" control of a group of lights can be obtained from any number of positions. The switch, true to its name, is a marvel of ingenuity. The latest patterns of the "Marvel" switch can be supplied with bases as small as 2⅛ inches

Admiralty Pattern Switch.

Push-button Switch.

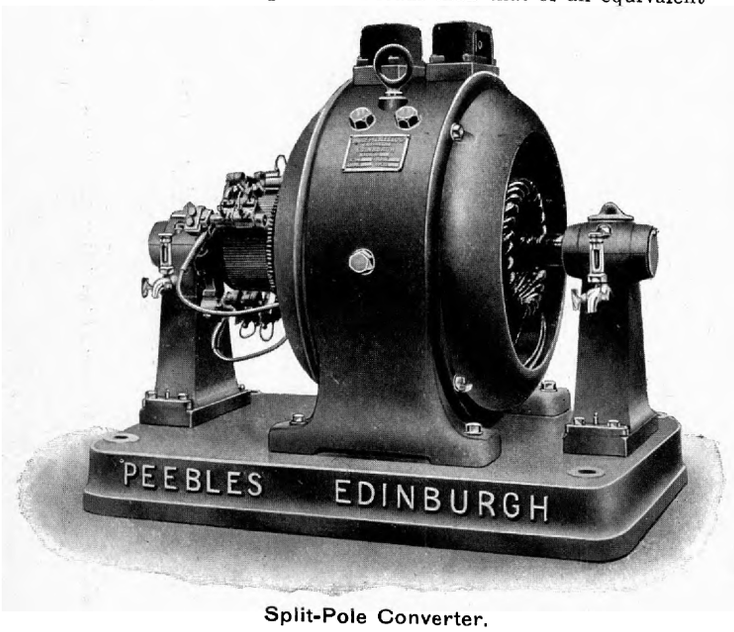
diameter. Examples are also shown of the "Clymax" edge-wise type of flush tumbler switch, particularly useful where it is desired to place a number of switches side by side in a small space. A large number of switches of this type are used, with ornamental cover plates, at Buckingham Palace. A new pattern of push-button switch with separate on and off buttons is shown, the construction of which renders it specially useful for sunk conduit work, as considerable lack of alignment of the box does not affect its working. Among the many designs of wall-plug may be noticed a very neat edgewise pattern, made in three sizes. An interesting feature of Messrs. Lundberg's plugs is the use of micanite bushes where the pins pass through the fibre base, giving an extraordinarily high insulation resistance. It is impossible to mention more than a small fraction of the articles in the stand. The popular



Hosted by Google

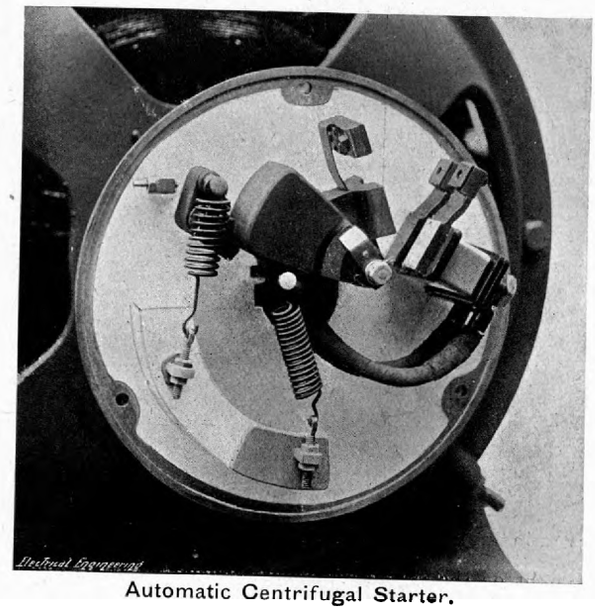
"Twinob" switches, including a modification for starting small motors where one switch springs back when the knob is released, are well represented, and not the least interesting item is the new water-tight push and pull switch which the firm have specially developed for Admiralty requirements. This is provided with a quick make as well as a quick break action, and is illustrated here.

Bruce, Peebles & Co., Ltd.,



HASTINGS HOUSE, NORFOLK STREET, STRAND, W.C. (STAND NOS. 119 & 140.)

Motor Converters and Motors.—This is one of the few firms showing comparatively heavy machinery, and the largest on the stand is a 500-k.w. La Cour motor converter, the main characteristics of which are well known to our readers. The stator coils for some of these machines consist of a series of rectangular copper bars covered with special



Split-Pole Converter 220-100 Volts D.C.

insulating tape thoroughly impregnated, so that no spaces are left round the copper for corrosion to take place. One end of each coil is shaped on a former, shown on the stand, the ends being left straight. Mica tubes are mechanically forced on, and they are then pushed into the slots. The most interesting exhibit is a D.-C. split pole converter, which we illustrate below. Its efficiency is claimed to be from 5 to 12 per cent. higher at all loads than that of an equivalent

Split-Pole Converter.

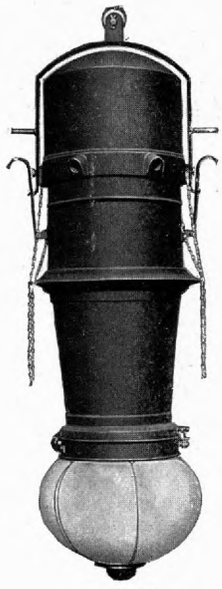
motor generator, and the floor space taken up is much less. It can be designed for any ratio of transformation between the limits 10 to 1 and 1-1, and can have shunt or compound characteristics. The field system consists of two motor and two generator poles, as well as two commutator poles. The armature has two circuits, each of which is provided with a set of brushes on the one commutator, one set being connected to the source of supply and the other giving out a current at a reduced or increased pressure. The high efficiency obtained can be seen from the performance curves for a 3-k.w. 220 to 100-volt machine, which we are able to reproduce. Machines of this class can be designed for several purposes, including cinematograph and projector work. Among the A.-C. machines a squirrel-cage rotor is shown, with its end rings cast solid to the conductors, thus eliminating all possibilities of bad joints. The slip-ring type is also to be seen, with the short-circuiting and brush-lifting device, and in another type the rotor winding is short-circuited automatically at a pre-determined speed. The feature of this machine is its high starting torque with small line current, as compared with the squirrel-cage motor. The illustration below shows this device as fitted to a three-phase machine, whose starting torque with full load current is 70 per cent. of full load torque. Another interesting exhibit is a spring-mounted loom motor, and attention should also be given to the haulage type of slip-ring brush-gear, which is designed for very rough use. Each brush-holder is a curved casting, covering nearly a semi-circle, with receptacles for six brushes. These are held in position by an adjustable spring plunger, secured between two steel plates. The castings are supported on insulated spindles attached to the top half of the pedestal bearing. The air gap of these machines can be adjusted by four set-screws fitted in the end covers.

Automatic Centrifugal Starter.

The D.-C. machines include the protected, semi-enclosed and totally enclosed types, a traction and a mining motor. The bearings are rendered flame-proof by thick leather washers, which bear upon the shaft, and are held in position on the inside ends of the bearing cover by steel plates. Rectangular apertures closed with cast-iron covers with glass centres for inspection purposes are also provided in the end shield at the commutator end, and the terminal holes are bushed with brass glands, vulcanite sleeves, and leather washers. A new design of brush gear has been developed, in which thick mica is moulded direct on to the squared end of the spindle, and protected by gunmetal clamps. The brush-holders are of the box type, supplied with an insulated adjusting screw.

The Bastian Meter Co., Ltd.,

KENTISH TOWN, N.W. (STAND NOS. 173 & 190.)



Electrolytic Meters.—On the same stand as that on which the Bastian Electric Heating Syndicate exhibit their heaters, &c., described in our supplement of last week, is a display of examples of the well-known Bastian electrolytic meters. These are shown in several standard sizes, and a novelty is on view in a portable submeter for heating circuits intended to be used by the consumer in series with his heating apparatus when connected to an ordinary lighting circuit, and the reading subtracted from the total metered for lighting and heating, thus enabling separate rates to be charged without the necessity for two circuits. The meter is a standard one, rendered portable by the addition of a special spring valve for the escape of the gas evolved, and a water-tight plug which closes over the filling hole when the top of the case is closed. For charging by the contract system a special meter with a wide tube giving a longer range and a closer scale than the ordinary pattern is shown. The scale reads five units per division, and the full scale reads up to 5 or 600 units. The company will shortly be putting on the market a prepayment meter, but have not been able to have one ready in time for the exhibition.

WHITTAKER'S BOOKS

WHITTAKER'S ELECTRICAL ENGINEER'S POCKET-BOOK. Edited by KENELM EDGCUMBE, A.M.I.C.E., M.I.E.E. Third Edition entirely re-written and enlarged. 600 pp. With 180 Illustrations. **5s.** net.

ELECTRIC WIRING, FITTINGS, SWITCHES, AND LAMPS (CIRCUITS). A practical Book for Electric Light Engineers and Contractors, Consulting Engineers, Wiremen and Students. By W. PERREN MAYCOCK, M.I.E.E. Fourth Edition, entirely re-written. With 600 Illustrations. **6s.** net.

ELECTRIC WIRING DIAGRAMS. Illustrating Circuit-Connections for Supply Mains, Distribution Boards, Transformers, Lamps, Heaters, Motors, Bells, Private Generating Plant, &c., &c. With brief explanation of the diagrams. By W. PERREN MAYCOCK, M.I.E.E. With 246 Illustrations. **2s. 6d.** net.

THE DYNAMO: Its Theory, Design, and Manufacture. By C. C. HAWKINS, M.I.E.E., and F. WALLIS, M.I.E.E. With 600 Illustrations. Fifth Edition, entirely re-written and enlarged. In two volumes. Vol. I., with 311 Illustrations, **10s. 6d.** net; Vol. II., with 283 Illustrations, **10s. 6d.** net.

VENTILATION OF ELECTRICAL MACHINERY. By W. H. MURDOCH, M.I.E.E. With 30 Illustrations. **3s.** net.

ELECTRIC MOTORS: Continuous, Polyphase and Single-Phase Motors, Their Theory and Construction. By H. M. HOBART, M.I.C.E., M.I.E.E. Second Edition, entirely re-written and enlarged. With 800 Illustrations. **18s.** net.

STEAM TURBINE ENGINEERING. By T. STEVENS, M.Inst.C.E., A.M.I.E.E., and H. M. HOBART, M.I.C.E., M.I.E.E. 820 pages. With 516 Illustrations. **21s.** net.

Whittaker's publications may be seen at the Exhibit of "Electrical Engineering," Stand No. 152, at the Electrical Exhibition, Olympia.

WHITTAKER & Co., 2, White Hart St., Paternoster Sq., **LONDON, E.C.**

NEW AND STANDARD BOOKS ON
ELECTRICAL ENGINEERING.

WIRELESS TELEGRAPHY: Its Theory and Practice. By JAMES ERSKINE-MURRAY, D.Sc., F.R.S.E., M.I.E.E. Third Edition, Revised and Enlarged. 400 pages, 190 Illustrations. Demy 8vo, cloth. **10s. 6d.** net. *Just Published.*

WIRELESS TELEPHONES: And How they Work. By J. ERSKINE-MURRAY, D.Sc., F.R.S.E., etc. Second Edition, revised. 76 pages, with Illustrations. Crown 8vo, cloth. **1s. 6d.** net.

TELEPHONES: Their Construction, Installation, Wiring, Operation, and Maintenance. By W. H. RADCLIFFE and H. C. CUSHING. 180 pages, 125 Illustrations. Foolscap 8vo, cloth. **4s. 6d.** net.

A POCKET-BOOK OF ELECTRIC LIGHTING AND HEATING. By S. F. WALKER. Fcap. 8vo, 448 pages, 270 Diagrams. **7s. 6d.** net.

THREE-PHASE TRANSMISSION. A Practical Treatise on the Economic Conditions governing the Transmission of Electrical Energy by Underground and Overhead Electrical Wires. By WM. BREW, M.I.E.E. 185 pages, 82 Illustrations. Demy 8vo, cloth. **7s. 6d.** net.
[*Just Published.*

FACTORY ACCOUNTS: Their Principles and Practice. By EMILE GARCKE and J. M. FELLS. Sixth Edition, revised and enlarged. Demy 8vo, cloth. 314 pages. **6s.** net. *Just Published.*

ALTERNATING & DIRECT CURRENT DYNAMOS. A Text-book on their Construction for Students, Engineer-Constructors, and Electricians-in-Charge. By TYSON SEWELL, A.M.I.E.E. 328 pages, 230 Illustrations. Large crown 8vo, cloth. **7s. 6d.** net.

ELEMENTARY ELECTRICAL CALCULATIONS. A Manual of Simple Engineering Mathematics. By T. O'CONNOR SLOANE. 314 pages, 43 Illustrations. Crown 8vo, cloth. **9s.** net.

The Henley Wiring System

Provisionally Protected

A new Wiring System that will enable Contractors to fit up Electric Light in small houses, where it has hitherto been impossible owing to the high cost of wiring.

The low first cost of the Henley Wiring System, and the quickness and ease with which it can be installed, will open up a large field for Wiring Contractors.

The System may be seen at

HENLEY'S STAND
NOS. 178/185
AT THE
ELECTRICAL EXHIBITION
OLYMPIA

where all particulars can be obtained, or they will be sent by return post on receipt of your postcard mentioning this paper.

At Henley's Stand, Nos. 178/185, there are also to be seen the very latest products in Electric Cables and Wires, and Accessories.

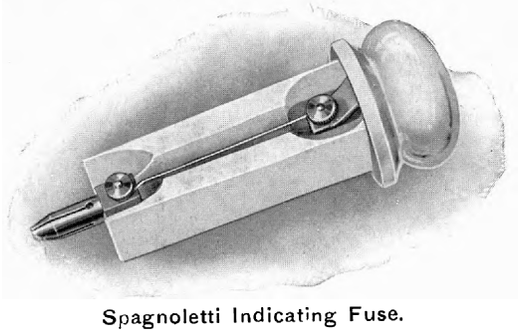
Hosted by Google

Pooley & Austin,

25 Victoria Street. (Stand Nos. 49 & 74.)

On this stand are shown the products of the three principal firms for whom Pooley & Austin act as the London office, namely, Mawdsley's, Ltd. (Zone Works, Dursley), Engineering Instruments, Ltd. (Skene Works, Darlington), and Spagnoletti, Ltd. (Goldhawk Road, W.), besides several specialities of their own, such as oil engines, pumps, &c.

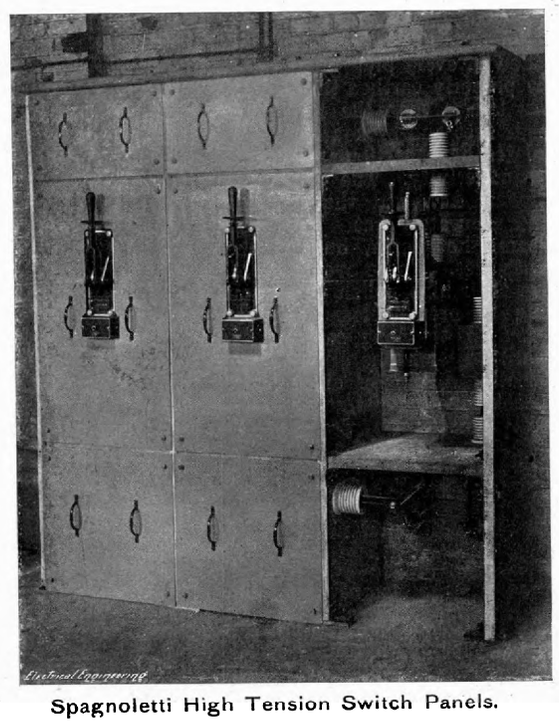
Oil Engine Sets.—One of the most prominent exhibits on the stand is a 50-k.w. generating set consisting of a Mawdsley dynamo direct coupled to a four-cylinder vertical enclosed marine type paraffin engine by Dixon Brothers and Hunter. This engine has overhead valves and is arranged to start on petrol or by means of a heated vapouriser on paraffin. At starting the valve levers are lifted by a special lever away from their cams, and the camshaft is shifted sideways. A charge



New Type of Spagnoletti Fuse Board.

is sucked into the cylinder by turning the engine round, when the closing of the ignition switch will cause the engine to start. Several smaller oil-driven generating sets are also shown.

Dynamos and Motors.—A number of examples of Mawdsley's continuous current machines with the patent "zone" winding are shown, including motors coupled to various classes of apparatus, such as small pumps, a cinematograph motor generator, a water-tight motor bolted up to the frame, a deck-fan forming a compact combined unit, and examples of a special design of 1/6 h.p. motor running at 1,850 r.p.m., large numbers of which have been supplied to the Post Office. This is a very much more substantial article than the usual fan-motor style of machine of this output, and is, we believe, extensively used for Post Office pneumatic tube exhausters. One of the motors used in the Thomas petrol-electric transmission system (see Electrical Engineering, May 4th, page 236) is also shown.



Motor Starters, &c.—A good show of starters and motor control gear of high-class, substantial construction, manufactured by Engineering Instruments, Ltd., is made, including

Spagnoletti Indicating Fuse.

ironclad switches, motor control panels, &c. The starters are all fitted with resistances capable of remaining at least one minute in circuit, and are provided with renewal contacts easily removable from the front by withdrawing a single screw in each. The "directon" starter is also shown among other types. In this starter one motion only is necessary to switch on the motor. When the starting handle is pressed home, a spring is compressed, and this spring drives the starter arm over the contacts against the suction of a totally enclosed oil dash-pot. Thus the attendant has no control over the speed at which the resistance is cut out of the armature circuit, and the overload and no volt releases are operative during the whole time of switching on.

Switchgear.—Of the manufactures of Spagnoletti, Ltd., on this stand one of the most prominent is the complete 6,000-volt oil switch cubicle, illustrated here, which has the current transformer for actuating the tripping coil in the same chamber as the switch, and is provided with particularly complete interlocking arrangements between the isolating links in the top chamber and the switch handle. A 2,000-volt substation panel is also shown, with the firm's latest pattern of loose handle switch. Another item, showing the excellent workmanship throughout all the Spagnoletti switchgear, is a complete and most compactly arranged country-house board. Further exhibits included full-sized feeder pillar, and a large board whereon are mounted a variety of examples of switches, instruments, &c., including a new pattern of indicating enclosed

Spagnoletti High Tension Switch Panels.

fuse, in which one end of the fuse is held in a pivotted clip, which falls so as to be visible through a little window when the fuse blows. Attention should also be drawn to a new pattern of switch, having a quick make as well as quick break, and a cartridge fuse mounted on the switch arm itself. The most interesting novelty from the mining engineer's point of view is the Bowie safety lamp relighter, for electrically relighting miners' lamps underground without fear of explosion. The lid of the stout gas-tight chamber, into which the lamp is placed, is interlocked with the magneto handle, so that it has to be quite closed for the handle to be free to turn. Another particular feature of the stand is the display of the beautifully made moving coil instruments of the firm's own manufacture.

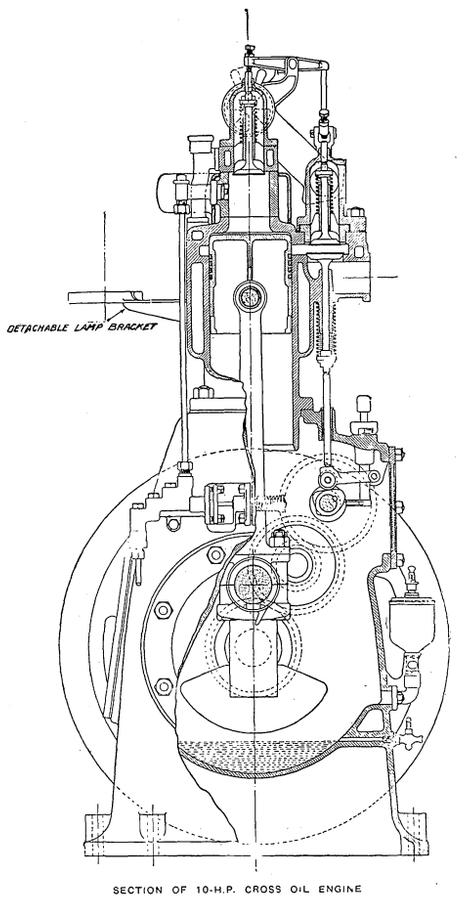
Marryat & Place,

28 Hatton Garden, E.C. (Stand No. 150.)

This firm has erected a full-size 50-ft. automatic push-button lift to demonstrate a new system (for which a patent has been applied) to obviate the difficulty of floor levelling hitherto experienced in lifts of this type. The rope simply passes over a sheave instead of being wound on a drum, an arrangement hitherto always avoided in a push-button lift on account of the difficulty in floor levelling. On the main slow-speed shaft there is a light grooved drum upon which two cords from the cage and counterweight respectively are anchored. This drum drives the selector switch. By this simple means great accuracy is obtained at floor levels without the use of floor switches.

Hosted by Google

The Berry Construction Co.,



29A Charing Cross Road, W.C. (Stand Nos. 30, 31 & 312.)

Cooking Applances.—On their stand in the main hall the Berry Construction Co. show practically all their patterns of "Tricity" cooking and heating apparatus. The basis of their system, as is well known, is the use of a stand fitted with one or two circular flat-topped hot plates, containing flat disc-shaped heating elements and provided with switches whereby, by connecting the resistances in series and parallel respectively two heats can be obtained, corresponding to consumption of 800 and 200 watts. These can be used on either A.-C. or D.-C. circuits. On the larger outfits, a plug is further supplied for an auxiliary extension hot plate connected to a flexible lead, so that it can be moved about. All the leads are well armoured by flexible metallic tubing, and a third pin is provided in every plug to ensure that the body of the apparatus is properly earthed through the armouring. The earthing pin is longer than the live pins, so that the earth contact is made first and broken last. The vessels for use with these hot plates have particularly flat bottoms to ensure good thermal conductivity. The bottoms are of copper in the metal saucepans, &c., and the earthenware vessels have bottoms ground accurately flat. The ovens are also made to fit over the same hot-plates, but in the latest patterns stand on separate feet. These ovens are of light construction, depending on their high polish to minimise radiation rather than on lagging to prevent loss of heat by conduction. A recent addition to the long series of appliances made to fit the standard heater is the urn here illustrated. Not only is there an effective display of all this apparatus on the main stand, but cooking demonstrations are actually in progress with "Tricity" cookers at Stand No 312 in the gallery.

The Westinghouse Brake Co., Ltd.,

82 York Road, King's Cross, N. (Stand No. 6.)

Oil Engine.—A new design of oil engine which is manufactured by the company, is shown running coupled to a 5-kw. continuous current Westinghouse dynamo. A section of this engine, which can run on the cheapest of oil fuels, is given here. At the head of the cylinder is an unjacketed combustion chamber forming the compression space into which the oil is sprayed. Into it is screwed a small iron bulb, which is heated by a blow lamp before starting, and serves to ignite the charge for the first few explosions. The blow lamp is removed as soon as the engine is running. The piston, on the first down stroke, draws air alone into the cylinder. On the next upstroke the air is compressed. Just before the piston reaches the end of the stroke, it cuts from the combustion chamber an annular chamber or pocket. At or near the end of this stroke, and after the air pocket is closed, the oil fuel is sprayed into the highly-heated air in the combustion chamber, and ignites. When the piston has slightly moved down on its power stroke, the annular pocket

SECTION OF 10-H.P. CROSS OIL ENGINE

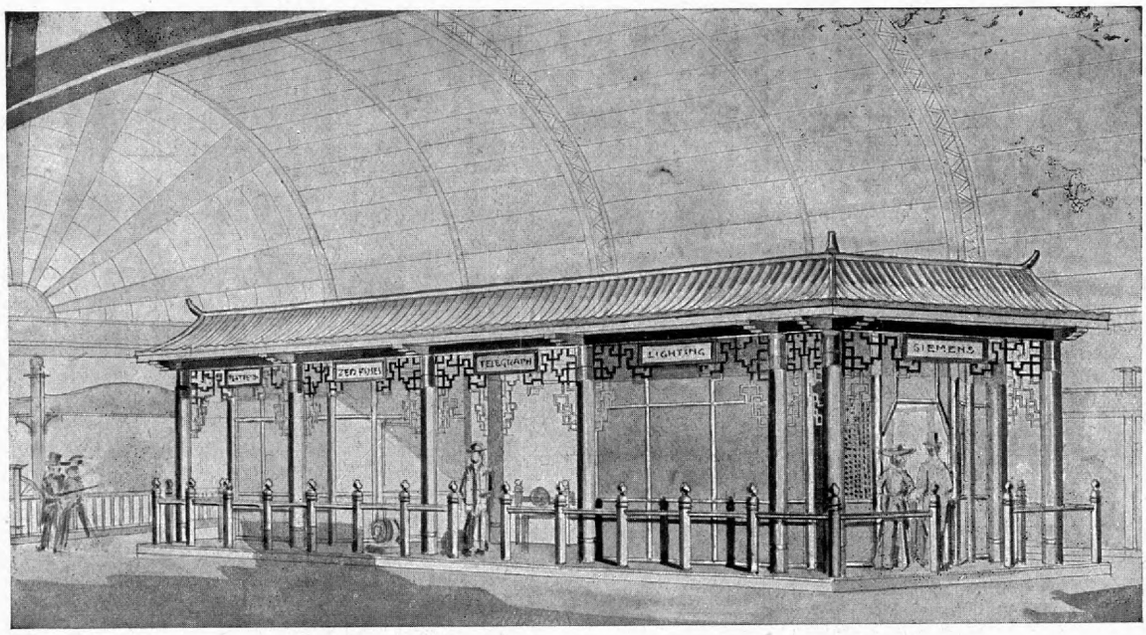
Cross Oil Engine.

containing heated compressed air is uncovered, and the additional air makes the combustion complete. Owing to this feature the engines are exceptionally clean, and there is no smoke from the exhaust or deposit of carbon on the valves or the cylinder. Just before the end of the power stroke, the exhaust valve opens the exhaust pipe. The speed of the engine is regulated by a governor, which varies the stroke of the feed pump.

The other exhibits demonstrate the properties of the Morse silent rocker-joint driving chain, of which some very large sizes are shown.

London and Provincial Electric Supply Authorities.

(Stand Nos. 106, 109, 128, and 131.)



Electric Supply Advertising.—A feature of the Exhibition is the combined stand of the Electric Supply Companies of London and District, in conjunction with certain of the Metropolitan Borough Electricity Undertakings and provincial companies. On the two stands near the entrance, which the above stand numbers represent, an ambitious scheme has been carried out in imitation of an Italian garden, from designs of Mr. Stanley Peach. The whole is under the auspices of the Electric Supply Publicity Committee, and the object is to provide a reception room for consumers and would-be consumers, where information regarding the possibilities of electric supply can be put at their disposal. The well-known series of pamphlets and other literature of the committee are well represented, and one of the stands is fitted up as a lecture room, accommodating about 50 visitors for demonstrations of electric cooking, heating, ironing, and domestic applications

of power. Lectures are being delivered here on Thursday and Saturday evenings during the Exhibition at 8 and 9 o'clock, by Mr. R. Borlase Matthews, by arrangement with the General Electric Co., on "Electric Cooking and Power in the Home" and "The Comforts of Electric Lighting and Heating." Mr. Matthews will also lecture on Friday, October 13th on Messrs. Spagnoletti's Therol system of cooking.

Elliott Brothers,

CENTURY WORKS, LEWISHAM, S.E. (STANDS NO. 54 & 69.)

Instruments.—The principal features of this firm's exhibits are the improvements that have been made, especially in the portable type of instrument. These include a new form of ammeter and voltmeter, in which the iron case is replaced by wood, the necessary shielding from stray currents being effected by means of thin sheets of Swedish iron. This renders the instruments quite 3 lbs. lighter. A useful improvement has been made in the combined ammeter and voltmeter portable testing set. On the voltmeter side, instead of the usual plugs for altering the range, a circular sliding switch is provided, the handle of which has a groove into which a projection in the lid fits when the switch is on the highest range. In any other position the instrument cannot be closed, so that the instrument cannot inadvertently be connected to the higher voltages with the shunt in the most sensitive position.

The Wimperis recorder for indicating the speed of shafts is shown in operation. In this a magneto generator generates voltage in proportion to the speed, which is shown on the indicator calibrated in r.p.m. The Wheatstone & Baudot telegraph systems are also shown working.

Earth-Driven Clock Co.,

11 BOWLING GREEN STREET, LEICESTER. (STAND NO. 307.)

This clock, which has been patented by Mr. Bentley, is causing great interest on the gallery, as it is understood that it will work without attention until it is worn out. It is supplied with energy from an earth battery consisting of two plates placed three feet below the ground. At the centre of the clock are two sets of three contact strips, the outer ones of which are permanently connected together. The battery is connected between the centre contact on one side and the short-circuited strips on the other. A coil is provided in a cylinder on the pendulum, which slides to and fro on two magnets with north poles placed end to end. It is actuated by gold rollers moving on platinum plates, which send a current through the coil alternately in opposite directions, according to which of the contact strips they are on.

R. A. Lister & Co., Ltd.,

47 VICTORIA STREET, S.W. (STAND NOS. 11 & 12.)

This firm shows a system for isolated generating plants, the feature of which is that it starts up automatically when lamps are switched on. The firm is exhibiting two sets of the Bruston automatic generating plant, which have been erected in the engine-house adjoining the stand, one for supplying 200 lights and the other for 40 lights. These are running on the ordinary town gas, and supply light for the stand and shed. As soon as a few lamps are switched on, a relay is actuated, and this allows current from a small battery to operate a solenoid starter, which starts up the dynamo as a motor. As soon as the engine is belted and the machine is up to speed, the dynamo generates current and supplies the required light. A fuller description appeared in ELECTRICAL ENGINEERING, May 18th, p. 266.

The Westminster Engineering Co., Ltd.,

VICTORIA ROAD, WILLESDEN JUNCTION, N.W. (STAND NO. 165.)

Arc Lamps.—Several Westminster enclosed lamps are shown, and a novelty is exhibited in a hand-regulated 2½-ampere enclosed arc lamp with one horizontal and one inclined carbon for lantern and projector work. A similar 4½-ampere lamp is also shown. A number of specially arranged lamps for photographic purposes are exhibited.

High-tension Apparatus.—The company have on the stand examples of the Partridge safety device for transformers, consisting of a collection of alternate brass and mica discs, which flash over and automatically short-circuit the primary winding, and so cause the circuit-breaker to come out or the fuse to blow in the event of a breakdown of insulation between the primary and the secondary windings. A well-designed but reasonably priced 2,000 to 3,000-volt 15/20-ampere oil break switch suitable for house or transformer service is also shown.

The British Vacuum Cleaner Co., Ltd., PARSONS GREEN LANE, S.W. (STAND NOS. 174 & 189.) *Vacuum Cleaners.*—Demonstrations are given of carpet cleaning by electrically driven vacuum cleaners, which are shown in a variety of patterns. The larger machines have the company's special rotary pump, and a fixed machine of this class driven by a 2-h.p. motor is shown, as well as several small outfits arranged on light hand trucks. Some of the more portable self-contained models are worked by diaphragm pumps, and a domestic set weighing no more than 34 lbs., in which the motion is produced by a centrifugal fan, is also shown.

The Eyre Smelting Co., Ltd., BARDON ROAD WORKS, TONBRIDGE, KENT. (STAND NO. 263.)—Examples of Bamber's non-encrusting zincs are to be seen on this stand. These are amalgamated throughout, so that they are free from encrustation and local action, since, when cleaned by wiping, they give a brilliant mercurial surface, which wears uniformly and remains smooth throughout. Attention is drawn to the tapered designs, especially the zinc rods for Leclanché cells. These are made thicker where the work is heaviest, greatly prolonging their life. The rods wear evenly to a very fine point, and the wires are firmly secured by being cast in. The "Bamber" zinc has undergone severe tests at the National Physical Laboratory, and fully bears out all that is claimed for it. Anti-friction white metal for lining bearings, made by a special process, is also exhibited.

Phillips' Commutator Grinder Co., Ltd., 22 WALBROOK, E.C. (STAND NO. 7.)—Examples are shown of the Phillips patent commutator grinding apparatus for large commutators, for which the power is taken by a rubber-covered friction pulley from the commutator itself, so that no separate motor is required. The feed is automatic, and the same apparatus can be adjusted for a considerable range of commutator diameters.

C. JENNINGS & CO. can supply woodwork of any description at short notice, Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support BRITISH Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. JENNINGS & Co., 955, Pennywell Road, Bristol.

SUMMARY

The fourth part of our special description of the Electrical Exhibition now being held at Olympia forms a portion of this issue. Our detailed descriptions of the stands are continued. Notes are included among these on a new 1½ kw. wireless telegraph equipment for cargo-boats, and a remarkable motor for running under water. A new enclosed flame arc lamp with some original features is described, and mention is made of a light transforming reflector for mercury vapour lamps. Other novelties described include an indicating enclosed fuse, a system of accurate floor levelling for push-button lifts, some new patterns of meters, and an oil engine with new features. An "earth-driven" electric clock is also described.

A discussion took place at the last meeting of the St. Marylebone Borough Council regarding the policy of continuing the sales branch of the Electricity Department. Mr. Duncan Watson, Mr. Oswald Lewis, and a few others strongly opposed the maintenance of the department, but eventually a joint report of the Finance and Electricity Committees dealing with the matter was passed by a substantial majority. (Page 555.)

A short article describes some new forms of porcelain insulators for various purposes. (Page 555.)

One of the Papers read at the autumn meeting of the Iron and Steel Institute in London gave a review of the electric steel industry in Italy. (Page 556.)

We give a description of Messrs. Veritys. new London show rooms, where fittings are displayed to their best advantage by an arrangement avoiding the juxtaposition of clashing styles. Radiators of a new pattern are also to be seen there, as well as heating and cooking apparatus in great variety. (Page 557.)

A new lamp showcard is illustrated. (Page 558.)

Among the lawsuits of electrical interest which will come on for hearing during the Michaelmas sittings of the High Courts is one for the prolongation of the Strowger automatic telephone patent. Another important action is the one regarding the Sheffield municipal wiring department. (Page 559.)

There is a dispute in progress in St. Pancras owing to the Borough Council having issued a rule that all fuses are to have at least a 3 in. break unless they are of the enclosed cartridge type built up of porcelain, and ironclad main fuses are prohibited. (Page 559.)

A correspondent suggests a safety appliance for stopping a motor when a belt breaks or comes off. Another letter relates to the rating of a battery lamp. (Page 559.)

Two patents have been published during last week in connection with metallic filaments. One, by the British Thomson-Houston Co., provides means for strengthening them at their rigid supports, and the other refers to the elimination of metals added during their manufacture. Another specification published by the Patent Office describes a zinc-carbon dry storage battery.—Opposition has been entered to the grant of a patent to H. G. White for an inter-communication telephone system, in which the receiver is connected electrically with the selector switch. (Page 560.)

Hosted by Google

Under "Telephony and Telegraphy" we give the decision of the Lambeth magistrate in favour of the Postmaster-General with regard to the overhead wires in Southwark. We also mention successful wireless messages between San Francisco and Japan, and a proposal for direct telephonic communication between England and Germany, and the most interesting points from the Postmaster-General's report.—A telephone cable with "loaded" circuits has been laid between England and Belgium. (Page 501.)

The Scottish Court of Session has decided against Messrs. D. Stewart & Co. in the action by the Johannesburg Corporation for breach of contract in connection with the gas-driven electricity works. The total amount, including the return of part of the purchase price, breach of contract, and sums guaranteed for non-performance of contract, comes to over £400,000. Messrs. Stewart & Co. have also to pay for costs. (Page 502.)

An Edinburgh Municipal deputation has been strongly impressed with the trolley omnibus system for that city. We also mention in our Electric Traction Notes further difficulties in connection with the Hartlepool tramways, the continued opposition of the Stepney Borough Council to overhead trolley tramways;-a proposed revival of the scheme for running trolley omnibuses between Brighton and Worthing, and also give a description of the moving stairways at Earl's Court Station. (Page 562.)

The Sydney City Electrical Engineer recommends the laying of mains in all streets, and large reductions in the price charged for electricity.—The Birmingham Electricity Department are rapidly laying mains for supply to those districts which were recently incorporated.—The Newport (Mon.) Electricity Committee recommend the appointment of a general commercial manager for the tramways and electricity undertakings.—The City of London Corporation have been asked to sanction further tramways in their area.—Arrangements for mutual supply between the lighting and tramway power stations at Sheffield are being inquired into. (Page 562.)

A Local Government Board inquiry was held at Croydon last week (£10,000); the Darlington Council are to apply for a loan of £3,220, and a loan of £4,859 has been sanctioned at Reigate. Electric light undertakings are contemplated at Biddulph, Clevedon, and Teignmouth. Quantities of telephone material are required in Australia. The Victoria Postmaster-General has accepted a tender for an automatic telephone switchboard. (Page 563.)

The British Thomson-Houston Co. show a net profit of £6,374 for the year to March 31st. At the meeting of Messrs. Willans & Robinson held on Tuesday, it was stated that the Company now only have the Rugby works, both the Queensferry and Thames Ditton factories having been disposed of. (Page 564.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, October 12th.
British Electrical and Allied Manufacturers' Association.
2.30 p.m. Council Meeting at Olympia.
7 for 7.30 p.m. Annual Dinner at Hotel Cecil.

FRIDAY, October 13th.
Northampton Institute Engineering Society.
5.45 p.m. Opening meeting at the Institute.
Junior Institution of Engineers.
6.30 p.m. Visit to "Model Engineer" small-power engineering and scientific exhibition at Royal Horticultural Hall, Westminster, S.W.

SATURDAY, October 14th.
Birmingham and District Electric Club.
7.30 p.m. At Colonnade Hotel, New Street.

TUESDAY, October 17th.
Faraday Society.
8 p.m. At Institution of Electrical Engineers, Victoria Embankment. Discussion on papers by J. Härden, D. F. Campbell, and E. K. Scott read at meeting on October 3rd.

FRIDAY, October 20th.
Electro Harmonic Society.
8 p.m. Smoking Concert at Holborn Restaurant.

HAMLET (Mr. A. H. Seabrook, of Marylebone)—Another hit! What say you?
LAERTES (Mr. Duncan Watson, of Marylebone)—A touch, a touch, I do confess.

HAMLET—Come, for the third, Laertes. You but dally.

(See page 555.)

Hosted by Google

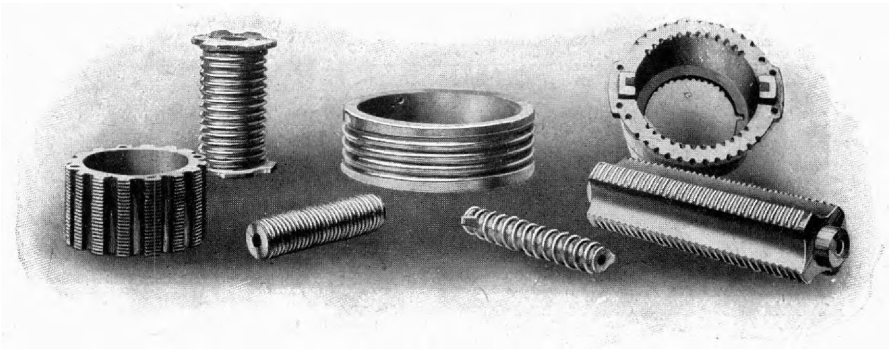
THE MARYLEBONE SALES DEPARTMENT

THE opponents of the Sales Department of the St. Marylebone Borough Council found an opportunity to discuss the policy and management at the Council meeting on Thursday last, October 5th. The occasion was the presentation of a joint report of the Finance and Electric Supply Committees, which dealt with a report prepared by the Borough Accountant, Mr. T. H. Puzey, and the Secretary and Accountant of the Electric Supply Department, Mr. E. J. Jennings. The latter report dealt with the financial effect of the operations of the sales section arising from the sale of apparatus and works incidental thereto, as destined for the publicity work in connection with the development and general management of the electric supply undertaking. This apportionment of the charges and revenue showed that the Sales Branch last year made a net profit of £221. The Sales and Publicity Branches as a combined department showed an excess of expenditure over receipts of £2,212. This figure, however, covers the cost of publicity for the whole undertaking and the cost incurred, not only in cultivating and obtaining new business, but also in retaining business already obtained.

In the discussion which followed the presentation of this report, Mr. Duncan Watson and Mr. Oswald Lewis, and one or two other speakers, challenged the apportionment of the expenditure allocated to the Sales Branch, and argued that it had been unduly favoured in this respect, whereas every penny of profit that could possibly be shown had been set down to its credit. Considerable play was made with an item of £500 for advertising, which had been wholly set down to publicity or development, and to the cost of printing, and literature distributed in connection with the undertaking. Both of these criticisms were disposed of by the Chairman of the Electric Supply Committee. Both the Finance Committee and the Electric Supply Committee had agreed by large majorities that advertising is an expenditure which must be wholly credited to publicity, as it would be necessary to spend an equal amount, or even more, did the Sales Branch not exist. The literature referred to, it was pointed out, was largely supplied by the makers of apparatus, the name of the department being printed on, whilst the remainder was issued by the Electric Supply Publicity Committee and would be used by the Electric Supply Department in any event.

The management of the electric supply undertaking received considerable support: indeed, one speaker referred to the opponents as the fourth party, as, he said, it consisted of four members. The charge of competing with the local contractors was dealt with by Col. Hopkins, the Chairman of the Electric Supply Committee, in refuting a specific charge relating to 71 Cornwall Mansions. It was alleged that a contractor had quoted fourteen guineas for a certain job, and that the department, knowing this, had offered to do the work for £10 4s., although the speaker did not make it clear that in spite of this the job went to the contractor. The whole of the correspondence in connection with the job was looked up, and later in the evening Col. Hopkins announced that the department, before the contractor came on the scene, quoted £9 6s. for certain work, that the consumer then asked for a quotation for a larger installation, and this amounted to £10 4s., but that the contractor came along and quoted £2 less and got the job!

After one Councillor had urged the appointment of a special committee, having nothing to do with the Electric Supply and Finance Committees, to investigate the methods and management of the Sales Department, the report was adopted on a show of hands, only a few members voting against.



Subsequently the Chairman of the Electric Supply Committee put in a few facts disproving an insinuation that Mr. Holmes, the manager of the Sales Department, is financially interested in some heating apparatus supplied to the Council.

Street Fire-Alarm and Ambulance Telephones.—According to the *Elektrotechnische Zeitschrift*, public loud-speaking telephones have been installed in the streets of Kiel, Germany. The act of opening the door of the iron containing box rings up the fire or ambulance station, and the caller can give full instructions at once as to where the fire or accident is. The articulation at the receiving end is good, in spite of the use of a strong current microphone being necessitated by the excessive street noises.

PORCELAIN INSULATORS, &c.

A LARGE variety of patterns of insulators for many purposes, including a number of new designs, are contained in a new catalogue just issued by Doulton & Co., Ltd. (Lambeth). A particular feature is the collection of special insulators for supporting bare copper conductors of rectangular section, of which a good many are standardised, although the company are always willing to design insulators of this class for special requirements. Other specialities useful in central station work include racks for carrying groups of cables on walls, comprising cast-iron bases, with fixed studs supporting sets of cleats, each consisting of a pair of grooved glaze stoneware insulators.

The company have also taken up the manufacture of resistance bobbins in special admixtures of fireclay for heat resistance suitable for arc lamp and other resistances, and

PORCELAIN BOBBINS FOR RESISTANCES.

heaters of the connection type. A selection of these are illustrated here. Other patterns of insulator listed include telegraph and transmission live pin type insulators, shackle insulators, strain insulators, fuse handles, wall cleats, stoneware liquid resistance jars for theatre dimmers, tubes for cables passing through floors, walls, etc., battery stands, and bridges for cables laid on the solid system. Finally, several pages of the catalogue are devoted to third rail insulators for electric railways, which the company now manufacture for all the schemes of electric traction on the third rail system in this country, as well as for the L.C.C. conduit tramways. The patterns illustrated in the catalogue include the insulators in use on the Great Western Railway (which were described and illustrated in ELECTRICAL ENGINEERING, Vol. II., August 10, 1907, page 182) and the insulators on the London tube railways, illustrated in ELECTRICAL ENGINEERING, Vol. I., January 3rd, 1907, page 38.

Motors for Logging.—The *Electrical World* of New York gives particulars of electric haulage now being used in logging operations in the Spokane (Washington) district, and to be introduced in forests in other parts of the Pacific Slope and neighbouring districts. The apparatus, specially built for severe service, is driven by a 150-h.p. three-phase motor running at 435 r.p.m. on 550 volts at 60 cycles, and equipped with a current-limiting device. Ten machines, to handle from 300,000 ft. to 500,000 ft. a day, will be installed to replace steam engines. A portable sub-station, consisting of a three-phase 150-kw. transformer, will step down the voltage from 11,000 to 550 volts, which will be taken to the motor on the logger by a steel-armoured cable. This will be made in sections, so that the logger can be worked out to a distance of 1,800 ft. from the sub-station. Mr. E. P. Barry, Engineer to the Potlatch Lumber Co., who originated this scheme from experiments carried out, is also interested in the electrification of logging roads. He says that though the first cost of an electric line is much higher than the steam line, the maintenance costs are much less. It is also stated that delays through breakdowns have been reduced to one-third since adopting electricity. The average cost for electric locomotives is about the same as steam of the same power, namely, from £2,200 to £3,200. A great advantage of the electric drive is that the large quantities of fuel at present burned as refuse by the lumber mills can now be utilised.

Engineering Course.—We have received the prospectus of the Borough Polytechnic Institute (103 Borough Road, S.E.), giving full information regarding the full courses in electrical engineering at this Institute, which cover four years.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ALUMINIUM.—Two leaflets from the British Aluminium Co. (109 Queen Victoria Street, London, E.C.) illustrate aluminium high-tension transmission lines and aluminium feeders on light railways and tramways.

LIQUID FUEL.—The British Petroleum Co., Ltd. (22 Fenchurch Street, E.C.), have sent us a booklet dealing in an interesting way with the advantages of liquid fuel, and describing its applications for boiler firing in the navy and mercantile marine, for industrial furnaces in metallurgical work, glass blowing, enamelling, &c., for railway locomotives, fire engines, and stationary boilers. The Carbogen and Kermode liquid fuel burners are described, and a useful list of makers of burners is given. Finally, the Diesel engine is dealt with, as well as other oil engines for land and marine work, and a list of makers of internal combustion engines is given.

ELECTRIC MOTORS, HOISTS, AND LIFT GEARS.—A collection of lists from the Victoria Dynamo & Motor Co. (Craven House, Kingsway) deal with continuous-current motors and two- and three-phase induction motors, electric pulley blocks, builders' hoists, lift gears of several types, hand-rope lift controllers, and push-button controllers.

ARC WELDING PLANT.—A pamphlet from the Allgemeine Elektricitäts-Gesellschaft gives particulars of the apparatus which they have developed for arc welding, in which continuous current is employed, taken from a specially designed heavy current generator with a falling characteristic. Striking illustrations of repairs to castings, &c., which have been executed by this process, are given.

AEGMA LAMPS.—A booklet from the Electrical Co., Ltd. (122-4 Charing Cross Road, W.C.), gives some details of these lamps. We understand that 35,000 are made daily, and that from recent tests the full candle-power is maintained within 5 per cent. for a life of 1,000 hours, and within 12 per cent. over 2,000 hours. They can be had in voltages from 20 to 260. A record of one of these lamps is given, in which it burnt for 6,090 hours, having been switched on and off 699 times.

THE TURIN EXHIBITION.—We have just received from the Exhibitions Branch of the Board of Trade copies of the catalogue of exhibits in the British Chemical Industries Section and of the French edition of the catalogue of mathematical and scientific instruments in the British Section. The former of these is considerably more than a mere catalogue, as it contains a series of articles by experts giving *résumés* of the technical position of some of the principal branches of the industry. The latter contains some descriptive matter, and is fully illustrated, but both would have been much more useful near the opening than near the close of the exhibition.

METAL FILAMENT LAMPS.—A most effective little booklet bearing the inscription, "Mazda means electric light for everybody," and addressed more particularly to consumers, is being issued by the British Thomson-Houston Co. It is bright and breezy in its writing, and the style of the illustrations is shown

"Just One-fifth of what the First Lamp Required"

by the one which we have chosen out of the whole series of eight to reproduce here. The prevailing note is, of course, the cheapening of light by the Mazda Lamp, and this and other points in its favour are well driven home by ingenious similes and solid arithmetical facts.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ARC LAMPS.—The new enclosed flame arc lamp and the long burning enclosed arc lamp of the Abbey Electric Co. (17 Victoria Street), which are described in our special Exhibition Supplement this week, are dealt with in new leaflets just issued by the firm.

ELECTRIC SUPPLY ADVERTISING.—New issues made by the Electric Supply Publicity Committee include a handsome brochure entitled "Electricity in the Home," which contains a series of coloured illustrations putting before non-consumers or those who are consumers only to a limited extent the full possibilities of electricity as an artistic illuminant, as well as the various domestic uses to which it can be put. Another leaflet entitled "Public Safety" reproduces a humorous illustration from the *Tatler*, showing the electric lamp and the safety with which moths can approach same without the proverbial singeing of wings, with a few congratulatory words as to the precautions taken in modern times. A new power poster of very striking design has also been issued.

INSTRUMENTS.—The Cambridge Scientific Co., Ltd. (Cambridge, England), has issued a new list of electrometers. The titled gold-leaf electrometer has an adjustable inclined charged plate for varying the equilibrium of the gold leaf. The universal portable type is specially designed to measure the potential of the atmosphere. The micro-electroscope, the string electrometer, and the Dolezalek quadrant electrometer are also described. The H-type of Weston Normal cell has been modified and made more portable. The crystals are retained in loose contact in a constricted portion of each limb, which serves to keep the other contents in their proper places. Another leaflet from the same company describes a method of measuring the mechanical and electrical equivalents of heat.

ELECTRICAL CONDUITS AND FITTINGS.—The Brotherton Tubes & Conduits Co., Ltd. (66 Victoria Street, S.W.), has sent us an illustrated price list of steel conduits and fittings. The Excelsior conduit inspection fittings, which are made of malleable iron, are shown in two types, the watertight and the split type series of bends, tees, junction boxes, &c. Watertight and special flush switches, and combined switches and plugs are also included. Special cover-plates can be had for the latter, designed to match almost any decorations or furniture. Much useful information is contained at the end of the list, including a table of conductors, extracts from the wiring rules and the Phœnix Fire Office rules, and a list of British, Colonial, and foreign electricity and supply stations. We understand that the firm has found it necessary, owing to a great increase in business, to remove their stores to Brewer's Green Yard, Victoria Street, S.W.

ELECTROMETALLURGY IN ITALY

AMONG the Papers read at the autumn meeting of the Iron and Steel Institute, which was to have been held in Turin, but finally took place in London, was one by R. Catani, of Rome, on the applications of electricity in the metallurgical industry of Italy. Steel is manufactured in Italy in the electric furnace both direct from ore and from iron products. Stassano has carried on experiments from 1898 on the former process, and finally adopted a roofed-over furnace of the hearth type with long arcs playing between the mass of the charge and the arch of the furnace. His first series of experiments with a high-class hæmatite ore point to a cost as high as 93s. per ton, but later experiments appear to indicate a lower price under industrial conditions. With the electric furnace, however, the general practice is to use pig-iron prepared in the ordinary way to charge the furnace for the production of steel, and using even liquid charges where the energy is costly. The first such installation in Italy was a 200-h.p. Stassano furnace at the Artillery works at Turin, and subsequently the Stassano Electric Furnace Co. established an electric steel works in the same town, but on the closing of this establishment in 1909 some of the furnaces were transferred to the "Elba" Company at Portoferraio, and some to the Milan Steel Works. Two Heroult furnaces are used by the Mannesmann Tube Co. at Dalmine in Bergamo, and a 350-k.w. three-phase quod furnace is being erected at the steel works of the Cornigliano Ligure of the Ansaldo Co. All these are cold-charging furnaces. The first furnace for liquid charging in Italy was a Kjellin furnace at the Gregorini Co. at Castro. This is a 300-k.w. induction furnace producing about 10 tons daily with a consumption of about 690 k.w.-hours per ton. Experiments have been carried out by Carcano on the production of pig-iron from residues of pyrites, but complete economic results are not available. The chief metallurgical products manufactured in the electric furnace in large quantities are ferro alloys, but the only one of these manufactured in Italy on an important scale is that of ferro-silicon. The greater part of this is produced from quartz and scrap iron. The first works in Italy which manufactured ferro-silicon on an industrial scale were those of the Societa Elettrochimica at Bussi, which produced 606 tons in 1909.

In 1909 the Piedmontese Company for the Manufacture of Carbide of Calcium and Allied Products produced 22 tons of ferro-silicon. The furnace for smelting ferro-silicon is identical with that used for the production of carbide of calcium. The author has also experimented in the production of ferro-silicon, using pig-iron in place of scrap. The yield corresponded to 2·112 kilogrammes of ferro-silicon per kilowatt-day.

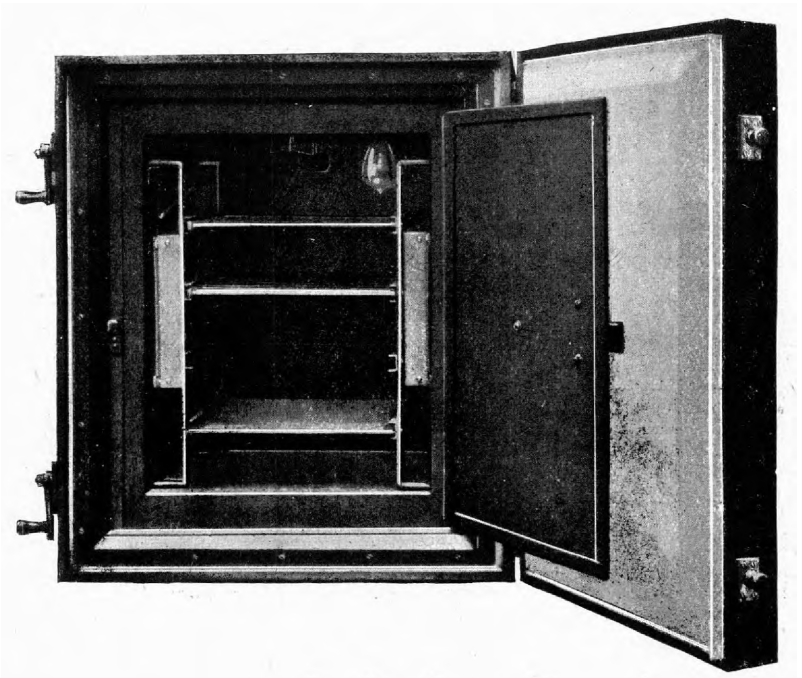
A NOVELTY IN SHOWROOMS

Verity's Newly-arranged Premises

IMPELLED by the constantly increasing nature of their business, and by the demand in London for something novel and effective in the way of a showroom, Messrs. Verity's, Ltd., have recently extended, at considerable expense, and entirely reorganised their well-known showrooms and premises at King Street, Covent Garden. The frontage of the buildings has been greatly improved, and the whole of the ground floor has been altered and given over to a series of showrooms and trade supply counters, with the exception of some space in the front of the building, retained for the purposes of the Admiralty and Government departments, which have of late been exceptionally busy.

In planning their new showrooms, the chief objective of the firm has been to periodise the various rooms according to the fittings, and thus to prevent the horrible contrasts between antique and modern fittings which it is difficult to avoid in showrooms of a more limited capacity. The scheme of decoration in each room has also been made to harmonise with the style of fitting, and with most successful results.

The first showroom is dedicated to fittings designed after the styles of the Louis XIV., XV., XVI. and other French



LOUIS XV. BRACKET.

periods, and it may be noted that many of the candelabra in this room are designed from copies collected in the old French palaces by Mr. George Verity. This room has medium-blue felt panelling, which admirably shows up the chased brasswork of the fittings, framed in waxed mahogany. In a smaller adjoining room with dark blue panels set in white are fittings in the Adams and similar styles, the fittings in the third room, which is employed also for general trade purposes, exemplifying the modern and less expensive styles. The next room, with dark green panels and dull oak woodwork, is devoted to Tudor, Stuart, and early Georgian fittings mostly finished in antique brass. The last room, or eighteenth-century room, is probably the most artistically arranged, and its yellow panels framed in a specially stained decorated woodwork shows off to the best advantage the silver, lustre, and cut glass of the Chippendale, Georgian, Sheraton, and similar styles.

Radiators.—The highest classes of radiators are as carefully periodised, and they take their places in the rooms already mentioned. Special mention should be made of a line of inexpensive radiators specially designed for hiring-out by supply companies. Messrs. Verity's have developed a new style of radiator of the hot-wire pattern, with particularly easily removable elements, and arranged for various combinations of series and parallel, giving a great range of temperature. A point to be noted is that the reflectors and cases of all radiators made by the firm are either in solid brass or solid copper, copper and brass-plated sheet metal having been completely discarded as unsuitable to stand the heat. This new pattern of radiator is stocked to match all the English styles of fittings mentioned above, and has been adopted by the Admiralty and by many of the leading shipbuilding firms.

Heating and Cooking Apparatus.—Although Messrs. Verity have long been manufacturing this class of apparatus, they have just completed some novel developments, and have set aside a special showroom for the purpose of pushing these novelties on the market. A hot-wire element similar to that of the radiators is employed. The apparatus in this room includes every conceivable appliance for cooking or heating, from shaving-pots to large ovens. One speciality

THE NEW ELECTRIC OVEN.

is a small cooker with double-side heater at different temperatures, so that boiling, &c., can be carried on on top and grilling or toasting underneath simultaneously, and the heating element can be turned so as to have the maximum heat on top or bottom as required. This room also includes a range of apparatus for factory use, such as soldering irons (which have been well taken up by the food-canning and similar trades), glue-pots, wax-melters, &c.

The greatest novelty in this room is, however, the new Verity electric oven. This has very excellent heat-retaining properties, and the oven will maintain a good cooking temperature for six hours after the current has been switched off. It consists of an outer case of teak, which gives it the appearance of a cabinet rather than an oven, and an inner casing of the ordinary sheet-iron. Between the two casings is inserted a special manufactured packing designed to retain the heat for a long period. The oven is provided with an outer door of teak and the inner of sheet-metal. There are eight heating elements fitted in the oven itself on either side, and a range of three different temperatures is given.

In this same room are shown a variety of the well-known Aston signs and illuminated fixtures, for which we understand there is a very big demand at the present moment. Some of the largest signs erected on the south side of the Thames, and which form a conspicuous feature of the view from the Embankment at night, were supplied by Messrs. Verity's, Ltd.

Hosted by Google

Adjacent to the heating and cooking showrooms are various large showcases in which are placed measuring instruments both of the switchboard and portable type, relays, mining-bells, batteries, hand-lamps, &c.; medical apparatus of every description, including X-ray work; motor-car lamps and

Georgian Pendant.

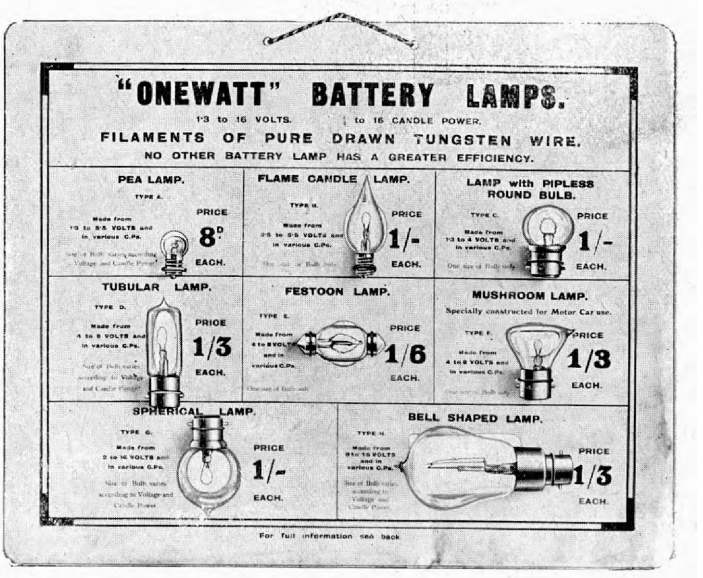
accessories. The firm have developed a very efficient lamp for motor cars, for head-lights, side-lights, &c., with a parabolic reflector which gives a perfect centre of light. The lamp is so constructed that in case of damage any part, including

Radiator in Design of the Stuart Period.

the glass and reflector, can be removed and replaced in a few seconds.

That part of the ground floor not occupied by showrooms is given over to trade counters for the supply of general accessories, cables, wires, lamps, fans, shades, &c., &c. Each counter has its own stock immediately at the back of it, so as to minimise time in serving customers. In this space also is a special show of inexpensive fittings and fixtures such as are generally used by supply concerns to hire out. These fittings are priced from 2s. 9d. gross upwards, and a very large stock is kept in London so that immediate delivery can be given. There are also shown a large range of lanterns for lighting streets, shops, railway stations, &c., including a special pattern adopted by the G.P.O., and of which over 1,000 were supplied for the new Post Office, and a lantern with a radiant-diffusing globe which we understand is being largely adopted for street and shop-front lighting.

Electric Clocks.—An interesting feature of the newly arranged premises is that they are fitted throughout with Aston electric clocks, all controlled from a master clock on the ground floor. These clocks are manufactured at Messrs. Verity's Aston works.



The engineering and Admiralty and Government departments dealing with dynamos, motors, switchboards, controllers, arc-lamps, large fans, &c., &c., have been provided with offices on the premises.

In order to deal with increased business, Messrs. Verity have also found it necessary to enlarge their works at Aston and have just completed the addition of a large new bay.

It is impossible in the space at our disposal to deal with all the manufactures of this firm, but suffice it to say there is no electrical plant or apparatus which cannot be supplied by Messrs. Verity. We found our tour of inspection round their new showrooms exceedingly interesting, and we can confidently recommend a visit on the part of any of our readers who are interested.

A NEW LAMP SHOWCARD

We reproduce here an illustration of a showcard for the use of contractors, which Siemens Brothers Dynamo Works, Ltd., have prepared in connection with their "one-watt" battery lamps. A sample of each type of lamp is mounted on

New "Onewatt" Battery Lamp Showcard.

the card, which is suitably cut away for their reception, and on the back of the card are printed full particulars of all the sizes obtainable. The design is printed effectively in red and blue, and the whole should be of great use in assisting contractors to push the sale of these lamps.

Turkish Electrical Enterprise.—We recently referred to the establishment of a company to control electrical undertakings in Turkey. From information sent by the British Acting Consul-General at Constantinople, says the *Board of Trade Journal*, it appears that the object of the syndicate is to control the transport and lighting enterprises of Constantinople, including the tramways of Constantinople, the Galata-Pera tunnel, and the "Société Anonyme Ottomane d'Electricité (Ganz & Co.)," which has already absorbed the "Société Anonyme pour l'Eclairage de la Ville de Constantinople."It is proposed also to obtain the concession for a tunnel from Chichli to Stamboul, passing under the Golden Horn, and to take up other transport, lighting, and power enterprises in Turkey. A Belgian company is to be formed under the name of the "Union Ottomane—Société d'Entreprises Electriques à Constantinople," with a capital of 90,000,000 frs. (£3,600,000). The syndicate is composed of French, Belgian, Belgo-Hungarian, German, and Swiss groups.

PENDING ELECTRICAL LAWSUITS

(Strictly Copyright.)

THE Michaelmas sittings at the Law Courts commence to-day, and one of the most interesting cases of electrical interest (which will, however, be fairly late on the list and will probably come on about the middle of November) will be an application for the prolongation of the Strowger automatic telephone patent No. 809 of 1898. The Strowger British patent is held by the British Insulated and Helsby Cable, Ltd., and we understand that the petition for the prolongation of the patent in question will be opposed by three telephone manufacturing companies—the Western Electric Co., and, we believe, the Adnil Electric Co. (representing the Deutsche Telephonwerke), and Siemens Bros. & Co. Apparently there is to be no opposition on behalf of the holders of the Lorimer patents, and that it is doubtful whether there will be opposition by the Attorney-General. The case will come on before Mr. Justice Parker in the Chancery Division, and will presumably be based on the usual grounds of inadequate financial return to the patentee. The application is of great importance in view of the fact that the Post Office is, for the first time, equipping two actual exchanges as an experiment with automatic systems (see ELECTRICAL ENGINEERING, July 20th, p. 417).

Another action to which a great deal of attention will be paid is that of the Attorney-General, at the instance of a ratepayer, against the Sheffield Corporation, with regard to the municipal wiring department, some particulars of which we have already given (ELECTRICAL ENGINEERING, Sept. 28th, p. 535). It is anticipated that the action will come on before Mr. Justice Eve during the next few days, and that it will really take the form of an appeal against the decision of Mr. Justice Nevill in the Leicester case. This held that it is illegal for a municipality to carry out wiring work on a consumer's premises where the Corporation has no Parliamentary powers other than those contained in the General Electric Lighting Acts. Mr. P. O. Lawrence and Mr. Maurice Drucquer will appear for the contractors who are bringing the action, and Mr. Danckwerts, K.C., and Mr. J. Serjeant for the Sheffield Corporation.

There is no other action of outstanding interest in the Chancery Division. The much-anticipated patent action by the Osram Lamp Works against the "Z" Electric Lamp Syndicate has had to be postponed through delay in completing the pleadings.

In the Court of Appeal, the dispute between the Metropolitan Electric Tramways, Ltd., and the Tottenham Urban District Council with regard to the rating of their tramways, will be heard. The tramway company claim that lines sanctioned under the Light Railways Act should only be assessed as railways, *i.e.*, one-fourth the rateable value, but this contention was dismissed at a Middlesex Petty Sessions. By agreement, the appeal of the Company to a Divisional Court in June this year was dismissed without argument in order to hasten the case getting to the Court of Appeal.

DISPUTE re MUNICIPAL WIRING RULES AT ST. PANCRAS

AN interesting and unusual application has been made to Mr. Bros, the Magistrate at the Clerkenwell Police Court. It appears that the St. Pancras Borough Council Electricity Department issued a regulation at the end of last year as follows: "On and after January 1st, 1911, all main fuses should be of the enclosed cartridge type built up of porcelain. If other types are used, a clear break of not less than 4 inches must be provided for main fuses and 3 inches for sub-fuses. All main fuses to be enclosed by preference in hard-wood boxes lined with asbestos. Ironclad and double-pole main fuse boxes prohibited."

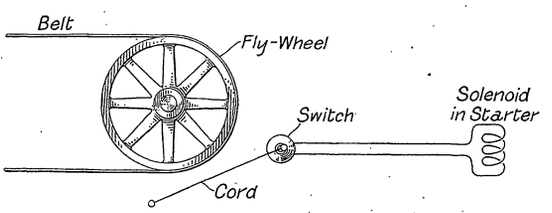
As the distance between contacts in the fuse of a standard distribution board is about 2½ inches, and is certainly quite ample for all ordinary purposes, the regulation in question is naturally a cause for complaint among electrical contractors working in St. Pancras, and the prohibition of ironclad main fuses is, to say the least, remarkable.

The battle against the Borough Council has been opened by Mr. Syer, of the firm of Macdonald, Syer & Co., who is a St. Pancras ratepayer and at the same time a wiring contractor. It appears that the Borough Council had refused to connect up a new 150-light installation which this firm had completed in Fitzroy Square, owing to ordinary cartridge fuses having been used instead of the porcelain cartridge fuses specified in the rule. Mr. Syer, who appeared in person, applied to the magistrate for the appointment of an electrical inspector to settle the dispute, under Section 28 of the St. Pancras Lighting Order, which is as follows:—

Appointment of Electrical Inspector by Court of Summary Jurisdiction.—A Court of Summary Jurisdiction, on the application of any person supplied with electricity by the undertaker within the area of supply, or by the undertakers, shall from time to time appoint, or shall appoint and keep appointed, one or more competent persons to be electric inspectors for the purpose of inspecting electric lines and works and certifying meters under this Order.

The application was opposed by Mr. Barrington Ward on behalf of the Borough Council, who raised various technical legal objections, and the case has been adjourned until October 19th, when Mr. Syer will probably have legal assistance. The Electrical Contractors' Association are watching the case.

The procedure is somewhat unusual. The St. Pancras Electric Lighting Order dates back to 1883, and in the case of later Provisional Orders and Special Acts it rests with the local authority or Board of Trade to appoint an electrical inspector, but, as seen above, at St. Pancras application has to be made to a magistrate. Further, it is doubtful whether it would fall within the duties of an electrical inspector, if appointed, to decide with regard to a dispute as to the method of wiring premises.



Even if the St. Pancras Borough Council are within their legal rights in insisting on the observance of the rule in question, or in making its observance a condition in the consumers' contracts, we cannot but think that they will be well advised to drop it, as it is certainly an unnecessary restriction. Were it an essential to good wiring work, ninety-nine hundredths of the wiring for electric lighting in this country would be bad.

CORRESPONDENCE

A SAFETY DEVICE.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I enclose, for the benefit and safety of your readers who have charge of any power installations, a rough sketch of automatically stopping a motor should a belt break. Passing under a fly-wheel or driving belt is a cord, one end secured to a bracket, and the other end secured to an ordinary 5-amp.

switch knob. From the switch two wires are run to the no-voltage release coil of the starter.

When the strap breaks, it fouls the string, and closes the switch, which short-circuits the release coil of the starter and stops the motor. I have had it in use some time, and it has been of great value. It cost about 2s. 6d. to fix.

Yours truly,

Sept. 25th, 1911. F. C. MOINS.

A MINER'S LAMP.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—With reference to the notice in your Mining Supplement of the 5th inst., regarding a miner's electric lamp made by the Electrical Power Storage Co., I do not quite see how 27 hours' light could be got from the battery mentioned. The latter is stated to give 10 ampere-hours 4 volts, or, say, 1½ watts for 27 hours. The lamp gives 2½ c.p., which would make its consumption 0·6 watt per c.p. I have never heard of a metal filament lamp with as low a consumption as this.

Yours truly,

J. S.

[Our correspondent is certainly justified in his criticism. The lamp can only consume 1½ watts if it will burn 27 hours on one charge, as the makers claim. Presumably they have taken the reflector into account when estimating the candle-power at 2½.—ED. *E.E.*]

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 5, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications. Names in italics indicate communicators of inventions from abroad.

26,119/10. **Commutator Motor.** J. Gray (*Latour*). A method of controlling a series-connected polyphase machine of this kind is described in this specification. Each phase of the stator winding is permanently connected in series with the corresponding phase of a transformer, the secondary winding of which is taken to the brushes. By means of a two-way switch the stator can be star-connected for low speeds and for starting, and delta-connected for higher speeds. One figure.

28,755/10. **Secondary Batteries.** G. Inrig and Gavan Inrig, Ltd. A dry storage battery, with no plates to buckle, is made up as follows:—The positive electrode is a carbon block of star-shaped cross-section, fitted into the centre of a block of depolarising material. The electrolyte is separated from a zinc electrode of square section by a series of cane strips ⅛ in. square to allow for air circulation. In charging the cell, contact is made with the zinc through the moisture absorbed by the cane strips from the electrolyte. As the charging proceeds, a spongy deposit collects on the zinc and makes a permanent porous connection between the zinc and the electrolyte. Two figures.

30,323/10. **Filament Supports.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). The strength of filaments at their points of support is increased by this method of mounting. The copper leading-in wires are flattened and perforated at the ends, through which the filament is passed. It is then surrounded at this point by a helix of some tough material, such as drawn molybdenum, and the wire, filament, and helix are welded together by an arc. The filament is supported at the curved end of the bulb by a similar helix, which is fused at one end into a glass support attached to the bulb. The filament is then slipped over one of the coils of the helix and mounted so that a certain amount of tension is exerted on the filament. Should this tension be too great, it is adjusted during incandescence, as the heat communicated to the helix causes it to soften, and the coil adjoining the filament is drawn out. Four figures.

1,162/11. **Manufacture of Lamps.** H. G. Moller. The auxiliary metal, which is always added to the refractory material to render it workable, is by this method almost entirely eliminated before mounting it on the supporting frame. It is maintained that the small quantity, about 1 per cent., that is left in gives the filament sufficient flexibility to enable it to be mounted and to receive the necessary bends. At the same time, the percentage of this metal becomes so small that the lamp can be manufactured with this amount still present, which will leave it during use.

12,976/11. **Condensers.** Aktieselskabet Hovlands Radiotelegraf. These comprise hollow bodies of insulating material in the form of inverted truncated cones, provided with inner and outer metallic coatings. The end of these are well separated by means of a coned flange placed reversely at the open end of the body. To reduce the space, and at the same time to obtain a large capacity, these are placed one inside the other, so that the outer and inner coatings of neighbouring condensers are in contact, and connections can therefore be made between alternate pairs of the contacting coatings and one terminal, and between the remaining pairs and the other terminal. Nine figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables, and Wires: Burnside [Sealing conductors through vitreous substances] 1,880/11; Chemische Fabrik Griesheim-Elektron [Method of using batteries to supply lamps] 15,447/11.

Dynamos, Motors, and Transformers: Montgomery [A.-C. rectification] 25,385/10; Rucker [A.-C. automatic feed-regulator] 30,054/10; Ozonair, Ltd., and Joseph [Transformer] 7,295/11.

Electrometallurgy and Electrochemistry: Ampère Ges. and Müller [Production of metals and alloys] 21,603/10.

Meters: Glover and George Glover & Co. [Coin-controlled meter mechanism] 25,172/10.

Switchgear: Berry [Switches for heating apparatus] 21,943/10; Weymouth [Switches] 4,922/11; Harhorn [Reversing switch for hub-motors] 5,871/11; Venner and Griesbach [Automatic switches] 13,103/11.

Telephony, Telegraphy, and Signalling: Scott [Signalling apparatus] 13,837/10; Jones [Selective systems for printing telegraphs] 14,484/10; Wirth and Beck [Varying the tuning of receivers] 28,973/10; Girardeau [Automatic commutator for radiotelegraphy] 3,946/11; Ges. für Drahtlose Telegraphie [Production of slightly damped oscillations] 8,712/11; Girardeau [Mounting receiving and transmitting apparatus] 11,999/11; Macku [Production of slightly damped oscillations] 8,524/11.

Traction: Jack [Conduit system] 22,120/10; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Electric supervision of railway points] 774/11.

Miscellaneous: Johnson (*Badische Anilin & Soda Fabrik*) [Purification of gases] 30,194/10; Weissmann [Illuminating bodies] 3,950/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Motors: Spalazzi [For transmitting angular movements] 9,555/11.

Miscellaneous: Allgemeine Elektricitäts Ges. [Arc rupturing devices] 20,409/11.

The following amended Specification can now be obtained.

C. A. Parsons [Turbines] 25,651/09.

Amendment

23,077/05. **Electric Welding.** L. S. Lachman. This specification referred to in Electrical Engineering, April 6th, 1911, p. 183, has been amended by making Claim 1 more explicit. The specification relates to a process of welding together sheet metal articles, on which projections are made, and sufficient space is provided to allow for the spreading out of the fused metal projections, so as not to interfere with the close contact of the parts.

Opposition to Grant of Patent

22,239/10. **Telephone System.** H. G. White. Opposition to the grant of this patent has been entered. It relates to an intercommunication system in which each station is provided with a relay. This has a movable armature connected to the receiver, which operates between two contacts connected respectively to the home line and selector switch, so that when the relay is energised by pressing the ringing key, the receiver is disconnected with the home line and placed in contact with the selector switch without mechanical aid, and is kept in this position as long as the receiver is off the switch hook.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. R. Ridings, 13,025/05.

Insulating Materials: W. A. Phillips and F. Hutchins [Insulation for conductors] 13,943/07.

Dynamos and Motors: C. H. Iles and W. Armistead [Separate excitation arrangement] 14,433/06; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Armatures, field magnets] 14,203/07; T. S. S. Marshall [Brush-holders] 14,413/07.

Storage Batteries: H. E. R. Little [Secondary batteries] 13,983/07; E. L. Oppermann [Secondary batteries] 14,255/07.

Switchgear and Fuses: A. B. Reynders, C. B. Auel, R. D. T. Alexander, and J. R. Spurrier [Switches, cut-outs] 13,911/03; J. H. Golding [Switches] 14,111/04; A. B. Webber and Standard Time Co. [Switches] 12,999/05; M. Kallmann [Switches] 14,058/06.

Telephony, Telegraphy, and Signalling: A. Muirhead [Aerials] 14,060/06; W. H. Wheatley (*C. Govenz*) [Telephone system] 14,090/06; A. J. Boult (*Zorge Safety Railway Equipment Co.*) [Railway signals] 14,398/06; E. E. Moore and W. Powles [Signalling] 14,150/07; C. Enderlein, W. Landwehr, and K. Schulz [Signalling system] 14,183/07; British Insulated & Helsby Cables, Ltd., and W. Bartlett [Telegraphs] 14,238/07; C. F. Blundell [Switches] 14,259/07; H. W. Lake (*C. M. Thompson Co.*) [Telephone switches] 14,368/07.

Traction: G. R. Forster [Trolley collector] 13,940/07.

Electrometallurgy and Electrochemistry: S. Z. De Ferranti [Furnaces] 13,949/06 and 13,949A/06.

Incandescent Lamps: H. J. Haddan (*Bergmann-Elektricitäts-Werke Akt.-Ges.*) 13,986/07.

Meters: D. J. Steele and C. Kratt [Meters] 13,973/03.

Miscellaneous: J. A. and E. W. Timmis [Electromagnets] 14,109/02; A. Denny and C. H. Johnson [Dynamometers] 13,690/03; S. O. Cowper-Coles [Pointing needles, pins by electrolysis] 13,980/07; H. Henning [Testing a cut-out] 14,426/07.

Hosted by Google

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Some interesting statistics of the past year's working appear in the Postmaster-General's fifty-seventh annual report on the Post Office. We note a satisfactory increase in the use of the wireless coast stations. New stations are to be provided at Newcatle-on-Tyne, and in the neighbourhood of the Island of Valentia, and at Land's End to replace the existing station at the Lizard. The ranges of the two last-named will be 500 and 250 miles respectively. New licences for 107 land stations were granted during the year. All of these, with the exception of one, were for experimental purposes. With a view to the quicker despatch of telegraph messages between London and the larger provincial offices, the Wheatstone apparatus and Gell keyboard perforators are now used. The Baudot apparatus has been installed experimentally on the London-Birmingham circuit, and the Murray multiplex apparatus on the London-Manchester circuit. Trials have also been made of Undulator apparatus between Bristol and Cork. The licences for the municipal telephone systems at Hull and Guernsey expire at the end of the year, and the continuation of the service is under consideration. The licence of the Portsmouth Corporation does not expire until 1926, and the Corporation do not wish to sell the system to the Post Office nor to purchase the National Telephone Company's plant. The Post Office will, therefore, have to compete with the Corporation until 1926. A submarine cable with loading coils for the Anglo-Belgian service is also referred to. This, we may mention, has now been laid. Reference is made to the repeated opposition of the local authorities to the erection of overhead wires, and appeals to the Courts have had to be made in many instances. We refer to one elsewhere on this page.

There has been an interesting dispute between the National Telephone Co. and the Hythe (Kent) Council with regard to the retention of overhead wires in the Borough. For some time past the Council have been agitating for the removal of a number of poles and wires in the Grove and the Mayor's Avenue, which are two of the beauty spots of the town, and require the company to transfer the wires underground. The company refused to do this owing to the expense involved, and as the Council insisted upon having its own way, and ordered the wires to be removed, the company agreed to do so, intimating at the same time that the subscribers would be left without telephonic communication. Not deterred by this threat, the Council insisted upon the wires being removed, and the company informed the particular subscribers affected, numbering 72, that after yesterday they would not be able to secure any telephonic communication. The determination of the company apparently brought the Council to its senses, for they have now asked the company to withhold any action until they have interviewed the Postmaster-General in order to ascertain the possible attitude which he will take up in the matter when the Government take over the Telephone Company's system.

Particulars as to an application for the extension of the Strowger automatic telephone patent appear under "Pending Electrical Lawsuits," on another page.

It is stated in the daily papers that some successful experiments have just been carried out at Portsmouth in the control of submarines by Hertzian waves. The experiments, it is stated, were conducted off Selsey with one of the Holland type submarines.

According to the *Daily Telegraph* New York correspondent, wireless operators at San Francisco have exchanged messages, for the first time, with Japan over a distance of 6,000 miles of ocean. The connection was established with the Japanese operator at Hokesu, which is the most northerly wireless station in Japan.

Successful trials are reported over the new telephone line between Paris and Madrid.

We referred in our issue for September 28th, p. 537, to a case in which the Southwark Borough Council objected to the erection of overhead wires by the Postmaster-General in certain streets. Mr. Hopkins, Magistrate at the Lambeth Police Court, delivered judgment on Monday in favour of the Postmaster-General. The proposal was to connect two or three fire alarm posts with one of the County Council fire stations, and the erection of overhead wires was estimated to cost £90, whilst the proposal of the Borough Council to put them underground would involve a cost to the Post Office of £340. The magistrate said that he made up his mind on the matter without any difficulty. He had walked over the streets in question, and had failed to imagine how they would be worse for the addition of fifteen telegraph poles at intervals throughout their length. He had been unable to discover any reason for apprehending either danger, disfigurement, or inconvenience.

The Bissao-Bolama cable communication with Quillenges and Lubango, the Falmouth-Bilbao cable, as well as the Malta-Tripoli cable, are *hors de combat*, and with respect to the latter it is said that it has been cut.—Turkey has issued notices that code telegrams between that country and Italy are not admitted.—The Alaska lines have not yet been repaired, but telegrams are being sent by wireless telegraphy. —The *viâ* Fao route was down on the 3rd inst., and on the folowing day the lines in Angola to Bucoio and Balombo were not working.—On the 5th inst. the El Arich route beyond Beyreuth ceased working, and the Fao route was in working order.—We are also able to state that lines in Hayti, West Indies, are practically again in normal condition.—The 6th inst. saw the restoration of the El Arich route, while wireless communication with Derna Guelemicho was interrupted. —Code telegrams between Abyssinia and Turkey have been prohibited since 6th inst., and finally we are in a position to inform our readers that a "Coronation Durbar" station has been opened to the public since 2nd inst. The full name is "Coronation Durbar," India."—The cable-ship *John Pender* arrived in England from Bilbao.—On the 9th inst. the Sierra Leone-Bathurst cable was repaired.

ELECTRIC TRACTION NOTES

The Darlington Tramway Engineer has prepared a report upon the adoption of trolley omnibuses, but the Electricity and Light Railway Committee recommend that no further steps be taken in the matter at present.

Subscriptions are being invited for 16,895 6 per cent. cumulative preference £1 shares of the Mansfield and District Tramways, Ltd. This is the balance of 80,000 preference shares.

The deputation appointed by the Edinburgh Town Council to inspect trolley omnibus systems at Leeds and Bradford have issued a report strongly favouring this method of traction. The report contains illustrated descriptions of the two systems now in operation, and discusses the advantages of trolley 'buses as compared with the overhead trolley system. Whilst not suggesting any specific routes, the deputation point out that there are many suburban streets and roads in Edinburgh where trolley omnibuses would be suitable.

The ratepayers of West Hartlepool still seem dissatisfied with the attitude of the Corporation with regard to the tramways. Some time ago, by a small majority, the Corporation committed itself to the purchase of two sections, and after prolonged negotiations have been unable to come to terms with the tramway company to take a further lease of these lines. Consequently, the Council decided to purchase the whole of the lines, and applied for powers to do so, and also for the construction of additional lines. This decision was arrived at by a majority of six, and there is a strong feeling that the matter has been rushed. It has now been suggested that it would be in the interests of the ratepayers if the Corporation, after having secured the control of the whole of the lines, put them into thorough repair, and leased them to another company.

An extraordinary general meeting of the British Electric Traction Co. is to be held on October 17th, for the purpose of considering a scheme for the rearrangement of the capital, as already mentioned in our columns.

The Stepney Borough Council have decided to oppose the London County Council's proposal to reconstruct the present horse tramways from West India Docks to Victoria Park on the overhead trolley system. As the road authority, the Stepney Council insist upon the conduit system.

The first true moving stairways, or "Escalators," in this country, were opened at Earl's Court Station on Wednesday, October 4th, and are used to transfer passengers from the Piccadilly Railway to the platforms of the District Railway, a rise of about 40 ft. The stairways, which were supplied by the Otis Elevator Co. (4 Queen Victoria Street) are four in number, an ascending and descending stairway being provided for both the up and down platforms. The apparatus consists of a series of travelling steps strung together by an endless chain, which is driven by a 35-40 h.p. motor. Each step has two front and two rear wheels, arranged with a wheel base six inches longer than the tread of the step. Separate rails are provided for the front and rear wheels, and

Hosted by Google

these are at different levels, while the steps are travelling on the incline, but are level when the steps are travelling flush with each other at the landings, so that the tread is always level. The rate of working is one step per second, and since each step can take three people, the maximum carrying capacity of each stairway is 180 persons per minute, or 10,800 per hour. Hand rails moving at the same speed as the stairway are provided, and these are laterally inclined to facilitate stepping off at the ends. Arrangements are made whereby in case of stoppage of the ascending stairway, the corresponding descending stairway can have its direction of motion reversed. We understand that four of these escalators are being erected at Liverpool Street Station.

The Birmingham Tramways Committee have withdrawn from their programme for 1912 a number of tramways upon which opinions were somewhat divided, but have re-submitted to the Council a number of other tramways, and recommend the authorisation to promote a Bill in Parliament next year.

An interim dividend at the rate of 5 per cent. per annum on the ordinary shares, free of tax, has been declared by the Calcutta Tramways Co.

The St. Helens Corporation have agreed to appoint a special committee to inquire into the relations between the St. Helens Tramway Company and the Corporation.

It is stated that the scheme for constructing a system of trolley omnibuses between Brighton and Worthing, which was abandoned last year, is to be revived.

JOHANNESBURG ELECTRICITY WORKS

£400,000 Damages Awarded

JUDGMENT was issued on Tuesday by Lord Ormidale in the Edinburgh Court of Session in the action by the Johannesburg Municipal Council against D. Stewart & Co. (1902), Ltd., Glasgow, and William Beardmore, shipbuilder and steel manufacturer, for sums amounting to over £400,000 in respect of Messrs. Stewart & Co. having failed to complete contracts for installation of gas engines and electrical plant for tramway, lighting and power purposes. Messrs. Stewart & Co. denied the breach of contract, and stated that the installation was made according to the specification, and that any failure to reach the prescribed tests was due to the unsuitability of the coal supplied for gas-producing purposes. W. Beardmore was guarantor for the performance of the contract, his liability being limited to £115,134. The balance of the sum sued for was £145,000 for repayment of part of the purchase price paid to Stewart & Co., and about £200,000 for damages for breach of contract.

Lord Ormidale found in favour of the plaintiffs, and granted a decree against Stewart & Co. and Wm. Beardmore, jointly, for the payment of £115,134 6s. 6d., with interest at the rate of 4 per cent. per annum from July 1st, 1908, until payment, reserving to Wm. Beardmore such right of relief against Stewart & Co. as might be competent to him. His Lordship further decided against Stewart & Co. for payment to the plaintiffs of (1) £27,961 3s. 1d., with interest at 5 per cent. per annum from July 1st, 1908, till payment; (2) £127,907 8s. 6d.; and (3) £69,175, with interest on these sums of £127,907 8s. 6d. and £69,175 at 5 per cent. per annum till payment. Messrs. Stewart & Co. alone were found liable for costs. In the specification on which the contracts were based, Section A was for gas-producing plant and accessories, Section B was for gas engines, and Sections C, D, and E were for electrical generating machinery—(C) two-phase alternators, (D) direct-current dynamos, and (E) balancers. His lordship said he had to decide, in the first place, whether in fact the contractors repudiated their contracts. He held they did. It seemed to him to be enough, in the view he took, that the contractors admitted that the plant and machinery were not in a condition to allow the stipulated tests to be carried out, and that they threw up the contracts and ceased working. They made no proposal that they should be allowed further time in order to put the plant and machinery in a condition that would satisfy the tests, and their acknowledgment of its inability to satisfy the tests was universal, and included Sections A to E. By their ceasing to work on a day's notice, or rather on a few hours' notice, and withdrawing their workmen from the station, the contractors made it absolutely impossible to apply the provisions to satisfy the stipulated tests, or, indeed, any other provisions of the contracts. He had no doubt that the pursuers were entitled to treat the contracts as at an end, and this obviously involved the guarantor.

LOCAL NOTES

Australia: *Sydney: Policy of Electricity Undertaking.*—Mr. R. Forbes-Mackay, the Sydney City Electrical Engineer, has prepared a report upon the future of the electricity undertaking, in which he recommends extension of mains in all directions and to sell electricity at the lowest possible price for all purposes with the object of helping manufacturers, and superseding obsolete, dirty, and unwholesome methods of lighting and power production. The Electricity Committee have postponed their discussion on the matter, the Town Clerk having been asked to submit a report on the policy followed in Great Britain and other countries.

Batley: *Electricity Committee.*—Alderman George Hirst, one of the members of the Electricity Committee, has informed the Council that in consequence of what he deems to be the entire lack of management and the lack of business principle in connection with the Electricity Committee, he feels he can no longer continue to be a member.

Birmingham: *Supply in Moseley.*—Considerable progress is being made with the laying of mains for the supply of electricity to Moseley, which is one of the districts recently incorporated with Birmingham. A sub-station has been erected for supplying this district, and others are to be erected for supply to Harborne, King's Norton, and Yardley.

Bristol: *Pupils' Premiums.*—Hitherto it has been the practice for the premiums received from improvers at the electricity works to be divided between the Corporation and the Electrical Engineer, and these payments have been taken into consideration in fixing the amount of his salary from time to time. The average amount received by the Electrical Engineer during the last ten years from this source has been £102 per annum. The Committee now recommend that the whole of the premiums received should be paid over to the Corporation, and that the Engineer be paid £100 per annum in lieu thereof, to be considered as a salary.

Canada: *Electric Power Supply.*—The Imperial Trade correspondent at Toronto, says the *Board of Trade Journal*, reports that a company with a capital of £8,200,000 has been granted a charter in Canada with powers to purchase lines and water powers for the generation of electric energy. An address to which communications may be sent is on file at 73 Basinghall Street, London, E.C.

Cheltenham: *Extension of Area.*—The Council have decided to apply to the Board of Trade for an electric lighting provisional order to considerably extend the present area of supply.

Hull: *Electricity Supply.*—The Electricity Committee have been in negotiation with the Hessle Council with regard to the supply of electricity, and have made an offer of 2d. per unit up to 70,000 units, and 1½d. per unit up to 100,000 units.

London: *City of London Tramways.*—The L.C.C. have asked for the consent of the City Corporation for the construction of tramways from the City boundary at Norton Folgate to a point near the Great Eastern Hotel, Liverpool Street, and for the construction of tramways from Charles Street, Farringdon Street, to the north side of Ludgate Circus. The lines would be the property of the City Corporation, as in the case of the tramway over Blackfriars Bridge, and would be leased for a nominal sum to the London County Council. It is understood that the Improvement and Finance Committee will recommend the City Corporation to give its approval.

Hackney: Electricity Sales Department.—In his annual report, the district auditor points out that owing to the transactions of the wiring and fittings department having increased considerably, it is necessary to carefully consider the system upon which the cost of the works is recorded. He recommends that in order to put the matter upon a satisfactory basis, a slight addition to the clerical staff is necessary.

Middlesbrough: *Electricity Accounts.*—After meeting capital charges, &c., there is a net profit on the working of the electricity undertaking last year of £2,078. This sum has been transferred to reserve fund. The total costs were reduced from 1·157d. per unit to 1·083d. per unit.

Newport (Mon.): *Commercial Manager.*—The Electricity Committee have decided to recommend the Council to appoint a general commercial manager for the tramways and electricity undertakings, with Mr. H. Collings-Bishop as Electrical Engineer to both undertakings. According to the *South Wales Daily News*, Mr. Collings-Bishop has prepared a lengthy report, in which he defends the present method of carrying on the undertakings.

Hosted by Google

Ross (Herefordshire): *Street Lighting.*—The question of whether the streets shall be lighted by electricity or gas has been referred to a special committee.

Sheffield: *Electricity Supply.*—A proposal is to be placed before the Council that the chief officials of the tramways and electricity departments should report as to the advisability of arranging for inter-communication between the Neepsend and Kelham Island power stations. The former belongs to the electric light undertaking, and the latter to the tramways.

Worthing: *Plant Extensions.*—The Local Government Board have sanctioned a loan of £4,532 for extensions at the electricity works. Tenders for this plant have already been accepted, and they include Diesel engines.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Biddulph.—The Town Clerk has been instructed to write to several consulting engineers for terms.

Clevedon.—It is stated that an electric lighting company has been formed for this district, and that shares to the value of £6,000 have already been taken up.

Croydon.—A Local Government Board inquiry was held last week concerning a loan of £10,000, of which £9,500 is for the extension of mains for street lighting, and £500 for transformers. There was no opposition. Having gone into some of the figures, Mr. H. Ross-Hooper, the inspector, expressed the opinion that the undertaking seemed to be in a very satisfactory condition.

Darlington.—A loan of £3,220 is to be applied for in connection with the new generating plant at the electricity works.

London: *Hackney.*—The London County Council have agreed to grant a loan of £4,364 at 3¾ per cent. for electricity purposes. Mains extensions are to be carried out at an estimated cost of about £200.

Reigate.—The Local Government Board have sanctioned a loan of £4,859 for new engines, switchboard, &c., repayable in 17 years, and £1,118 for prospective expenditure on mains, house services, and transformers, repayable in 15 years.

Teignmouth.—The Council are discussing the question of electric lighting in connection with an application by Dr. J. W. Purves for permission to apply for an order. The Town Clerk has been instructed to employ a Parliamentary Agent, and, if necessary, a Consulting Engineer, in connection with the proposal.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Coventry.—Considerable extensions to Coventry and Warwickshire Hospital. Particulars from F. J. Cox, 2 Verulam Buildings, Gray's Inn, or H. W. Chattaway, Trinity Churchyard, Coventry.

Croydon.—Electric theatre, Windmill Road. J. J. Taylor, Westminster.—24 houses, Baring Road, H. R. Hunter, Sydenham.—12 houses, Ashburton Avenue, P. Crowley, Burlington Road.

Lancashire.—New County schools at Failsworth and Denton. H. Littler, 16 Ribblesdale Place, Preston.

Swansea.—Tenders are invited for an electric light installation at the Corporation's cattle market and slaughter-house. Borough Electrical Engineer.

Tunbridge Wells.—New County school for the Kent Education Committee. F. W. Crook, Caxton House, Westminster.

Uxbridge.—Tenders are to be invited for the electric wiring of the scarlet fever and diphtheria wards at the Kingston Lane Hospital.

Winchester.—Elementary school. Architect, A. H. Johnson.

York.—Stores for hotel department, North Eastern Railway. Secretary.

MISCELLANEOUS

Australia.—The Deputy Postmaster-General, Melbourne, invites tenders by November 28th, for 2,000 ebonite telephone ear pieces, and 5,000 stoneware insulators.

Enfield.—Tenders are invited by October 25th for the installation of eight telephone instruments and the overhauling of two existing 10-line exchanges at the Chase Farm Schools. Consulting Engineers, Messrs. May & Hawes, Caxton House, Westminster.

Rotherham.—The Council have agreed to several extensions of the tramways in the Borough.

Russia.—According to the *Board of Trade Journal*, the Russian Administration of Posts and Telegraphs have applied for powers for laying an additional line between Moscow and St. Petersburg, at an estimated cost of about £21,100.

Truro.—Tenders are invited by October 21st for an internal telephone system at the new County offices. Particulars from the Clerk of the Works.

TENDERS RECEIVED AND ACCEPTED

Australia.—The *Australian Mining Standard* states that the Victorian Postmaster-General has accepted the tender of the Automatic Electric Co. for an automatic telephone switchboard for the new Geelong telephone exchange, at a cost of £14,293. There were two tenders for automatic boards, the accepted one being the lowest. The departmental experts have reported to the Postmaster-General that the automatic system will probably prove suitable in Geelong, though they are less certain of its suitability for the metropolitan exchanges at Sydney and Melbourne. The board in question is being installed as an experiment.

Lewes.—The Electric Lighting Committee have again recommended the acceptance of the tender of the Lewes and District Electric Supply Co. for street lighting. A similar recommendation a short time ago was referred back for further consideration. The tender of the Electric Lighting Co., which is now accepted, involves a saving of 6s. 3d. per post compared with the price previously paid for gas.

London.—Messrs. Willans & Robinson, Ltd., have received an order from Messrs. D. Napier & Son, Ltd., for a Willans-Diesel oil engine to drive a 200-kw. direct-current dynamo, for installation at their works at Acton Vale, London, W.

South Africa.—According to *Commercial Intelligence*, Messrs. Siemens Bros. & Co., Ltd., submitted the lowest tender for the Potchefstroom electric lighting contract, but the Town Engineer has recommended the division of the work between two other contractors, Messrs. Reunert & Lens, and Messrs. H. Davies & Co. The tenders of these two firms amount to £12,487, as compared with £12,243 tendered by Messrs. Siemens for the whole work.

APPOINTMENTS AND PERSONAL NOTES

A mechanical superintendent is required at the West Ham power station. (See an advertisement on another page.)

Seventy-four applications were received by the Hackney Borough Council for the position of third-class clerk in the Electricity Sales Department, at a commencing salary of £105, rising by £7 10s. per annum to £120 per annum. The Electricity Committee put forward the names of W. E. Bates, Prime Cost Clerk, Southwark Electricity Department; F. G. Jennings, Prime Cost Clerk, Poplar Electricity Department; and G. Woolley, at present with the Western Electric Co., Ltd.

Mr. E. L. Joseph, Managing Director of Ozonair, Ltd., has appointed Mr. R. Borlase Matthews as Manager. Mr. Matthews informs us that he is relinquishing his present work as consulting engineer to take up the appointment.

Mr. W. C. Field wishes to notify his numerous friends that he is in charge of the stand of Metalite, Ltd., at the Electrical Exhibition, Olympia, where he will be glad to see any of them.

The Secretaryship of the Junior Institution of Engineers, rendered vacant by the resignation of Mr. Walter T. Dunn, has been filled by the appointment of Mr. A. Clifford Swales, Engineering Assistant to the City Engineer of Leeds.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £56 15s. to £57 (last week, £56 15s. to £57 5s.).

Liquidations.—A meeting of creditors of the Lahmeyer Electrical Co. will be held at 133 & 135, Oxford Street, London, on Thursday, October 19th, at 12 noon.

Creditors of the Howe Electrical Engineering Co., Ltd., are requested to send particulars of their claims to Mr. A. Thraves, 7 Victoria Street, Liverpool, before October 11th.

Hosted by Google

Bankruptcies.—A first and final dividend of 5s. 6d. in the £ will be paid in the bankruptcy of George Barker, Electrical Engineer, Roundhay, Leeds, on October 16th, at the Official Receiver's office, the Red House, Duncombe Place, York.

The first meeting of creditors in the bankruptcy of W. F. Flint, Electrical Engineer, 53 Jameson Street, Hull, was held last week. The gross liabilities were estimated at £1,785, and the deficiency at £1,106. The bankruptcy is attributed to loss on contracts, and a committee of inquiry has been appointed.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

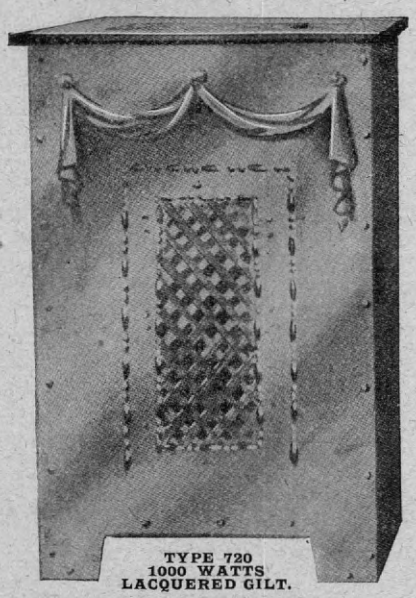
NEW COMPANIES

LEITNER ELECTRICAL CO., 7 Princes Street, Westminster, S.W. Capital, £27,500. To acquire from H. Leitner a license to work his electric train and boat lighting system.

GLAIS ELECTRICAL CO. Capital, £2,000. To take over the electric lighting station now carried on by E. Lewis, at Glais, Glamorganshire.

MUNICIPAL TRAMWAYS ASSOCIATION (Incorporated). Registered with 300 members, each liable for £1 in the event of winding up. The management is invested in a Council, the first members of which are:—J. Dalrymple, H. E. Blain, C. J. Spencer, A. L. C. Bell, J. Aldworth, H. Linsley, A. R. Fearnley, A. Baker, P. Fisher, S. Flint, J. B. Hamilton, J. M. McElroy, H. Mozley, W. F. Russell, L. Slattery, E. R. Pickmere.

INDUSTRIAL PLANT CO.—Capital, £40,000. Manufacturers of all classes of machinery in connection with the generation and supply of electricity. The first directors are Mr. F. S. Newall and Mr. R. P. Sloan (Newcastle).



ORMSKIRK ELECTRIC SUPPLY CO.—Capital, £3,000. To acquire an Electric Lighting Provisional Order granted in 1900 to the Ormskirk Council. The subscribers are Messrs. Rhodes Motors, Ltd., A. L. Rhodes, and J. W. Speight.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Willans & Robinson.—The half-yearly meeting was held in London on Tuesday, Mr. A. C. Peache presiding. He pointed out that the recent law case, which had involved the company in a heavy loss, arose out of contracts carried out by the Queensferry Works. The Rugby business now stood on its own merits, and since the close of the year the Thames Ditton Works had been sold. The loss of £7,692 for the past half-year was entirely due to the continued low scale of prices. The debtor balance of £91,948 was owing to the fact that their business was largely with municipalities, whose custom was to spread payment over twelve months after delivery.

British Thomson-Houston Co.—The report for the year to March 31st shows a net profit of £6,374, and after writing off £628 depreciation on office furniture, &c., and £5,343 depreciation on apparatus, meters, supplies, &c., a balance of £403 is carried forward. Satisfactory business in all departments is reported.

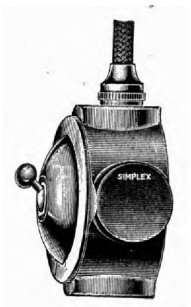
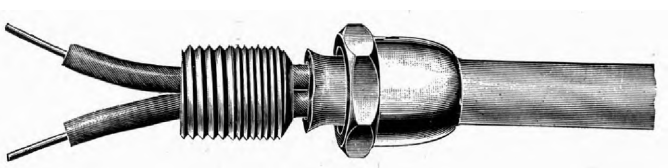
CHEAPNESS



is an object which has been aimed at by all classes to such an extent that it has almost become a craze by those people who regard low price as the only qualification necessary. It is an admitted fact, however, that the best is the cheapest in the end, but in no case has the demand for cheapness been more pronounced than in electric wiring, and the same qualifications apply. It is probably through the introduction of the metal filament lamp and the consequent reduced cost of electric lighting that has brought the consideration of lower costs for installation work much to the fore during the last eighteen months. The Central Station Engineer now finds it necessary to reach a consumer who before did not merit his attention, either because his bill was already sufficiently high with the old carbon filament lamps, or because the price he found it necessary to charge for electricity per unit was such as to place this form of illumination beyond the means of the small consumer. The trade is, therefore, faced with the problem of finding a cheap and efficient system of electric wiring which can be installed in small villas, artisans' flats, and dwellings on a wholesale basis at a very low cost.

Although the electrical contractor himself has possibly no particular desire to use cheap systems of wiring, it has become necessary owing to the force of circumstances mentioned and by the pressure put upon him by Central Station Engineers, Architects, and Builders. There are, at the present moment, numerous low priced systems of wiring available which possess more or less the defects consequent upon cheapness. It is of interest, therefore, to the whole of the industry to be acquainted with those systems which combine the greatest factor of safety at the lowest costs. In this particular connection special mention may be made of Simplex flexible wiring system; the very fact that this system bears the name SIMPLEX, which is synonymous with everything of the best in installation material, substantiates the claim made that the system is worthy of careful consideration. It should not be overlooked that the promoters have had very many years of close practical connection with electrical installation work, and are therefore able to give appreciation of the difficulties and considerations which arise, which many other makers who rush into the business are not able to do.

Briefly described, the charm of the system is the simplicity of its erection. This is arrived at by the introduction of a minimum number of component parts, which go to form the whole system. This flexible wiring system has a circular twin flexible wire, which is supplied in two styles; the first has a flame-proof cover, and the second is braided with tinned copper wire, which, without diminishing in any way the flexibility of the cable, provides perfect mechanical protection against injury, and at the same time allows the whole system to be erected electrically continuous throughout its length. This latter point is one of the greatest importance, and is not met with in any other purely flexible system. For use with this special flexible a Universal cast-iron box has been designed, which will take either a ceiling rose, a switch, a lamp-holder, a wall socket, or any other standard accessory. This box is provided with a patent grip nipple, which effects a secure junction between the cable and the box, and in the case of the armoured flexible, a lasting electrical contact for continuity purpose. It is obvious that as the work is wholly on the surface, one accessory is required that the system can be erected at a minimum price compatible with reasonable safety. Certain extreme conditions which obtain in some situations have led to a modification of this surface flexible system, and out of it has been produced yet another system equally safe and almost as inexpensive, which may be used for external work, wash houses, dyeing and cleaning factories, &c. This is the Simplex lead-covered system, which possesses the further advantage of being watertight. The same fitting—the Universal Box—is used with this lead wire, which is circular twin 1/18's of standard size, the wiring being carried into the box through a special brass nipple in such a manner as to effect a watertight electrically continuous joint between the lead covering of the cable and the box itself.



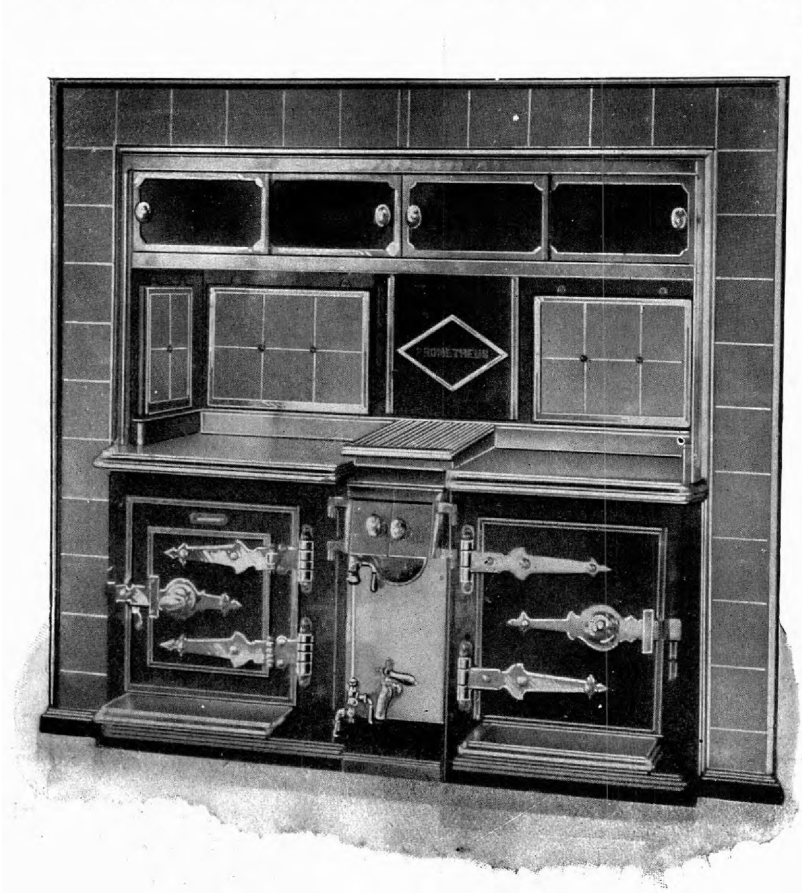
The many engineers interested in this question of cheap wiring should not fail to examine samples of the Simplex Co.'s exhibit at the Electrical Exhibition, Stands Nos. 148 and 163, and particular attention should be paid to the fact that in the case of the lead-covered system there is no soldered joint whatever, connection in both systems being made to specially easily wired terminals of ample proportions on china interiors where jointing work is necessary. The systems have been submitted to many of the leading Consulting and Fire Office and Station Engineers throughout the country, and have secured unqualified approval. Full particulars can be obtained from

STANDS Nos. 148 and 163.

Hosted by Google

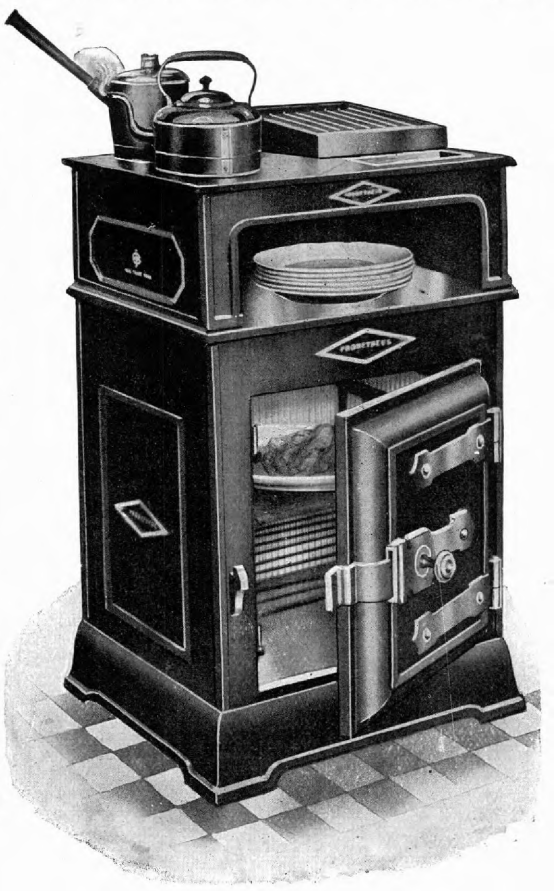
THE ELECTRICAL EXHIBITION OF 1911

(FIFTH NOTICE.)



British Prometheus Co., Ltd.,

SALOP STREET WORKS, BIRMINGHAM. (STAND NOS. 197 & 218.)



Cooking and Heating.—The interest in the large electric cooking apparatus shown by this firm is considerably enhanced by the statement that the company is prepared to guarantee this apparatus for three years. A large electric cooking range, shown in operation, and capable of cooking for up to sixty people, proves a great attraction. We illustrate this. On the left is a roasting oven 20 in. wide, 19 in. high, and 22 in. deep, taking about 4 kw. at full load. It has an inner glass door so that the food can be inspected without opening the oven. The two sides and back are faced with cast-iron rib plates covered with white vitreous enamel, and behind these are the heating elements, which are constructed on the standard Prometheus principle, namely, very thin films of metal deposited on mica; the mica is backed with an armouring of metal plates. On the top side of the oven is an incandescent heating element (for "browning") made up of rods of "silundum," a highly refractory product of the electric furnace. On the right-hand side is a second oven for baking. The size and arrangement are similar to those of the roasting oven, except that the incandescent heat is omitted. The space between the two ovens contains a cast-iron circulating hot-water boiler, just as does an ordinary coal-fired kitchen range; this consumes about 2 kw., and has armoured Prometheus heating elements at the bottom. Just above this there are incandescent toasting bars of silundum (about $1\frac{1}{2}$ kw., and above this again a nickel-plated grill taking about 2·5 kw. For the grill the Prometheus type of element is again used, and the underside of the grill is machined flat, and is in thermal contact with the armoured elements. Similar elements are employed for a boiling plate and a simmering plate, which are placed one above each of the ovens and take about 2 and 1 kw. respectively. Above the whole is a hot-cupboard, which is sufficiently warmed by the heat rising from the range. It is seen that the total power when all the range is switched on is 17 kw., but in practice the ordinary running consumption is from 6 to 8 kw. only. About half-an-hour is required for the oven to attain its cooking temperature, and as there are eight combinations of heat on each oven, the temperature can be accurately regulated during the cooking; this is facilitated in the case of the roasting oven by a thermometer, the tube of which is outside. When the roasting is practically finished, all the side elements can be switched off and the incandescent element switched on alone for browning off. The toaster, water-boiler, hot-plates, and grill are all subdivided also, so that they can be switched off to half-heat (in some cases also $\frac{2}{3}$ and $\frac{1}{3}$).

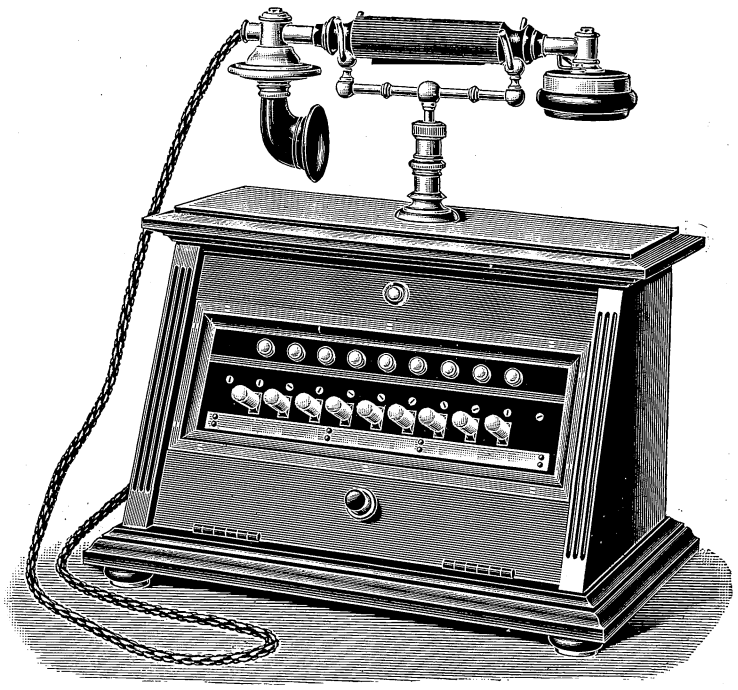
A specimen of a slightly smaller oven which the company has supplied in large quantities is also exhibited. This is built on the same lines, consumes $4\frac{1}{2}$ kw., of which $2\frac{1}{2}$ is required for the oven itself and the remainder for the top plate apparatus, and is sufficiently large to cook for twelve to eighteen persons. Its top-plate apparatus comprises a grill, frying-pan, and simmering and boiling plates. A large hot-cupboard and carving table is also shown.

Another large exhibit is a steamer for vegetables and fish. This is supplied by a steam generator taking 15 kw., which has armoured heating elements at the bottom. It will raise steam 15 lbs. per sq. in. in about two minutes. The steamer is in two compartments, each 19 in. wide × $13\frac{1}{2}$ in. high × 20 in. deep, fitted with galvanised iron trays, and it has a total capacity of 1 cwt. of potatoes or 150 lbs. of fish. When the pressure of 15 lbs. is reached the current can be reduced, and we are informed that it will then cook its hundred-

17 kw. Kitchen Range for 60 persons.

4½ kw. Oven, with Grill, Frying Pan, and Simmering and Boiling Plates.

Hosted by Google



weight of potatoes in from 12 to 15 minutes on a consumption of about 7 kw. Six switches are provided for regulation. The water supply to the steam generator is automatically controlled by a float.

The smaller apparatus exhibited by the Prometheus Co. shows almost endless varieties of kinds and patterns. Various forms of kettles, hot-water jugs with a small heating element at the bottom to keep the water warm, coffee-pots, hot-plates, toasters, and electric irons are to be seen at the stand, and fine examples of convectors for room heating. A "universal voltage" iron with three terminals should be useful; one pair of terminals is for 100 to 125 volts and the other for 200 to 250 volts, so that it can be used almost anywhere. We were also pleased with a plain 12s. 6d. shaving-pot, which will boil the water in one minute, taking 200 watts. Another interesting device is a curling-tong heater, so arranged that the current is automatically switched off when the tongs are taken out.

The Sterling Telephone & Electric Co., Ltd.,

200 Upper Thames Street, E.C. (Stand Nos. 127 & 132.)

Telephones.—In this finely arranged exhibit, the enormous number of sizes and patterns of intercommunication telephones is remarkable. The company's "Primax" interphones, although on the single-wire common return system, are designed to overcome the trouble of induced overhearing and cross-talk from which all common return intercommunication systems are liable to suffer to a certain extent. Two separate batteries are employed, one for speaking (to which heavier conductors are employed) and one for ringing, so that four bat-

Secret Conversation, Lamp-Signalling Interphone.

tery wires are required. In the "Era" interphone, a double line system is employed, so that induced cross-talk is entirely eliminated. The intercommunication telephone "de luxe" is represented by the lamp-signalling, secret conversation interphones. In these last, double lines are used, a cable is run from each instrument to a cross-connection board, and it is impossible for an engaged line to be tipped from another station. A central battery is employed, either a secondary battery or a primary battery of the "sack" type. The lamp indicators give a visual indication of the station calling, and there is also a definite indication to the calling station whether the station wanted is engaged or disengaged. We illustrate the table type of this instrument.

In addition to the interphones large varieties of every kind of instrument are shown, from the cheap "parlyphone" for connecting to bell-circuits to exchange telephones and mining and naval telephones. In the latter the microphone is protected in a practical manner from the shock occasioned by gun-fire.

Bells.—Several examples are shown of the strong, water-tight bells in which the company specialise. In the larger type the entire movement is enclosed in an hermetically sealed chamber, and the motion of the armature is transmitted through a German silver diaphragm, to which the hammer-stem is fixed. The entire movement is insulated from the frame, and the line wires are led in through stuffing glands. The neat design of the company's smaller "Thruster" type bell has been fairly recently described and illustrated in our columns, and will be familiar to our readers. Mention must also be made of the "Unitype" indicator (described in our columns more recently), in which each movement is self-contained in a metal case. The company's ingenious patent hinged backboard is employed with these to facilitate wiring.

The Union Electric Co., Ltd.,

Park Street, Southwark, S.E. (Stand Nos. 101 & 104.)

Arc Lamps.—The most prominent feature of the Union Electric Co.'s stand is the high platform on which is mounted a searchlight projector and a group of the company's well-known Excello flame arc lamps and a very complete exhibit of arc lamps for ordinary use and special purposes such as stage lighting, photographic work, &c. Most of these lamps are fed from a motor generator running on the stand.

Switchgear and Instruments.—Surrounding the lower part of this platform is a series of switch panels representing the company's standard practice in high-tension switchgear. A number of high-tension oil switches of various patterns are shown separately, and one of the most interesting of these is a 6,000-volt 200-ampere remote control switch shown in action complete with control panel fitted with push-buttons and indicating lamps. Examples of mining switches are also shown, as well as complete panels of the safety pull-out pattern. A particular feature of the large representative collection of switchboard and other instruments are the frequency and speed indicators on the vibrating reed principle.

Motors, Transformers, &c.—Among the various patterns of motors shown a novelty is included in a special fully enclosed motor, which is provided with a series of sheet-metal tubes of large cooling surface inside the bedplate, through which the air circulates, giving increased power of dissipating heat while the motor is still fully enclosed. Attention may also be called to the examples of small fan motors, in which all the motor parts are fully interchangeable, this being facilitated by making the carcase of Mannesmann tube instead of from castings.

The London & Rugby Engineering Co., Ltd.,

10 Bush Lane, Cannon Street, E.C. (Stand Nos. 23 & 38.)

Lamps.—Metal filament and carbon lamps, from the very smallest sizes upwards, are shown with every variety of bulb and cap, and specimens of parts of lamps showing the different stages of manufacture are exhibited. Among the special types is a double filament lamp for ships' navigation lights.

Automatic Stokers and Coal Conveyors.—The company are the sole London agents for Proctor stokers, and exhibit both the shovel stoker and the Proctor coking stoker and self-cleaning fire-bars. In the latter stoker the coal is carried well inside the furnace by a ram; the ram travels forward with a charge of coal, and as it returns the coal falls off on to the fire. On the next stroke of the ram, the partially coked fuel is pushed forward, leaving a bright fire underneath to receive the next charge. A ram feed is also the feature of the Proctor coal elevator and conveyor. Jamming and wear of the buckets is prevented by allowing the coal to fall in front of a ram which pushes it forward into the ascending bucket, instead of the buckets being dragged through the coal.

Venner & Co., Ltd.,

6 Old Queen Street, S.W. (Stand Nos. 156 & 157.)

Messrs. Venner & Co. exhibit both inside and outside the tasteful little house which they have erected on their stand, the products of the Credenda Signs Co. (New Canal Street, Birmingham), Chamberlain & Hookham, Ltd. (New Bartholomew Street, Birmingham), for whom they are agents, as well as Venner Time Switches, Ltd.

Signs.—The Venner sign is well known, but it is not often that it has such an excellent opportunity of being compared with other signs, and showing not only how well it can be adapted to decorative work, outlining posters, &c., but how little its brilliancy is affected by neighbouring lights. Each point of light is a glass head closing a hole in the metal front of the sign and illuminated from lamps within. As compared

with signs where separate lamps are used for every point of light, an economy of 70 to 80 per cent. can be obtained. A number of well-known railway posters are shown outlined in this way, and the fearsome skeleton of a gorilla shown here shines out at us by one of the stand entrances. A very pretty effect can be obtained with lamps of several colours, as each

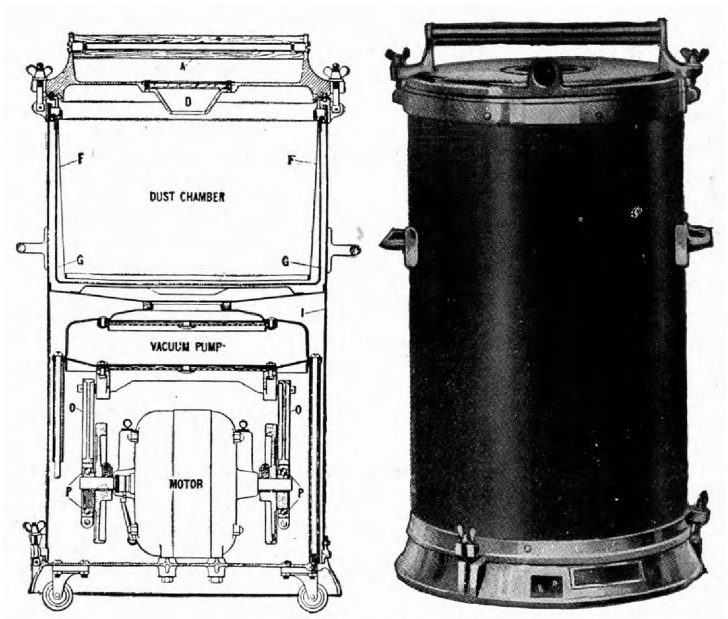
Venner Sign.

colour is reflected separately in every single head. The system is also well adapted to shop window signs, where the same lamps do duty for general illumination as for the sign, and its decorative capabilities are well shown by the design round the top of the stand.

Meters.—A good show is made of Chamberlain & Hookham meters. Among them is the special tramcar meter, with its unspillable mercury container and heavy shunt to avoid damage on short circuits. We understand that 3,000 of these are in use, forming more than 80 per cent. of the tramcar meters in this country. A recent pattern of A.-C. induction type meter is shown, which has a full load torque as high as 7·5 c. grs., and is claimed to have the highest ratio of torque to weight of disc to any on the market. An accuracy within 2·5 per cent. is guaranteed right down to 1/80 of full load, and they are stated to start on $\frac{1}{8}$ of one per cent. of full load. Prepayment meters are also shown, as well as meters fitted with the Lackie maximum demand attachment.

Time Switches.—The Venner time switch (see ELECTRICAL ENGINEERING, Vol. I., p. 730) is well represented, and one of the new patterns shown is a special switch designed for restricted hour service. The switch itself has to be put on by hand, but this can only be done when the clock mechanism allows the catch connecting the loose handle and the switch arm to engage. The switch, however, flies off automatically when the period has elapsed.

The British Electric Transformer Co., Ltd.,



HAYES, MIDDLESEX. (STAND NOS. 30 & 31.)

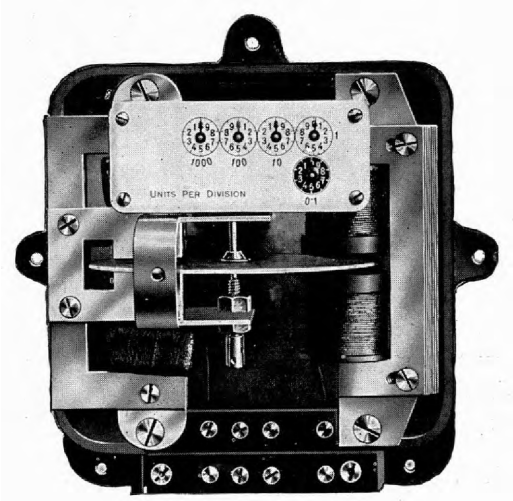
Transformers and Series Gear.—On this firm's stand are shown two examples of the well-known Berry air-cooled transformer, one for 100 kw. and one for 10 kw., and these are of additional interest as being connected up to the switch-gear known as the Berry series gear, which automatically transfers the load from the large to the small transformer when the demand falls below a certain value, and *vice versâ*, to minimise the light load losses. This system was described in considerable detail in ELECTRICAL ENGINEERING, Vol. III., page 197, February 6th, 1908, but the apparatus now exhibited has some improvements in detail over that there described, principally in that the change-over switch is now enclosed in oil, and, requiring less force to work it, operates particularly smoothly and quietly. It should be mentioned that Berry transformers are used in the special exhibition substation on stand 240, as well as in the permanent Olympia substation, so that the whole of the power used in the exhibition passes through them.

Duncan, Watson & Co.,

62 BERNERS STREET, W. (STAND NOS. 60 & 63.)

Vacuum Cleaners.—This stand is devoted chiefly to demonstrating the firm's portable, electrically-driven, self-contained vacuum cleaner. This apparatus, which is shown in section in the illustration, is of a convenient size for domestic purposes, and contains a positive vacuum pump of the diaphragm pattern, capable of producing a vacuum of 7 to 8 in. of mercury and displacing 25 to 30 cubic ft. of free air per minute, driven direct by ball-bearing cranks

Duncan Watson Vacuum Cleaner.



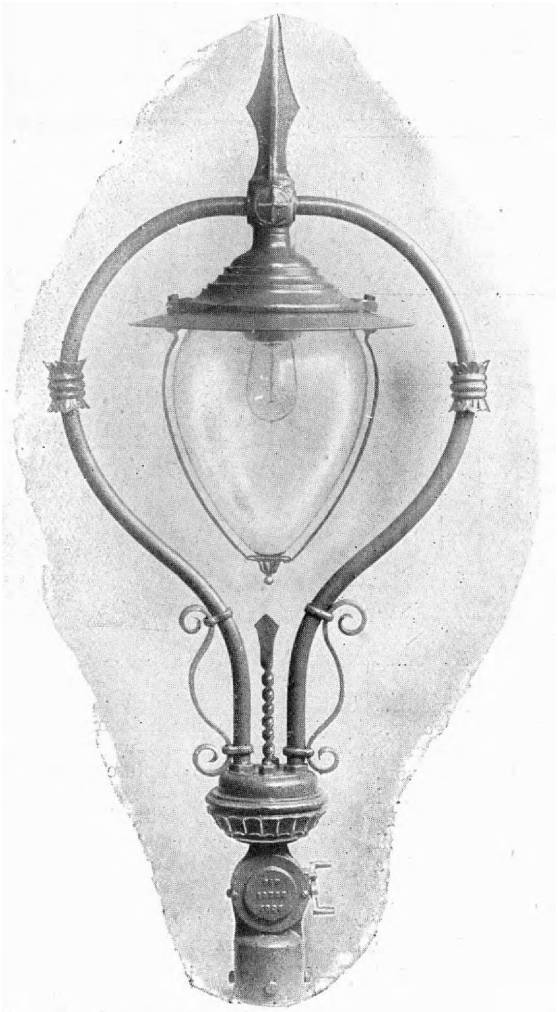
from a $\frac{1}{3}$-h.p. motor. The most approved arrangement of dust filter and receiver is used, and the whole machine runs on ball-bearing castors, but is not too heavy to be easily carried by one person. A particularly complete set of accessories, nozzles, etc., is supplied.

Other Exhibits.—A complete $\frac{1}{2}$-h.p. country-house lighting set with Hornsby oil engine is shown on the stand, and another attraction is a handsome electric fountain.

Haydn T. Harrison,

11 VICTORIA STREET. (STAND NO. 309.)

Street Lighting Fittings.—This stand is devoted to novelties connected with street lighting. Among these are fittings for all classes of streets fitted with Mr. Harrison's special reflectors, which direct the upper hemispherical light rays into the useful angles for street lighting, thus increasing the available efficiency of tungsten lamp fittings by more than 50 per cent. One of the newest of these fittings is



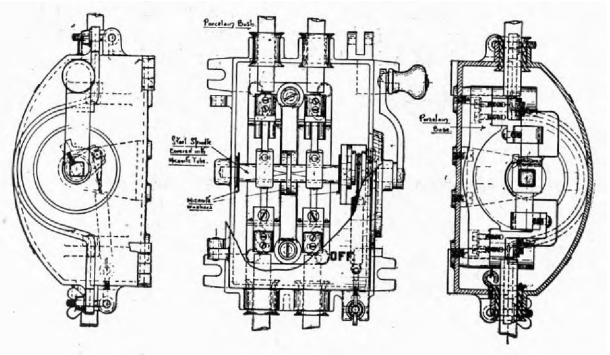
J. B. Meter, with Cover removed.

the high candle-power lantern illustrated on page 88, of which we understand that nearly one thousand have been erected during the last few months to replace open-type arc lamps. In some others combinations of the 100-watt tungsten lamps are used, three of these being necessary to produce 500 effective candle-power. An interesting development in street lighting time switches is exhibited, which does away

Hosted by Google

with the necessity of periodically setting for the change in time of lighting or extinguishing. Another interesting feature is the automatic half-night switch, which allows of the number of lighted lamps per lantern being reduced by momentarily switching off the circuits from the switching centres.

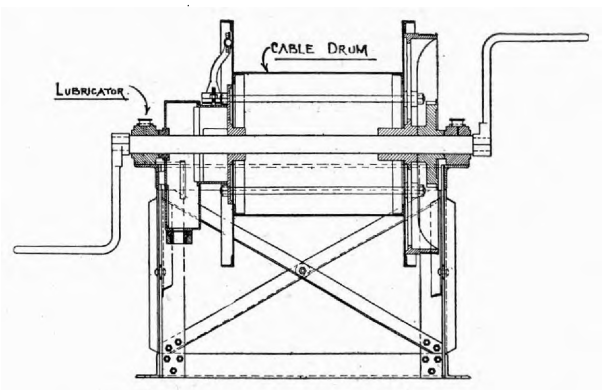
New Street Lighting Fitting, to take one 600 c.p. Metal Filament Lamp with Globe, or one 1000 c.p. Lamp without Globe.



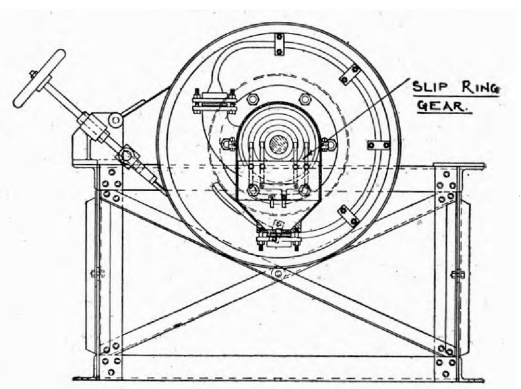
Meters.—On the same stand Johnson Billington Electricity Meters, Ltd. (11 Victoria Street, S.W.) exhibits examples of the J.B. alternating current watt-hour meter, which is quite novel in construction, though the principle of driving by means of a rotary field varying in strength in proportion to the watts is retained. On the other hand the permanent magnet brake with its liability to vary is dispensed with, being replaced by an alternating current magnet excited by coils in series with the fine wire coils of the driving magnet. The advantages gained are absolute permanency, low speed, and low friction losses, perfect temperature correction, and a straight line characteristic under all conditions; the meter will record correctly down to less than 1/100 part of full load, and is not affected by large variations in power factor or periodicity. The construction is extremely simple, and every part is accessible when the cover is removed. An illustration of this meter is given on page 87.

Callender's Cable & Construction Co., Ltd.,

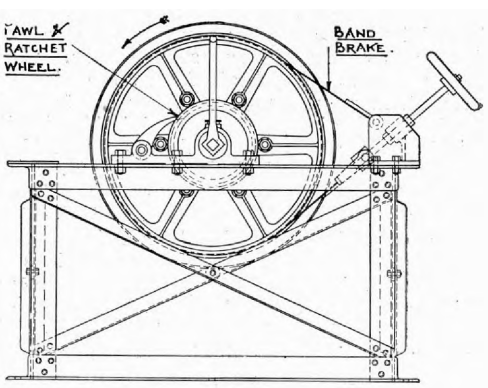
HAMILTON HOUSE, VICTORIA EMBANKMENT. (STAND NOS. 196 & 219.)



Callender's consider their cables too well known to need exhibiting, but they show several fine specimens of junction boxes.



A New Switch.—A novelty is Scott's patent D.P. main switch, which has not only a rapid break, but a rapid spring-controlled make. The moving contact-bars are solid and are on a loose spindle, which carries a cam with two projections. The handle is at the side of the box, and when it is turned towards on, a pawl engages with one of the projections and turns the loose spindle of the contact arm, at the same time extending a helical spring, one end of which is anchored on the box and the other is fixed on the loose moving part of the switch. As soon as the cam passes the dead-point of its rotation the spring carries the spindle sharply round,



Scott's Patent Quick-make Switch.

drawing the cam away from the pawl, and pulls the contact-bar sharply into the fixed contact blades. A similar action takes place on switching off. The movement is extremely ingenious, and the switch is certain to prove a favourite. An idea of the general arrangement will be obtained from the illustration above.

Cable Sinking Drum for Mines.

London: 10 ORANGE STREET W.C.

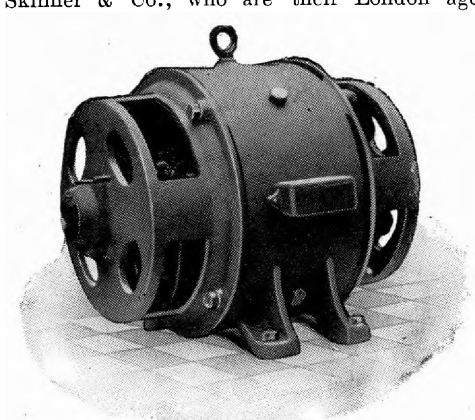
Hosted by Google

lowering cable gradually during the sinking of a mine shaft. Slip-rings and contacts are provided so that the cable can be connected to the supply at the drum, and as much as is required at each stage of the sinking operations can be drawn off without disconnecting. The drum is of mild steel, and a strong band-brake is provided as well as a pawl and ratchet wheel for raising or lowering. The slip-rings are mounted on a flat disc, and the whole of the slip-rings, contact brushes, and cable terminals are enclosed.

Other Exhibits.—The only piece of cable we saw on the stand was a trailing cable with the strong rubber armouring now known as the "cab-tyre" pattern. Specimens of insulating parts made of a new material called "Kalanite" are exhibited, and also a "Kalbitum" paint which has bitumen as a basis.

Spagnoletti, Ltd.,

GOLDHAWK ROAD, W. (STAND NO. 311.)



Heating and Cooking Apparatus.—A demonstration is given on the stand in the gallery of the Therol system of water heating and cooking, which has for its object the use of large heat storage capacity in the apparatus to enable a small current only to be consumed continuously throughout the whole twenty-four hours, instead of making a considerable call for energy for a short period while the actual cooking operations are in progress. This system, if adopted universally would greatly improve the station load factors, and by cutting down the maximum demand would avoid large expenditure on services, cables, &c. The Therol water-heater, as is well known, consists of a mass of iron, or other storage medium, continually heated by means of a small electrical heating element, and the whole is thoroughly insulated by means of magnesia. Suitable cored passages are cast in the iron block, and when water is passed through same it can be drawn from the water-heater instantly at any temperature required, from tepid to boiling. The cooking apparatus, which is now exhibited for the first time, is made on the same principle. The current for the cooker, when not being used, is taken up in heating the iron mass placed below the oven. When the oven is required to be used it is only necessary to open two dampers, and in a few minutes the oven reaches the required temperature of 300 to 400 degrees F. By adjusting the dampers the heat can be regulated in the oven to any required temperature.

With the Therol system boiling of water, vegetables, &c., is not done, as is usually the case, by electrically heated hot-plates on the top of the oven, but by a novel method with superheated steam, which by turning a tap can be made to circulate in the special jacketed utensils or steamers. This tap simply lets water from an external tank into the proper heated channels, where it is instantly converted into steam. Small auxiliary apparatus, irons, &c., are worked without increasing the demand by diverting the current from the water-heater or cooker. We understand that several companies are prepared to supply current at specially low rates where the Therol system is employed.

Wright and Wood, Ltd.,

CENTURY WORKS, HALIFAX. (STAND NOS. 129 & 130.)

This firm are exhibiting on the same stand as Messrs. Berry, Skinner & Co., who are their London agents. A

Rotary Transformer for Cinematograph Work.

considerable range of standard continuous and alternating current motors are shown, as well as machines and combinations for special purposes. We illustrate here a new rotary transformer for cinematograph work, which steps down from 460 to 65 volts, at which pressure it delivers 50 amperes. It is a single-field machine without voltage regulation on the generator side. Another special cinematograph set is the "duplex" type motor generator, in which two machines are coupled compactly together so that no bedplate is needed. Other motor generators are also shown, as well as small rotary converters with ball-bearings and a special rotary transformer for ignition cell charging. Polishing motors in several sizes are also shown.

Berry, Skinner & Co.,

78 UPPER THAMES STREET, E.C. (STAND NOS. 129 & 130.)

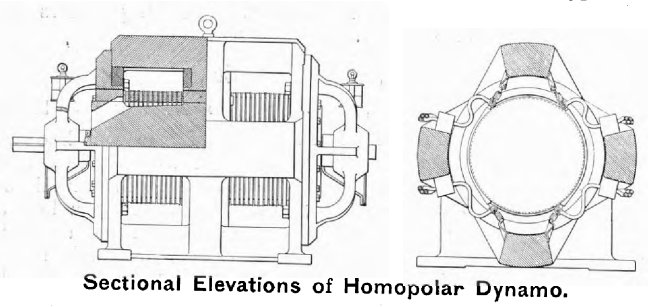
Switchgear.—A number of examples of the well-known Berry patent push-on and pull-off enclosed fused switch are shown, including one or two new types of recent introduction. One of these has the projecting spindle covered by a hood, and is arranged so that it can only be worked by a lever forming a detachable key. This switch was particularly designed for use in lunatic asylums, but has various other fields of usefulness, such as dockyards, public lighting, &c. Combinations of two switches linked together and interlocked so that they can be used as change-over switches are shown, and further modifications include watertight switches with special glands and a special Admiralty pattern insulated entirely with mica. The company's "Firimine" switch for colliery work, which was described in ELECTRICAL ENGINEERING IN MINES, June 1st, page xlii., is also shown. The way in which the switches are mounted on an iron framework to form complete switchboards is seen on the stand.

The Adams Manufacturing Co., Ltd.,

160 NEW BOND STREET, W. (STAND NOS. 107 & 108.)

Motor Control Apparatus, &c.—A fine display is made by the company of motor starters and controllers for a great variety of classes of work too numerous to detail here. An attractive feature of the exhibit is a revolving octagonal stage, over 10 ft. diameter at the base, and tapering by steps to the apex. The panels forming the eight sides are devoted to examples of switchgear and to photographs, and as the stage is motor driven it is used for demonstrating the effect of the various types of controllers and speed regulators that are exhibited on the stand. Attention may be drawn particularly to some of the new patterns of three-phase gear developed by the company. These include a complete remote control panel for a 100-h.p. motor, in which the time of closing of the contactors in regular sequence, cutting out the motor resistance, is determined by actual value of the rotor current, so that the rate of acceleration is automatically proportioned to the load. The company have also developed a new oil switch, which is shown in the 100-ampere size. Among the continuous current apparatus is a complete motor control pillar provided with a circuit-breaker and starter, so interlocked that the first movement of the handle in the direction for starting causes the circuit-breaker to close, but should an overload occur, it will re-open, and cannot be closed again until the load is lightened, and then only after all the starting resistance has been re-inserted. This starter may be used for "inching" to an unlimited extent, because of the method of interlock, whereby the slightest *backward* movement of the handle, either from the first or last or any intermediate contact, causes the circuit-breaker immediately to open and so confines the duty of opening circuit always to it. Among starters for special purposes are shown examples of the Broadbent starter for printing presses, described in the special supplement on the electrical equipment of Messrs. Richard Clay & Sons' printing works in ELECTRICAL ENGINEERING, May 15th.

Theatre Dimmers.—Another special feature of the stand is a demonstration of the capabilities of the Adams metallic resistance theatre dimmer, which was described in ELECTRICAL ENGINEERING, Vol. VI., page 680, October 27th, 1910, in connection with the installation at the Little Theatre.



Homopolar Generators,

CRAWLEY DOWN, SUSSEX. (STAND NOS. 27 & 34.)

A New High-speed Generator.—On this stand is shown a complete 100-volt, 50-kw. generator of the homopolar pattern running at 3,500 r.p.m., designed by Mr. R. H. Barbour. The machine is of a type which is being developed with a view to meeting the demand for continuous current generators running at steam turbine speeds, in sizes above the limits now imposed by commutation. The general arrangement of a machine almost exactly similar to the one exhibited is shown in the illustration. Briefly, the machine may be described as having a central pole extending completely round

Hosted by Google

the rotor with the same polarity throughout, and two similar end poles. The armature conductors, 12 in number, are mica-insulated rods lying in tunnels in the rotor under the central pole, and each end of these is collected to a slip-ring, so that there are in all 24 slip-rings, the brushes on which are arranged to connect all the armature conductors in series. The slip-rings are grooved and brushes of a special type are

Sectional Elevations of Homopolar Dynamo.

employed, consisting of flexible copper cores with a German silver armouring lying in the grooves around the greater part of the circumference, and kept tight by springs and tension units, as shown in the sectional end elevation. The machine shown has a rotor diameter of 14¼ in. and a length of 29½ in. between bearings. The over-all height is 28¼ in. The generator is shown working driven by a three-phase slip-ring motor controlled by an induction rotor controller with no resistances or contacts, made by the Electrical Apparatus Co.

Pope Shop-window Lamp. About half scale.

Pope's Electric Lamp Co., Ltd.,

HYTHE ROAD, WILLESDEN, N.W. (STAND NOS. 207 & 208.)

Sign.—The sign on this stand is one of the finest, if not the finest, in the exhibition. Four large white wooden boards have been erected to represent beams from a model of a lighthouse, which occupies the centre of the stand, and these bear the words Pope Lamps lined out in 10-c.p. lamps. There are 860 lamps on the sign, and the effect is enhanced by the use of white porcelain Benjamin lamp-holders in place of ordinary brass holders.

Lamp-Bumping Model.—To show the strength of their filaments, the company have exhibited four metal filament lamps on flexible cords, which are lifted and dropped with a jerk. An ingenious gear is used to work the device, which is driven by a small motor.

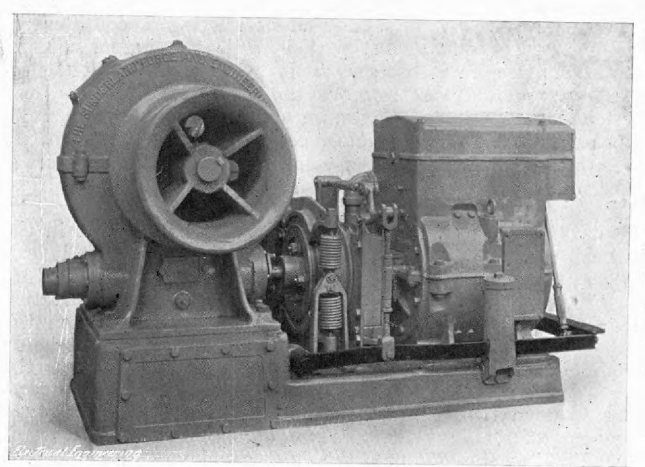
New Lamp for Shop-window Lighting.—This lamp, which we illustrate about half-size, should prove very useful on account of its length. It is 8⅝ in. long from end of cap to pip, and is made for 220-volts pressure as well as for low pressure; its candle-power is 50. The lamp has a tungsten filament and an efficiency of about 1¼ watts per British candle-power. A 3-pin cap is employed to enable the holder to support the lamp more firmly, and it is used in a Benjamin type reflector.

Several other lamps for special purposes are shown.

The Brush Electrical Engineering Co., Ltd.,

1 KINGSWAY, W.C. (STAND NOS. 84 & 89.)

Generating Sets.—The centre of attraction on this stand, and the only complete large generating set in the exhibition, is a 400-kw. mixed pressure turbo-generator destined for the Brush Company's own works. The turbine is of the Brush-Parsons combined action and reaction type capable of giving up to 300 kw. on exhaust steam alone, or up to 400 kw. on live steam alone, at 2,500 r.p.m., and the generator is a standard high-speed continuous current machine with commutating poles as well as compensating windings. A small 22·5-kw. continuous current set driven by a Brush reciprocating engine is also shown.



Motors and other Plant.—Among the motors of various descriptions on the stand may be mentioned a variable speed squirrel-cage induction motor, in which four economical speeds are obtained by different groupings of the stator coils to give 4, 6, 8, and 12 effective poles. A 150-h.p. slip-ring motor is also shown. Mention should also be made of two sets of electric pulley blocks, one of the Gese double purchase pattern for 1½ tons, and a worm-geared ½-ton Marshall hoist.

Lamps.—The "Metallum" metal filament lamp is, of course, well represented, and the main illumination of the stand is by Quartzalite mercury vapour lamps, of which a new pattern is shown giving 3,000 c.p. with a consumption of only 3½ amperes. The company also show a new flame arc lamp burning special carbons giving a particularly white light.

The Sunderland Forge and Engineering Co., Ltd.,

SUNDERLAND. (STAND NOS. 99 & 116.)

Dynamos, Motors, Steam Engines, Winches, &c.—We illustrate an electric 2-ton baggage winch, lifting at 70 feet per minute, of a type supplied to the *Olympic* and many other ships. This is worm-geared and particularly silent in action, and in addition to its compactness is interesting on account of the way the foot-brake is interlocked with the controller, returning it to the off position before applying the brake. The centre of the stand is occupied by a large 18-h.p. 30-ton

2 Ton Electric Baggage Hoist.

ship-geared winch with warping heads as well as a barrel. These are driven by motors of the firm's own manufacture, and a number of other examples of these motors, both for alternating and continuous current, are shown. Three sizes of ship-lighting sets with the firm's own open-type vertical engines for 35, 15, and 3 kw. are on the stand.

The Lancashire Dynamo & Motor Co.,

TRAFFORD PARK, MANCHESTER. (STAND NOS. 122 & 137.)

Planing Machine Drive.—Part of the stand forms a combined exhibit of the Lancashire Dynamo and Motor Co. and Joshua Buckton & Co. (Wellhouse Foundry, Leeds). This is a complete Buckton planing machine, to which is fitted the Lancashire system of reversing motor drive, in which the control of the driving motor is carried out on the field of a special motor generator, mounted on the machine, which supplied the current. The system was described in some detail in ELECTRICAL ENGINEERING, Vol. VI., page 114, February 17th, 1910, but the machine exhibited is fitted with one or two improvements, including provision for speeding up between the cuts, when two or more surfaces some distance apart are being planed by means of suitable lappet switches and for allowing the series characteristic of the compound wound motor to predominate when required to obtain a speeding up when the tool has entered the work, while it still overcomes the resistance of the beginning of the cut at a sufficiently slow speed.

Motors, &c.—Among the many examples of the companies' motors may be mentioned a chimney-ventilated type in which air is circulated by a fan carried on the armature, while the whole machine, except for the intake and outlet, is fully enclosed. A special vertical spindle motor is also shown, driving a 36-in. Watson-Laidlaw hydro-extractor provided with a slipping clutch for starting up. Other motors

ELECTRIC LIGHTING CASING. Special clean white 1½ in. at 22/6, 2 in. at 35/6 1,000 ft. Refuse foreign. Support BRITISH industry. We compete, own make. All sizes in stock, also cable troughs for underground, woodwork all descriptions. Send trade card. JENNINGS & Co., 955 Pennywell Road, Bristol.

Hosted by Google

POLYPHASE METERS

Last week we pointed out the advantages possessed by our single-phase meters. Now you may read about our polyphase meters.

Two single-phase elements act on two discs mounted on the same spindle, the spindle being geared into a cyclometer dial.

ALL THE GOOD POINTS of the single-phase meter, therefore, ARE TO BE FOUND IN THE POLYPHASE METER.

Moreover, the POLYPHASE METER can be TESTED and adjusted ON A SINGLE-PHASE CIRCUIT; for by connecting up one current coil in series with the other, but in the opposite sense, while the shunt coils are connected in parallel, the meter must stop at all loads.

The polyphase meter CAN BE USED for EITHER TWO-PHASE OR THREE-PHASE supply WITHOUT ALTERATION, as the two elements are electrically quite independent of each other.

Since the method of testing ensures that all the adjustments in both elements are identical, the meter is INDEPENDENT OF PHASE SEQUENCE.

The meter can be supplied for balanced loads or for unbalanced loads; and for three-wire or four-wire systems, either with earthed neutral or with insulated neutral.

Thus the meter FULFILS ALL REQUIREMENTS, both theoretical and practical.

You cannot do better than send your orders for polyphase meters to—

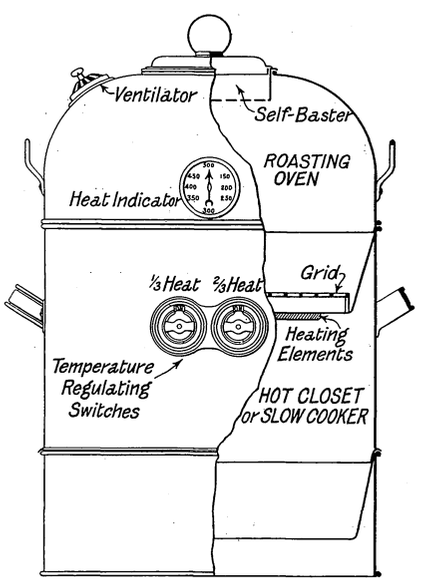
include a 5-h.p. continuous current motor driving a Sirocco fan, the impeller of which is mounted on an extension of the motor spindle, and a 15-h.p. induction motor coupled to a Hodges blower.

Engineering and Arc Lamps, Ltd.,



CHINGFORD AND ST. ALBANS. (STAND NO. 327.)

Arc Lamps.—One of the most interesting exhibits on this stand, which is in the gallery close to the right-hand end of the electric home, is the new well-tried Beacon flame arc lamp, which has several features to recommend it. The whole movement is remarkably free and frictionless, the whole case and frame is insulated from the carbons, and all working parts are in a thoroughly fume-proof chamber, and the excellent provision for ventilation keeps the globe free from deposit. Bronze is used throughout in place of brass for screws and small parts, and all constructive details appear to be well thought out. The chief point, however, is the steadiness of the positive ratchet feed, and it is largely this that enables five lamps to be run without a flicker in series on 220 volts, as is being done on the stand, and indeed the behaviour of these lamps is a contrast to some in the exhibition. It may also be mentioned that all these lamps are guaranteed for three years. Other patterns of lamp shown by the firm include the four carbon Sunrae flame lamp, several patterns of Davy and Gilbert enclosed lamps, an attractive new small 5-ampere enclosed lamp, and the White Star lamp specially suitable for shop lighting.

Purcell & Nobbs,

87 & 89 CLEVELAND STREET, FITZROY SQUARE, W. (STAND NO. 159.)

Heating and Cooking Apparatus.—The most interesting novelties on this stand are the "electroyl" steam cooker and oven. The former is made up of several sections. The lowest, at the top of which is a flat heating element, can be used for slow baking or similar operations, and grilling, frying, or boiling, &c., can be carried out on the top in the ordinary way; when used for steaming, however, the next section, containing water, is placed on the hot-plate with further sections above it, through which the steam circulates. In the oven, the arrangement of which is shown in the drawing, the heater is midway between an upper and lower section, where roasting and baking may be performed respectively. The

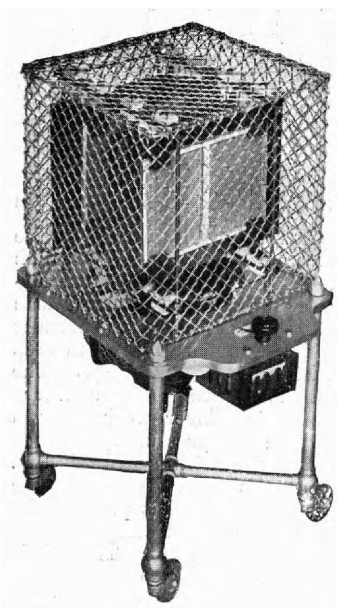
Electroyl Oven.

hot chamber is provided with a simple form of pyrometer and a self-basting arrangement is provided at the top. Three degrees of heat are obtained by two switches. All the inside and outside surface in both this and the steamer are brightly polished to minimise loss of heat. The company's convenient electrically heated towel-rails (see ELECTRICAL ENGINEERING, February 9th, page 69) are shown in several sizes, and hot-plates in various styles are exhibited, including those of a special material known as "Isolite" and a cheap hot-plate for quick heating up with a sheet steel surface. There is also a very complete selection of restaurant appliances. Radiators, convectors and combined radiators and convectors are well represented. A handsome form of heater for halls, &c., is a real Oriental brazier with a wire resistance frame mounted inside. A novelty is shown in a foot-warmer with a cane top in a mahogany frame, beneath which is mounted a 100-watt resistance net. The company's humidifier (see ELECTRICAL ENGINEERING, February 9th, page 70) is exhibited, as well as a fresh air heater for warming incoming air as it passes through a Tobin tube. Attention must also be drawn to the particularly strongly made soldering-irons with real platinum heating elements.

Bertram Thomas,

WORSLEY STREET, HULME, MANCHESTER. (STAND NOS. 22 & 29.)

Switchgear.—One of the most interesting items on the stand is an automatic continuous current control panel, which is shown in conjunction with a large Alley & Maclellan air-compressor driven by a Westinghouse motor. The starter arm itself is drawn up by a solenoid against the pull of a specially arranged dash pot, which permits of a quick jump from step to step, even though the average movement is slow. The current in the operating solenoid is controlled by auxiliary control switch actuated by a weighted lever worked by a small air-pressure cylinder, and both the pressures at which it cuts in and cuts out are adjustable within wide limits. A very simple adjustment also controls the speed of motion of the starter arm. An ingenious arrangement is provided by which the compressor valves are held up by electropneumatic means to take the load off during starting up. The whole is of most substantial construction, and the details have been very carefully thought out. The same general characteristics of solidarity and thoroughness of design are evidenced in a large three-phase automatic solenoid-operated three-phase starter of the 350-h.p. size, fitted with no-voltage release. A third panel on the same side of the stand contains an automatic battery regulating switch with two powerful operating solenoids, one for each direction, controlled by a floating contact lever. The contacts on this lever are only employed to make the solenoid circuits, as they are broken on a special quick break magnetic blow-out circuit breaker forming part of the mechanism. The switches can be moved by hand by a step-by-step motion, which gives as quick a passage from one step to the next as the automatic motion. Special limit switches are provided cutting the solenoids out of action when the switch reaches either end of its travel. Special means are taken to prevent all possibility of the switch arm being moved by vibration, and particular care is taken to lock all nuts, &c., on the apparatus for the same reason. Another piece of heavy switchgear is a straight line type continuous current step-by-step solenoid starter, constructed with two sets of contacts in parallel designed for 400 amperes each. Several other forms of step-by-step starter are shown, and there is a fine display of the firm's automatic circuit-breakers, including sizes up to 3,000 amperes. These involve a number of good points, which we have not the space to detail. Particularly interesting among them is a remote control circuit-breaker, which is closed and reset by a solenoid action. The reverse current release to these circuit-breakers has a very positive knock-off action, and the time lag mechanism is on the dash-pot principle, with independent provision for instantaneous release on extreme overloads. The auxiliary blow-out contacts are self-cleaning and are placed well away from the main contacts. Various other items of switchgear are mounted on a slate board forming one side of the stand, including a new design of tubular fuse with special cooling vanes between the fuse wire and the contact block.



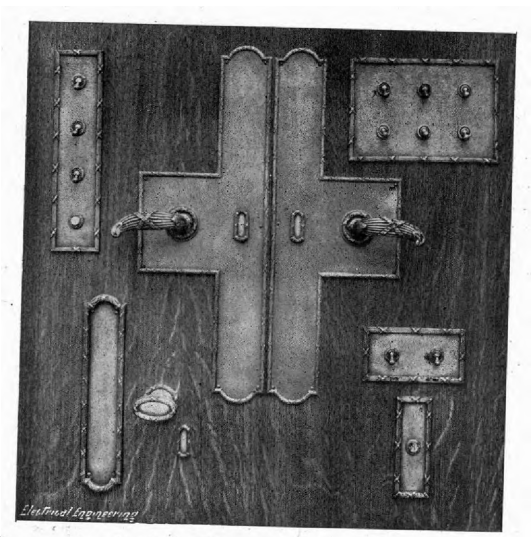
Cooking Apparatus.—The firm are showing on the same stand an example of the Gray patent electric oven, which is solidly made with large heat capacity, and is well lagged to retain the heat. The main feature of this oven is the way in which a circulation of air is maintained inside the oven. The air as it is heated by the resistances is conveyed through flues to the top of the oven, whence it passes down in a continuous stream over the food, and so returns to the heaters, giving remarkable uniformity of temperature. The oven shown takes 2½ kw. to heat up and ¾ kw. to keep hot, and is controlled by a special series parallel switch at the side; two hot-plates are provided on the top. Cooking demonstrations are in progress with this oven, and with a variety of other self-contained utensils, which are shown on a specially attractive marble-topped cooking table with a distribution board, in which all flexible leads not in use are drawn out of the way by weight after the manner of the cords of a telephone switchboard.

Hosted by Google

Ozonair, Ltd.,

96 Victoria Street, S.W. (Stand Nos. 53 & 70.)

We illustrate one of the simplest forms of the ozone generators exhibited, to indicate the process generally. This type is of a size for use in large rooms such as hospital wards, &c., for purifying the air by the generation of ozone. There are four sets of gauze plates, each consisting of a pair of plates separated by a sheet of micanite, which overlaps at the sides. The voltage is raised by a step-up transformer, and an invisible discharge takes place from one plate of each pair to the other, producing ozone. As there is no spark and the discharge surfaces are large and evenly distributed, no nitrogen compounds are formed by the discharge. A small vertical shaft motor fan beneath the set of condensers produces the necessary draught to disseminate the ozone, and the consumption of power is only 100 watts. In the smallest sizes 25 watts only are used. When alternating current is not available, a special arrangement of contacts on the fan shaft is employed in conjunction with the transformer for converting the current. In addition to the numerous portable types of apparatus at the exhibition, a ventilating system capable of dealing with 2,000 c. ft. of air per minute is shown in operation. The air is filtered, then passed through the ozone generator and a mixing chamber, and distributed by a fan to the pipe system. A water purifying plant is also shown, capable of dealing with 1,000 gals. per hour. Briefly, the method of purifying consists of atomising the water and bringing it into intimate contact with the ozone in three successive stages. Tests made by W. J. Dibdin & Son of two samples of water collected at the Ozonair stand at Olympia demonstrated that the ozonised water absorbed 8·7 per cent. less oxygen than the water from the main in four hours, and 6·1 per cent. less in 15 minutes, and the colonies per c.c. were reduced from 2,255 to 80.



Transportable Ozoniser for large Hospital Wards, &c.

The London Decorative Metal Works, Ltd.,

44–46 Eagle Street, Holborn, W.C. (Stand No. 291.)

Switch Plates, &c.—At this stand in the gallery is a fine collection of examples of art metalwork as applied to switch plates, door furniture, bell pushes, and similar articles, as well as decorative panels, name-plates, &c., in various styles, especially classic French and early English. Among the latter some handsome multiway Georgian plates finished in a soft antique silver will probably attract most attention. The accompanying illustration, which will give a good idea of the class of work made by this firm, is that of a show panel fitted with a Louis XVI. suite, in which the decoration is severely confined to the favourite reed and ribbon border. The workmanship of these articles reflects the same high degree of care as the designs.

Decorative Switch Plates, Ball Pushes, and Door Furniture.

The National Telewriter Co., Ltd.,

20, Bucklersbury, E.C. (Stand Nos. 146 & 269.)

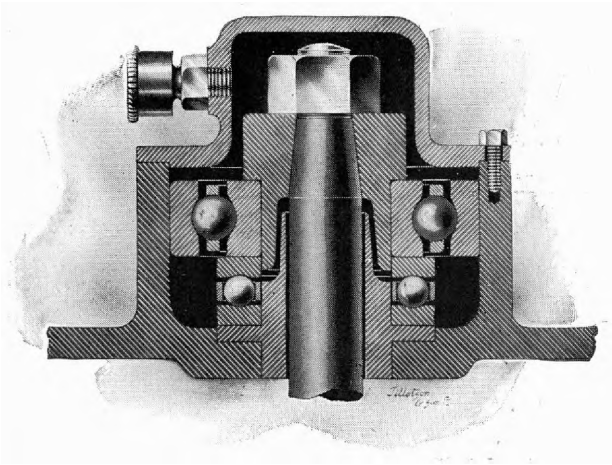
The telewriter is by no means a new instrument; it has been before the public for a number of years, and yet the transmission of autograph messages electrically between the company's two stands on the ground floor and gallery is one of the most popular "shows" in the exhibition. We noted that considerable improvement in the direction of simplification and accessibility of parts for inspection and repair had been made. The master-switch of the transmitter is now electrically operated, so that it cannot be forced out of adjustment; there are simpler arrangements for holding the paper roll, an improved method of pivotting and inking the pen of the receiver is employed, the moving system of the receiver has been modified, and other useful alterations in detail have been carried out. There could be few better tests of the machine than constant use on a busy Saturday afternoon at the exhibition in a succession of different hands, and the telewriter withstood this admirably.

Glass Table Standard.

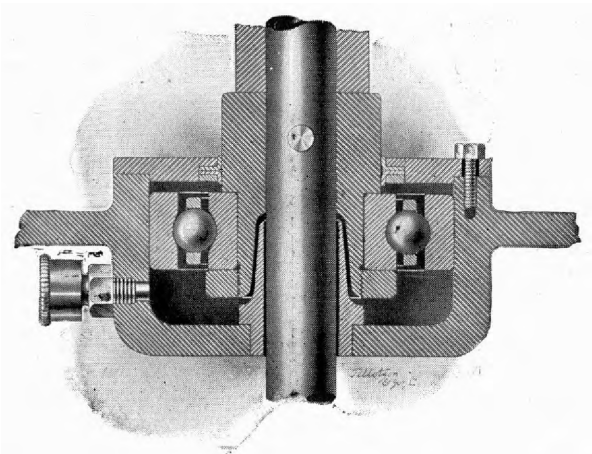
W. & R. Jacobs,

39c King William Street, E.C. (Stand No. 296.)

Fittings and Shades.—A large selection of glass shades of every description are on view, and the firm also show some very uncommon and artistic designs of glass and metal and glass fittings, some of very elaborate design. A small table standard in Bohemian glass of very attractive design is illustrated here. In some of the fittings remarkable effects are obtained with fringes of long tubular glass beads in conjunction with ornamental glass shades.



Electrical Novelties.—Another branch of the firm's business to be represented on the stand include small electrical novelties such as pocket flash-lamps, torches, small battery lamps, toy motors, &c.



Allen West & Co., Ltd.,

Lewes Road, Brighton. (Stand Nos. 202 & 213.)

Controllers.—Among the controllers shown by this firm we noticed particularly a 100-h.p. oil-immersed drum-type controller for mining work of the pattern illustrated here. In these controllers the drum and contact fingers are not attached to the lid as is sometimes the case, but are carried on a separate hinged framing, so that one man can easily throw open the lid and then lift all the working parts out of the oil, as the connections to the fingers are in the form of flexible strips. The lid is interlocked with the drum, so that it cannot be opened unless the controller is in the off position. A number of other drum-type controllers are shown for various classes of work, all with the same characteristics of solidarity of construction, standardised interchangeable parts, and a special form of contact finger hinged in a manner rendering side-play impossible, and with spiral springs instead of the more usual flat type. One special controller shown is for a 60-h.p. variable speed motor, and is suitable for printing press work. The first step of the hand-wheel puts in the main circuit-breaker and can be used for inching. All the 44 shunt-regulating steps are on the main drum, and the resistances are contained in a ventilated case at the back of the controller. Attention should also be drawn to the special heavy service controllers for steel works, &c. These are of the face-plate type with two sets of contacts at either end of the contact arm in parallel. The finger arm is of massive construction, and is built of iron castings clamped on a mica insulated steel

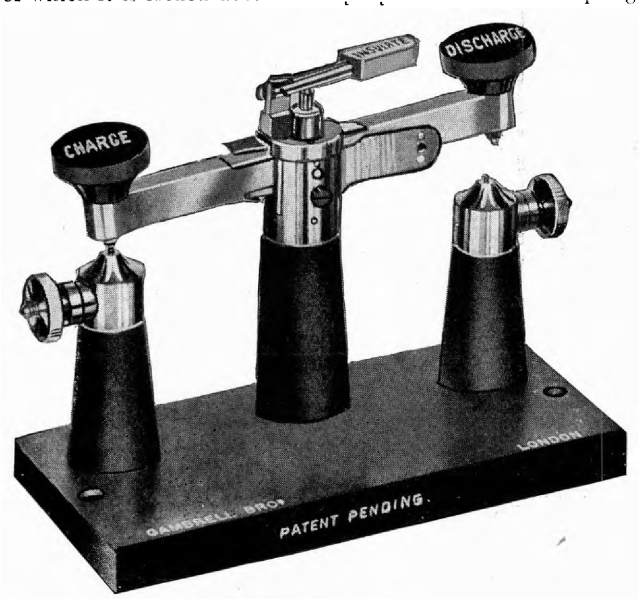
Digitized by Google

bar. The fingers are pivoted and pressed against the face contacts by compression springs. They are fitted with easily renewable contact tips of heavy section. The blow-out is very powerful, and the whole field is concentrated on the contacts over which the arm is moving. Crane controllers are shown of a drum pattern made up to 225 h.p., and a large 350-h.p. controller of the double drum type is also exhibited. The firm also make liquid starters and controllers, but these are not represented on the stand. Among the metallic resistances used are a special form of grid of thin stamped sheets and wire resistances of eureka wire wound on tubes and embedded in cement.

Medways Safety Lift Co.,



10 Bush Lane, E.C. (Stand Nos. 171 & 192.)

Electric Lifts.—A full-sized lift has been erected on the stand, fitted for demonstration purposes with both automatic push button and car switch control. A special feature of the former equipment is the electrical interlocking system, whereby the lift if empty can always be fetched to any floor irrespective of the gates being locked, but as soon as a passenger in the car closes the floor switch it is necessary for the gates to be shut before the lift can be started. Another point is that should two calls be made simultaneously, or should two buttons be pressed together in the car, no damage is done, but the lift proceeds to the furthest point called for, in the direction in which it was previously moving. The direction switches are in the shaft, and are actuated by cams on the car, so that accurate floor levelling is obtained, irrespective of stretching of the ropes. The actual controller consists, in addition to a panel containing relays for each floor, of a horizontal reversing switch, an eltromagnetic master-switch. The connections are such that the motor field is protected from self-induction troubles by being placed in parallel with the armature circuit. The rheostat is worked by the motor itself. The car switch control is generally similar, and an important feature of the car switch is that the switch can be reversed without damage when running at full speed, as the master-switch is arranged so that once tripped by the car switch passing through the zero position it cannot close again until the motor has stopped and the armature back E.M.F. gone. In addition to the complete lift, separate panels, controllers, and motor gear are shown.

Gambrell Bros ,

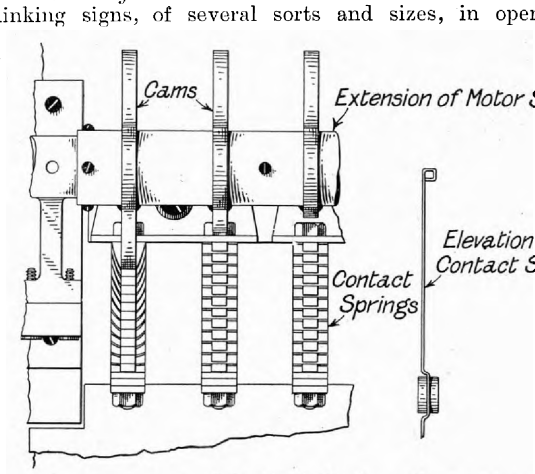
Durham House, North Side, Clapham Common, London, S.W. (Stand No. 290.)

Instruments.—A thermo-electric potentiometer for measuring small electromotive forces from 0–5,000 microvolts is on view at this stand. The connections can be seen at a glance, as they are marked out on the surface of the instrument. The slide is adjusted so that one millimetre represents two microvolts. A new key is another feature of the stand. It has three positions, charge, discharge, and insulate, in each of which it is locked automatically by means of a side spring,

Quick Action Key.

shown in the illustration. This has three holes, the outside ones defining the position at charge and discharge, while the centre hole fixes the cross arm when the insulate lever, seen in the middle, is depressed, the key then being out of circuit. A portable bridge, in which Mathers multipliers are used in the ratio arms, is also shown. Another interesting exhibit is Paley Yorkes' working models of practical forms of electrical instruments.

Walker, Horrocks & Co., Ltd.,



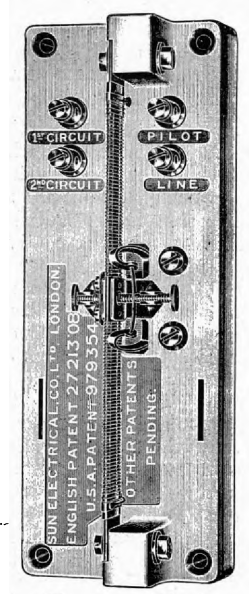
Cornwall Buildings, 45 Newhall Street, Birmingham. (Stand No. 231.)

An automatic generating plant for private installation supply is being exhibited by this firm. It varies somewhat in its operation from the others shown at the exhibition, as the lights are supplied direct from a battery, and the set only starts up when the battery discharge has reached a minimum. The capacity of the battery is such that it gives a voltage slightly higher than is required, but a number of regulating cells are provided to add to this. These are cut in automatically one by one by a regulator as the voltage drops to the minimum. When all these cells have been cut out, and the whole battery is in circuit, the regulator, in trying to cut out another, actuates a solenoid switch of an automatic starter, and sets the machinery in motion in the usual way. The reverse movements now take place; a charging current passes through the battery, and the potential across the cells will rise until the volts have reached a maximum, when a cell is cut out. This will go on until the battery is fully charged, and all the regulating cells have been cut out, leaving only the original number of cells in circuit, and then the regulator automatically shuts the set down, until the regulating cells have again been exhausted. The dynamo is reverse compound wound to give a constant output. Provision is made for the engine failing to fire, in which case a time limit relay is actuated, and attention is drawn to the fact by a red light. The plant is manufactured by the Austin Motor Co., Ltd.

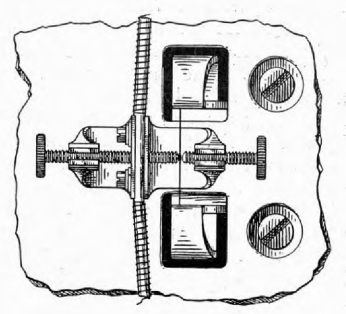
The Sun Electrical Co., Ltd.,

118–120 Charing Cross Road, W.C. (Stand Nos. 104 & 111.)

Electric Signs.—There is a fine collection of flashing and blinking signs, of several sorts and sizes, in operation on



Arrangement of Contact Springs for successive Lamp Switching on Motor Flasher.



this stand, and the company have specialised particularly in this class of work and are experts in sign design. A new pattern of motor flasher is employed for a large writing sign they have on the front of their stand. A series of blades, one for each lamp, are pressed together successively by a cam on the motor shaft and then simultaneously released as the cam leaves them. We give a sketch of this part of the mechanism. In combination with this is, at the other end of the shaft, a toothed wheel driven by a cam arranged so that the contact is changed once a revolution so that changes of colour or of circuits can be made at regular intervals. Another new device is a two-way thermal blinker. In the ordinary thermal blink, a flat strip of metal, upon which a heating coil is wound, the expansion causes contact to be broken at a contact screw; this allows the strip to cool, and contact is again made. The distance of travel of the contact-maker is small, so that hitherto difficulties have been experienced in making a two-way arrangement with a contact in each position, but this has now been overcome by the bow-spring arrangement seen in the general view and detail drawing. The mercury contact flasher for D.-C. circuits carrying large currents was described and illustrated in our issue of October 20, 1910; an adaptation of this for A.-C.

Hosted by Google

circuits is now made. In this new pattern a motor meter movement actuates the mercury make and break switch through worm-gear, and it is fitted with an adjustable brake magnet so that the speed can be varied.

New Two-way Flasher (half scale).

Full-size view of Contact Arrangement of New Two-way Flasher.

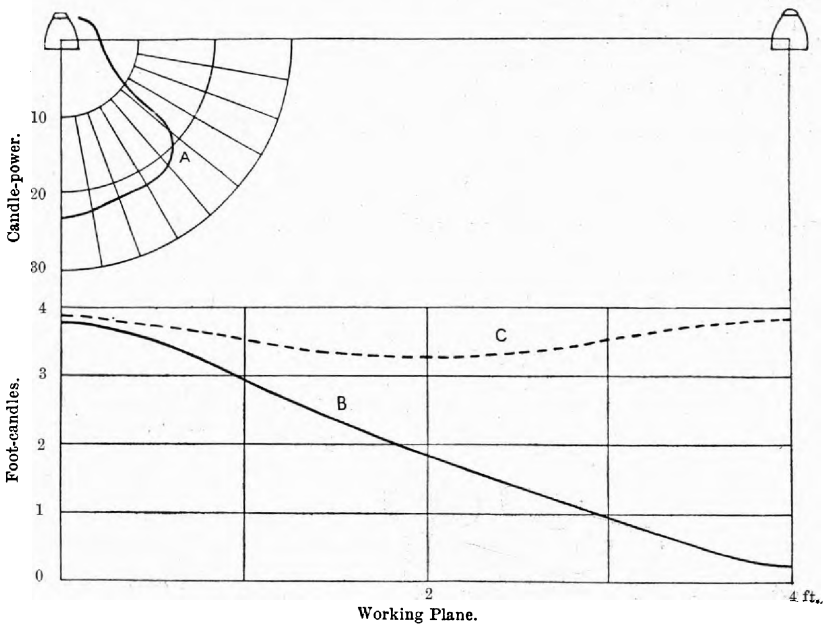
Candle Lamps.—The "Flexalite" candle lamp was described in our issue of January 12, 1911. Its characteristic, it will be remembered, is that the candle tube and the lamp are not rigidly supported, so that the candle when receiving a knock will deflect and return to its original position, thus rendering it less liable to breakage. To demonstrate this a slowly oscillating hand with two projecting fingers has been put up on the stand, which works the candle on the fitting backwards and forwards, and clearly demonstrates this property.

Other Exhibits.—Several types of the "Sunlite" trough reflectors are shown, which it is claimed reflect 250 per cent. of the mean horizontal candle-power of the lamps in a direct line, and there is a useful pattern with the front pierced in letters so that it can serve as a shop-front sign as well as a window reflector. A hair-dryer is popular among the lay and lady visitors. It is a thing shaped somewhat like a revolver and light enough to hold in the hand, and contains a small motor fan and a heating resistance, so that a blast of hot air is blown from the nozzle. A good selection of electric light fittings is shown, and last but not least, the "Kalkos" wiring system is well in evidence.

J. W. and C. J. Phillips, Ltd.,

23 College Hill, Cannon Street, E.C. (Stand No. 3.)

Recorders.—A large and varied assortment of these instruments manufactured by the Bristol Company, of Waterbury, U.S.A., are shown on this stand. These include pressure and vacuum recorders, the pens of which are attached directly to the pressure tube. For ranges of pressure above 3 lbs. a helical tube is used, and below this a more sensitive diaphragm type is employed. Several electrical recorders are exhibited for volts, amperes, and watts, and these are made for all ranges of A.-C. and D.-C. Some portable types are also shown. Other interesting pieces of apparatus exhibited are long-distance recording thermometers and pyrometers.



Holophane, Ltd.,

12 Carteret Street, S.W. (Stand Nos. 199 & 216.)

Shades and Reflectors.—The "Holophane" shades and reflectors continue to increase in popularity, but the makers are nevertheless constantly bringing out new designs. The "residential" patterns, recently described and illustrated in our columns, are well displayed at the stand and are being welcomed by those who desire to have in their homes the advantages of the improved light distribution which the holophane reflector affords, and yet wish to depart from the standard forms seen everywhere. Another new design, or rather an adaptation of an existing design, which will be much appreciated, is the "bank desk" unit. One of the "Stiletto" series of shades, the "extensive" pattern (No. E.60), is employed, and over it a green and white opal shade is placed, fitting closely to it. The external appearance is that customarily desired on bank desks, &c., but the advantages of the holophane reflector within are obtained. An interesting curve giving the illumination with the holophane reflector is shown above.

Holophane "Bank Desk" Fitting."

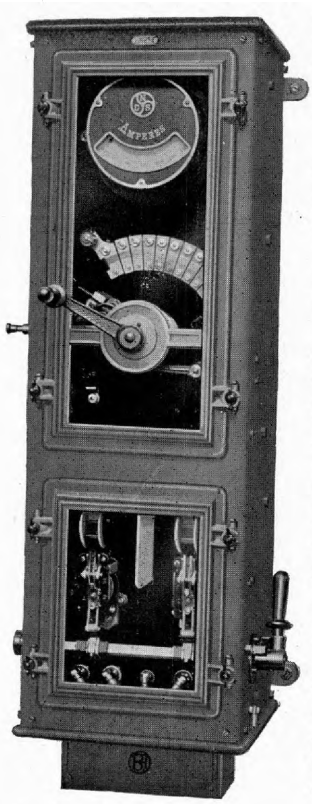
INSULATORS for Electric Furnaces, Tram-ways, &c., &c.



being 1,000 c.p., and there is, of course, a collection of radiator lamps, for it will be remembered that the Sunbeam Lamp Co. were the first, in conjunction with the Dowsing Radiant Heat Co., to put this class of lamp on the market. The "Lux" candle lamp fitting is shown. In this a short lamp replaces the usual bulb flame lamp, and a glass tube (the lower part of which is an imitation candle and the upper part is of plain glass and covers the candle lamp) is placed over it. Specimens of the Sunbeam stage number and cab signs are shown. In these a number of small lamps are placed in diamond-shaped compartments in a square or rectangular frame, which is covered with red glass so that the edge of the partitions come right up to the glass. A set of lamps representing the number or letter required are lighted up by means of a special controller, and show through the red glass, the remaining part of the glass in front of the unlighted partitions being left quite dark. The Sunbeam Company are also exhibiting electric cooking utensils and general supplies.

Brook, Hirst & Co., Ltd.,

NORTHGATE ELECTRICAL WORKS, CHESTER. (STAND NO. 153.)

Motor Control Apparatus.—This firm show a variety of motor panels embodying some interesting features. The illustration shows a standard constant speed wall pattern panel with starter, with solenoid pattern overload trip, renewable copper contacts, each with a subsidiary carbon roller wipe, and separate D.P. magnetic blow-out circuit-breaker with no-voltage and overload releases perfectly free to act during or after the operation of starting. The starter and circuit-breaker are so interlocked that the circuit-breaker can only be put on when the starter is off, and the starter can only be put on when the handle of the circuit-breaker is free. Several varieties of these panels are shown, some of which are fitted with an adjustable thermal time lag device actuated by a special form of compound metal spring, which is found to be particularly reliable in action. Among the panels exhibited is one of special Admiralty design with mica insulation throughout and without slate. A special form of panel is provided where frequent "inching" is required; here only one pole of the circuit-breaker is actuated by hand, the other being closed electrically by putting the starter handle on the first notch, so that the circuit is not broken on the starter contacts. Both breakers are, however, thrown out by the releases. Some of these starters are provided with mechanically interlocked shunt regulators. The largest panel shown is a multiple lever type panel, in which successive movements of the single handle close first the main D.P. circuit-breakers, then the row of starter contactors, and lastly a "final contact" circuit-breaker, to which the load is transferred. Current is broken on tripping by the circuit-breakers only, and an electrical interlock prevents the circuit being made again till all the starter contactors are off. An important feature is that a button has to be kept pressed during the starting operation to keep the circuit-breakers in, so that the attendant cannot leave the starter with the starting operation half completed. Another interesting pillar contains an automatic starter in which a set of contactors are mechanically released and allowed to engage successively under the control of a dash-pot.

Brook Hirst Standard Wall Motor Panel with Interlocked Circuit-breakers.

The Lazilite Co.,

SOUTHAMPTON HOUSE, HIGH HOLBORN. (STAND NO. 316.)

On this stand in the gallery are shown examples of an extensible fitting, on the "lazy tongs" principle, for fixing to a ceiling or wall to enable a lamp suspended from a counter-weight pendant to be placed in any position within a ten-foot circle. The construction of the fitting renders it able to sustain an 8-lb. weight when fully extended to a length of five feet. The fitting should have an extensive field of application, both for office and domestic use.

Isenthal & Co., 85 MORTIMER STREET, W. (STAND NOS. 20 & 41).—On this stand is an imposing array of Moscicki condensers, Giles valves, and other appliances, including a 35,000 surge protection equipment complete with choking coils, disconnecting liquid switches, &c. Examples of batteries of this and other forms of condenser as used in wireless telegraphy are also shown, and there is also a display of small adjustable resistances for laboratory and testing-room use, as well as field regulators for dynamo and motors.

The Efandem Co., Ltd., 83 UPPER THAMES STREET, E.C. (STAND NO 4.)—The principal exhibit on this stand is the dry battery for pocket lamps, of which we are told that 10,000 are being turned out daily from the Wolverhampton Works. Sheet metal cases for pocket lamps and torches are also on view. Another branch in which this firm specialises is a British-made bell, which is shown in several sizes. Some very complete charging sets, to be run from the lighting circuits, consisting of a rotary converter and switch-board with automatic cut-in and cut-outs, must also be mentioned.

W. Lucy & Co., Ltd., EAGLE IRONWORKS, OXFORD. (STAND No. 96.) *Street Lighting and Mains Accessories.*—On this stand are to be seen a number of typical examples of fittings and lamp-posts for street lighting and accessories for overhead distribution, including a convenient form of overhead distribution-box as used on the poles at Carmarthen. This is supplied complete and ready for connecting up from the outside, and is thoroughly weather-proof. Several designs of cable-box are shown, including a fine junction-box for large triple concentric cables. Feeder pillars, both for high and low tension systems, are exemplified, and a special method of sealing in without the use of rubber tail-ends is demonstrated. There is also on this well-arranged stand a particularly good show of cast-iron house service and other fuse-boxes.

A. Emanuel & Son, Ltd., 7 to 13, GEORGE STREET, MANCHESTER SQUARE, W. (STAND NOS. 195 & 220.) *Fittings and Accessories.*—This firm have a fine display of fittings on the some stand as the Foster Engineering Co., including some very artistic designs of pendants, standards, &c., made at their Birmingham Works. Outside lanterns, radiators, and other accessories are also shown, and particular attention should be called to the company's "Kwik-Fix" ceiling-rose entirely without back connections or screws into china.

The Rapid Magnetting Machine Co., Ltd., 18, THE CRESCENT, BIRMINGHAM. (STAND NO. 10.) *Separators.*—Several forms of magnetic separator are shown. A standard pattern machine with a revolving gunmetal drum within which are powerful radial electromagnet

Hosted by Google

poles is shown at work, removing iron from mass and other non-magnetic turnings, &c. Another machine is specially designed for removing iron particles, nails, &c., from such material as destructor furnace clinker. This has the magnet poles arranged circumferentially and is used for treating crushed clinker used for the tramway sand-boxes by the Corporation of Birmingham, and at Glasgow for removing iron from the clinker used for making paths in parks and public gardens. Similar machines at Folkestone remove iron from material used for gritting roads. Another pattern of separator for more finely divided iron consists of an inclined shaking table with magnet poles at intervals, to which the iron adheres, while the other material passes to a spout. A special device prevents the iron falling off and remingling with the other material should the current fail, by causing the deflecting spout to be held up by a magnet, so that it drops away when the current is cut off. The company are also bringing out a machine for treating large quantities of material on a belt-conveyor in which magnet drums are used both from above and below the belt, with their poles arranged to give a very intense field.

Eastman & Warne, 241–243, Acton Vale, W. (Stand No. 236.) *Electric Irons, &c.*—This firm show a considerable range of "hot point" electric irons for industrial and domestic work as used in the works of Messrs. Eastman & Sons (dyers and cleaners). These are of substantial construction, with heating elements consisting of plenty of heavy-guage wire wound on mica or similar strips embedded in a large number of slots in the upper part of the sole. A 1,400-watt hot-plate cooker with seven degrees of heat is among the other objects shown.

Hans Renold, Ltd., Progress Works, Brook Street, Manchester. (Stand No. 250.)—On their stand in the gallery this firm have an excellent display of their well-known steel driving chains and wheels for the transmission of power, including examples of their patent silent chain suitable for speeds up to 1,300 ft. per minute, and powers up to 300 h.p. One of these chains can be viewed running through a rotoscope, by means of which visitors can see while the chain is in motion exactly how the links mesh with the wheel teeth. Roller and block chains are also shown.

The Imperial Lighting Co., 157 Blackfriars Road, S.E. Stand No. 233.)—This firm, who equipped the large outside sign over the entrance, with its 1,500 incandescent lamps, partly metal filament and partly carbon, and two 80-ampere searchlights, has been greatly handicapped in the preparation of their stand by a fire which took place at their works a few weeks ago. The company's well-known Fairyland strip is well represented, and demonstrations are being given of its waterproof qualities. The addition of a strip with miniature B.C. holders now brings the patterns made up to twelve. Among the signs is an effective arrangement employing 14-volt metal filament lamps in multiple series for outlining letters, &c. A motor-driven flasher is shown in action, and various items of stage-lighting equipment are exemplified. Above the stand is mounted a new form of large electric bell with a slowly swinging, electromagnetically actuated clapper, known as the Knoxem bell.

The Leskole Co., Ltd., Palace Works, Enfield. (Stand No. 222.) *Thermometers.*—The principal electrical exhibits of this firm include two kinds of thermometers. The distance thermometer, for temperatures up to about 900° F., relies on the variation with temperature of the resistance of small coils of pure nickel. This is compared with others not sensitive to temperature, which are arranged in an indicator to form a Wheatstone bridge with the thermometer resistance. The current is supplied by a 2-volt accumulator. The other kind is the pyrometer, in which the thermo-elements are of carbon-nickel for measuring up to 2,280° F. Platinum-iridium is used for higher temperatures up to 2,900° F. A continuous recorder is also shown.

Etchells, Congdon & Muir, Ltd., 15 Cannel Street, Manchester. (Stand Nos. 18 & 43.) *Lifts.*—This firm show a model lift to demonstrate their very simple system of push-button control. The controller is entirely self-contained, and the same pair of solenoids which control the change-over direction switch draw up the starter contact against a dash-pot. A number of accessories such as gate-locks, interconnected with the control system, self-closing doors for goods lifts, examples of the particularly simple and robust "Eureka" push-buttons, entirely without springs, and other details of lift control apparatus are shown, as well as an automatic speed governor for instantaneously engaging the safety catches on a rise in speed. A complete motor and gear for a goods lift is also shown.

Bi-Metals, Ltd., 80A Southwark Street, London, S.E. (Stand No. 324.)—An interesting exhibit on the gallery is the "Tinol" paste solder. This is a combination of finely divided tin and lead in certain proportions, and a flux. The paste is placed on the metal and heated until it runs, the flux liquifying and not dissipating until the solder is fused, so that any oxides that may be present are dissolved. Six different alloys are made up in this way, including one with a very low melting point, 120° C., consisting of tin, lead, and cadmium, which is very useful for instrument work. It is also made up in the solid form for heavier work, in which the solder is self-fluxing, having a central core made of the paste. Demonstrations with this solder are given at the stand, which is well worth a visit. "Tinol" can be had in various quantities, and several outfits are shown.

F. M. Russell & Co., Ltd., Junction Works, Willesden, N.W. (Stand No. 320.) *Time Recorders.*—Examples are shown of the Kosmoid time-recorder for works, &c., where each employee, on entering and leaving, signs his name on a paper strip upon which the time is automatically printed. In another form each man inserts a key, which prints a number on the slip. The key is inserted a different distance for in or out, or in the case of tramways, &c., for "up" and "down" journeys. The instruments are compact and portable, and suitable for outside contracting work, as well as factories, &c. A large wall pattern of recorder is also shown.

R. W. Paul, 33 Leicester Square, W.C. (Stand No. 240.) *Instruments.*—A small laboratory comprising all the latest developments in Mr. Paul's instruments is fitted up on this stand. Attention may be drawn to the Harris portable ohmmeter with a 500-volt generator with a specially open scale, and a push-button switch for dividing the reading by ten. A slide potentiometer having a double pole key, by which the balance of the standard cell can be checked without shifting the switches or slider, is also shown. The Ampall for measuring currents in copper conductors without shunts, which we described in Electrical Engineering, May 25th, page 297, is also on view. A number of resistance boxes are shown, including the precision decade resistance, with three dials, each having ten oil-cooled manganin coils, with which direct contact is made by self-adjusting laminated copper brushes. Among the A.-C. instruments mention must be made of the unipivot dynamometer wattmeter for measuring small currents and pressures.

Wireless telegraphy is represented by Campbell's apparatus for high-frequency measurements of inductance, capacity, and effective resistance, including the microphone hummer, tuned telephone detector, vibration galvanometer, and variable mutual inductance. Two types of pyrometers are also shown, with iron-eureka and platinum-rhodium couples, and other exhibits include galvanometers, portable ammeters and voltmeters, all with unipivots; also Fleming's high-frequency thermo-electric ammeter, the Cohen interrupter and barretter for telephonic measurements, the Irwin hot-wire oscillograph, and the Duddell-Mather standard wattmeter.

Aerators, Ltd., Upper Edmonton, N. (Stand No. 77.) *Die Finished Castings.*—On this stand are shown castings with specially high finish and accuracy, made in special alloys by the "Prana" process, in which the metal is kept under pressure in the mould until set. These castings save a considerable amount of machining, as even fine screw threads can be cast on accurately. The alloys used are exceptionally well adapted to nickel-plating, and the whole method possesses great advantages for such work as the manufacture of telephone parts. A special plaited hose-covering equally suitable as a cable covering is shown, and on the same stand is a display of CO_2 fire-extinguishers by the British Fire Appliances Co., Ltd. (Craig's Court House, S.W.).

Richard Hornsby & Sons, Ltd., 75B Queen Victoria Street, E.C. (Stand No. 9.).—On this stand can be seen running a 17 b.h.p. single cylinder horizontal gas engine with magneto ignition, driving a dynamo which supplies the lighting of the stand, and taking gas from a complete suction plant working on anthracite also on the stand. A 6½ b.h.p. oil engine on the company's well-known type, with automatic ignition, is also to be seen running, and a 3 b.h.p. single cylinder horizontal petrol engine, direct coupled to a 1½ kw. dynamo, is also shown.

Pirelli, Ltd., 45 Basinghall Street, London, E.C. (Stand Nos. 172 & 191.)—The most striking exhibit to be seen here is a 75,000-volt three-core cable shown wound on a drum with one end mounted to show the cross section. Smaller sizes of cable of every description, including multiple telephone and flexible cables, are exhibited in show cases, where some excellently mounted specimens can be seen. Rubber gloves and insulating tapes of various kinds are also on view.

The Dussek Bitumen Co., Canal Bank, Trundley's Road, Deptford, S.E. (Stand No. 242.)—This firm is showing some very fine specimens of Trinidad bitumen, which can be seen both in the crude and the refined states. The firm is also experienced in the actual laying of cables, and show a trough with the cables in position and partly filled with bitumen. Samples of joint-box compound, resin oil, bituminous paint for preserving iron and steel, and greases for lubricating and other purposes are other exhibits. All those who are interested should apply at the stand for the firm's latest pamphlets, which contain interesting information.

The Crypto Electrical Co., Bermondsey Street, London, S.E. (Stand No. 57.)—One of the principal exhibits on this stand is the A.-C. to D.-C. transformer. This is shown in two forms, a squirrel-cage motor coupled to a shunt-wound dynamo for charging accumulators or lighting cinematograph arc lamps, and a combined set, in which the two machines are mounted in the same frame. This is suitable for charging accumulators from A.-C. mains, and is very widely used. A private lighting plant with vertical petrol engine, which can be seen working, and a series of small A.-C. and D.-C. motors, all of British manufacture, are also shown.

Bullers, Ltd., 6 Laurence Pountney Hill, E.C. (Stand Nos. 118 & 141.)—Porcelain insulators of every description are to be seen at this stand. The suspension types for voltages of 100,000 has mechanical fittings, which are tested to three tons. A number of the pin-type for voltages of 2,000 to 50,000 are also prominent. The feature of this stand is no doubt the testing of these insulators. This is done under a spray of water with a 100,000-volt transformer, and a large crowd is attracted at each demonstration. A section is given to telephone and telegraph work, where a series of insulators, for use under all conditions, can be inspected. A large lattice steel mast is also erected on the stand.

A NEW LAMP SHOWCARD

A NEW and attractive showcard has just been issued by the British Thomson-Houston Co., Ltd. (83 Cannon Street, E.C.). This lamp's special feature, mechanical strength, due to the employment of drawn wire in place of the pressed composition tungsten filament, is graphically demonstrated by the

New Mazda Lamp Showcard.

centre illustration. Other attractive features of the new showcard are the three well-displayed catchwords, "The Sun's Only Rival," "Better Light—Lighter Bills—Saves 75%," and "British Made by British Labour." The black and white reproduction given here gives no idea of the brilliant colouring—the circle in the centre of the card is a vivid red, and compels attention.

SUMMARY

The fifth part of our special description of the Electrical Exhibition at Olympia (which closes on Saturday) forms part of this issue, containing detailed accounts of over 50 stands. Among the novelties described and illustrated are the fine electric cooking ranges and cookers of the British Prometheus Co., a new type of A.-C. meter, and a cable-sinking drum for mines. Several new forms of electric heating and cooking apparatus and details of different systems of lift control are discussed, some new sign flashers are illustrated, and illumination curves relating to a new holophane fitting are reproduced.

A submarine telephone cable laid between England and Belgium is described. The weights of copper and gutta-percha are only 160 and 150 lbs. respectively per naut of core, and speaking through this has been rendered possible by the use of loading coils and a special gutta-percha with low leakance. The cable, which has two pairs of cores, will be used for three simultaneous conversations by employing a "phantom" circuit, and an additional series of loading coils is inserted to enable this to be done. (Page 567.)

In view of the manufacturing difficulties in connection with the production of high-voltage metal filament lamps having now been largely overcome, and in consequence of increased outputs, the leading manufacturers are now able to effect substantial reductions in price. The 200–260 volt lamps in the ordinary sizes are now sold at 3s. each, and those for 100–135 volts have been reduced to 2s. 6d. (Page 567.)

A description is given of a new electrically-driven appliance for displaying posters or samples of material. (Page 569.)

At the inaugural dinner of the British Electrical and Allied Manufacturers' Association on Thursday, Mr. S. Z. de Ferranti, who occupied the chair, said that the fact that the electrical industry was not as prosperous as one would like to see it was partly due to the manufacturers themselves. He desired to see less competition purely in price, and keen competition in excellence. Mr. A. B. Anderson, to whom it had evidently been delegated to disclose the programme of the Association in general terms, made it clear that one of the endeavours of the Association would be to discourage buying abroad. He also disclaimed any intention of the Association to form a trust or cartel, and in this he was supported by Mr. Hugo Hirst. (Page 569.)

A method of sealing wires into hard, vitreous substances, and a lampholder for use with electric signs, in which the terminals are well insulated and protected from the outside metal parts, were among the specifications published by the Patent Office last week.—B. Macku has introduced a means of producing slightly damped oscillations by condenser discharges, and E. Girardeau deals with the mounting of wireless telegraph receiving and transmitting apparatus with a view to protecting the detector in the receiving circuit from the emission waves.—The purification of gases by passing them between electrodes is dealt with in another specification. (Page 570.)

Under "Telephony and Telegraphy (including Wireless)," we refer to a proposed issue of £250,000 new ordinary shares by the Marconi Co.; the present position of the National Telewriter Co.; the settlement of the dispute with regard to overhead wires at Hythe, and the possible sale of the Grindell-Matthews Wireless Telephone Syndicate. (Page 571.)

In our "Electric Traction Notes" we mention the adoption of the British Electric Traction Co.'s capital reorganisation scheme; a proposal of the L.C.C. for tramways to Cheapside; and the loss of £5,749 upon the Liverpool tramways due to the strike. (Page 572.)

Hosted by Google

The Birmingham Electricity Committee propose to erect a new high-tension power station.—There was a net profit of £9,000 upon the Bradford Electricity Department last year, and £8,430 at Edinburgh.—Some very satisfactory results have been obtained with the new generating plant at Brownlow Hill Workhouse (Liverpool).—The Sheffield Corporation are proposing to apply for wiring powers next session.—The cost to the Winchester Corporation of acquiring the local electric supply company was £2,263. (Page 573.)

A 1,000 b.h.p. gas-engine plant is required at Accrington; storage battery at Bury; a 5,500 kw. steam turbine at Sheffield; a 250 kw. Diesel engine at Swindon, and a generating plant at Radcliffe and Stourbridge. Tramway supplies are required at Bradford and Dublin. Considerable extensions to the tramways are contemplated at Halifax. (Page 573.)

Ferranti, Ltd. made a net profit of £4,166 last year. No dividend is declared. The A.E.G. (Berlin) again declare a dividend of 14 per cent. (Page 574.)

A 60,000-kw. Power House.—The *Electrical World* (New York) reports excellent progress in the new Spokane power house, which is being erected by the Water Power Co., Spokane, Washington, at Long Lake, four miles from the Little Falls. The coffer-dam is complete, and preparations are being made for commencing a dam which will be 140 ft. high. The new plant will be equipped with four 22,500-h.p. turbines, each direct-connected to 15,000-kw. 400 volt three-phase 60-cycle G.E.C. generators. The turbines are being made by the J. P. Morris Company, Philadelphia, to operate under a head of 140 ft. The transformers that will be installed to step up the pressure to 60,000 volts will comprise either four 15,000-kw. three-phase, or twelve 5,000-kw. single-phase units. A transmission line will be built connecting the new power house with an existing station at Little Falls, and eventually a tower line will be constructed for a distance of 50 miles north of the river.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) FRIDAY, OCTOBER 20th.

Electro Harmonic Society.

8 p.m. Smoking concert at Holborn Restaurant.

FRIDAY, OCTOBER 27th.

Physical Society.

5 p.m. At Imperial Technical College. The agenda includes:—"Further Observations on the After Glow of Electric Discharge and Kindred Phenomena," by the Hon. R. J. Strutt.

A Safety Device.—We regret that the name of Mr. F. C. Morris, the writer of a letter given under the above heading on page 559 of our last issue was given incorrectly as F. C. Moins.

Engineering and Machinery Exhibition, 1912.—We are informed that considerable progress has already been made in letting space for this exhibition, which is to be held at Olympia from October 4th to 16th next year, and that comprehensive display of electrically-driven machine tools will be made.

Manchester Section of the I.E.E.—The opening meeting of the Manchester Section of the Institution of Electrical Engineers will be held at the Midland Hotel on Friday, October 27th, at 7.30 p.m., when the Chairman, Mr. W. Cramp, will deliver his Inaugural Address. A smoking concert will follow. The remaining meetings will be held as usual at the University. The programme for the session is as follows:—November 7th, "The Mechanical Design of Direct-current Turbo-generators," by R. Roberts; November 15th, Joint Meeting with the Liverpool Engineering Society at Liverpool, "The Function of the Laboratory in the Training of an Engineer," by Prof. E. W. Marchant; November 28th, "Automatic Reversible Battery Boosters," by R. Rankin; December 12th, "Heat Conductivity in Electrical Machinery," by Miles Walker and H. D. Symons; January 16th, "Recent Developments in Turbine Practice," by Karl Baumann; January 27th, Meeting with the Manchester Association of Engineers, "Electrical Furnaces," by Cecil Myers; February 13th, "Specifications," by Fred S. Sells; February 23rd, Annual Dinner; February 27th, "High Tension Porcelain Insulators," by J. Lustgarten; March 12th, "The Mechanics of Electric Train Movement," by F. W. Carter; March 26th, "The Corrugation of Rails," by Prof. A. Schwartz and R. G. Cunliffe; April 16th, "Recent Developments in the Application of Electricity in Textile Factories," by J. F. Crowley; April 30th, Annual General Meeting, Lecture by Dr. R. Thury.

CAPTAIN OF FISHING SMACK: Steady with that anchor, Bill. There be submarine cables here. I don't mind about 'em as a rule, but they say that new one be loaded, and we don't want to be blown up with their blooming electricity.

Hosted by Google

NEW TELEPHONE CABLE BETWEEN ENGLAND AND BELGIUM

THE new telephone cable which has been laid between St. Margaret's (Kent) and La Panne, in Belgium, represents the greatest advance that has yet been made in the application of the Pupin coil system to telephony. It will be remembered that the first cable in which Pupin coils were used was the latest submarine telephone cable between England and France, a full description of which appeared in our issues of March 17th and December 22nd, 1910.

In this cable, although it was felt that the Pupin coil system as applied would bear out the predetermination of the results arrived at by calculation and previous research, yet it was deemed advisable to make the cable in such a way that even if the Pupin coils were unsuccessful, and had to be cut out, the cable would still be used in the ordinary course for telephone purposes. The Anglo-French cable was therefore made with conductors weighing 160 lbs. per naut, and gutta-percha 300 lbs. per naut, *i.e.*, similar to the other telephone cables between England and France. It will be remembered that the results of the addition of the loading coils was to improve the speaking properties of the cable enormously, and was quite up to anticipations.

In designing the Anglo-Belgian cable, therefore, it was decided that full account should be taken of the effect of the loading coils, and that the cable should be constructed throughout in accordance with the modern theory of telephonic transmission. The conductors are the same size, viz., 160 lbs. per naut, but instead of the dielectric weighing 300 lbs. per naut, it weighs only 150 lbs. A special gutta-percha is used in the Anglo-Belgian cable with a particularly small leakance, and the ratio S/K has been reduced from 120 in the Anglo-French cable to 12 in the Anglo-Belgian cable.

In addition to this advance in cable construction, there is further progress by the fact that the two circuits in the cable, instead of being used merely for two conversations, will be able to be used for three simultaneous conversations by the use of what was formerly somewhat incorrectly called duplexing, and is now usually termed a "phantom" circuit. The wires of each circuit are bridged by repeating coils, the centre of each of which is connected to form the third circuit, so that the two wires of each of the "side circuits" are used in parallel for the "phantom" circuit, as has frequently been done in the case of long-distance land lines. To enable this to be possible in the case of a loaded circuit, however, it was necessary to add an additional series of loading coils in each circuit. The two windings in the loading coil in the side circuits are wound, as in the Anglo-French cable, on one core, and are, of course, so wound that the inductive actions of the two windings assist one another. When the two conductors are used in parallel on the phantom circuit, these two windings therefore neutralise one another, and another coil is necessary with a pair of windings wound both in the same direction, instead of in contrary directions, so that they act as an inductance coil when the two wires are used in parallel for the phantom circuit, but the inductances oppose one another when the two conductors are used in the ordinary way.

The total length of the cable is 47·892 nauts, and each wire has a length of 48·366 nauts. The following are the other constants of the cable:—

Resistance per naut of conductor without coils	14·2 ohms at 15° C.
Capacity per naut (wire to wire) without coils	0·157 mfd.
Capacity per naut of phantom circuit without coils	0·314 mfd.
S/K at 800 cycles per sec. and 15° C. (S = leakance in micro-mhos, K = wire to wire capacity)	12
Inductance of the coils for the transformer circuit	0·1 henry.
Ohmic resistance of the inductive and non-inductive coils of the transformer circuit	6·6 ohms.
Effective resistance of the inductive and non-inductive coils of the transformer circuit at 800 cycles with 1 milliampere at 15° C.	11·5 ohms.
Inductance of the coils in the phantom circuit	0·05 henry.
Ohmic resistance of all coils in the phantom circuit	3·3 ohms.
Effective resistance of all the coils in the phantom circuit at 800 cycles with 1 milliampere at 15° C.	4·6 ohms.
Capacity of the coils in the transformer circuit	0·004 mfd.
Additional capacity of the coils in the phantom circuit, less than	0·0001 mfd.

"βl" for 50 Nautical Miles (measured).

$2\pi n$	3,000	4,000	5,000	6,000	7,000
Transformer circuit	0·863	0·872	0·893	0·920	0·977
Phantom circuit	—	0·877	0·904	0·928	—

On testing the cable after laying, the speaking properties were equivalent to 7½ miles of "standard" cable.* This test may be considered fairly accurate, as 10 miles of "standard" cable was added at each end to eliminate terminal losses.

The actual construction of the cable, and the method of inserting the armouring and loading coils follows exactly that employed in the Anglo-French cable. Loading coils are inserted one naut apart, and the additional loading coil for the "phantom" circuit is inserted at the same place. In construction, this additional loading coil is similar to the others, except that one of the windings is reversed, and it merely increases the length of the bulge by eight inches. In spite of the smaller amount of dielectric, the total diameter of the cable is the same, and the same number and size of armouring wires are employed, the difference in diameter being made up by the additional jute under the armouring. Teredo tape is employed, as in all channel submarine cables nowadays.

The laying of the cable was completed on August 30th, but it has not yet been taken into use, as the land lines at the two ends are not yet complete. A very interesting point, which was rather welcomed by the Post Office engineers than otherwise, was that after laying, a fault was observed. This was localised, and was found to be an ordinary jointer's fault between the coils and the core, close to the St. Margaret's end. This afforded the Post Office engineers an opportunity of ascertaining whether it was as easy to repair a cable of this character as an ordinary submarine cable. The cable was lifted at the fault, and no difficulty at all was found in effecting the repair in the ordinary way, after which the cable was tested and found to be perfect. The fault was localised by an ordinary Varley loop test.

For the information in this article we are indebted to Major W. A. J. O'Meara, R.E., C.M.G., Engineer-in-Chief to the General Post Office, and to Messrs. Siemens Bros. & Co., who were the makers of the cable.

New Publications.—In the list of new publications in our last issue we gave the price of "Electrical Mining Installations," by P. W. Freudemacher, as 1s. net instead of 2s. net.

Dissolution of National Electric Lamp Co. (U.S.).—The United States District Court, Toledo, has decided that the combination of the National Electric Lamp Co. and 35 subsidiary companies is illegal, and has ordered the dissolution of the company. The efforts of this company were directed to the maintaining of the prices of electrical apparatus, and it is this which is declared illegal.

Rugby Engineering Society.—1911–12 session commenced on Thursday, Oct. 12th. The following Papers will be read during the session, the meetings being held at the Benn Buildings, High Street, Rugby:—Oct. 12th, "Multiple-effect Evaporation," by E. R. Briggs. Nov. 16th, "Gyrostats," by R. C. Clinker. Dec. 14th, "Machine Shop Practice," by P. V. Vernon. Jan. 11th, 1912, "Air Compressor Efficiency," by B. M. Woodhouse. Feb. 15th, "Workshop Economics," by J. Picken. March 21st, "High-speed Electrical Machinery," by F. H. Clough.

* Standard cable is that having a wire to wire capacity of each pair of wires of 0·054 microfarads per statute mile, a loop resistance of 88 ohms per statute mile, and an average insulation resistance of not less than 200 megohms per statute mile wire to wire.

REDUCTION IN THE PRICES OF METAL FILAMENT LAMPS

IMPORTANT announcements are being made by the leading makers of reductions in the prices of metal filament lamps, especially those for the higher voltages. In the case of Osram lamps, the list price of the 200–260-volt 32, 40 and 55-watt lamps has been reduced to 3s. (instead of 3s. 9d. and 4s.), and the 100–135-volts 17, 25, 32 and 55-watt sizes are now sold at 2s. 6d. The price of the new 20-watt 200–260-volt lamp is also very moderate, being 3s. 3d. These low prices are in no way due to competitive cutting, for indeed they form a concerted move on the part of the principal firms, who have a patent understanding amongst one another, but are solely the outcome of the vast manufacturing improvements, which have caused the former difficulties in the manufacture of very thin filaments to disappear. There is no doubt that, combined with the introduction of a really convenient sized 200-volt metal filament lamp for small units, a great impulse will be given to electric lighting in general, and that yet another step has been taken in the superceding of gas.

Messrs. Drake & Gorham, who hold very large stocks of Osram lamps, enabling them to give prompt delivery, announce similar reductions.

Siemens Brothers Dynamo Works have also been enabled, owing to their increasing rate of output, to announce reductions in the prices of Tantalum lamps from 200–250 volts, which will, as from Monday last, stand at 3s. Corresponding reductions have also been made as regards the same firm's 55-watt drawn tungsten "Onewatt" lamp, which will henceforth be sold at 2s. 6d. for 100–130 volts, and 3s. 3d. for 200–250 volts. (The above prices refer to standard bulbs. Special bulbs are 3d. extra both for Tantalum and Onewatt lamps.) The discounts remain as before, and we are asked to state that lists with the new prices can be supplied overprinted with contractors' names and addresses.

The British Thomson-Houston Co. are likewise able to lower the prices of their British-made Mazda lamps with wire-drawn filaments, which are now sold at 2s. 6d. each for the 100–125-volt 17, 25, 30, 40 and 60-watt sizes, and at 3s. for the 200–260-volt 30, 40 and 60-watt sizes.

Similar reductions in the prices of Mazda lamps are being made by G. M. Boddy & Co. (8 Leadenhall Street, E.C.).

The Edison & Swan United Electric Light Co., Ltd., are also bringing the prices of their Royal Ediswan metal lamps in line with those given above, viz., 100–130 volts 17–55 watts, 2s. 6d., and 200–260 volts, 32–63 watts, 3s. They also make the important announcement that they are introducing a 100–130-volt 12-watt lamp at 2s. 8d., and a 200–260-volt 24-watt lamp at 3s. 3d.

The British Westinghouse "Auriga" lamps are also being sold at the reduced price of 2s. 6d. for the 100–135-volt 20–63-watt sizes, and 3s. for the 200–260-volt 32–63-watt sizes.

The Electrical Company's "Aegma" lamps are subject to similar reductions, the sizes affected being 25, 32 and 50 c.p. for 200–260 volts, which are reduced to 3s., and 16, 25, 32 and 50 c.p. 100–130 volts to 2s. 6d. This reduction applies to lamps purchased since September 16th.

Brimsdown Lamp Works announce similar reductions, the 17–57-watt 100–135-volt lamps now selling at 2s. 6d., and the 32–55-watt 200–260-volt lamps at 3s.; and Simplex Conduits, Ltd., are selling at similar prices.

The Sunbeam Lamp Co. are bringing their prices both for high and low voltage lamps in line with those given above. Reductions in price are also being made by the "Z" Electric Lamp Manufacturing Co., who at the same time announce the introduction of a high-voltage 16-c.p. lamp. Cryselco, Limited, are reducing their 25 to 50-c.p. high-voltage lamps to 3s.

Krupka & Jacoby announce reduced prices for Graetzin lamps, which are now sold in the following sizes:—100–135 volts, 16–50 c.p., 2s. 6d.; 200–260 volts, 25–50 c.p., 3s. (round bulbs 3d. extra).

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CATALOGUES FOR SOUTH AFRICA.—We have received from the A.E.G. Electrical Co. of South Africa, Ltd. (Caxton House, Westminster), several publications of the Foreign Department of the Allgemeine Elektricitäts-Gesellschaft, of Berlin, relating to metallic filament lamp fittings, balance or differential protective systems, meters, and a description of the Adamello power scheme.

HAIR DRYERS.—A card from Simplex Conduits, Ltd., calls attention to the Simplex electric hair dryer, consisting of a small motor-driven fan delivering electrically-heated air, and weighing no more than 2 lbs.

HIGH AND LOW TENSION SWITCHGEAR.—Messrs. Messrs. Vedovelli, Priestley & Co. (Paris), whose London agents are Laing, Wharton, Ltd. (7 Newport Street, W.C.), have sent us a copy of a comprehensive catalogue containing particulars of switchgear &c., of their manufacture, including knife and other low tension switches and fuses, H.T. oil switches, overhead horn break switches, isolating switches, link suspension insulators, circuit breakers, remote control switches, lightning protection apparatus, &c.

ELECTRICITY IN DAILY LIFE.—A new booklet entitled "The Magic Wand of Science," designed to place before the public the possibilities of electricity for household purposes, is being issued by the General Electric Co., who are prepared to supply it in small quantities to any central station who will undertake to distribute copies among the consumers. The booklet is excellently produced, copiously illustrated, and deals thoroughly with the uses of small motors for driving household appliances, sewing machines, &c., electric heating, cooking, and ironing, vacuum cleaners, fans, &c.

METAL FILAMENT LAMPS.—An effective form of advertisement of the General Electric Co.'s new 200-260-volt. 16-c.p. (20 watts) Osram lamp with continuous drawn tungsten filament is a card the exact size of the lamp with an illustration of the lamp on the front, and price and particulars on the back.

FITTINGS AND HEATING APPARATUS.—Two attractive booklets, entitled respectively "The Electric Light Fixture" and "The Aston Electric Working Appliances," from Veritys (31 King Street, Covent Garden), deal with the fittings in the styles of various periods, and the new forms of heating and cooking apparatus referred to in our special article last week on their new London showrooms.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ONEWATT LAMPS.—We have received from Siemens Bros. Dynamo Works, Ltd. (Incandescent Lamp and Fittings Department, Tyssen Street, Dalston), a framed copy of a clever, humorous sketch illustrating the manufacture of the onewatt lamp. Various stages are pleasantly suggested, but the scene we like best is "drawing" the filament by a tug-of-war between two traction engines.

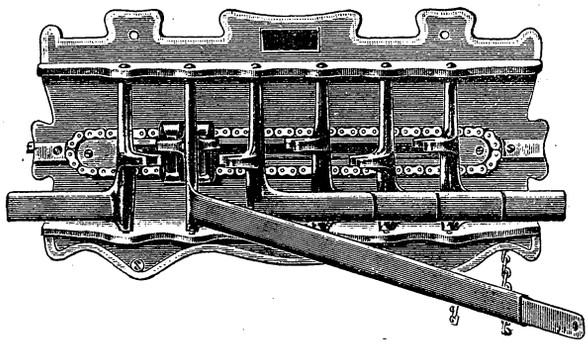
MACHINERY.—Lists from the Metallic Seamless Tube Co., Ltd. (Wiggin Street, Birmingham), give the prices, weights, and full particulars of motor generators, rotary transformers, and converters, D.-C. motors and dynamos, and two- and three-phase induction motors with 4, 6, 8, 10, or 12 poles.

SWITCHGEAR.—The same firm also send a leaflet relating to starters, starting panels, and shunt regulators for D.-C. machines.

LANTERNS AND FITTINGS.—A new catalogue from the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), shows a number of new designs of lanterns and fittings for street, shop, and works lighting. Several types are shown suitable for use under all conditions. Details and prices are also given, so that it should be found very useful for future reference.

HEATING APPARATUS.—The same company also send details of the Bastian Quatzalite heaters, which are being used on the s.s. *Olympic* and *Medina*, and a list of quartz heating and cookery apparatus described in our exhibition article, Part III., October 5th, 1911, pp. 44 and 47.

LIGHT TRANSFORMING REFLECTOR.—A leaflet from the Westinghouse Cooper Hewitt Co., Ltd. (151-2 Great Saffron Hill, Holborn Circus, E.C.), refers to the mercury vapour lamp fitted with this reflector, which we described in Part IV. of our exhibition supplement, October 12th, p. 64.



DRIVING CHAINS.—A pamphlet from Hans Renold, Ltd. (Progress Works, Manchester), discusses the application of well-known Renold chain to governors and valve gear driving. It combines the advantages of belt and gear drive, it does not slip, and encircles more than a third of the circumference of the pinion, so that the movement is practically continuous and free from shocks.

LAMPS AND ACCESSORIES.—A new pocket list issued by the Edison & Swan United Electric Light Co., Ltd. (Queen Street, E.C.), contains in a most convenient form full particulars of the "Royal Ediswan" metal (tungsten) filament lamps from 9 to 600 c.p., for voltages from 25 to 600, as well as the carbon lamps on which the firm's reputation was built up. Numerous patterns of lampholders, adaptors, ceiling roses, sockets, plugs, fuses, and switches are also listed, including the well-known "Phlatta" switch, and larger pattern wood blocks, conduits, and casing are also dealt with, as well as flexible, simple fittings and shades, while other sections are devoted to switchboard and portable instruments, fans, bells, and telephones. A further small but effective brochure deals in a more general way with the excellence of the Royal Ediswan lamp.

A MOVING SHOP WINDOW DISPLAY APPARATUS

A VERY ingenious and effective piece of apparatus has been brought out by Messrs. Laing, Wharton, Ltd. (7 Great Newport Street, W.C.), under the name of the "auto-exposer," for the continuous display of lengths of fabrics, carpets, wall-papers, or posters by turning them over like the pages of a book one at a time. One of these appliances is at work at the London and Provincial Supply authorities at Olympia, showing off the effective posters of the Electric Supply Publicity Committee. The apparatus is made in several sizes, the largest of which is capable of handling carpets and rugs up to 7 ft. by 10 ft. The illustration gives an idea of the working. The apparatus is driven by

MECHANISM OF "AUTO-EXPOSER."

a small motor, of 1/30 h.p. in the size exhibited. The motor drives a chain running up to the "exposer" through a reducing gear. The frame of the exposer carries pivoted arms, the backs of which are provided with three teeth, which engage with two teeth on a travelling slide. The slide travels along a channel, and is driven by an endless chain within the frame. One pin of the chain is sufficiently long to engage in a slot in the slide; the pin rides in the top of the slot when moving in one direction, and passes down to the bottom of the slot when rounding the pulley at the end, taking the slide back with it so that the arms are moved back again in the reverse order.

THE BRITISH ELECTRICAL AND ALLIED MANUFACTURERS' ASSOCIATION

THE inaugural dinner of the British Electrical and Allied Manufacturers' Association (Incorporated) was held at the Hotel Cecil on Thursday night. Mr. S. Z. Ferranti (President of the Institution of Electrical Engineers) was in the chair, and there were over two hundred people present.

In proposing the toast of the Association, Mr. FERRANTI said that, generally speaking, the electrical industry in this country was not as prosperous as one would like it to be. One of the reasons attributed to this had been the divergent interests in the electrical engineering industry in this country, but he did not agree with that view. The prosperity of the country depended on the prosperity of its manufacturers, and it was impossible for the manufacturers to make progress unless they were sufficiently prosperous to be in a position to make continued investigation and research with a view to improvements—this was vital to the buyer as well as to the seller. The condition of affairs, however, had been partly due to the manufacturers themselves, and he was glad to see that so many were now meeting together, for they should compete as good friends. Competition was excellent, and if it were not for competition we should become fossilised and do no good. There was, however, too much competition purely in price, instead of there being merely reasonable competition in price and keen competition in excellence.

Mr. F. H. NALDER, replying as Chairman of the Council of the British Electrical and Allied Manufacturers' Association, referred in general terms to the reorganisation of the Association. He urged the members not to grudge the increased subscription in view of the benefits which they would derive, and reminded them that the subscriptions of the Council themselves had risen from forty guineas to about six or seven hundred. In conclusion, he quoted a sentence from a letter of one of the applicants for the position of Secretary, "The tendency of modern industrialism is to temper competition by conference."

Mr. A. BRUCE ANDERSON, who in the course of his speech congratulated the Association on having secured the services of Mr. D. N. Dunlop as Secretary, proposed the toast of "The Industry." The British Empire, he said, lived very largely by its manufacturing industries. Although he saw no reason for placing the electrical industry second to any other industry, he saw no reason for placing it first. He was fully alive to the fact that if it were not for the older industries the members of the electrical industry would not be where they are, but he was also perfectly certain that if they did not work together they would never achieve the greatest of their possibilities. The great majority of those present had to buy at least as much as they had to sell—in the case of some manufacturers, alas, at about the same price. In the minds of some people, however, the idea of a manufacturers' association implied all the evils of trusts and combines and cartels; and these gentlemen, in their affright, declared that, in order to frustrate such evil designs, they would buy outside the Manufacturers' Association, and even outside that greater association of their fellow-countrymen, and would buy abroad. The power to buy abroad might be a necessary weapon in the hand of the buyer for fear the home manufacturer should become arrogant, but that was a contingency so remote in this country that he did not think they need stop to discuss it. The process of buying in a market where one could not sell was one which could not go on indefinitely. "The question no doubt arises in your minds," Mr. Anderson continued, "what is the Manufacturers' Association going to do about it? Well, perhaps I may be permitted to add in very general terms a few words to that which Mr. Nalder has said on this subject. So far as buying abroad goes, we are going to ask you not to do it, or, if you will do it, we are going to ask you to do it as little as possible, and if the conditions are such that you find yourselves compelled to do it, whether you will or not, we are going to say, do so with a shamed face and a sore heart, and set to work to alter the conditions." To send work abroad for goods which might be made at home by men who were standing idle was a shameful thing, and they ought to find out the reason for it, whatever it might be. In order that such matters might be put before them effectually, the British Electrical and Allied Manufacturers' Association had been created. The intentions of the Association had been well summed up in the sentence quoted by Mr. Nalder. They were going to hold "conversations"—they had been moving gunboats about for a considerable time, and as no one had been very much frightened, they had decided to converse together. They had created an Association and an organisation for carrying out the desires of the manufacturers as a whole, as soon as they had found out what desires were practicable, and it would be agreed that there were scores of questions, entirely aside from the question of price to the user, which could only be handled by such an Association in such a way as to benefit the manufacturer. Whatever was done to strengthen the manufacturers of this country must strengthen the industry as a whole and the country as a whole, because that strength would be used to fight for work in the big market of the world, which meant employing more people at home. It was only right and proper that the electrical industry should be amongst the first to recognise that idividualism, however magnificent, could not ultimately triumph against combination.

Mr. JAMES SWINBURNE (Past President of the Institution of Electrical Engineers), replying on behalf of the industry, referred to the difficulties placed in the way of new undertakings by Parliamentary Committees. He also referred to the education of the British workman himself. Apparently the British workman had the impression that there was a certain amount of work in the world to do, after which there would be none left, so that it would be expedient to do it as slowly as possible. As an example of one of the details which could be improved by a combination of manufacturers, he mentioned the lack of uniformity of catalogues, and explained his difficulty in devising a filing system which would make any catalogue easily accessible.

The next toast was "The Guests," proposed by Mr. HUGO HIRST (Vice-President of the British Electrical and Allied Manufacturers' Association). He said that as electrical manufacturers they were accustomed to efficiencies of about 95 per cent., but if the efforts of the Association had only an efficiency of 50 per cent., they were well worth making. He emphasised Mr. Anderson's point that the Association was nothing in the nature of a trust or cartel, but he advocated the regulation of selling prices, leaving sufficient margin for middlemen's and selling agents' profit.

Major W. J. O'MEARA, C.M.G. (Engineer-in-Chief to the General Post Office) and Captain R. MUIRHEAD COLLINS, C.M.G. (Representative of the Commonwealth of Australia in Great Britain) replied.

The Chairman's health was proposed by Mr. B. LONGBOTTOM (Vice-President of the Council of the British Electrical and Allied Manufacturers' Association), and Mr. Ferranti briefly responded.

Electrical Works Driving.—The following advertisement from a Yorkshire paper speaks for itself:—"For sale, eight horse . . . gas engine (run up to 14 horse), good as new, used at *Advertiser* office, Horsforth, up to last week-end. Only parting with it on account of machinery at new premises being run by electricity; will sell at great sacrifice."

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 12, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

30,194/10. **Purification of Gases.** J. Y. Johnson (*Badische Anilin & Soda Fabrik*). The gases containing impurities are passed between two electrodes connected to an H.-T. supply. One of these is formed to give a brush discharge, which charges the suspended impurities and causes them to settle on the other electrode. The discharge electrode takes the form of a carbon plate with a sharpened edge, and is so arranged relatively to the collecting electrode, that the field all round the edge is uniform, and the separation of the impurities takes place regularly. The wall of the vessel, through which the gases pass, may form the collecting electrode. To separate solid impurities the direction of the flow of gas is suddenly changed to assist the impurities to settle down. Three figures.

1,880/11. **Sealing Wires into Hard Vitreous Substances.** G. B. Burnside. The wire is placed through a small aperture in the glass or other vitreous substance, and heated by a blow-pipe flame until perfect cohesion between the two takes place. The seal is then removed from the flame, and when at a dull red heat, it is cooled by gradually increasing immersions, of about two or three seconds' duration, in some sperm or similar oil or in wax. For currents above 15 amperes, round tubular conductors, plugged with a conducting material, are employed. This form is very useful for mercury vapour lamps or rectifiers, as the tubular shell is made of a substance that does not form an amalgam, and thus protects the copper from the mercury. Seven figures.

3,950/11. **Lampholder.** G. Weissmann. This is intended for use with electric signs. A cube of insulating material with ring-shaped extensions has a central boring and two slots, one above the other, at right angles to the bore. Two conducting strips to form the terminals are fitted into the slots, the lower strip being continuous, and the upper strip having a threaded hole. This corresponds to the bore, and takes the threaded part of the lamp cap, which is screwed in until it makes contact with the lower strip. This gives a very tight holder, as after inserting the strips the joints can be cemented. The strips are also well insulated from the other plates. These are provided with holes, through which the cube extensions pass, so that the holder is firmly secured. Seventeen figures.

8,524/11. **Electric Oscillations.** B. Macku. This invention relates to the production of slightly damped oscillations by means of condenser discharges. Two resonant circuits of slightly different frequencies are arranged in parallel across a spark gap connected to a H.-T. current. At the first discharge across the gap, both condensers discharge simultaneously, but at the second discharge the first condenser begins to discharge before the other has finished charging, so that some of the energy of the first condenser flows into the second and the current across the gap is reduced. The greater the difference of phase, the smaller the current becomes until it is so small that the spark is cooled and extinguished. The energy still continues to oscillate, but flows round the circuits provided, as in a single circuit. One figure.

11,999/11. **Mounting Receiving and Transmitting Apparatus.** E. Girardeau. This relates to a wireless telegraph station with the above apparatus, in which the antenna is connected to earth through a gap device, across which the primary of the receiving circuit is connected, the secondary being connected to a detector. The object of the invention is to protect the detector from the emission waves, so that a more sensitive one can be used. The gap referred to is placed close to the spark gap in the emission circuit, so that when the spark is operative it automatically lowers the explosive potential in the gap device, and consequently reduces the strain on the detector. Instead of using the spark gap directly, a vacuum or neon tube may be employed, so that the ultra-violet rays from the tube during the operation of the emission system reduces the potential of the gap device. Two figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) 607/11; Körting and Mathiesen Akt.-Ges. [Rain-proof ventilator for] 10,886/11; Ges. für Maschinen und Metall Industrie, 15,730/11.

Dynamos, Motors, and Transformers: Cabot [Electric conversion] 27,696/10; Rauschburg and Perlusz [Portable transformer for medical purposes] 1,951/11; Maes [Generator] 5,457/11; Anschutz and Co. [Motors] 5,866/11; Brown, Boveri et Cie [Variable frequency commutator machine] 7,061/11.

Electric Ignition: Maher, 7,108/11.

Switchgear, Fuses, and Fittings: Venner and Griesbach [Switches] 17,658/10; Alexanderson [Motor control] 8,149/11; Lowen (*Killing*) [Globe and shade holders for lamps] 12,572/11.

Telephony, Telegraphy, and Signalling: Cortland [Signalling systems] 22,085/10; Siemens Bros. & Co. and Ferreira [Railway signalling] 26,647/10, and [Electro-magnetic relays] 24,003/10; Sterling Telephone & Electric Co. and Burney [Intercommunication systems] 26,854/10; Gledall [Device for receiving and transmitting] 3,630/11; Vahey [Railway signalling apparatus] 6,630/11; Goldschmidt [Apparatus for intensifying weak alternating currents] 8,978/11; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Telegraph instrument] 15,130/11.

Electrochemistry and Electrometallurgy: Cowper-Coles [Electro-deposition of iron] 28,226/10; Ludecke and Imperial Lamp Works (Brimsdown), Ltd. [Furnaces for treating metal filaments] 8,996/11.

Incandescent Lamps: "Z" Electric Lamp Manufacturing Co. and Hoge, 23,332/10; O'Brien and Catts [Lamps and reflectors] 25,404/10; Polack [Locking lamps in holders, &c.] 28,138/10.

Miscellaneous: Rorke and Rorke [Electro-magnetic valve control] 22,397/10; Pucillo [Aluminium treatment] 22,684/10; Siemens Bros. Dynamo Works, Ltd. (*Siemens Schuckertwerke Ges.*) [Driving ring-spinning and doubling machines] 23,641/10; Johnson (*Badische Anilin & Soda Fabrik*) [Electrical purification of gases] 142/11; Von Leiben, Reisz and Strauss [Relay for undulatory currents] 1,482/11; Henri Helbronner and Von Recklington [Sterilizing apparatus] 6,178/11; Cremer [Miner's Safety Lamps] 8,632/11; Evans (*Allgemeine Electricitäts Ges.*) [Welding machine] 12,585/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Switchgear: Elektromotoren-Werke Hermann Gradenwitz [Remote-control systems for electric driving] 10,551/11; Canfield [Controllers] 20,534/11; Ferguson [Regulator for machines] 20,586/11; Schiodt [Protective device for machines] 20,636/11.

Miscellaneous: Ritter [Apparatus for winding armatures] 20,997/11.

Expiring and Expired Patents

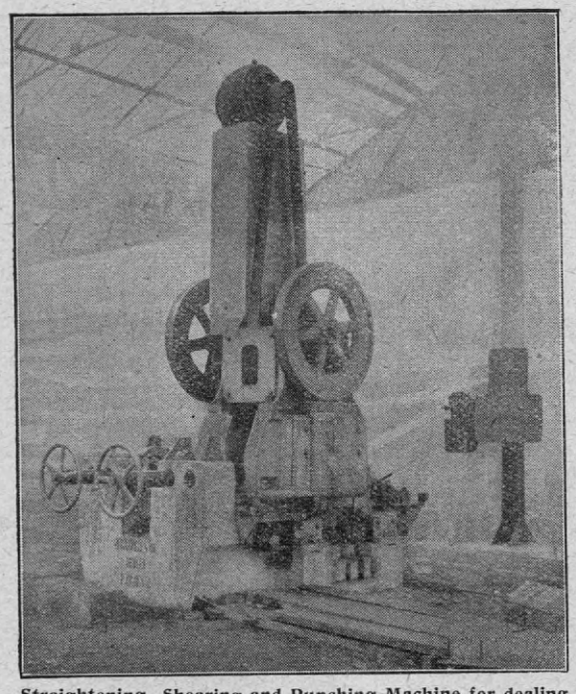
The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. J. Davy, 14,809/06.

Distributing Systems, and Cables and Wires: E. Lycett [Cable couplings] 14,617/04; T. and L. Torda [Distribution] 14,935/07.

Dynamos, Motors and Transformers: Brown, Boveri et Cie [Regulation for constant charging current] 12,097/04; C. A. Parsons and A. Flint [Armatures] 13,107/05; A. Lloyd [Motor-generator for medical work] 14,780/06; Siemens Bros. Dynamo Works [Preventing distortion of field and sparking at brushes] 14,838/07; J. E. Noeggerath [Armatures, homopolar type] 14,876/07.

Meters: W. B. Thorpe [Coin-freed meter] 14,831/07.



Switchgear and Fuses: F. W. Le Tall (*Cooper-Hewitt Electric Co., New York*) [Cut-outs] 14,173/03. G. B. Bowell and Pearson Fire Alarm, Ltd. [Fuse] 14,605/03; G. C. Fricker [Selecting switch for advertising mechanism] 14,590/06; A. Eckstein, A. C. Heap and D. B. Mellis [Solenoid switch] 14,567/07; Veritys, Ltd., and A. E. Gott [Switches and cut-outs] 14,797/07.

Telephony, Telegraphy and Signalling: C. M. Jacobs and A. H. Nicholson [Switch for selective signalling apparatus] 14,375/03; W. Reid [Railway signals] 14,495/06; A. J. Boult (*Zorge Safety Railway Equipment Co.*) [Railway signals] 14,518-9/07.

Miscellaneous: H. Walder [Speed indicators] 14,335/06; F. Schübbe [Electro-magnetic piano players] 14,637/07; C. W. Taylor [Medical battery] 14,638/07; S. J. Ross [Coils for electro-magnets, &c.] 15,012/07.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A special article on another page gives details with regard to the new submarine telephone cable laid between England and Belgium, which shows that this country is maintaining its position as pioneer in submarine cable work. The cable depends absolutely on the use of loading coils for speech to be possible through it, and it will be seen that the weight of gutta-percha on each core is only 150 lbs. per naut., with 160 lbs. copper. In this connection our readers will also doubtless be interested in the cartoon on page 566.

The second ordinary general meeting of the National Telewriter Co. was held on Monday, when the Chairman, Mr. E. Edwards, said that since the date of the last meeting, the number of their subscribers had steadily increased. Permission had been received from the General Post Office to instal telewriters at the offices of the principal cable companies to enable them to receive cablegrams direct from their clients. A small exchange had been established in the West End, and the Contract Department has been reopened under the supervision of an experienced telephone contract officer. The company have secured the services of Mr. H. Laws-Webb as Consulting Engineer. Orders have been received from Australia, Italy, Austria, and other countries, and an important firm of electrical engineers in Berlin have been appointed agents for Germany. It appears that serious difficulties were encountered with some of the technical details of the English machine, with the result that the company have thought it wise to negotiate with the American Company for the supply of instruments, which have been found to give greater satisfaction.

A meeting of the Marconi's Wireless Telegraph Co. is to be held on October 25th in connection with the creation of 250,000 new ordinary £1 shares. It is announced that the company have secured the control and direct management of the Russian Company of Wireless Telephony and Telegraphy of St. Petersburg, and that Mr. A. Simpson, of the London Marconi Co., has been appointed managing director, and will proceed to St. Petersburg to assume control. By manufacturing in Russia the Russian Company secures the bulk of the Russian Government business.

The October issue of the *Marconigraph* contains a description of a 5-k.w. wireless station in the Falkland Islands, an order for which has been placed by the Crown Agents for the Colonies with Marconi's Wireless Telegraph Co., Ltd. The station will be situated at Port Stanley, on East Falkland, and will have a working range of 400 nautical miles and a considerably longer maximum range. It will be arranged to tune in transmission to waves of 300 and 600 metres, and to any waves between 600 and 1,200 metres, and in reception to any waves between 100 and 2,500 metres. Two sectional steel masts, with wooden top-masts, each 220 feet in height, will be provided to support a two-part aerial of the "T" type. A 15-h.p. oil engine will drive an alternator and exciter, and the disc discharger will be mounted on an extension of the alternator shaft. In conjunction with the oil-cooled transformers, suitable oil-cooled iron-core primary low-frequency inductances will be provided, and provision will be made against injurious induced effects from the high frequency circuit by air-core protecting chokes. The condenser battery will consist of eight independent whole glass plate condensers. The disc-discharger will produce a musical note, and will consist of a steel disc, with transverse copper studs rotating between adjustable revolving electrodes. The high-frequency inductance will be continuously adjustable over the full range of inductance required for varying wave length between the stops of the condenser combination so as to provide for the waves specified. The transmitting jigger will be of the independent primary and secondary circuit type, contained in teak cases, the secondary being adjusted laterally with respect to the primary for varying the coupling between the circuits. The receiver will consist of the one part of a double magnetic detector and multiple tuner providing for the reception of all waves between 100 and 2,500 metres, the multiple tuner being calibrated to permit the instrument to be set to any pre-arranged wave length to be received, and provided with a change switch to permit of instantaneous change of the circuit from a highly syntonised tuned condition to an untuned condition specially devised for picking up incoming waves of widely different wave length when standing by. The receiving circuit will be arranged so that it may

Hosted by Google

be permanently connected to the aerial through the insulated plate of the earth arrester terminal, thus permitting the operator to be interrupted in the transmission of a message in the event of erroneous reception by a corresponding station. The receiver will consist for the other part of a valve receiver of generally similar construction to the above combination, except that the valve detector and the wave length in reception will be from 1,600 to 4,000 metres.

Messrs. Siemens Bros. & Co., Ltd., who possess the British rights of the Telefunken system of wireless telegraphy, have decided to institute proceedings against the Marconi Co. for alleged infringement of patents.

According to the *Elektrotechnische Zeitschrift*, important commercial interests in Germany recently approached the German Post Office on the matter of direct telephonic communication between England and Germany. The secretary, in his reply, stated that the present knowledge of long-distance submarine telephony did not render possible the working of a direct cable between Germany and England. The length of such a cable would be about 280 miles, as compared with 55 miles between England and Belgium. The secretary added, however, that an attempt would be made to provide such communication *viâ* the new England-Belgium cable.

An application was made to Mr. Justice Parker in the Chancery Division on Friday in connection with the prolongation of the Strowger automatic telephone patent, which was referred to in our last issue. The Automatic Telephone Co., Ltd., applied for an extension of time in which to deliver particulars. Mr. T. Terrell, K.C., stated that the action had been put down for November 20th. Mr. Justice Parker granted the extension of time asked for, but stated that the date fixed for the hearing must remain. The patent expires in January next year.

Sir William Bull, M.P., presided at the first ordinary general meeting of the Grindell-Matthews Wireless Telephone Syndicate on Friday. He mentioned that a large amount of experimental work has been carried out in the little creek of Pilning on the Severn, and called attention to the fact that whilst the general body of shareholders did not seem disposed to put more money into the concern, a finance company has agreed to provide further capital to complete the experiments. This finance company has an option to purchase the syndicate for £150,000, provided that certain experiments are satisfactorily completed. If this option is exercised, the ordinary shareholders will get £7 10s. for each of their £1 shares. The depôt at Pilning is now being removed to London, where larger instruments are being prepared for long distance work.

An interim dividend at the rate of 3 per cent. per annum free of tax has been declared by the Anglo-Portuguese Telephone Co.

According to the *Financial News*, negotiations are in progress for the formation of an English Company for the installation of a telephone system in Constantinople, the concession for which was secured some time ago, by Mr. H. Laws Webb on behalf of an international group. The plans are to be submitted to the Government for approval within six months of October 17th, 1911. The first plant will consist of 10,000 lines with scope for increasing to 18,000. There will be 75 public call offices, for which the charge will be 4d. per call. Private users will be upon the message rate system, and there is to be an unlimited subscription rate for dwelling-houses. Twenty months is spoken of as the time for the completion of the first portion of the system, the capital outlay upon which will be about £250,000.

With reference to the note published in our last issue concerning the dispute between the Hythe Council and the National Telephone Co., the Postmaster-General has informed the Council that at the end of the year he will have the offending poles removed. It is therefore anticipated that the Council will withdraw their demand to the company for the immediate removal of the poles.

Communication with Rabat is again normal, but telegrams for Mogador are still subject to delay.—Telegrams to Turkey in code or cypher are prohibited.—The Indo-European Telegraph Company suffered an interruption of lines between Kertch and Soukhoumkale for a short while, but the cable between Tripoli and Malta was again working on the 10th inst. In this connection it is interesting to note that an Italian vessel has been engaged in the laying of a new direct cable between Sicily and Tripoli, and this should relieve congestion when it is working, which should be in a few days.—The Indo-European Company's lines were in trouble between Djoulfa and Tabriz on the 13th inst., but were again put through on the 17th inst.—In case of misconception, it would be well to explain that telegrams in code may pass Turkish lines in transit, but must not be deliverable in that country.—It is only natural that the Chinese troubles should bring telegraphic restrictions in their train, and so we find that telegrams to Hankow can now only be accepted at sender's risk.—Private telegrams must be written in plain English.

ELECTRIC TRACTION NOTES

The capital reorganisation scheme of the British Electric Traction Co. was sanctioned at meetings on Tuesday. At the commencement of the proceedings the Chairman, Mr. E. Garcke, stated that the proxies which had been lodged indicated that the Board had the full confidence of the shareholders, and he understood that in view of the large support which the directors had, the amendment for the appointment of a shareholders' Committee would not be moved. This being so, the directors were willing, after having the scheme for the sub-division and rearrangement of the capital passed, subject to adjustment of details, to agree to an adjournment for a fortnight to allow time to discuss the situation with the representatives of dissentient shareholders. This course was adopted. As explained in our issue for August 3rd, under the scheme the preference shareholders obtain an advantage in priority of capital and waive part of their rights to future distribution of profits, the ordinary shareholders have their prospect of dividend improved and waive part of their right as to capital.

A joint report has been presented by the Highways and Improvements Committees of the L.C.C. with respect to tramways in connection with the new St. Paul's bridge. It is proposed to construct a double line of conduit tramways from the south side of the bridge over the bridge, and terminate at Cheapside. The tramways between Cheapside and the south side of Cannon Street are to be constructed in a subway, and the whole is to be leased to the City Corporation for a term of 60 years. The Committees recommend that the Council shall contribute £350,000, or one-half of the net cost, whichever is the less, towards the widening of St. Paul's Churchyard in connection with this scheme.

There was a credit balance of £28,854 on the working of the Cape electric tramways for the year to June 30th. After providing for debenture interest and redemption of debentures, reserve is credited with £8,000, and the directors recommend a 2½ per cent. dividend free of tax on the ordinary shares, and carry forward £8,574.

It is estimated that the total loss of revenue upon the Liverpool Tramways during the strike in the summer amounted to £5,749. In spite of this, however, the total receipts for the first nine months of the year constitute a record. The number of passengers carried increased by 2,266,686, and the receipts by £13,616.

The Stockport Corporation Tramways Committee have decided to recommend the Council to seek powers for running trolley omnibuses from the Market Place to Marples. Owing to the narrowness of the roads on this route, frequent representations for tramways have had to be ignored.

It was stated at the last meeting of the Burton-on-Trent Corporation that the tramway receipts during the six months ended September 30th show an increase of £600, whilst the energy consumption was the lowest reached since the beginning of the undertaking.

Subscriptions are invited until to-morrow (Friday) by the Paisley and District Tramways Co. for 80,000 4 per cent. mortgage debentures at 96.

The Perth Corporation have decided to separate the management of the tramways from that of the electricity undertaking. Mr. J. Lambert, at present electrical engineer and tramways manager, will in future only have charge of the overhead and other electrical equipment of the tramway system and the supply of current, for which services he will be paid a salary of £50 per annum by the Tramways Department. Mr. W. G. Snell, at present traffic superintendent, has been appointed interim manager for a period of three months at a salary of £130 per annum. In making a recommendation to this effect, the Electricity and Tramways Committees specially pointed out that it was not intended as any reflection upon Mr. Lambert, but they felt he was not able to give the necessary attention to the proper development of the electricity undertaking at present.

Hosted by Google

LOCAL NOTES

Birmingham: *Proposed New Power Station.*—The Electricity Committee have decided to purchase 17 acres of land for the purposes of another generating station. It is anticipated that the capacity of the Summer Lane power station will only be equal to the requirements of the department until 1915. It is expected that the new high-tension power station will cost about £250,000.

Bradford: *Electricity Accounts.*—The annual report of the Electricity Committee to March 31st last shows a net profit of nearly £9,000.

Edinburgh: *Electric Light Accounts.*—There was a net revenue of £69,440 on the working of the electricity undertaking for the year to May 15th last. After meeting interest and sinking fund charges, there is a balance of £8,430. The total number of units sold was 16,228,906, against 15,309,493 in the previous twelve months.

Holmfirth: *Electric Lighting.*—The Council recently submitted the question as to whether a supply of electricity should be undertaken to a poll of ratepayers. The result was that 1,276 votes were received in favour of the scheme, 580 were against, and 204 neutral.

Liverpool: *Workhouse Lighting.*—When the proposal for lighting the Brownlow Hill workhouse was first made some time ago there was a long discussion as to whether it would be more economical to instal special generating plant or take the current from the Corporation mains. The advocates of the former course, who eventually carried the day, are feeling very satisfied with themselves at the results of the first year's working. The total cost, including £700 for interest and repayment of loans, has only amounted to £1,698, compared with £3,291 which would have been charged by the Corporation for the same supply.

Penzance: *Electricity Supply.*—The scheme of the Penzance and District Electric Supply Co. for laying cables in connection with the supply of electricity has been approved by the Council.

Sheffield: *Municipal Wiring.*—In an omnibus Bill which the Corporation propose to promote in the next session of Parliament are clauses authorising them to provide, let for hire, and fix, wire, &c., the premises of electric light consumers. Objection was taken to this clause at the last meeting of the Corporation, but the Chairman of the Electricity Committee asked that the matter should not be discussed then, as legal proceedings were pending, and anything said would be used against the Corporation. The objections were thereupon withdrawn on the understanding that the matter should be discussed at a later stage.

Winchester: *Electric Light Undertaking.*—The Electricity Committee report that the costs of obtaining the Act of Parliament sanctioning the transfer of the Winchester electric light and power undertaking to the Corporation amounted to £2,263. The purchase price was £97,000.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—Tenders are invited by October 28th for a 1,000-B.H.P. gas engine plant, together with a 750-kw. generator. Particulars from Borough Electrical Engineer.

Bury (Lancs.).—The storage battery, which has at present a capacity of 350 ampere-hours, is to be increased to 1,000 ampere-hours.

London: *L.C.C.*—The Highways Committee recommend the erection of a new sub-station at Vauxhall, and an expenditure of about £33,300 in connection with it.

Sheffield.—The Electric Light Committee invite tenders for a 5,500 kw. steam turbine with condensing plant, pumps, pipe-work, &c.; also an alternator and exciter. Particulars from General Manager and tenders by November 13th.

Swindon.—The Electrical Engineer has estimated the cost of a 250 kw. Diesel engine, switchgear, &c., at £5,600, and the Corporation have decided to apply to the Local Government Board for the necessary loan.

Radcliffe.—Tenders are invited for two 300-kw. rotary converters and transformers and extra high-tension switchgear (see an advertisement on another page).

Stourbridge.—Tenders are invited for an electricity generating plant, wiring, lamps, for the Stourbridge and Halesowen Hospital. Architect, Mr. H. E. Folkes, Waterloo Buildings, Stourbridge.

Wednesbury.—A Local Government Board inquiry was held last week concerning an application for a loan of £4,997 for extensions at the electricity works. There was no opposition.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Fulham.—Proposed new music-hall at 444 and 446 Fulham Road, Messrs. Matcham & Co.

Glasgow.—Picture theatre, 72 Renfrew Street. Glasgow Picture House Co.

Reconstruction of saw mills and offices recently destroyed by fire in Kinning Park. Architects, Messrs. H. & D. Barclay.

London.—New offices for the Board of Agriculture and Fisheries. Architect, H. A. Collins, H.M. Office of Works, London.

Neath.—New infirmary.

Paddington.—Cinematograph theatre at 140 Maida Vale.

Paisley.—Public refrigerator. Town Council.

Rhondda.—Alterations and additions to girls' and infants' schools. Architect, Mr. J. Rees, Hillside Cottage, Pentre.

Stoke Newington.—Cinematograph theatre at 538 and 540, Kingsland Road, N.

Tewkesbury.—Isolation hospital, &c. Architect, Mr. J. Villar, 5 Essex Place, Cheltenham.

Wrexham.—School to accommodate 400 children. Architect, W. G. Wiles, 42A High Street.

MISCELLANEOUS

Bradford.—The Tramways Department invited tenders for a twelve months' supply of miscellaneous stores, including lamp fittings, traction lamps, insulating material, insulated bolts, &c. Particulars from Tramway Offices, and tenders by November 11th.

Dewsbury.—It is proposed to extend the tramways from Market Place to the eastern border of Batley. A second scheme involves the laying of some lines inside the Batley boundary as a continuation of this extension, and there seems every prospect of the two Councils agreeing.

Dublin.—The Dublin United Tramways Co. invite tenders for general stores, including car fittings, electric supplies, &c. Particulars from Secretary, and tenders by November 6th.

Halifax.—The Tramways Committee have sanctioned an extensive scheme of track-doubling at an estimated cost of £10,000.

Portsmouth.—It is proposed to extend the tramways from Gosport to Lee-on-Solent.

TENDERS RECEIVED AND ACCEPTED

Aldershot.—The tender of the Diesel Engine Co., for a 200 h.p. engine made by Messrs. Carels, coupled to a Bruce Peebles dynamo, at £2,298, has been accepted.

Belfast.—The tender of Messrs. Craig & Paton has been accepted for the electric wiring of the new abattoir at £505.

Bury (Lancs).—The tender of the Switchgear Co., Ltd., for supplying two regulating switches for the battery has been accepted.

Dundee.—The tender of Messrs. Lowdon Bros., of Dundee, for the electric lighting and power distribution system in the new engineering laboratories of the University, has been accepted.

Norwich.—The Electricity Committee recommend the acceptance of the tender of Messrs. G. G. Stowers & Son, of Norwich, for new buildings at the electricity works at £2,960.

Stoke-on-Trent.—The following tenders have been accepted:—300 ampere-hour battery, D. P. Battery Co., £91; motor generator, three-phase to D.-C., Bruce Peebles & Co., £225; electric feed pump, British Westinghouse Co., £180; three-phase transformers, British Westinghouse Co., £91.

OSRAM-LAMPS

Hosted by Google

APPOINTMENTS AND PERSONAL NOTES

Mr. Ashton Bremner is opening an office as consulting engineer at 27 Paradise Street, Birmingham. He has been called in to advise the Wakefield Corporation upon their destructor plant, and has been invited by the Walsall Electricity Committee to report on the condition of their generating and distributing plant, to which he has been acting electrical engineer for the last six months.

Mr. Alfred H. Gibbings is opening up an engineering and electrical contracting business at Buenos Aires (Congallo 564) under a partnership agreement with Messrs. Scott & Hume, late Alejandro Hume, Scott & Hume, railway contractors, &c. The firm has already secured agencies for a number of well-known British firms.

Mr. J. W. Meares is leaving to-day for India on the P. & O. steamer *Morea*. All communications should, therefore, now be sent to him at the Electrical Advisor's Office, Calcutta.

The salary of Mr. J. Allan, Secretary of the Dublin electric light undertaking, is to be increased by four annual increments of £50, making £600 per annum.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 to £57 5s. (last week, £56 15s. to £57).

Checkogram, Ltd.—We are informed that Checkogram (1908), Ltd. (150 Oxford Street), are extending their business to include electrical installation work, including telephones, and invite catalogues from manufacturers.

Western Electric Co., Ltd.—The company have opened a branch office in Glasgow, under the charge of Mr. M. Breingan. Telegraphic address, Microphone, Glasgow; telephone, Central 1999.

Submersible and J.-L. Motors, Ltd.—Submersible Motors, Ltd. (23 St. Swithin's Lane, E.C.), have taken over the business and works at Southall of the J.-L. Manufacturing Co., Ltd., and the name of the company will be altered to that given above. Mr. T. L. Reed-Cooper, Managing Director of the J.-L. Co., will be Managing Director of the new company, and the manufacture of both the Macdonald submersible motor and the J.-L. laminated field motor will be continued.

Benjamin Reflectors.—We understand from the Benjamin Electric, Ltd. (117 Victoria Street, E.C.), that at the Canadian National Exhibition at Toronto no less than 1,795 of the type of reflector illustrated in Electrical Engineering, January 12th, page 16, were used.

G.E.C. Athletic Club.—The General Electric Co.'s Athletic Club invite applications for football clubs in the electrical trade (non-league), London and district, to enter for the Davis Challenge Cup. Full particulars from the Secretaries, Messrs. H. Chard and J. Peters, 67 Queen Victoria Street, E.C. The cup has been presented by Mr. S. Davis, of 30 & 31 St. Swithin's Lane, E.C.

B.T.-H. Leeds Office.—The British Thomson-Houston Company, Ltd., are removing their Leeds Office from Greek Street Chambers to Standard Buildings, City Square, and the telephone number will be the same as previously, namely, 3244 Central.

The Silent Electric Clock Co.—Owing to increase of business, the Silent Electric Clock Co. (192 Goswell Road, E.C.) have found it necessary for the second time within twelve months to enlarge their premises.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Drake & Gorham.—The annual general meeting was held on Wednesday last week, Mr. Bernard Drake presiding. He said there had been considerable increase in the turnover of all sections of the business. Severe competition still continued, however, and it was difficult to get people to appreciate that if they accepted lower tenders they would not necessarily be getting the same quality of material and workmanship. He had been told that Messrs. Drake & Gorham had the reputation for doing very good work, but that they were expensive. Nevertheless, the policy would be to maintain at all costs the high standard of excellence. It had been found necessary to take an additional warehouse and offices in Felix Street, from which the wholesale business would be conducted in future.

Ferranti.—The trading profit for the year to June 30th was £49,074, and after meeting interest, repairs and renewals, bad debts, &c., there was a balance of £22,044. After meeting prior lien debentures and mortgage interest, and allocating £10,000 to depreciation, the balance of £4,166 was carried forward.

Allgemeine Elektricitäts Gesellschaft.—The report for the past twelve months shows a net profit of 14 per cent., the same as in the previous year. The capital, which now stands at 130 million marks, has increased by 30 million marks. The orders in hand are said to be considerably more than at this time last year. The Oerlikon Machine Works, Zurich, declare a dividend of 4 per cent. It is expected that electrical working on the Lotschberg Railway, the order for which the company has secured, will be commenced in 1913. The agreement with the Siemens-Schuckert Works, Berlin, providing for joint action with regard to railway electrification in Switzerland, has been terminated.

SUMMARY

There was further criticism on the Marylebone Electricity Department at the meeting of the Council last Thursday. The Chairman of the Electric Supply Committee replied at length to the various charges made against the department, showing that the undertaking is in a sound financial condition, and eventually the accounts for the year to June 30th were passed by a large majority. (Page 577.)

We regret to announce the death of Mr. John Conacher, for some years general manager of the Metropolitan Electric Supply Co. (Page 577.)

A letter from Siemens Brothers & Co. refers to the relative position of the Telefunken patents, of which they are proprietors in this country, and the Marconi patents, and announces their intention of proceeding against the Marconi company for infringement. (Page 578.)

We had the opportunity of inspecting a large Willans-Diesel engine coupled to a Siemens' alternator at Messrs. Willans & Robinson's works on Monday. (Page 579.)

A new design of H.T. feeder on motor panel in iron plate cubicle is described and illustrated. (Page 580.)

In our sixth and last notice of the Olympia Electrical Exhibition, which closed last Saturday, we describe some interesting motor control gear, a fuse on a new principle, electrical mechanism for chime ringing, and other novelties. (Page 583.)

Three Patents in connection with incandescent lamps were published last week. One provides means for mounting the filament supporting wires, another an arrangement for fixing a shade and at the same time locking the lamp in its holder, and a third relates to a furnace for treating raw metallic filaments, which takes the form of a cylinder produced by the dissociation of tungsten and molybdenum chlorides into their component parts. Another specification protects a portable transformer for medical purposes, from which a low-tension current as well as a faradised current can be obtained. An electrolytic process for producing very pure iron is also covered by S. O. Cowper-Coles. Opposition has been entered to the grant of a patent to T. G. Smith and F. J. Platt which relates to an ignition plug. (Page 584.)

Some interesting cases of breakdowns of electrical machinery are recorded in the annual report of the chief engineer to a large insurance company. (Page 585.)

We describe an experimental installation just erected at Billericay for the application of electricity in horticulture. A new type of influence machine is employed. (Page 585.)

A new combined shade carrier and lamp-locking device is described. (Page 585.)

Some notes are given on a theatre lighting installation employing metal filament lamps. (Page 585.)

Hosted by Google

In our "Electric Traction Notes" we refer to the fatal accident on the Stalybridge tramways, the difficulty experienced by the National Electric Construction Co. to raise the necessary capital for the Oxford tramways, and the refusal of the Corporation to modify the existing agreement, and a proposal by the Brighton and Hove Corporations to introduce the trolley-omnibus system. (Page 586.)

We make the important announcement under "Telephony and Telegraphy (Including Wireless)" that the dispute between the Marconi's Wireless Telegraph Co., Ltd., and the Lodge-Muirhead Syndicate, Ltd., as to patents, has been ended. Sir Oliver Lodge will, in future, act as scientific adviser to the Marconi Co.—The Marconi Co. have issued a writ against Messrs. Siemens Bros. & Co., Ltd.—The dispute between the Hythe Council and the National Telephone Co. is still unsettled.—The conference of municipal authorities, which was to have been held this month regarding the telephone system of the country, has been postponed.—Successful experiments have been made in telephoning between London and Geneva and Basel, *viâ* the loaded Anglo-French cable, and the public will shortly be able to telephone between these three towns.—Major O'Meara, in an address delivered to the Institution of Post Office Electrical Engineers last week, referred to the injury done by "quack" engineers. He also read a Paper on multiple telegraphy, in which he reviewed and compared the various systems and gave interesting indications as to the tendency of the policy of the Post Office in this direction. (Page 587.)

The Bethnal Green Council have retained Mr. J. F. C. Snell to advise them with regard to a supply of electricity.—Messrs. Handcock & Dykes have prepared a report for the Douglas Council recommending an electric lighting scheme.—The Grimsby Electricity Committee have decided to transfer £1,000 to relief of rates.—Street lighting experiments with electricity and gas are being carried out in Dawlish.—The Metropolitan Electric Supply Co. are giving a bulk supply in Brentford. (Page 588.)

Mains extensions are to be carried out in Battersea at an estimated cost of £588; the Hammersmith Council have been granted a loan of £15,000; the Blackpool Electrical Engineer recommends new generating plant, &c., at a cost of £12,000; and a complete electricity generating equipment is required at Lethbridge, Canada.—An electric lighting, heating, and power installation is required at the Edinburgh College of Art, and a street fire-alarm system at Sidcup. (Page 588.)

The accounts of the Edison & Swan United Electric Light Co. for the year to June 30th show a net profit of £19,013. No dividend is recommended.—Callender's Cable and Construction Co. recommend an interim dividend at the rate of 10 per cent. per annum. (Page 590.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) FRIDAY, OCTOBER 27th.

Physical Society.

5 p.m. At Imperial Technical College. The agenda includes:—"Further Observations on the After Glow of Electric Discharge and Kindred Phenomena," by the Hon. R. J. Strutt.

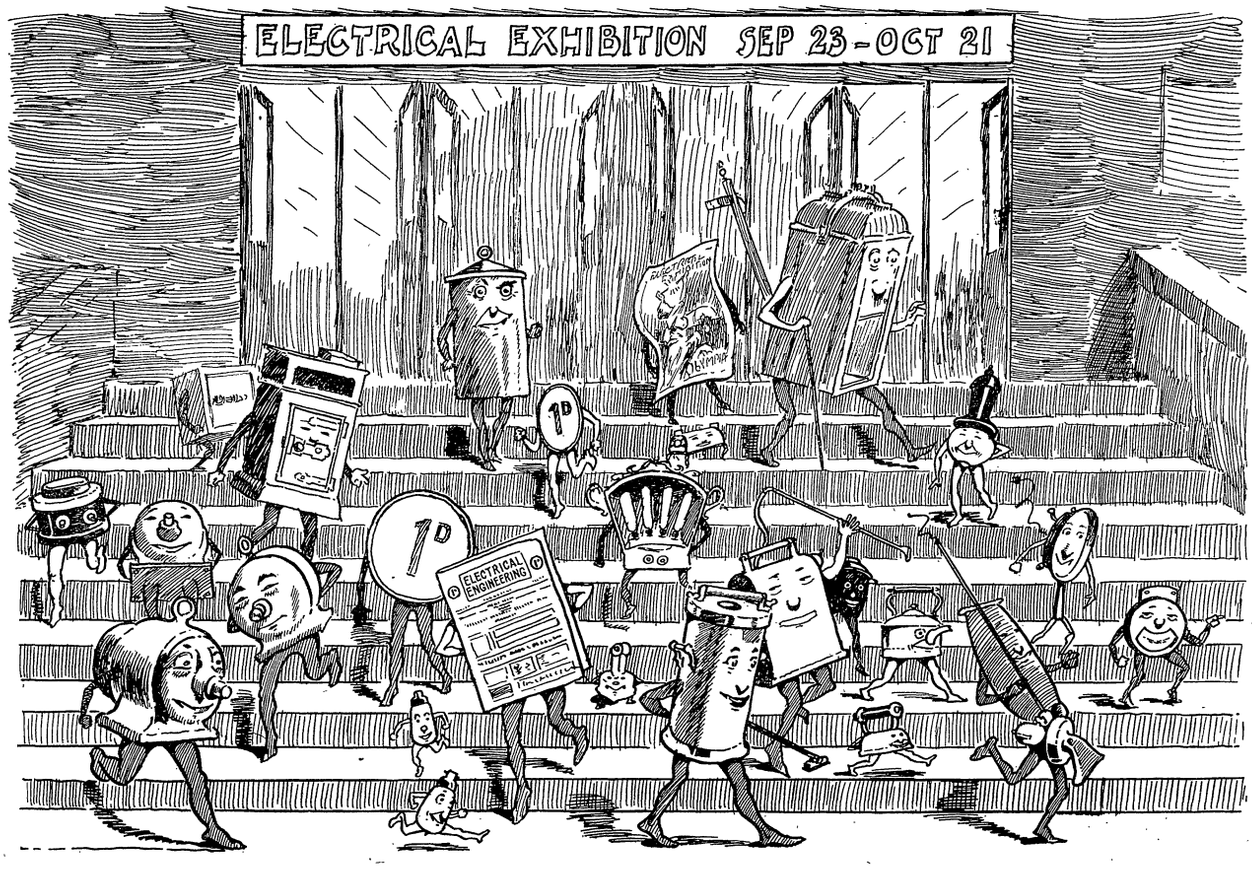
The "Generators."

6.45 for 7.15 p.m. Dinner at Imperial Restaurant, Regent Street.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. Inaugural address by Chairman, Mr. W. Cramp, at Midland Hotel.

TUESDAY, OCTOBER 31st.



Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At Municipal School of Technology. Address by Mr. J. F. C. Snell.

SATURDAY, NOVEMBER 4th.

Junior Institution of Engineers.

7 p.m. Reception by the President, Sir J. J. Thomson, F.R.S., and Lady Thomson.

The Electrical Exhibition at Olympia closed last Saturday.

Hosted by Google

"LEANDA" LAMPS

IN order to bring them into line with other leading makes the prices of "Leanda" (Metal Filament) Lamps have been reduced, the 200/260 Volt, 25, 32 and 50 Candle-power being now listed at 3/-. The discounts and rebates, which are exceptionally liberal, remain the same as before. The high quality is fully maintained, and they are universally recognised by those who are competent to judge as being the best. That this is so is proved by the ever-increasing sales.

Those who study their own interests will send for particulars at once to the

ELECTRICAL ENGINEERING & AGENCY CO., LTD.
Bank Buildings, 109/111, New Oxford Street, London, W.C.

THE MARYLEBONE SALES DEPARTMENT

AT the meeting of the Marylebone Council on Thursday, October 19th, the accounts of the electricity department for the year to March 31st, 1911, were adopted. These show a surplus of £12,088 15s. compared with £8,481 in the previous twelve months. The accounts were partly discussed last July, and only one or two speakers besides the Chairman of the Electricity Committee took part in the debate on Thursday. One of the chief points made was that a member of the Electricity Supply Committee has received electrical apparatus on loan, free of charge. Colonel Hopkins, Chairman of the Electric Supply Committee explained this to the Council. It appears that in order to be better able to push electric heating and cooking apparatus, the officials of the Electric Supply Department thought it would be well to obtain some independent tests. Consequently Dr. Bokenham, a member of the Electric Supply Committee, undertook to have some apparatus installed in his house and keep careful records, reporting the results to the Committee from time to time. Naturally, the apparatus was loaned free of charge, and although much had been made of the fact, the explanation was a very simple one.

Colonel Hopkins replied at some length to various criticisms upon the accounts, and complained bitterly of the methods adopted by a certain local paper and also a London morning paper in regard to the undertaking, charging them with publishing every accusation that could possibly be made against it, and giving none of the facts in its favour, nor even publishing any figures of the accounts. After having explained one or two other charges of alleged taking away of custom from local contractors, Colonel Hopkins complained of a statement made by Councillor Duncan Watson to the representative of the *Standard* that over 2,000 consumers were paying at the rate of 8d. a unit. In the Council, he said, Councillor Duncan Watson said that this was "over 6d.," which was rather different. The facts were that 2,000 consumers were paying over 6d., but of these only 573 paid 8d.; the average price paid by these 2,000 consumers was 6½d. per unit, and as they were very unprofitable consumers, using only a few units per quarter, he did not think they had much cause for complaint. Charges had been made, he continued, that the undertaking was not paying off its capital debts quickly enough. As a matter of fact, in spite of their £2,000,000 of goodwill which had to be paid off, they were repaying their loans at rates equal to any other municipal undertaking in London. So far as he could see, there was absolutely nothing to be said against the financial position, and he was disappointed that not one word had fallen from any member of the Council in praise of the good work which the officials of the Electric Supply Department had accomplished in the most adverse circumstances. The percentage of working expenses to total revenue was the lowest of any undertaking, either municipal or company, in London, and only one place in the country, viz., Stalybridge, had a higher number of units sold per head of population to Marylebone. The Marylebone figure was 87.

OBITUARY

JOHN CONACHER.

WE regret to announce the death of Mr. John Conacher, on Wednesday last week, at the age of 66. Whilst it is particularly in the railway world that Mr. Conacher was best known, yet he was a very familiar figure in London electric supply circles. He held the position of General Manager of the Metropolitan Electric Supply Co. for several years, during which time the company made great progress. He took a leading part in the opposition of the London electric supply companies to the bulk supply schemes promoted by Mr. C. H. Merz and the London County Council, and was responsible for getting through Parliament the Metropolitan Electric Supply Company's bulk supply Bill. This gave the company a large area in West Middlesex, which is now being developed. In 1907 he resigned his position with the Metropolitan Electric Supply Co., and proceeded to South Africa for the purpose of preparing a report upon the conditions and possibilities of the railways there. In 1909 he was elected Chairman of the Cambrian Railways, and was on the board of several other railway companies.

CORRESPONDENCE

WIRELESS TELEGRAPH PATENTS

To the Editor of Electrical Engineering.

Sir,—Some time ago we received a circular from Marconi's Wireless Telegraph Co., Ltd., which we believe has been widely distributed, sending us a summary of the action and of the Judgment delivered by Mr. Justice Parker in respect of their British Patent No. 7,777 of 1900.

The circular states :—

"We desire to draw your attention to the fact that the system protected by this said British patent is the only known system of wireless telegraphy capable of dealing with practical modern requirements, and every wireless telegraphic installation, if it have any practical value, is an infringement of the Marconi patent."

We beg to state that there is, as a matter of fact, a well-known system which has been proved in many installations all over the world to be capable of dealing with practical modern requirements, and which at the same time in no way infringes the Marconi patent (No. 7,777 of 1900), whether the said patent be valid or not.

The system we refer to is the "Singing Spark System," known on the Continent as the "Telefunken System," of which we hold the exclusive rights in this country.

Counsel's opinion has been taken on the question whether this system infringes patent No. 7,777 of 1900, and is as follows :—

Re The Telefunken Co. and Marconi's Patent No. 7,777/00.

OPINION.

"We have carefully considered the arrangements of the Telefunken System of Wireless Telegraphy, known as the "Singing Quenched Spark" System, in relation to Marconi's Patent No. 7,777/00. We are of opinion that the Telefunken arrangements do not in any way infringe the Marconi Patent. In giving this opinion we have paid special attention to the Judgment of Mr. Justice Parker in the recent case of Marconi *v.* the British Radio Telegraph Co. The reasoning upon which that Judgment was founded appears to support the opinion at which we arrive in this case."

Temple, 38/8/11.

W. R. Bousfield.
George H. Hume.

In view of this, we are prepared fully to indemnify our customers against any action for infringement in respect of wireless telegraph installations supplied by us.

Moreover, as already announced in the *Financial Times* of October 16th, we have decided to commence an action against the Marconi Company for infringement of certain Telefunken patents of which we are the assignees.

Yours faithfully,

Caxton House, Westminster, London, S.W., October 19, 1911.

Siemens Bros. & Co., Limited,
W. Wheeler,
Secretary.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ELECTRICAL SUPPLIES.—We have received from Drake & Gorham, Ltd., a copy of their new 1911–12 general catalogue, which is very comprehensive and at the same time most conveniently arranged in eleven sections, of which the first deals with incandescent lamps, including Osram, Philips, Mazda, Tantalum, and Onewatt lamps, as well as carbon lamps, radiator lamps, &c. In the next section the Butt, Excello, and several other arc lamps are listed, and following this we have cables and wires and a long section on switchboards, switchgear, and lighting accessories, including a considerable amount manufactured at Drake & Gorham's own works. The electric heating and cooking section is very complete, and embraces a full range of the Bastian quartz apparatus, as well as appliances on the Archer, Economic, Zoroaster, Royce, and Drakel systems. Succeeding sections are devoted to bells and telephones, auto-transformers, insulators, fans, vacuum cleaners, and fittings. The last-mentioned section occupies over 100 pages, and a very large selection of fittings are illustrated, including many specially designed for holophane glass ware; watertight and exterior fittings are also dealt with as well as shop window reflectors and illuminated signs. The new Holophane-Benjamin steel reflectors in a number of forms are also listed.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

CABLES AND SUPPLIES.—The Western Electric Co., Ltd. (North Woolwich, London, E.) have issued an illustrated handbook of over 400 pages, which will be found to be of the greatest utility by all mains engineers. The first part contains particulars of almost every type and size of electric light and power cable and wire, and also gives some useful data and illustrations concerning dry-core telephone and telegraph cable. The second part is equally valuable. Commencing with illustrations of junction and end boxes, it next gives instructions for laying and jointing, and also for overhead work. There is also a chapter on loading coils for telephone cables. The last part of the book gives the Institution of Electrical Engineers wiring rules in full, the Board of Trade regulations under the Electric Lighting Acts, the Board of Trade rules for low and medium pressure overhead wires, the Phœnix Fire Office wiring and lightning conductor rules, and the recommended special rules (issued by the Home Office Committee) for electrical installations in mines. Useful reference and conversion tables are also appended.

INSTRUMENTS.—The Globe Electric Co., Ltd. (11 Farringdon Avenue, London, E.C.) has issued a list of instruments including the "Globe-Nadir" universal testing set. A metal filament lamp testing apparatus, with which 2,400 filaments can be tested per day by one operator, is described. A patented spring clip is provided to take any thickness of filament without injury. Particulars are also given of galvanometers, pyrometers, moving coil ammeters, and voltmeters, and a combined set, with two moving systems, one of which can be used for both current and voltage measurements.

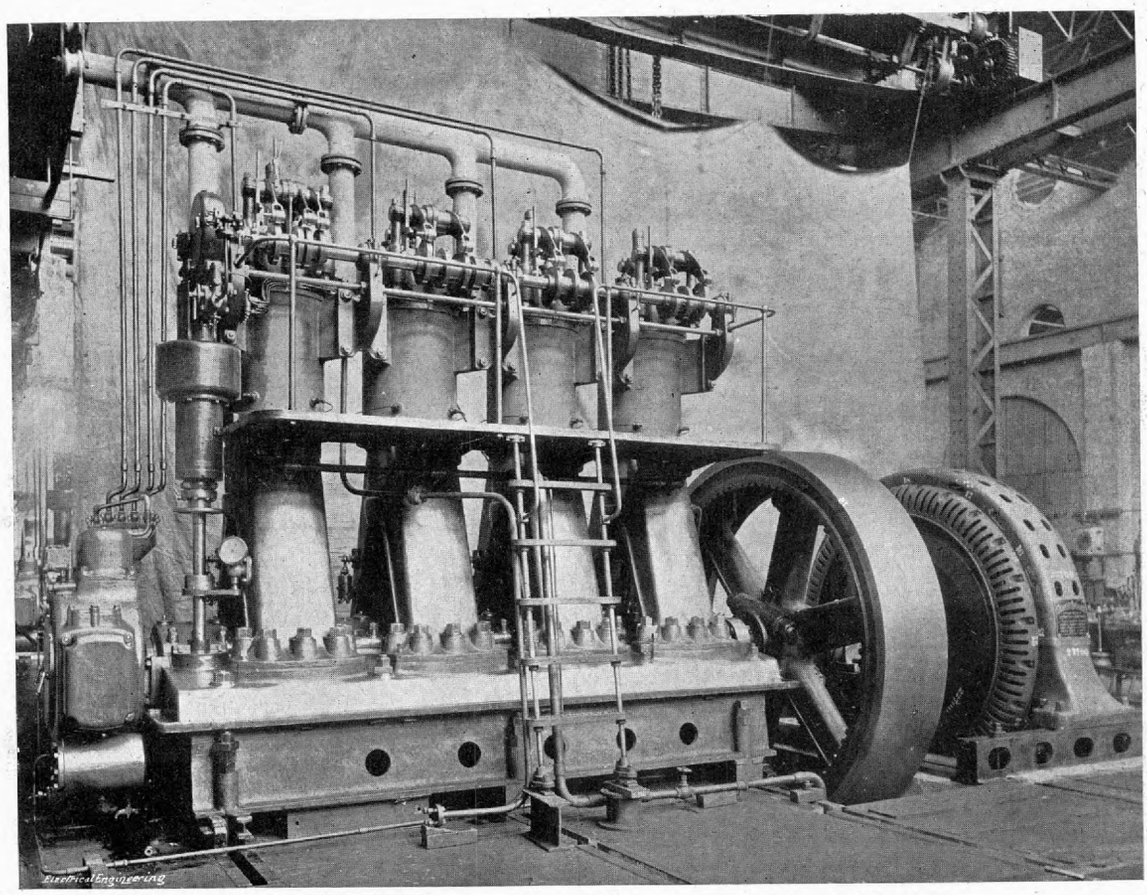
FITTINGS.—A neat little booklet of conveniently small size, from the Benjamin Electric, Ltd., deals with their well-known wireless clusters and other fittings for various kinds of lighting, giving useful explanatory notes as to their uses.

INSTALLATION MATERIALS.—An abridged price list from the A. E. G. Electric Co., Ltd. (133-135 Oxford Street, W.) deals in a very exhaustive manner with a complete equipment for electric light and power installations. As an introduction attention is given to the firm's turbo dynamos, pumps, and compressors, dynamos and motors of all types, D.C. or A.C., switchboards, transformers, and H.T. apparatus, machine tools, furnaces, welding machines, and electric drives for printing works, textile factories, paper mills, breweries, cement and brick works. The list is well arranged, the technical terms in the list are explained, and an index, which is very essential for this 126 page booklet, completes a most useful general catalogue.

MOTORS.—A stock list of D.-C. motors is to hand from the Electrical Co., Ltd. (122–124 Charing Cross Road, W.C.).

JOINTING MATERIALS.—A new list of jointing materials in the same standard form as their other lists has been issued by W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, London Wall, E.C.). This deals with numerous kinds of insulating and fire-resisting tapes, compounds, tools, &c. Among the tapes is the special unvulcanised Vulcan tape, which can be quickly vulcanised in place by a blow lamp. Another important item is a non-inflammable rubber solution, and attention should also be called to a safety spirit lamp, so constructed as to prevent the possibility of the flame reaching the spirit through the vent hole.

VACUUM CLEANERS.—The Electrical Co., Ltd., send us a card illustrating in an effective way a simple form of electrically-driven small vacuum cleaner, in which the motor centrifugal pump and dust chamber are in a light case, which stands on the ground while the usual flexible hose is used.



TELEGRAPH APPARATUS.—We have received a fine new catalogue of Morse telegraph apparatus from Siemens Brothers & Co., Ltd. (Caxton House, Westminster), which is remarkably complete, and is copiously illustrated from photographs of the actual instruments made at the Woolwich works. Both Post Office and Siemens standard apparatus is included. The scheme on which the catalogue has been arranged is that the component parts of which telegraph station sets are made up are listed at the commencement, beginning with inkers, and continuing with keys, sounders, galvanoscopes, relays, &c., to switches. After that we come to station sets. The first section deals with single current, which in turn is divided into simplex and duplex; the next with double current, which is also divided into simplex and duplex, and then follows the quadruplex system. The catalogue concludes with a few pages of accessories, diagrams of connections of station sets, and a comprehensive code and index. A pamphlet of instructions for using Morse station sets accompanies the list.

Electric Driving of Cotton Mills.—The first meeting of the Joint Committee of the Textile Institute and the Manchester Section of the Institution of Electrical Engineers, which was appointed in August to conduct an investigation into the electric driving of textile mills (Electrical Engineering, August 3rd, 1911) was held at the Textile Institute, Manchester, on Friday. In the report prepared by a sub-committee, it was recommended that the committee should appoint a secretary and two honorary secretaries, one of each of the latter representing the two institutions. This report was adopted, and it is understood that the first step in the investigation will be the collection of statistical information regarding the various kinds of motor power used in the United Kingdom, United States, Canada, and most of the continental countries. After this has been completed, the further course of action on the part of the committee will be decided. A special sub-committee has been formed to conduct investigations outside the United Kingdom.

A LARGE WILLANS-DIESEL ENGINE

THROUGH the courtesy of Messrs. Willans & Robinson, Ltd. (Victoria Works, Rugby), we were enabled to inspect at their works last Monday a fine example of one of their large Diesel engines running on full load prior to delivery. The engine in question is one of two which have been built to the order of the Alianza Co., Ltd., of London, for lighting and power purposes at their nitrate works at Bellavista in the Argentine Republic, to the specifications of Messrs. Strain & Robertson, consulting engineers, Glasgow. The engines are each coupled directly to an alternator manufactured by Siemens Brothers' Dynamo Works, Ltd., to the order of the same company under a separate contract. A view of one of the sets is given in the illustration.

WILLANS-DIESEL ENGINE WITH SIEMENS ALTERNATOR FOR SOUTH AMERICA.

The engine is of the four-cylinder vertical semi-enclosed four-cycle standard Diesel type, with cylinders 15 in. bore by 22 in. stroke. The standard normal output of this size of engine is 335 b.h.p. when running at 220 r.p.m. with an overload capacity of 10 per cent. for two hours, but conditions of alternator frequency in this particular case imposed a speed of 187 r.p.m., at which speed the engines are arranged to develop 280 b.h.p. continuously or 325 b.h.p. for two hours at sea-level. They will, however, be installed at an altitude of about 3,200 ft., where they will be called upon to give 200 b.h.p. continuously and 230 b.h.p. as an overload for two hours.

The Siemens alternators to which they are coupled are of the rotating field type rated at 175 k.v.a., or 140 kw. (460 amperes) at 220 volts, three-phase, 50 cycles, with a 25 per cent. overload capacity. Each has its own direct-coupled eight-pole exciter, giving 35·5 amperes at 110 volts. The two sets are designed to run in parallel, and a 10-ton flywheel has been provided, in addition to the very large flywheel effect already contained in the rotor. The speed variation is guaranteed within one part in 250. Official tests have been made of the sets, including twenty-four-hour runs at full load, followed by two hours at 15 per cent. overload and one hour at three-quarter-, half-, and quarter-loads (at sea-level); governing and paralleling tests were also carried out to the satisfaction of the consulting engineers.

The guaranteed fuel consumptions, subject to a margin of 5 per cent. for the newness of the engines, are given below, in lbs. per b.h.p.-hour.

Full load	0·44	¼ load	0·72
¾ load	0·46	15 % overload ...	0·52
½ load	0·52		

An idea of the size of the sets may be given by the following figures:—

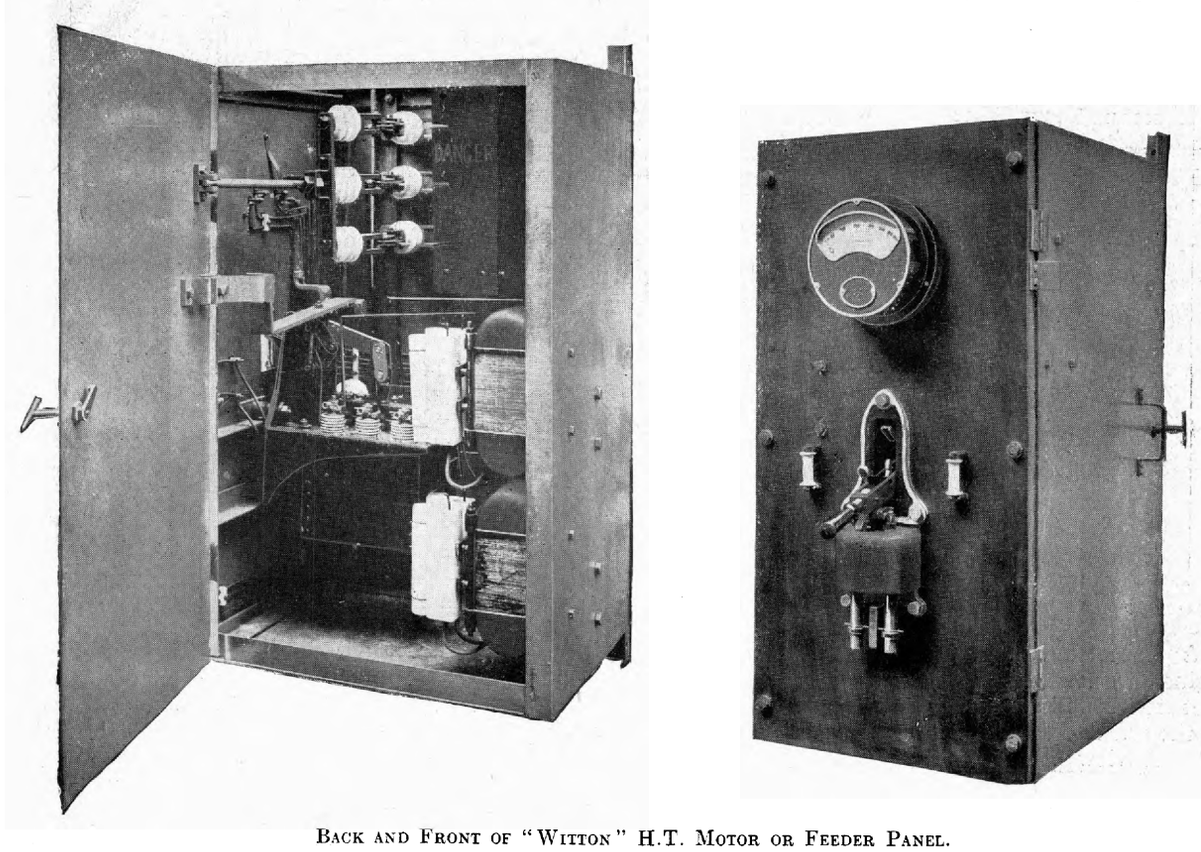
Total overall length	28 ft. 9 in.
Total overall width	11 ft. 6 in.
Total approximate height	11 ft. 0 in.
Approximate net weight	57 tons.

The two sets are identical with a further pair recently shipped to South America under separate orders from the Rosario Nitrate Co. for their works in Peru, also to the specifications of Messrs. Strain & Robertson.

The engines conform in practically all particulars with what is now regarded as standard two-stroke moderate-speed Diesel practice, and form one of a range of sizes standardised by Messrs. Willans & Robinson from 50 to 640 h.p., with from one to four cylinders. The design throughout is simple and straightforward, particularly as regards the valve gear. As seen in the illustration, an overhead cam-shaft is used with one simple rocking lever to each valve. The cams themselves are of cast-iron with a chilled surface, upon which bears a case-hardened roller, ensuring exceptionally good wearing quality. The air inlet and the exhaust valves are of the ordinary mushroom pattern in the cylinder heads, but

Hosted by Google

the most distinctive feature of the Diesel engine is the fuel admission valve. The oil, as is well known, is supplied by a pump in the correct quantity to each cylinder, and is actually driven into the cylinder by an air blast controlled by a needle valve, which carries the oil through a "pulveriser" consisting of a series of perforated plates with their holes staggered, and finally injects it into the compression space of the cylinder in a fine mist from the specially shaped "flame plate." Owing to the high compression, complete combustion ensues as the oil enters, without the necessity for any ignition apparatus whatever, giving a steady initial pressure rather than a sudden explosion. In these engines a single fuel pump is used with a distributing valve to the various cylinders, and the governing is effected entirely by regulating the time of opening of the fuel pump inlet valve, thus grading the amount of fuel delivered in proportion to the load. The actual fuel injection or air blast valve does not vary in its time of opening, but simply blows into the cylinder the amount of oil supplied to it. The exact point in the stroke at which the fuel valve opens is of some importance, and this can be set to a nicety by the tip of the cam being made as a separate piece, whose position can be adjusted relatively to the rest of the cam. Starting gear is fitted to one cylinder only, and a simple method of mounting the cam lever spindles eccentrically permits of the starting or running valves being put into action alternatively. In none of the sizes are water-cooled valves used: in the very largest, however, two air inlets and two exhaust valves are employed. A three-crank engine of this pattern, giving 450 h.p., was on the test bed at the time of our visit.



The compressed air required for fuel injection and starting is supplied from three reservoirs or "bottles," one smaller one normally for the injection, one larger one for starting, and a third large one as a spare. These are kept constantly charged at a pressure above 60 atmospheres by a Reavell water-cooled compressor direct-coupled to the engine. Lubrication of the main bearings, which are of ample length between each crank, is effected by rings; the crank pins are lubricated by gravity feed, while the pistons are supplied by positive timed forced feed.

A stroll round the works revealed a number of interesting details as to the manufacturing methods which enable such fine work as that invariably associated with the name of Willans & Robinson to be put into these engines, parts of a very large number of which were going through. Particularly interesting were the details of the pulveriser through which the fuel is sprayed into the cylinder, the special machine for grinding in valves, and the method of making piston rings of an even thickness to give constant pressure all round. Considerable numbers of steam turbines were also in progress, and it was interesting to see that all these are now provided with impulse high pressure and reaction low pressure stages. The foundry, too, was one of the busiest parts of the works, not only with large engine turbine, pump and condenser parts, but also with complicated cylinder castings for automobile engines, which Willans & Robinson supply to a large number of motor-car builders, with most ingenious devices for arranging and ventilating the cores.

H.T. MOTOR OR FEEDER PANELS

THE accompanying illustrations show a pattern of H.T. panel which has been developed by the General Electric Co. for controlling three-phase high-tension motors or feeders, and is made at their Witton works. It takes the form of an iron cubicle suitable for fixing to the wall, and fitted with three single-pole isolating links, one three-pole automatic switch, the necessary current and potential transformers for operating the trip coils or oil-switch, &c., and an ammeter or wattmeter on the front of the cubicle above the oil-switch operating handle.

The special feature about this cubicle is the arrangement of interlocking the various pieces of apparatus with the door designed to render it absolutely fool-proof. The isolating links are interlocked with the doors of the cubicle in such a way that the action of opening the door also opens the links, and the door is further interlocked with the oil-switch so that it cannot be opened until the switch is in the "off" position. Also, the oil-switch cannot be closed until the door of the cubicle is closed. It will thus be seen that it is impossible to either make or break the circuit by means of the isolating links. Careful attention has also been paid to efficiently isolating the line sides of the isolating links by means of insulating barriers, so that it is impossible to touch any live parts when the door of the cubicle is open, consequently adjusting and cleaning of the various apparatus can be done in absolute safety.

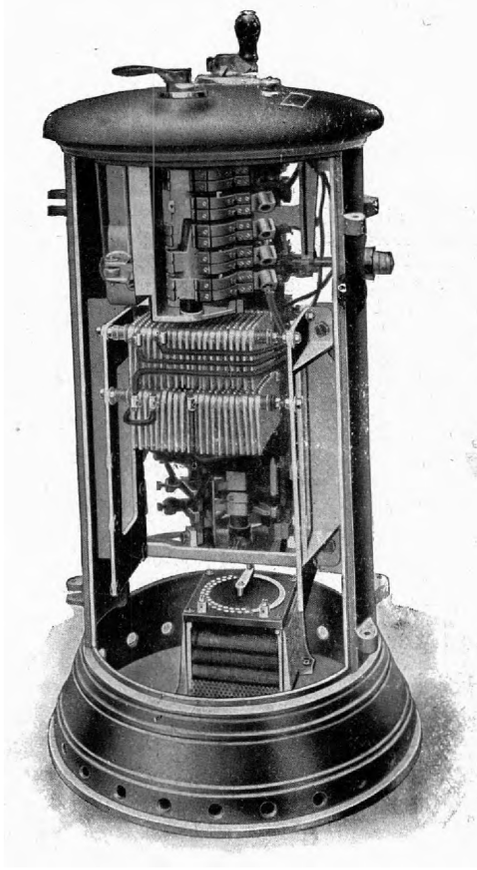
BACK AND FRONT OF "WITTON" H.T. MOTOR OR FEEDER PANEL.

The Northampton Institute.—The new scheme for the management of the Northampton Polytechnic Institute, rendered necessary by the dissolution of the City Polytechnic in 1907, has now been sealed by the Charity Commissioners. Under their new powers, the governors have offered the appointment of President to H.R.H. the Duke of Connaught, who has accepted the office.

Hosted by Google

THE ELECTRICAL EXHIBITION OF 1911

(Sixth Notice.)

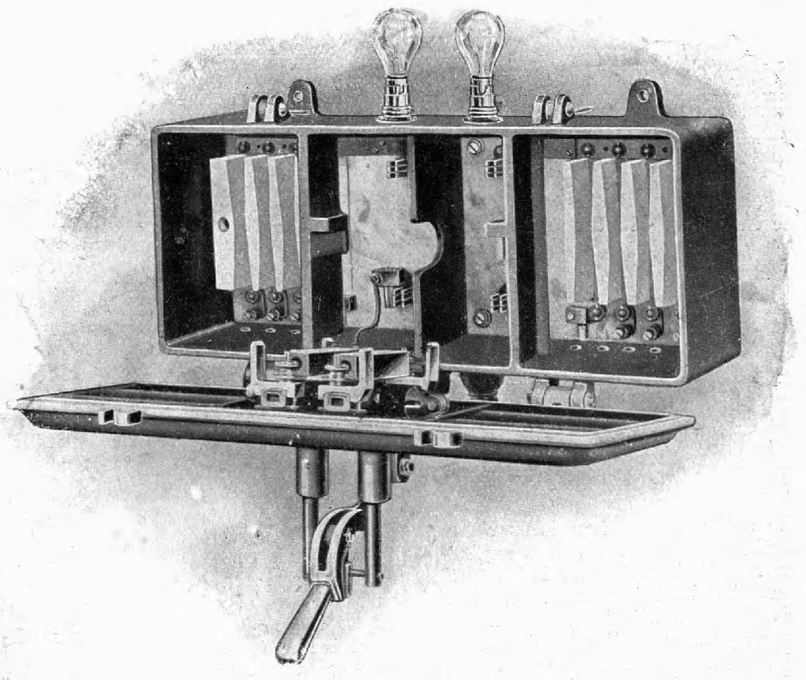


THE Electrical Exhibition at Olympia closed on Saturday last, after being open for four weeks. We conclude our notice of some of the more interesting exhibits.

Electric & Ordnance Accessories Co., Ltd. (Vickers, Ltd.),

Aston, Birmingham.

This firm showed a new line of A.-C. induction motors, ranging from ¼ to 15 h.p. The rotors of the sizes from 5 h.p. upwards have slip-rings. In these one end of the three-phase winding of the rotor is earthed to the frame, so that only two leads need be brought through the spindle, and the whole motor is at earth potential when it is short-circuited on reaching running speed. The motors have a solid belt-tightening bedplate, and show evidence of good design and workmanship.



Another interesting exhibit on this stand was a control pillar for shunt-wound workshop motors. It is a new design intended as a substitute for the ordinary motor control panel. We illustrate the pillar open, to show the starting resistance, reversing barrel, reversing handle, and regulator. In addition to the starting handle at the top, there is a knob which has to be kept pressed down while switching on, and if this knob is released before the handle reaches the running position, the circuit-breaker opens. A magnetic blow-out coil is provided, and as this covers every step of the starting switch, spark wear should be reduced to a minimum, and there are shields between every set of fingers. The starting resistance is in the lower part of the pillar, so that the whole gear is self-contained. The circuit-breaker (which breaks on both poles) is so interlocked with the main barrel that, when it is open, the handle has to be brought to the off position before the motor can be re-started. In addition, an emergency stop push-button enables the motor to be stopped at any position of the starting handle; as well as releasing the no-voltage coil, it also operates the circuit-breaker mechanically in the event of the latter sticking, due to the contacts being slightly welded or the spring being broken, so that the stopping is absolutely instantaneous. A reversing switch was also fitted in the pillar shown at the exhibition and illustrated here; it is worked by a separate lever interlocked with the starting barrel and preventing the connections being reversed unless the starting handle is on "off." On opening the door of the pillar, a catch operates the emergency stop, and everything is made dead except the two main fingers.

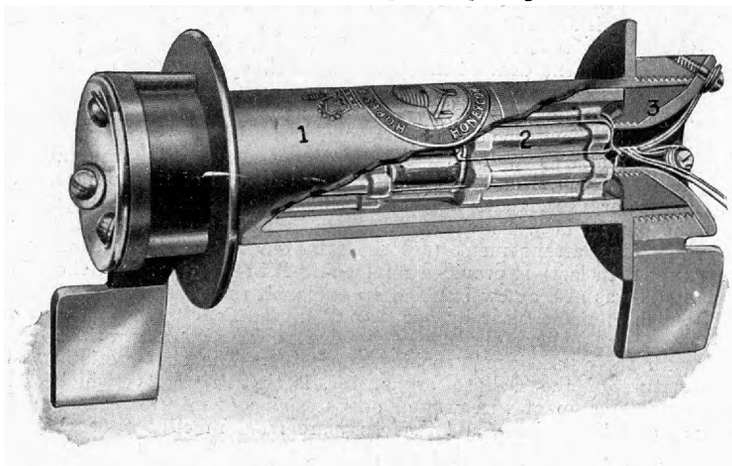
Control Pillar Open.

Another new type of switch shown was a knife pattern with quick make as well as quick break. On switching on, a helical spring is extended, which takes control of the contact bar after the handle has passed a certain point, and brings the bar in between the fixed contacts with a snap, and an ingenious arrangement (described in our Patent Record on July 27th last) is provided for locking it in position. On the stand was also a new ironclad crane panel, the construction of which is made clear by our second illustration.

On the gallery the company gave cooking demonstrations with their "Eclipse" cooking apparatus. The characteristic feature of the Eclipse ovens, &c., is that the coils (which are made up of wire wound on flat strips of mica) are used at a dull red heat, and that they are fixed in clips on each side of the oven and exposed so that replacements are extremely easy and can be carried out by the consumer himself. In front of the heating elements are cast-iron protecting guards, or "gates," on hinges, which can be swung out for cleaning and for examining the elements. These guards also serve for carrying the shelves. In the case of hot-plates, &c., where the coils are not exposed, they are protected by mica and tin-plate. A practical form of kitchen switch-panel with indicating lamps to show which apparatus were switched on was also exhibited.

Ironclad Crane Panel.

Parmiter, Hope & Sugden,

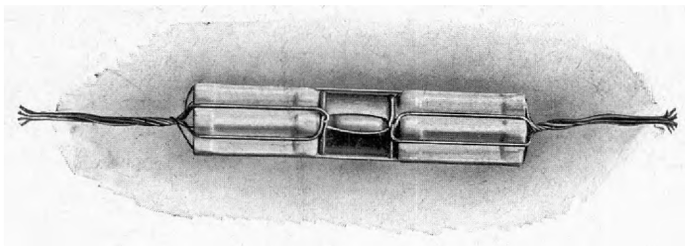


Hulme, Manchester.

The exhibit which attracted most attention at this stand was Hope's "Bi-metal" fuse wire, demonstrations of which were being constantly given. It consists of a copper wire covered with a thick layer of tin alloy. The latter melts off first before the fuse blows, so that there is no spluttering of tin, and, while not being liable to oxidisation and ageing, the fuse blows as cleanly as ordinary copper fuses. In addition, the construction enables it to carry even 90 per cent. of its fusing current practically indefinitely, and it will stand momentary overloads without blowing.

The same firm showed their new "honeycomb" fuse, designed to withstand heavy short-circuits. Our illustrations show the construction. The outer body consists of a red fibre tube, 1, lined with a fire-resisting compound. The

Hosted by Google



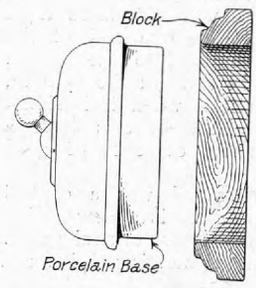
ends of the fibre are screwed to receive contact ends, and the end caps or baffle plates, 3, are of gun-metal lined with hard fibre. Inside is a cylindrical china body, on the outer surface of which there are a number of cells, 2, in which the fuse wires are placed, whilst through the centre of this body there is a hole with a tapered opening at either end.

The "Honeycomb" Fuse.

This central chamber serves as an expansion chamber. Round the centre portion of the outer surface of the honeycomb cylinder a tin "time element band" is fixed, which is connected to the terminals by copper strands. In addition a number of small copper strands, varying in number from three to six, according to the size of the fuse, run right through from terminal to terminal.

A "honeycomb" carrier is shown below, wired ready to place in position in the outer casing.

The action of the fuse is as follows: Running on a small load the copper "through strands" carry the bulk of the current as their resistance is lower than that of the tin band, but as the load increases, the temperature of the copper "through strands" rises, and the resistance of these strands becomes greater until a portion of the current is shunted and carried by the central tin band. When the load exceeds the maximum continuous rating of the fuse, the temperature rises until the latter is melted. All the load is then thrown on the copper "through strands," which immediately fuse. It will be seen, therefore, that on ordinary overload conditions the break takes place on the copper through strands only, and consequently a comparatively small mass of metal only is volatilised. On a heavy short circuit, however, the "fusible tin band" is as a rule left unfused, the connecting copper strands fusing instead. Mr. S. L. Pearce, City Electrical Engineer, Manchester, has tested a 700-ampere fuse by shorting it across the 440-volt terminals of the huge Dickinson Street battery, and it broke circuit satisfactorily without splashing or even damaging the fuse terminals.



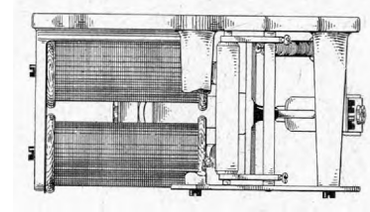
O. C. Hawkes, Ltd.,

69 & 70 Aldersgate Street, E.C.

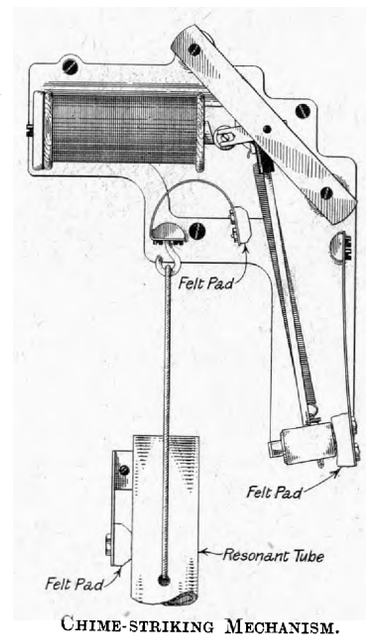
The point which this firm are emphasising is the construction both of their electric stoves and electric cookers, so that the heating elements can easily be replaced. They are encouraging contractors to keep stocks of the apparatus without coils and a separate and larger stock of coils, so that they can make up a heater for any desired pressure at practically a moment's notice. The coils of the sitting-room stoves are mostly wound on fireclay bobbins, but the heating elements for the ovens, wound on strips of mica and glowing at a red heat, are also employed in some types of radiators and convectors. Among other exhibits was a very cheap and light type of kitchen oven with heating elements on the top and bottom only; the top elements serve as well to heat a hot-plate, which can also be employed for a grill. The firm's combined stove and cooker—used as the latter in combination with a "Dutch oven"—was described in our columns some time ago (October 13th, 1910), and this was also exhibited. Several specimens of signs were exhibited, among which the most effective had incised gilt letters with a narrow slit at the back enabling it to be employed with lamps behind for illuminating at night.

J. H. Tucker & Co.,

King's Road, Hay Mills, Birmingham.



Semi-recessed Switch. Half Size.



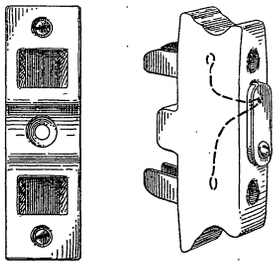
The semi-recessed switch, which we illustrate, is not quite new, but may not be known to all our readers. It is a compromise between a flush switch and an ordinary one, as it can be employed with ordinary concealed wiring without the additional cutting away necessitated by the flush switch. As seen, the projection is very slight. The firm also exhibited switches of heavier type, some well-designed distribution boards, and interest was evinced in a show-board on which were the 38 parts of an ordinary tumbler switch unassembled. Few people realise the enormous number of parts involved in the making of a switch which sells for a few pence.

Gent & Co., Ltd.,

Faraday Works, Leicester.

One of the neatest things on this stand was a set of chimes for connection to an electric clock system. The "chime transmitter" movement is actuated by impulses from a master clock in the ordinary way, and a cam is raised to a different height during every quarter-hour and

Chime-striking Mechanism.

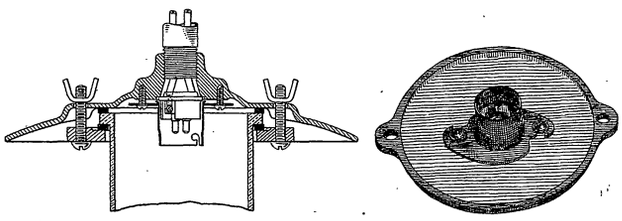


then released. In returning to its normal position, it makes a series of contacts which actuate the electromagnetic striking gear above each of the resonant tubes forming the chime. We illustrate the striking gear. The armature roller is attracted along the face of the magnet, and the hammer attached to it strikes the tube. As is seen, means are taken to make the action quite silent, and the tone is beautifully clear and is free from extraneous noises.

Hosted by Google

Dorman and Smith,

Ordsall Electrical Works, Salford, Manchester.



This firm had only a small exhibit, on the same stand as the Phœnix Dynamo and Motor Co. A large photograph of the main switchgear on board the *Olympic* and *Titanic* excited much interest. We illustrate a new fuse just brought out by

Fuse to Comply with Home Office Requirements. (*Half-size.*)

the firm to meet Home Office requirements. It is seen that the contacts are thoroughly protected, and that, instead of the fuse-holder being simply tubular, the wire makes a detour (indicated by a dotted line in the drawing) through the thickness of the handle. By loosening the screw at the top of the holder and turning back the asbestos-lined brass flap, the bend in the fuse wire can be examined to see if the wire has blown, without removing the fuse-carrier.

Another useful fitting is the cast-iron mill fitting shown in the second illustration. A special type of lamp-holder is

Mill Fitting Designed for Easy Wiring.

employed, and the method of fixing indicated enables the usual lamp-holder nipple to be dispensed with, so that the wires have a wide and straight run through into the lamp-holder insulator.

Globe Electric Co., Ltd., and **The Armorduct Manufacturing Co., Ltd.** (6 & 11 Farringdon Avenue, London, E.C.).—The Globe Electric exhibited a new electromagnetic hammer, just placed on the market. The power is furnished by a series motor, and is transmitted through spur gearing to a connecting rod, which links the motor to a moving sleeve. A solenoid, with a uni-directional current, surrounds the sleeve and plunger, which is a piece of hardened tool steel, and supplies a magnetic connection between them. This produces a cushioning effect, as the magnet does not move with the plunger, but simply acts as a flexible clutch to prevent the blow having any ill effects on the mechanism. The tool is operated by a switch in the handle, so that the pressure of the operator's hand on the tool also closes the circuit. The machine is equally suitable for drilling, caulking, or chipping. It weighs 25 lbs., is 13 in. long, and has a 1½-in. stroke, which can drill a 1-in. hole to a depth of 3½ in. in hard stone in one minute. The current required is 1 ampere at 220 volts. The firm also exhibited the "Glob-o-Lite" glass bead signs, arc lamps, both for ordinary and photographic work, and some measuring instruments. The Armorduct Company exhibited wires and cables, conduit fittings, and other accessories, metal filament lamps, heating and cooking appliances, fans, electrically operated tools, and the "Magic" suction feeder, described under a separate heading.

Magic Appliances, Ltd. (6 Farringdon Avenue, London, E.C.).—At this stand demonstrations were given with a self-contained electric suction cleaner mounted on rubber-tyred wheels fitted with ball-bearings. In addition to being wheeled about bodily for carpet cleaning, the apparatus can be used stationary with a flexible vacuum hose, with which the usual accessories are supplied. A hose can also be attached to the outlet for blowing. The suction is obtained from a motor-driven disc-turbine fan, and the dust is received in a bag. The case is made of aluminium, and the whole weighs about 9½ lbs.

The National Machine Recorder Co. (Marquette Building, Chicago, U.S.A.).—An example of the advanced ideas prevalent in America in connection with factory organisation was shown in the shape of a recorder to be placed in a works office, and connected electrically to every machine, so as to produce a record of the time each machine has been working. A chart is mounted on a drum, which revolves by clock-work, and is large enough to take the records of fifty markers. Each of these has an "on" and "off" position controlled by electromagnets, which are connected by wire to a switch on the machine. As soon as a machine is started a switch is closed, but the recorder is not in circuit until the machine is actually working, when the action of the material passing through the machine closes another switch. For all wire-working and screw machines a wire is run through this switch, and in the case of lathes, planers, milling machines, &c., the cutting tool actuates the switch. When this is closed the corresponding magnet deflects the pencils to the production position on the chart. It is held in this position until the material stops passing through the machine, when the switch is opened, and the pencils fall back to the idle position. This idle time is automatically added up by means of an attachment, which has a separate wheel for each machine. For variable-speed machines time switches are provided worked by the recorder clock. They show whether the operator is working his machines at the maximum efficiency, because all time taken in excess of the limit allowed for a job is recorded on the chart.

The Morgan Crucible Co., Ltd. (Battersea Works, London, S.W.).—The well-known "Morganite" brush was well represented at this stand, as well as the high-grade "Battersea" carbon brush, suitable for use under the severest conditions. A feature of this brush is the method of fixing the flexible: a hole about ½ in. deep is drilled in the brush, and the end of the flexible, which is splayed out, is inserted, and held in position by compressed pure metallic powder, thus ensuring good contact. The firm is also making Morganite gland rings for steam turbines, specially suitable for withstanding heat and moisture without disintegrating. A new departure of the firm is a tilting furnace, a model of which was shown. The Brazil patent carbon powder resistance for use with lightning arresters was another exhibit (see Electrical Engineering, Vol. V., page 1039, December 9th, 1908).

J. Hopkinson & Co., Ltd. (Huddersfield).—A fine display was given of this firm's well-known valves for all purposes including the Hopkinson-Ferranti steam stop valve. A full set of boiler mountings is also shown on a model Lancashire boiler front.

C. W. Goodchild & Partner (30–32 Farringdon Road, E.C.).—Machine tools manufactured by Ludwig Loewe & Co., for whom this firm are agents, were shown, as well as small tools, gauges, &c., and examples of D.W.F. ball-bearings. Attention should be directed particularly to an automatic pin and stud machine shown at work.

Chicago Rawhide Co., Ltd. (Hythe Road, Willesden, N.W.).—Examples were shown at this stand in the gallery of Chicago rawhide belting, which is prepared by a special process, retaining the pliable nature of the hide as well as its softness. Belt laces, packing, rawhide pinions and blanks, and other leather articles are also shown.

Reunion of Cromptonians.—One hundred past and present Cromptonians dined together at the Trocadero Restaurant on Saturday, October 14th last, under the chairmanship of Col. R. E. B. Crompton. Mr. W. A. Chamen acted as vice-chairman, and Col. Crompton was supported among others by Mr. James Swinburne, a former works manager at the arc works, and by Mr. A. P. Lundberg, Col. Crompton's original assistant at the works. Mr. Chamen, in proposing the toast of "Cromptonians," pointed out that there were no less than 25 Old Crompton men occupying at the present time the position of chief engineer to electric lighting and power undertakings, and, further, that names of men such as James Swinburne, Gisbert Kapp, A. P. Lundberg, Sam Mavor, J. F. C. Snell, J. W. Kempster, A. Bergtheil, and others, bore record of the importance which the old firm had played in the building up of the electric industry. Col. Crompton, in reply, expressed his pleasure in seeing around him so many of those who were associated with him in his earlier days. The dinner was organised by a committee consisting of Messrs. W. A. Chamen, S. Dobson, E. J. Fox, H. Leaf, C. Peel, A. H. Pott, and W. L. Pakenham. Many still associated with the company were present, among others Lt.-Col. Clibborn and Mr. B. Gibson, directors, and Messrs. E. Reeves and A. H. Hodgson, joint managers.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 19, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

23,332/10. **Incandescent Lamps.** The "Z" Electric Lamp Manufacturing Co., Ltd., and F. Hoge. A method of mounting that part of the central rod of a lamp to which the filament supporting wires are attached is covered by this patent. A glass bead is slipped over the central stem near the bottom, and in it the supporting wires are embedded. The leading-in wires are connected, by twisting and welding, one to each of two of the supporting wires. These are double, the other part being attached to the filament, so that the bead, which is loose, is held in position on the stem, and the leading-in wires form a resilient support for it. The manufacture of the bead is also protected by this patent. Four figures.

28,138/10. **Lamp Shade and Locking Device.** W. G. Polack. A combined arrangement, in which both the lamp and its shade are fixed, consists in resting the shade on the shoulder at the neck of the lamp, and fixing it there by means of a metal collar, over which a ring is screwed down, causing the collar to press on the top of the shade. The collar and ring may be combined. Three figures.

28,226/10. **Production of Iron.** S. O. Cowper-Coles. This is an electrolytic process, in which the cathodes consist of thin sheets of electrolytic iron, and the anodes of bars of pig iron of any kind. The electrolyte can be sulphuric or hydrochloric acids, or a mixture of both, or a ferrous ammonium sulphate. Any thickness of iron may be deposited on the cathode, which can be removed from the cell and the iron taken off. It can then be further treated, such as converting it into steel. To prevent the anodes becoming coated with carbon, graphite or other impurities, brushes are mounted on a spindle, and attached to the cathode. These revolve and keep the anode surfaces free. Two figures.

1,951/11. **Portable Transformer.** Dr. P. Ranschburg and D. Perlusz. An apparatus adapted to be used from a lamp socket on any ordinary lighting circuit, for supplying current for medical purposes. The main current passes through a fixed resistance, such as a glow lamp, and an adjustable resistance, which are in series, and a low-tension current can be taken from terminals provided. In parallel with the regulating resistance, the primary and interrupter of an induction apparatus are connected, the secondary being taken to another pair of terminals at which a corresponding faradised current is available. The induction apparatus can be cut out by means of a switch in the primary circuit, and the core is also adjustable. Instead of the lamp, a fixed resistance can be used, in the form of platinum wire embedded in porcelain and interrupted at one point, where two contacts are provided. This resistance is such, that if a loop of a cauterising surgical instrument be placed between the contacts, it will be brought to incandescence by the current flowing. Five figures.

8,996/11. **Electric Furnace.** G. Lüdecke and The Imperial Lamp Works (Brimsdown), Ltd. This relates to an apparatus for decarbonising and sintering raw metallic filaments. The inner well of a carbon cylinder or other refractory metal, whose conductivity is lower than tungsten, is coated with a deposit formed by evaporating the chlorides or oxy-chlorides of tungsten and molybdenum within the cylinder. In a preferred form the cylinder is evacuated and brought to incandescence and tungsten hexa-chloride is evaporated within, the high temperature causing a uniform and dense coating of tungsten to form on the interior. An inner cylinder of tungsten and an outer of carbon may be produced, the latter forming a part of the resistance. The cylinder is held between cast-iron rings, which are connected to conductor terminals. One figure.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Arc Lamps: Blondel, 27,989/10.

Distributing Systems: Strasser [Distribution system, equalising arrangements] 168/11.

Dynamos, Motors, and Transformers: Holbech [Dynamos] 15,587/10; Girardelli [Motors for transmitting angular movements] 22,714/10; Parker-Haigh [Single-phase motors] 26,984/10; Beeton and Morgan Crucible Co. [Carbon brushes] 27,162/10; Leitner [Dynamo connection] 709/11; Brown, Boveri et Cie. [Compounding dynamos] 4,256/11.

Electrometallurgy and Electrochemistry: Cowper-Coles [Electro-deposition of iron] 28,592/10; Reid [Furnaces] 1,609/11.

Heating: Schneider [Thermostats] 11,548/11.

Incandescent Lamps: W. C. Heraeus Ges. and Trenzen [Metal filaments] 1,544/11.

Switchgear, Fuses, and Fittings: Royce [Connectors] 23,445/10; Romeu [Automatic multi-fuse cut-out] 28,840/10, Hirst and Chapman [Cut-outs] 1914/11; Pintsch's Patent Lighting Co. and Vidal [Switches] 9,005/11.

Telephony, Telegraphy, and Signalling: Urban [Transcribing telegraphic characters] 22,697/10; Fleming [Wireless telegraphy transmitting apparatus] 23,242/10; Automatic Electric Block Signalling Co. and Brousson [Automatic signalling] 1,048/11; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Semi and automatic exchange calling circuits] 14,144/11.

Miscellaneous: Henri, Helbronner and Von Reckling-hausen [Sterilising liquids] 23,077/10 and 4,895/11; Brush Electrical Engineering Co. and Salisbury [Vapour electrical apparatus] 28,991/10; Davy Bros., Ltd., and Holmes [Overload relief apparatus for cranes] 30,215/10; H. Aron Elektricitäts Zahlerfabrik Ges. [Operation of electric clock installations] 7,862/11; Giles [Indicating an earth on a line] 9,745/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Miscellaneous: Veifa-Werke Vereinigte Elektrotechnische Institute Frankfurt-Aschaffenburg Ges. and Dessauer [Regulating device for induction coils] 21,333/11.

Opposition to Grant of Patent

1,028/11. **Ignition Plugs.** T. G. Smith and F. J. Platt. Opposition has been entered to the grant of this patent, in which the fixed terminal is made in the form of a hollow tube, provided with a glass window for inspection purposes. It was abstracted in Electrical Engineering, August 31st, p. 490.

Expiring and Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: J. W. Nasmith (*T. L. Carbone*) [For 3-phase current] 15,107/06.

Distributing Systems, and Insulating Materials: P. F. Corkhill [Distribution] 13,964A/05; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Insulation for laminations, &c.] 15,171/07; J. S. Peck [A-C. distribution] 15,335/07.

Dynamos, Motors and Transformers: M. Latour [Self-exciting A-C. dynamos] 13,402/01; W. E. Burnand [A-C. machines] 14,770/03; L. R. Auvert and A. F. E. Ferrand [Converter] 13,585/06; V. A. Fynn [A-C. machines] 15,151/07; G. C. Dymond (*E. Eisemann & Co.*) [Armatures of magneto machines] 15,594/07.

Electric Ignition: M. Kemp-Welch, Olantye and P. Lyle, 15,412/06.

Heating and Cooking: W. S. Adlard [Electric heater] 15,079/07.

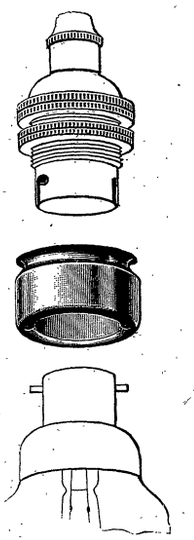
Instruments and Meters: British Thomson-Houston Co. and F. Holden [Instrument for magnetic measurements] 15,113/02; W. Hamilton and Ferranti, Ltd. [Induction motor meter] 13,696/05.

Switchgear: R. Amberton and E. Schattner [Controller regulator] 15,366/07; J. N. Maskelyne [Lamp switch operated by door] 15,522/07.

Telephony and Telegraphy: Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Telephone systems] 13,586/05; W. K. L. Dickson [Combined telegraph and telephone system] 15,169/07; L. H. Walter [Electro-magnetic wave detector] 15,412/07; P. M. Justice (*Sub-Target Gun Co.*) [Ships' telegraphs] 15,532/07.

Traction: Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Railway points and signals] 13,980/99.

Miscellaneous: Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges*) [Condensers] 13,682/05; A. C. Stray [Clocks] 15,100/07 and 15,100A/07.



Hosted by Google

DYNAMO AND MOTOR BREAKDOWNS

THE annual report of Mr. Michael Longridge, Chief Engineer to the British Engine, Boiler, and Electrical Insurance Co., contains, in addition to a quantity of information regarding accidents to steam and gas plant, &c., some interesting particulars relating to dynamo and motor breakdowns. In some statistical tables it is shown that 85·5 per cent. of the breakdowns with which the company was concerned were those to D.-C. machines, the remaining 14·5 per cent. being alternating. In the case of dynamos 43 per cent., and in the case of motors 33 per cent., of the cases were due to armature or rotor breakdowns, and 25 and 26 per cent. respectively originated in commutators or slip-rings. 24 per cent. of the total number are ascribed directly to dirt and neglect. Some typical examples are described in detail. Among these are failures due to excessive wear of white-metal bearings causing contact between rotor and stator, and in this connection the company record satisfactory experience with ball bearings as avoiding possibility of minor accidents. In another case field coils were damaged by excessive soaking with oil, and an instance of field-coil winding breaking through insufficient protection where lead in from the terminals is recorded. Excessive sparking due to unequal wear of the copper and mica of commutators is also referred to. In two cases trouble was experienced in induction motors with the slip-ring leads where they pass through tunnels in the shaft, and in a D.-C. motor short circuits were caused by absence of proper covering over the cast-iron drums under the end connections. In another case the presspahn troughs in the armature slots were too short and left a sharp edge which cut the insulation. Loose connections produced sufficient heat to set fire to insulation in a motor with proper terminal boxes, and another cause of trouble referred to was broken commutator connections. A very curious case is also mentioned where the company's inspector was consulted as to the cause of the repeated blowing of a fuse in circuit with a variable speed motor driving a heavy planer. This would blow just as the machine was being switched off, and the cause was eventually found to lie in the attendant switching off by moving back the combined stator and speed regulator instead of pulling out the main D.P. switch, thereby cutting resistance out of the field and causing the motor, backed up by the inertia of the heavy machine, to become a generator and to send back a heavy wave of current into the line before pulling up. Another interesting case is that of a generator which continually went to earth owing to a black oil deposit attributed indirectly to the effect of the fumes from a suction gas plant, partly in that these were continually corroding the copper of the commutator, with the result that it was rubbed with emery paper much too often, allowing an excessive amount of copper dust to find its way into the armature, and partly by the action of the fumes on oil creeping into the machine.

ELECTRICITY IN HORTICULTURE

FROM time to time we have noted the experiments that have been made in the application of electricity to horticulture by erecting wires charged at a high potential above fields containing crops or in greenhouses. Originally electrostatic influence machines were employed for the purpose, but these, as is well known, require very careful attention, are apt to fail to excite, and are also of a rather unsatisfactory construction mechanically. Induction coils and Lodge valves were substituted, and good results were obtained, but the cost of the equipment is fairly high. We learn that Mr. S. Clark has devised a new type of influence machine for the purpose, a demonstration of which was held at the Highfield Nurseries, Downham, Billericay, on the 11th inst. It has six plates, 26 in. diameter, mounted on ball bearings, and the spindle does not pass through the plates. The air is dried by the exhaust from the engine before passing into the case of the machine, and in like manner the dust is extracted from the air to render the machine indifferent to atmospheric conditions. The plates have no sectors, the electrodes are sliding and removable for cleaning purposes, and the terminals are arranged so as not to accumulate dust. The engine has been placed in a separate house to the electrical machine; the two houses are a foot apart, and the driving belt is protected by a movable pent roof. The building is heated by hot water pipes. The machine house is placed about 18 in. from the greenhouse, end on. A glass dormer covers the exposed 18 in. of insulated wire, which passes through a 20 in. square glass varnished pane, out of the machine house and through a similar pane of glass, into the greenhouse, where it joins on to the main overhead wires, three in number, stretched down the length of the greenhouse. The wires are suspended from the roof by glass insulators (dipped into paraffin wax), and kept taut by weights on pulleys at each end of the greenhouse. The greenhouse is 200 ft. × 24 ft. 6 in. centres, and was specially designed for the purpose by Messrs. H. L. Rowdon and Son; all ventilating rods and gears are on the outside of the roof, and all stove-pipes as far distant from the overhead wires as possible. The wires are hung 7 ft. from the ground. Fifty feet of the greenhouse is partitioned off for seedlings, and it is so arranged that the current can be applied to this part alone or to the whole 200 ft. The machine working normally produces 600,000 volts, and the glass insulators have been tested up to 800,000 volts. No horticultural experiments have taken place yet, but rough vacuum tube tests have been made, and it has been found that tubes are lighted up by a wire stretched 4 ft. away from the overhead wires. The influence machine is being sold at £36, and the maker estimates that it can be worked for 48 hours for the cost of 3s. Messrs. Highfield Nurseries, Ltd., are sole agents for the influence machine, and offer to exhibit their installation to any interested in this development in horticulture. The installation is under the direct supervision of Mr. J. R. Milne, who has been for many years privately interested in the subject, and to whom we are indebted for the notes from which the above article has been written.

A NEW SHADE CARRIER AND LAMP-LOCKING DEVICE

WE illustrate here a simple and convenient lamp-locking device combined with shade-carrier, which has been put on the market by C. H. Jeffcoat (148 Addison Gardens, W.). The locking collar is first placed on the lamp cap and the shade is placed over both. The lamp is then put into the holder in the ordinary way, and the shade-ring is screwed down over it, so that the lamp cannot be pushed in to disengage without slacking back the shade-ring. This arrangement does not require any special form of lampholder, nor any tools for unlocking, and renders the shade much more easy of removal than when supported by the shade-ring in the ordinary way.

THEATRE LIGHTING BY METAL FILAMENT LAMPS

THE Prince of Wales' Theatre, Birmingham, has recently been reconstructed and redecorated, and the opportunity has been taken to modernise the electric lighting arrangements by the adoption of the British Thomson-Houston Co.'s new drawn-wire Mazda lamps, of which some 1,500 are employed, with substantial gain in economy of current consumption. Specially successful measures have been taken to avoid glare in the arrangement of the lamps, many of which are frosted, and some very fine decorative fittings have been installed. The foyer is provided with five three-light electroliers, and two-light brackets, finished in dull gold, with the lamps shaded by fringes of crimson beads. The staircase, leading to the grand saloon and dress circle, is lighted by four three-light electroliers and side brackets of similar style. The grand saloon itself is provided with five handsome electroliers in dull gold, the largest fitted with ten lights, and the remaining four with three lights each. The dress circle, upper circle, and corridors are lighted by means of ceiling fittings and wall brackets. All the dressing rooms and offices are lighted entirely with Mazda lamps.

From the centre of the auditorium ceiling depends an imposing electrolier, holding some fifty lamps. This is supplemented by four lesser electroliers accommodating six lights each. All these fixtures are finished in dull gold, and equipped with Mazda lamps. The whole of the incandescent stage lighting is by Mazda lamps, work for which a tough filament is specially necessary. In the footlights there are some 104 of these, 52 clear, 26 red, and 26 blue lamps. In addition, there are six rows of batten lights, each batten containing a similar number of lamps and assortment of colours. The switching of these lights is so arranged that all or any part of each batten may be thrown in circuit at any desired time to produce the requisite colour effects.

On account of the different characteristics of metal and carbon lamps, specially designed dimmers have been put in. The stage is further illuminated as required with hanging battens of lamps, and with portable swivel standards holding "bunch" lights.

Hosted by Google

ELECTRIC TRACTION NOTES

According to the *Financial News*, the experiment of the German State Railway Administration with the electric railway service between Dessau and Bitterfeld having proved satisfactory, electric traction will now be adapted to the Bitterfeld-Leipzig-Halle and Dessau-Magdeburg lines, each line being of a length of 150 kilometres. The electrification of the Berlin city and district railway will take place in the near future, all preliminaries having been successfully concluded. The Allgemeine Electricitäts Gesellschaft of Berlin is to carry out the work, and for this purpose, as well as for the construction of the Berliner North-South underground, the company is considering a new loan.

At a meeting, last Friday, of the Metropolitan Association of Electric Tramway Managers, Mr. A. H. Stanley (Managing Director, London Electric Railways and London United Tramways) and Mr. T. B. Goodyer (Tramways Manager, Croydon) were elected Chairman and Honorary Secretary respectively, and Messrs. Z. A. Knapp (General Manager, London United Tramways) and S. Dudman (Manager, Dartford Light Railways) were elected members of the Association.

As the result of the recent report regarding the use of trolley omnibuses, the Tramways Committee of the Edinburgh Town Council have appointed a Sub-committee consisting of the Lord Provost, the Convener of the Tramway Committee, and another councillor to consider the scheme, and to confer on the subject with the Tramway Co. and the Leith Town Council. It is stated that the Tramways Committee are prepared to recommend the Town Council to apply for Parliamentary powers to run trolley omnibuses over three experimental routes.

Subscriptions are being invited by the Fife Tramway Light and Power Co. for 51,195 ordinary shares of £1 each at par.

It is stated that the extension of the Central London Railway from the Bank to Liverpool Street will be opened in June.

The difficulty of raising capital for the Oxford tramways has not yet been overcome by the National Electric Construction Co. A few years ago the consent of the Corporation was obtained to a modification of the original electric tramway scheme by which there would be a much larger proportion of overhead trolley and a correspondingly smaller amount of conduit traction over the central portion of the city. Now the company have informed the Corporation that there are grave difficulties in the way of obtaining the £180,000 capital required, and, in fact, that it cannot be raised under the conditions of the present agreement. In other words, the company is not able to proceed with any scheme which involves the laying of the expensive conduit system. A special meeting of the Corporation has been held to consider the position and it was decided by 46 votes to 6 to decline to accept any modification of the existing agreement.

The Anglo-Argentine Tramways Co. is issuing £1,500,000 of 5 per cent. debenture stock at 97½.

The accounts of the Auckland Electric Tramways, Ltd., for the year to June 30th show a net surplus of £43,574. Of this, £15,000 has been placed to reserve, and a 7 per cent. dividend recommended on the ordinary shares, against 6 per cent. last year, carrying forward £7,147.

A terrible tramway accident took place on Friday morning upon the Stalybridge, Mossley, Hyde, and Dukinfield Joint Board's tramway system, resulting in the death of five persons and injury to six others, one of whom has subsequently died. The car got out of control on a very steep road, which, after a clear run of half-a-mile, takes a sharp turn to the left and crosses a railway bridge. At this point the car was going at too great a speed to take the curve, with the result that it crashed into the wall of the railway bridge and toppled over on to the railway lines, 30 feet below. The accident occurred at about 5 o'clock in the morning. A Board of Trade inquiry was opened on Monday and adjourned after a short sitting.

A deadlock has occurred between the Watford District Council and the Metropolitan Electric Tramways, Ltd., with regard to the construction of tramways in the High Street. The Council insist upon certain widenings being carried out, but the company are against the latter on account of the heavy capital cost, and in this contention they have the support of the County Council, which is the tramway authority. The Urban District Council say that to build the tramways without the widenings would be "nothing short of a public calamity."

The Merthyr Tydfil Council have appointed a Committee to approach the local tramways company with a view to acquiring the undertaking. The Borough Engineer has also been instructed to make inquiries with regard to the trolley omnibus system in Bradford and Leeds, with a view to the adoption of the system between Merthyr and some of the outlying districts.

There was a loss of £1,599 upon the Sunderland and District Electric Tramways Co. working for the past year. This makes the total debit balance £16,202. A scheme for the reorganisation of the company is in preparation.

The General Purposes Committee of the Brighton Corporation recommend the Corporation to apply for powers to instal trolley omnibuses. There has been a conference with the Hove Corporation, but the latter body are recommended by a sub-committee to provide a separate Bill for Hove.

An action of some importance to tramway undertakings will come on for hearing in the Sheriff's Court this week. The Greenock and Port Glasgow Tramways Co. are suing a firm of engineers and also a firm of contractors for compensation for damage alleged to have been caused to their tramway track in Main Street, Greenock, by the haulage of large boilers and heavy machinery over the roadway. The tramway company seek to have the conveyance of such loads over their tramway tracks prohibited. It is expected that the hearing of the action will last five days.

We refer in our "Local Notes" to a report upon electric lighting at Douglas (I.o.M.) by Messrs. Handcock & Dykes. In reference to the conversion of the tramways to electric traction, they recommend the Council to take no action until the electric supply scheme has been carried out.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The "loaded" telephone cable between England and France (described in Electrical Engineering of March 17th and December 22nd, 1910) has been employed for interesting tests made during the past few days, in which speech trials were made between London, Geneva, and Basel by English and Continental telephone experts. Earlier trials had demonstrated that telephonic facilities would, in future, be possible between towns so far separated as Aberdeen and Paris, a distance of 800 miles. In the present trials connections were established between London and Geneva (560 miles), *viâ* Paris and Lyons, and between London and Basel *viâ* Paris and Belfort, and in each instance satisfactory commercial conversation was obtained. We are officially informed that the results of the test calls are such that a telephonic service between subscribers in inner London and in Geneva and Basel will be inaugurated when the necessary arrangements between the two Administrations are completed.

Wireless telegraph regulations issued by the Australian Government provide for general licences at a cost of five shillings each for ships registered in Australia, and one guinea for experimental licences. No ship's wireless apparatus may be worked without permission while the ship is in any harbour or any territory of the Commonwealth. Any apparatus, including experimental, may be taken possession of and used in the King's service, and a censorship may also be exercised over messages sent from any apparatus, and it is provided that reasonable compensation will be paid for any damage done in the exercise of these powers.

It is announced that the Marconi's Wireless Telegraph Co., Ltd., and the Lodge-Muirhead Syndicate, Ltd., have arrived at a settlement of their difference with regard to patents, which will put an end to the threatened litigation between the two companies. The Marconi Wireless Telegraph Co., Ltd., are to take over all the Lodge-Muirhead patents and Sir Oliver Lodge will, in future, be associated with the Marconi Co., and act as scientific adviser. We are officially informed that the Marconi Co. have actually issued a writ against Messrs. Siemens Bros. & Co., Ltd., for infringement of their patents. Messrs. Siemens Bros. & Co. are, of course, owners of the British patents of the Telefunken system. A letter from Messrs. Siemens Bros. & Co., Ltd., in reference to this appears in our correspondence columns.

The question of the payment of local rates by the Government after the acquisition of the National Telephone Company's undertaking was discussed at the autumn meeting of the Association of Municipal Corporations in London on Saturday. The Town Clerk of Sheffield, who seconded a motion requesting the Government to continue these local rates or pay an equivalent contribution, said that any change in the present system would mean a loss of £4,000 a year to Sheffield. The Earl of Derby (a former Postmaster-

Hosted by Google

General) said he had a fellow feeling with the Postmaster-General in this matter, for on one side there were the Corporations asking for some assessments, and on the other the general public demanding cheaper subscriptions. The resolution was carried, and a deputation is to be appointed to wait upon the Postmaster-General.

It is reported in the *Electrical Review and Western Electrician, Chicago*, that the Saskatchewan Government is taking over the telephone system of Saskatoon, Canada, which it will convert to an automatic system.

It is stated that the Spanish Government have decided to carry on inland wireless telegraphy, as a part of the general telegraph business of the country.

The dispute between the Hythe Council and the National Telephone Co. concerning overhead wires, referred to in our issues for October 12th and 19th, is not yet settled. It appears that the Postmaster-General, in informing the Council that they would place the wires underground after they had taken over the National Telephone Company's system, recommend the Council to give the company notice to remove the poles on December 27th. The company object to this treatment, and expressed their intention of removing the wires forthwith. Up to 9 a.m. yesterday, however, no subscribers had yet been disconnected.

Recent information concerning telegraphs and cables appears to centre chiefly around the arena of war. Thus the Italian Administration only accepts telegrams for Tripoli in plain language at sender's risk. Brief telegrams in code, not exceeding 25 words, are accepted in exceptional cases if transmitted *viâ* Italy, and the codes are produced, one to be available in Tripoli and one in Rome.—The wireless coast station at Karlskrona in Sweden will be temporarily closed as from the 1st November.—The Indo-European Telegraph Company had its lines down between Tiflis and Tabriz for a short while on the 23rd inst.—The Chinese Administration does not accept telegrams for the interior of China, excepting at sender's risk. Communication with Hankow is, of course, down.—It is not possible at present to obtain definite information concerning the new cable being laid by the Italian Government between Sicily and Tripoli.

At the first meeting of the new session of the Institution of Post Office Engineers last week, Major W. A. J. O'Meara, C.M.G., Engineer-in-Chief to the Post Office, delivered a short address. He extended on behalf of the Institution a cordial welcome to members of the National Telephone Company's engineering staff who might desire to join the Institution at the end of the year, and equally cordially invited offers of papers from them. He next referred to Sir William Ramsay's indictment of British methods in technical education, as expressed in his presidential address to the British Association. He endorsed Sir William's opinion that a fallacious idea prevails that the functions of an engineer correspond to those of a foreman; he believed that a great amount of injury was being done by "quack" engineers, and considered that there should be some system of registration before a young man was admitted to practise as an engineer. He admitted that there was a difference of opinion as to the value to be placed on a scientific degree, and suggested that, in substitution for the present requirements for a degree, some means should be found for marking down a man's qualifications in such a way as to indicate his ability to apply his theoretical knowledge effectively in an organisation in which human beings, and not the materials used, constitute the factor of prime importance. In the meantime, however, he thought that the degree must be accepted as an indication of certain scholastic attainments, and that the employer himself must assess the value of the personal and practical qualities of each aspirant engineer.

Major O'Meara then read an English translation of the French Paper on Multiple Telegraphy, which he had read before the International Congress of Applied Electricity in Turin last month. The Paper reviewed no less than eleven systems of multiple telegraphy. The author first summarised the recent improvements in the Morse quadruplex, and then dealt with the Mercadier system, which although used to some extent abroad, had not been adopted here, owing to its occasioning serious disturbances in neighbouring telephone circuits (described by some telephone users as resembling the singing of a number of birds). The disturbing effect on telephone circuits has also prevented the Phonopore system from being adopted by the British Telegraph Administration. The Picard system is used in France to operate Hughes apparatus in the ordinary way on one channel, and to operate a second Hughes channel by rapidly alternating currents. In Great Britain, however, the Hughes system is confined to a few long underground cables on which it is worked duplex, or for international circuits which would not be suitable for carrying the second channel. The Delany system was next dealt with. As is well known, this system worked successfully for many years on several circuits in England, but it had to be abandoned because of the more or less imperfect character of the signals, which increased as it became necessary gradually to increase the length of the underground sections in the important trunk lines. An improvement in the Delany system due to S. A. Pollock also worked very well indeed for a time, but was eventually discontinued on account of the difficulty in maintaining a sufficiently accurate balance (for the speed required) on aerial lines in the variable climate of England, and because the other lines working between the two towns where this apparatus was fixed were not suitable for the high duplex speed necessary, on account of the long sections of gutta-percha-covered wire included in them. After briefly mentioning the Meyer system, Major O'Meara dealt at some length with the Baudot system, of which apparently he is much in favour.

This is largely used in France. On the London-Paris-Zurich-Marseilles circuit London works two channels to Marseilles and two channels to Zurich, while Paris also works two channels to Zurich, and there have been fewer stoppages between London and Zurich since this arrangement was installed than when a simplex Hughes was being worked between these two towns. The Paris-Algiers communication works over one wire from Paris to Marseilles, and three submarine cables, each about 800 km. long, between Paris and Algiers. Four channels are worked between Paris and Algiers (three in one direction, and one in the other as required), while Marseilles works two channels with Algiers, one in each direction. The author expressed his surprise that the Baudot invention, which is actually about thirty years old, had taken so long a time in finding appreciation outside the country of the inventor. Its use is, however, now rapidly spreading; Russia has installed seventy-five sets during the last five years, and British India thirty sets during the same period. In Great Britain, however, traffic conditions have been somewhat different owing to the very cheap newspaper tariff rate. The Wheatstone automatic still holds the field for this class of work, but the use of the Baudot is likely to be extended for ordinary messages. Twelve quadruple sets have already been installed, and provision has been made for installing the equivalent of at least ten more during the next twelve months. A sextuple duplex is proposed between London and Birmingham, and if this is successful, as it is expected it will be, the Baudot system will be proved to be the most expeditious machine printing telegraph system for dealing with large volumes of traffic.

The Donald Murray multiplex is an advance on the Baudot in point of speed, and aims at a great saving in labour from the adoption of page printing. It remains to be seen, however, said Major O'Meara, whether on aerial lines subject to occasional interruptions any real advantage will accrue from reception in this form. An experimental installation of a double duplex has been erected, giving four channels working at a total speed of 160 works per minute (80 in each direction).

The Munier method of arranging the Hughes instrument for multiple working, and the Rowland system, which was given an extended trial in America, but ultimately abandoned, were finally commented on.

In his concluding remarks Major O'Meara compared the utility of multiple systems with that of high-speed Wheatstone automatic. He pointed out that except for newspaper work there was a disadvantage in transmitting a continuous system of signals by the Wheatstone automatic, as repetitions or verifications occasioned considerable delay, while with a multiplex the message is dealt with immediately it is received, and corrections, &c., can be given immediately they are asked for. He admitted that opinions are still divided on the subject of reception on tape, as compared with reception in page form, but thought it probable that future developments in printing telegraphs must follow the lead of the Baudot principle, on account of the great saving of line time and the simplicity in mechanical details.

Glasgow Students' Section of the Institution of Electrical Engineers.—At the opening meeting on Friday last, Mr. W. W. Lackie, Chief Electrical Engineer to the Glasgow Corporation, delivered his inaugural address as chairman, dealing with the training of engineers. He favoured the system in which the student went direct from school to college and finished his technical training before serving any part of the apprenticeship, and considered that this arrangement has many advantages over the workshop training being taken along with evening classes during the winter months, or day classes being taken in the winter and workshop training in the summer.

Hosted by Google

LOCAL NOTES

Birmingham: *New Power Station.*—The Corporation have authorised the raising of £500,000 in connection with the new power station.

Brentford: *Electric Supply.*—The Brentford Electric Supply Co. have entered into an agreement with the Metropolitan Electric Supply Co., Ltd., for a bulk supply, and are now in a position to deal with all applications for a supply of electricity in the Brentford district. A large number of important contracts have already been secured. The Metropolitan Electric Supply Co.'s local office and show room is at 3 The Broadway, Hanwell, W.

Brighton: *Meter Rents.*—Mr. J. Christie, Borough Electrical Engineer, has again submitted to the Electricity Committee his views in favour of the abolition of meter rents. It is estimated that the immediate loss of revenue would amount to about £1,200 per annum, but the Committee, who in August recommended the Council to adopt this course, except in the case of consumers upon the maximum demand system, now ask that this recommendation be rescinded.

Extension of Supply Area.—The Corporation propose to apply next session for authority to supply electricity in Portslade, Southwick, and Shoreham.

Bury: *New Power Station.*—There is to be a formal opening of the new Chamber Hall power station in a few weeks time.

Dawlish: *Street Lighting.*—A competitive experiment with street lighting is being carried out by the Council, a number of electric and gas lamps having been erected in the main thoroughfare.

Doncaster: *Electric Supply.*—A deputation from the Corporation attended at a recent meeting of the Wheatley Urban District Council, and discussed the question of a supply of electricity being given from the Doncaster mains.

Douglas (Isle of Man): *An Electricity Scheme.*—Messrs. Handcock & Dykes have prepared an electric lighting scheme for the Corporation. The estimated cost is put at £20,889, or £24,789 with certain additional items for extra mains, services, &c., in order to provide for the development of the undertaking.

Dublin: *Electrical Exhibition.*—The Electricity Supply Committee have organised an Electrical Exhibition of apparatus and fittings relating to the use of electricity for lighting, heating, cooking, and power purposes, which will be held at the Mansion House from the 30th October to the 4th November. The Exhibition will be confined exclusively to manufacturers, and the exhibitors have agreed that no goods shall be sold in any section. Several gentlemen have accepted the invitation of the Committee to deliver short addresses in the evenings. On Monday, October 30th, Mr. Richard Cronin, Chief Locomotive Engineer of the Dublin and South-Eastern Railway, will lecture on "Electricity in Home Decoration"; on Wednesday, Dr. Maurice Hayes, on "Electricity in Medicine and Surgery"; on Thursday, Mr. Ramsay MacNab on "Electricity and Insurance"; on Friday, Mr. R. Borlase Matthews, on "Electric Cooking and Power in the Home"; and on Saturday, Mr. Borlase Matthews on "The Comforts of Electric Lighting and Heating."

Great Harwood: *Electric Supply.*—The electric supply scheme prepared by Mr. J. W. Speight has advanced a stage further. A Committee has been appointed to deal with the matter, and two Councillors are to visit Penrith for the purpose of making observations, where a similar scheme to that proposed is in operation.

Grimsby: *Electric Supply Profits.*—The sum of £1,000 is to be handed from the profits of the electricity undertaking to relief of rates.

Hull: *Electrical Trades Union.*—It has been decided to form a branch of the Electrical Trades Union in Hull.

London: *L.C.C.: Greenwich Turbo-Generators.*—The maintenance period of twelve months in connection with the two 5,000 kw. Zoelly steam turbo-generators, supplied by the British Westinghouse Co., has now expired, and although the whole of the spare parts and sundry material ordered as extras have not yet been delivered, the Highways Committee recommend the Council to pay to the British Westinghouse Co. part of the retention money due under the contract. The remainder is to be paid when all the spare parts, &c., have been delivered.

Bethnal Green: Electricity Supply.—The Borough Council have decided to engage Mr. J. F. C. Snell at a fee of 200 guineas to prepare a scheme for the supply of electricity.

Selby: *Electric Lighting.*—The Council have expressed their intention of opposing an application by a company for an electric lighting provisional order.

Swanage: *Electric Supply.*—The Swanage Electric Supply Co. have obtained an extension of time within which to put their electric lighting order into force. The Board of Trade have intimated to the company that if substantial progress is not made by June next year, the order will be revoked without further notice.

Uruguay: *Electric Power Supply.*—It is stated that the Government are putting forward proposals for increasing the use of electric power throughout the country.

Wharfedale: *Electric Supply.*—The Council have decided to oppose an application by the Ilkley District Council for an electric lighting provisional order.

Wimbledon: *Supply in Maldens and Coombe.*—Last week witnessed the inauguration of electric supply in Maldens and Coombe by the Wimbledon Council. The supply has been installed within twenty-five days of obtaining the provisional order. The work includes the laying of 7,000 yards of extra high-tension cable, 2,000 yards of high-tension cable, and 3,000 yards of low-tension cable.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Blackpool.—The Electrical Engineer and Tramway Manager has submitted a report with regard to extensions at the electricity works. He recommends application being made to the Local Government Board for £12,000. The new plant includes an additional generating set.

Bradford.—The Electricity Committee propose to lay new cables along Cleckheaton Road, together with a transformer chamber, at an estimated cost of £1,935.

Canada.—The *Board of Trade Journal* states that the Lethbrige Municipality invite tenders for the supply and erection of boilers, economisers, turbo-generator, condenser, and sub-station equipment. Tenders to G. W. Robinson, Secretary and Treasurer, Lethbridge, Alberta, by November 24th.

Donaghadee.—The Town Council have decided to proceed with an electric supply scheme, for which a provisional order has already been granted.

Erith.—The Council have decided to apply to the Local Government Board for sanction to borrow £7,671 for expenditure upon the electricity undertaking during the next three years.

Grimsby.—Additional generating plant is to be installed at a cost of £900.

London: *Battersea.*—Mains extensions in connection with the requirements of the London & South Western Railway Co. are to be carried out at an estimated cost of £588.

Hammersmith.—The Finance Committee of the London County Council recommend a loan of £15,000, repayable in eight years, chiefly for mains extensions in connection with the conversion of all street lamps to electric lighting.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Bradford.—Spindle works in Mount Street. Architect, T. Riley, Lidget Green.

Croydon.—Ten houses, Silverleigh Road. Drake Bros., Shirley.—Five houses, Elmgrove Road. R. C. Palmer, Sherwood Road.

Dublin.—Cycle factory at Pleasants Street. Architect, T. J. Cullen, 25 Suffolk Street.

Edinburgh.—New training college at St. John Street.—Administration block at the Royal Scottish Museum. Drawings, &c., may be seen at H.M. Office of Works, 2 Parliament Street, Edinburgh.

Tenders are invited for an electric lighting, heating and power installation at the College of Art for the Corporation. Particulars from the City Electrical Engineer.

London.—It is stated that a new concert hall, at an estimated cost of £85,000, is to be erected on a site close to Piccadilly Circus.

Manchester.—Laundry at Withington Workhouse. Architect, F. H. Overmann, 48 King Street.

Hosted by Google

Rochester.—New post office. H.M. Office of Works, London.

Romford.—The Board of Guardians are considering the question of electrically lighting the workhouse.

Sidcup.—Tenders are invited for a street fire alarm system. Particulars from the Engineer and Surveyor, Council Offices.

MISCELLANEOUS

Bermuda.—The *Board of Trade Journal* states that it is proposed to construct an electric tramway in Bermuda. Either a local company or the Government will carry out the work.

Eccles.—A Local Government Board inquiry was held last week concerning a loan of £666 for street lighting.

Italy.—Tenders are invited by October 30th for the supply of electric lamps and fittings. Particulars from Generale dei Servizi Amministrativi, Ministero della Marina, Rome.

Montevideo.—The *Board of Trade Journal* states that the Port Authorities require 13 electric cranes. Further particulars at 73 Basinghall Street, where a list of agents established in Montevideo can be obtained, as local representation is necessary.

Rawtenstall.—Application is to be made for sanction to borrow £3,059 for tramway electrical equipment, and £1,608 for rolling stock.

TENDERS RECEIVED AND ACCEPTED

Accrington.—The tender of Messrs. Ferranti, Ltd., for switchgear in connection with the high-tension supply to Globe Works at £143 has been accepted. The tender of the British Westinghouse Co., Ltd., for a 300-k.v.a. three-phase transformer at £180 has also been accepted.

Belfast.—The tender for switchboard extensions of Mr. Bertram Thomas, at £154, has been accepted.

Blackburn.—The tender of Mr. F. L. Yates has been accepted for the electric lighting of the sub-police station.

London: *L.C.C.*—The following tenders have been received for the electric lighting of the Great College Street School:—Saville & Walton, £340; G. Weston & Sons, Ltd., £395; T. H. Smerdon, £412; Johnson & Phillips, Ltd., £455; Tredegar & Co., £465; Williams & Bach, £484; Waring & Withers, £496 13s.; E. Lawrence & Sons, Ltd., £528; The Fleet Electrical Co., £566 17s. The tender of Messrs. G. Weston & Sons has been accepted. In connection with this contract, the Education Committee had previously accepted, during the vacation, a tender by Messrs. Saville & Walton at £340. They report that this firm, after delivering the material and having their men on the job, withdrew them, stating that they did not intend to proceed with the contract. In consequence it is recommended that the name of this firm be entered on the list of persons and firms from whom the Council will not accept tenders.

The tender of Messrs. Pinching & Walton has been accepted for the electric wiring and fitting of the new testing ground at the chief fire brigade station at £55. An offer by the same firm to carry out the wiring and fitting of the East and North-east blocks at the chief fire brigade station at £235 has also been accepted.

The Highways Committee have accepted the tender of the Electrical Co., Ltd., for the supply of meters for use at the central car-repairing depôt at £389 12s.

The British Westinghouse Electric and Manufacturing Co., Ltd., has sent us a list of orders recently received. Among the more important are the following:—War Office, for Gibraltar: one 20, one 15, one 12, three 10, and two 7 h.p. motors; Gold Coast Machinery & Trading Co., Ltd.: two 70, and three 15 h.p., 200 volt, two-phase, 50 per. A.C. motors and control gear; Huddersfield Corporation: transformers and switchgear; Baroda State Railway: transformers and switchgear; Rhymney Iron Co.: transformers; Greenock Corporation: two 500 kw. rotaries, transformers, switchgear, &c.; Staveley C. and I. Co.: one 400 kva. transformer and six type "S" pillars; Bury Corporation: transformers; Bradford Corporation: transformers; Tennant & Barrs: one electric winder; Stothert & Pitt for Bristol Docks: equipment for nine two-ton electric cranes for Avonmouth, nine 40, nine 12, nine 6 h.p. 500 volts motors, control gear and spares; Rochdale Tramways: eleven brake equipments; Brush Co., for Rochdale Tramways: twenty-four controllers; Babcock & Wilcox: one 400 kw. rotary converter and switchgear; East Indian Railway: one 325 kw. A.C. generator, exciter, switchgear, &c.; Noyes Bros., Sydney, for Dunedin: six car equipments.

OSRAM·LAMPS

APPOINTMENTS AND PERSONAL NOTES

Visitors to the Electrical Exhibition will have noticed a very handsome electrically-driven grandfather's clock on the stand of Messrs. Drake & Gorham, and we understand that many of the admirers had marked out places in their halls where they could place such an article. We are glad to be able to congratulate Mr. Fowler, of Chelsea, on the acquisition of this prize.

Mr. C. C. Fowler, Assistant Manager of the Brighton Electricity Department, has resigned his position on having received an appointment in India. Mr. Fowler, who has been nineteen years with the Corporation, has been permitted by the Committee to terminate his appointment on November 7th, instead of giving three months' notice, and that he be granted leave of absence until Christmas, his resignation taking effect from that date. It is not without interest to recall that early this month the Brighton Corporation refused to adopt a recommendation of the Electricity Committee to increase Mr. Fowler's salary from £350 to £400 per annum.

In consequence of the death of Mr. S. R. Clarke, Mains Assistant in the Battersea Electricity Department, the Electricity Committee recommend that Mr. W. T. Magrath, at present draughtsman, be appointed Mains Assistant on probation until December next. A draughtsman for temporary work is to be advertised for at a wage of 35s. per week.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 5s. (last week, £57 to £57 5s.).

Plania Carbons.—The Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), have now the sole agency for the United Kingdom for these carbons, formerly held by H. G. Mayer & Co. Large stocks are kept, and Mr. W. G. Mayer has joined the firm to take over the management of this department.

Sunshine Flame Arc Lamps.—The Electrical Co., Ltd. (122-124 Charing Cross Road), ask us to publish the following:—"The rumour has got abroad that direct-current Sunshine Flame Arc Lamps have infringed patents, and cannot be sold. This is not the case. An arrangement has been entered into with the owners of the master patent, and Sunshine Flame Arc Lamps are now sold under royalty, and do not infringe any patents. The list prices will remain the same as formerly. Forms of indemnity will be given whenever required. Alternating-current Sunshine Lamps are not affected by patents in any way.

B.T.-H. New London Offices.—In order to deal with their increasing business in Mazda lamps, the British Thomson-Houston Co., Ltd., have opened new premises at 77 Upper Thames Street, London, E.C., as a sales and advertising department. The telephone number is 5561 Bank.

Canadian Agency.—A Lancashire firm of stage electrical accessories manufacturers is desirous of getting into touch with Canadian firms. Further particulars from 17 Victoria Street, S.W.

Bastian Heaters at the Exhibition.—We are pleased to hear that the Bastian Electric Heating Syndicate, Ltd., had a very great rush of business during the Exhibition period for their A and F type heaters. The record "catch" was 219 heaters in one day. Every effort is being made to increase the firm's output in order to give as prompt delivery as possible.

Turin Exhibition Awards.—Among the awards accorded to British exhibitors at the Turin Exhibition, 1911, are the following:—Synchronome Co., Ltd., *Diploma of Honour;* Babcock and Wilcox, Ltd., Campbell Gas Engine Co., Ltd., National Gas Engine Co., Ltd., and Hans Renold, Ltd., *Grand Prix* for steam plant, &c. The Westinghouse Electric and Manufacturing Co., Ltd., A Reyrolle & Co., Ltd., and Morgan Crucible Co., *Grand Prix;* Muirhead & Co., *Diploma of Honour;* Crypto Electrical Co., Lancashire Dynamo & Motor Co., Ltd., Ozonair, Ltd., and Venner Time Switches, Ltd., *Gold Medal* for electrical generating and distributing plant. Heath & Son, Ltd., *Gold Medal,* and Venner Time Switches, Ltd., *Silver Medal,* for electric lighting. Cambridge Scientific Instrument Co., *Hors Concours,*

Hosted by Google

and Marconi's Wireless Telegraph Co., Ltd., *Grand Prix*, for telegraphy. Cambridge Scientific Instrument Co., *Hors Concours*. Nalder Bros. & Thompson, Ltd., R. W. Paul, *Grand Prix*, and The Reason Manufacturing Co., Ltd., *Gold Medal* for electrical measuring instruments. Ozonair, Ltd., also received *Grand Prix* and *Diplomas of Honour* in a number of other sections.

Reductions in Prices of Metal Filament Lamps.—In the article on this subject on page 568 of last week's ELECTRICAL ENGINEERING, the reduced price of the 200–250-volt 55-watt drawn tungsten "onewatt" lamps was given as 3s. 3d. This price should have referred to the round bulb pattern, the reduced price for the pear-shaped bulb being 3s.

Meter Approved.—The Board of Trade have approved of the Alva single-phase meter, type C.A., deposited by Messrs. Gillespie & Beales, Amberley House, Norfolk Street, Strand, W.C.

The Bremer Arc Lamp Patents.—In the Court of Appeal on Tuesday, it was asked that the appeal of the Electrical Co., Ltd., against the judgment of Mr. Justice Swinfen Eady, who held that the "Sunshine" lamp infringed the Bremer patent, might stand over. It was explained that there were good prospects of the parties coming to an agreement. We reported the case in ELECTRICAL ENGINEERING, May 4th, p. 235, and June 22nd, p. 348.

Scottish Local Section of the I.E.E.—The 1911–12 session of the Scottish Local Section of the Institution of Electrical Engineers begins on Nov. 14th, and meetings will be held as usual on the second Tuesday in every month until May. The Annual Dinner will be held at the "Grosvenor," Gordon Street, on Tuesday, Dec. 12th, and applications for tickets should be made to Mr. J. Sayers, Honorary Secretary, 190 West George Street, Glasgow.

The Institution of Electrical Engineers.—The opening meeting of the coming session of the Institution of Electrical Engineers will be held on Thursday, November 9th, at 8 p.m. Contrary to the usual custom there will be no Presidential Address, Mr. S. Z. de Ferranti occupying the Presidential Chair for the second year in succession, and after the presentation of premiums and awards for last session, the following Paper will be read and discussed:—"Modern High Voltage Power Transformers in practice, with special reference to a 'T' Three Unit System," by W. T. Taylor.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

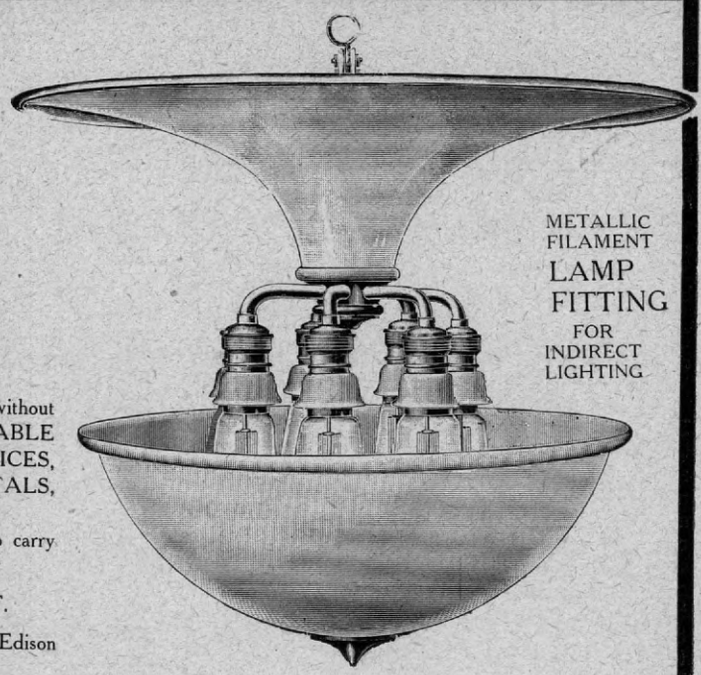
General Electric Co. of Madrid.—This company has been obliged to make arrangements with its creditors, and bond-holders are invited to put themselves into communication with the French Corporation of Foreign Bond-Holders, 5 Rue Gaillon, Paris, with a view to the formation of a bond-holders' defence committee. The position of the company is attributed to the competition of new undertakings.

Northampton Electric Light & Power Co.—The directors recently offered to the shareholders 13,346 £1 shares at a premium of 1s. In response to this invitation, applications have been received for a total of 23,138 shares.

British Thomson-Houston Co.—At the annual meeting last week, it was stated that whilst the various departments of the company are as full of work as they can be, and the value of the orders from March 3rd to date very largely in excess of those for the corresponding period of the previous year, the percentage of profit still remains low, competition being as keen as ever. Owing to the increasing business with Mazda lamps, new London premises in Upper Thames Street have been opened.

Ferranti.—Mr. A. W. Tait, who presided at the annual meeting on Friday, said that the development of the business was not being confined to any one department. Present indications were that the accounts of the current year would be quite as good as those just presented. The company has now exhausted its borrowing powers, and the board propose to increase them by another £50,000.

Callender's Cable & Construction Co.—An interim dividend at the rate of 10 per cent. per annum less tax is declared upon the ordinary shares.



The Edison & Swan United Electric Light Co.—There was a net profit of £19,013 for the year to June 30th, to which is added £6,843 from the previous year, making a total of £25,856. Of this amount the directors propose to place £17,500 to reserve, carrying forward the balance. The report states that, since the close of the financial year on June 30th, the trading shows satisfactory progress.

The "Cole" Code.—Under the heading of "New Publications," on page 564 of our issue for Oct. 12th, we noticed the "Cole" Code, which was priced at 10s. net. We are now informed by the compiler that he has raised the price to 15s. net.

The Electrical Standardising, Testing, and Training Institution.—Mr. R. J. Wallis-Jones begins a series of demonstrations on electric welding and allied processes to the senior students of Faraday House on November 8th.

METALLIC FILAMENT LAMP FITTING FOR INDIRECT LIGHTING

All the advantages of Inverted Arc Lighting without requiring any attention. SPECIALLY SUITABLE FOR WORKSHOPS, FACTORIES, OFFICES, SCHOOLS, DRAWING OFFICES, HOSPITALS, LECTURE-HALLS, etc.

Strongly constructed in white enamelled iron to carry from 3 to 6 lamps up to 100 candle-power.

PRICE FROM 16/6 to 27/- SUBJECT.

When ordering please state whether Bayonet, or Edison Screw, Lampholders are required.

SUMMARY

Our Monthly Supplement on Electrical Engineering in Mines is given in this issue. It opens with some notes on the electric power plant of a group of shale mines and oil works in Scotland, and contains a long article describing the electrical equipment of the Rhymney Valley collieries of the Powell Duffryn Steam Coal Co., which include generating plant driven by coke oven gas and exhaust steam, as well as two of the largest electric winding plants in the world at a colliery which is entirely without boilers. Reports are given of the annual meeting of the Association of Mining Electrical Engineers, and several branch meetings. Other articles include some notes on Electricity in Mines in Scotland, and a discussion on the avoidance of electrical accidents in mines.

A meeting of the Institution of Electrical Engineers this afternoon will have proposals placed before it for admitting as "Licentiates" men who do not possess sufficient qualifications to be Associate Members, for altering the method of election of Council, and other important changes in the Articles of Association. There will be opposition. (Page 593.)

A new motor-car lighting dynamo and regulator is described on page 594.

An Electrical Exhibition was opened at the Brighton Aquarium on Saturday last. A strong feature is being made of electric cooking, in the hope that with the reduced charge of 1d. per unit the demand for energy for this purpose will be greatly increased. (Page 594.)

An illustrated article calls attention to a new circuit-breaker. (Page 594.)

Mr. Cramp's inaugural address to the Manchester Local Section of the Institution of Electrical Engineers dealt with education. (Page 595.)

An electrically-driven transporter bridge was opened at Middlesbrough during last month. (Page 595.)

A correspondent calls attention to the coming into effect in India next year of a new Patent Act. (Page 595.)

Messrs. Waring and Gillow are giving a series of demonstrations in electric cooking in one of their departments, where a very representative collection of other heating apparatus is to be seen, as well as some very finely decorated dining-tables, which are arranged in adjoining rooms. (Page 596.)

In our Electric Traction Notes, we mention that the difficulties between the board of the British Electric Traction Co. and some of the shareholders as to the capital re-organisation have been overcome. The London County Council are applying to Parliament for powers to run trailer cars, owing to opposition by the Commissioner of Police. The arbitration award as to the price for tramway energy at Paisley has not been found satisfactory. The Brighton Corporation have decided in favour of adopting trolley omnibuses. Arbitration has been resorted to as to the price to be paid for electrical energy in Gravesend. (Page 597.)

Further long "loaded" telephone cables are to be laid. Telephone users in Jersey want the Government of the island to purchase the telephone system from the Post Office when it passes from the hands of the National Telephone Co. at the end of the year. Under Telephony and Telegraphy (including Wireless) we also give some details of the proposed Imperial scheme of wireless telegraphy, and mention an application to the High Courts in connection with the Hythe telephone dispute, and a scheme for connecting France by wireless telegraphy with all her colonies. (Page 597.)

Hosted by Google

IMPROVEMENTS in brush-holders to secure even pressure, and to eliminate sparking, by the provision of a resilient spring at the top of the brush, are described among the Specifications published at the Patent Office last week, as well as a simplified arrangement for rapidly connecting up train-lighting and similar dynamos. Specifications for sintering partly decarbonised metal filaments, and a new type of easily renewable fuse, are also published. H. Hunte has been successful with his appeal against the Comptroller's decision in connection with a patent for a dry cell. Two patents expire during the coming week, after a full term of fourteen years; one relates to a carbon electrode, and the other to an insulator for supporting telephone and telegraph wires. (Page 598.)

ONE of the cooling-towers now being erected at the Edinburgh Electricity Works was partially destroyed by fire last week.—The Heckmondwike Council have decided to take a supply in bulk from the Yorkshire Electric Power Co., and not to extend its plant.—An experiment in lighting small houses by electricity at Eccles at a charge of 6d. per week per house is said to have been quite satisfactory.—The Leigh (Lancs) Corporation are recommended to adopt a similar scheme.—The accounts of the four electricity works now included in the County Borough of Stoke-on-Trent show satisfactory increases all round. (Page 599.)

THREE 5,000-kw. turbo-alternators and 12 boilers are to be installed at the West Ham Electricity Works. Loans of £3,000 and £2,000 for mains at Bridlington and Hastings respectively are to be applied for. The Bradford Corporation propose an expenditure of £16,940, Salford £35,000, and Fulham £9,500 for electrical extensions. Mains are required at Stretford, submarine cable in Tasmania, an automatic electric lift at Newport (Mon.), and an electric light installation at the Heywood and Middleton Water Board offices. (Page 600.)

ARRANGEMENTS FOR THE WEEK

TO-DAY (THURSDAY), NOVEMBER 2ND.

Institution of Electrical Engineers.

4.30 p.m. Extraordinary General Meeting to consider proposed alterations in Articles of Association.

FRIDAY, NOVEMBER 3RD.

Northampton Institute Engineering Society.

5.45 p.m. At the Institute. "Diesel Engines," by T. R. Houston and F. G. Parnell.

Batti-Wallahs' Society.

7.45 p.m. Smoking Concert, Holborn Restaurant.

SATURDAY, NOVEMBER 4TH.

Junior Institution of Engineers.

7 p.m. Reception by the President, Sir J. J. Thomson, F.R.S., and Lady Thomson.

TUESDAY, NOVEMBER 7TH.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "The Mechanical Design of Direct-current Turbo-Generators," by R. Roberts.

Institution of Civil Engineers.

8 p.m. Presidential Address by Dr. W. C. Unwin, and presentation of medals and prizes.

Röntgen Society.

8.15 p.m. At Institution of Electrical Engineers. Presidential Address by Mr. A. A. Campbell Swinton.

WEDNESDAY, NOVEMBER 8TH.

Faraday Society.

8 p.m. Special Meeting at Institution of Electrical Engineers, when Dr. E. G. Acheson, of Niagara Falls, will give an account of his researches. [Non-members will be admitted by ticket, to be obtained from the Secretary, 82 Victoria Street, S.W.]

THURSDAY, NOVEMBER 9TH.

British Electrical and Allied Manufacturers' Association.

2.30 p.m. Council Meeting at 36 Kingsway, W.C.

Institution of Electrical Engineers.

8 p.m. Presentation of Premiums. "Modern High-voltage Power Transformers in Practice, with Special Reference to a 'T' Three-unit System," by W. T. Taylor. In the absence of the author, the Paper will be read by Mr. J. F. C. Snell.

FRIDAY, NOVEMBER 10TH.

Institution of Electrical Engineers: Birmingham Section.

7 for 7.30 p.m. Annual Dinner at Grand Hotel.

[See page 593.]

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

ELECTRIC POWER IN SHALE MINES AND OIL WORKS

ONE of the largest and best-equipped firms in Scotland engaged in the extraction of oil from shale is the Oakbank Oil Co. One of their mines is at New Farm, near Mid-Calder, and there are two more about two miles from the Forth Bridge, at distances of $1\frac{3}{4}$ and $2\frac{1}{2}$ miles from the Niddry Castle distillation plant at Winchburgh.

The refining of the oil is carried on at Mid-Calder, whither the oil is conveyed over the seven miles from Niddry Castle by rail. There is also a small shale pit and distillation plant at these works, but they are on a much smaller scale than those at Winchburgh.

The shafts in the mines are driven through the shale itself, which is worked partly by hand, and partly by electrically-driven bar cutters. Endless rope haulages are used to remove the shale, driven by 150-h.p. Westinghouse three-phase 400-volt 50-cycle slip-ring motors, running at 285 r.p.m. A ratchet-wheel eight to ten feet in diameter is provided to prevent the trucks running back, and this is operated by a lever fitted alongside the controller. These haulages are about two and a half miles long in each case, and have tubs fixed to the rope at intervals of about 60 feet, each tub carrying about 15 cwt. The average gradient is about one in five. On reaching the surface the tubs are hauled up an incline plane to the shale breakers and hoppers, into which they are tipped by a motor-driven cradle. The breakers consist of two rolls fitted with heavy teeth, which revolve in opposite directions at a speed of about 4 r.p.m. Each of the three sets of breaker rolls is driven by a 30-h.p. squirrel-cage Westinghouse motor, running at 710 r.p.m. From the breakers the shale is dropped into bins, and is then conveyed to the distillation plant. The mines are ventilated by fans, belt-driven by 30 h.p. squirrel-cage Westinghouse motors, running at 720 r.p.m., each situated in a house of its own.

At Winchburgh the shale waggons are drawn by locomotives constructed by the Baldwin Westinghouse firm, taking current from a 500-volt trolley line. The largest locomotive has one 85-h.p. motor, whilst the two smaller ones are each fitted with two 25-h.p. motors, permanently connected in parallel. The heavy locomotive is designed for a full-load speed of twelve miles per hour, and exerts, with a 33-inch driving wheel, a tractive effort of 5,000 lbs., whilst the lighter locomotives are designed for a full-load speed of ten miles per hour, exerting a pull of 3,000 lbs. with 30-inch driving wheels. At Winchburgh the trucks are carried to the top of the retorts by an inclined endless chain haulage, driven by a 20-h.p. Westinghouse motor. The shale is there distilled, giving off oil and water vapour, the latter containing ammonia; and then, after passing through aerial condensers to liquefy oil and water vapours, an incondensible gas passes on, and is used for the heating of the retorts.

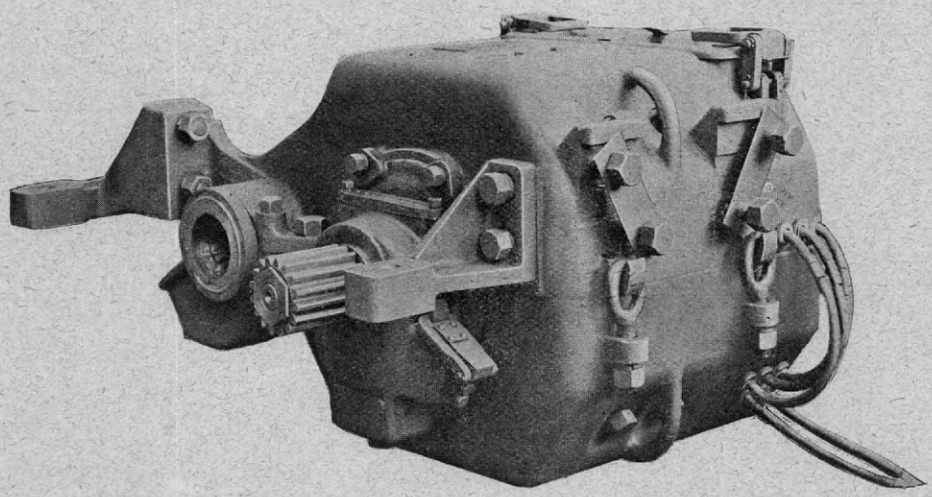
When this process is complete, and the oil has been allowed to settle, it is pumped for storage into large tanks by motor-driven turbine pumps, while the ammoniacal liquor is pumped to the recovery plant by a three-throw ram pump driven by a 5-h.p. motor, and is pumped into steaming towers. Here the ammonia gas is brought into contact with sulphuric acid, and converted into ammonium sulphate. Underneath the drying room is the packing room, in which there are two portable grinding machines driven by a 3-h.p. Westinghouse squirrel-cage motor, so arranged that sacks may be hung underneath the machine, and when filled and weighed conveyed to railway trucks by an endless belt driven by a 3-h.p. motor through Ross reducing gear.

The company's electric power station, which supplies power for all the electric plant on the works (Niddry Castle), is situated at Winchburgh, and contains four engine generator sets, two of which are made up of 200-kw. 440-volt 450-r.p.m. three-phase 25-cycle Westinghouse generators, driven by Westinghouse compound steam engines, and the other two of 500-kw. 250-r.p.m. 3,300-volt three-phase 25-cycle Westinghouse generators, coupled to Belliss & Morcom compound self-lubricating engines, the two latter sets being a recent extension. The low-pressure current is used for all local motor circuits, whilst the high-tension is transmitted to the mines, and transformed in sub-stations, of which there is one at each mine, down to 440 volts for use. It is also fed through transformers to two rotary converters, one of 100 kw. in the power station, and the other of 150 kw. in a sub-station, which convert alternating current to direct at 500 volts for use on the electric railway system. The two mine sub-stations are practically similar, each being equipped with four single-phase 250-kw. 25-cycle single-phase oil-immersed transformers, stepping down to 400/330 volts, one of which is kept as a spare. The sub-station switchgear is mounted on white marble boards, and comprises a high-tension feeder panel, and low-tension distribution panels mounted with oil-immersed circuit-breakers and the usual meters and switches.

The crude oil is taken to Mid-Calder, where it undergoes a series of refining processes which there is no need to detail here.

Steam has been entirely displaced at these works as a source of direct motive power, as all the pumping and compressing is done by electric motors of the three-phase 400-volt squirrel-cage induction type, controlled in the majority of cases by auto-starters. In connection with the refrigerating arrangements, there are two 150-h.p. slip-ring motors, driving the compressors, one of which has been in service nine years, whilst the other is a recent extension. These are controlled by drum-type controllers and drive by raw-hide pinions into machine-cut steel gears. A similar drive, though on a smaller scale, is the air-compressor for supplying the paraffin blowers, which is driven by bolts from a 40-h.p. squirrel-cage motor. There are a large number of small motors used for pumping the oil from process to process.

The company's power station at Mid-Calder contains two 200-kw. Westinghouse engine-driven sets. A new 275-kw. set has since been put down, consisting of a British Westinghouse three-phase 440-volt 25-cycle alternator, driven by a Belliss & Morcom engine. These units are controlled by a seven-panel marble switchboard. Part of this energy is stepped up to 3,300 volts for transmission to the mine, a distance of about one mile. The transmission lines are carried on the same pedestals as the aerial rope-ways, which convey the shale from the mines to Mid-Calder, and is actuated by a 60-b.h.p. squirrel-cage Westinghouse motor running at 720 r.p.m., driven by belt and bevel gear up to the main pulley wheel of the rope gear.



Electrical driving has been in use since 1901, and extensions have been added continuously right up to the present day.

The entire electrical equipment, both at Niddry Castle and at Mid-Calder, was supplied by the British Westinghouse Electric & Manufacturing Company, Limited, of Trafford Park, Manchester.

THE ELECTRICAL EQUIPMENT OF THE RHYMNEY VALLEY COLLIERIES OF THE POWELL DUFFRYN STEAM COAL CO.

THE electrical equipment of the Bargoed, Britannia, and Penallta pits, which together with two others form a group of collieries united by a self-contained electrical power scheme, forms a fine example of modern methods of power generation from waste heat, and includes, at the Britannia pits now in process of sinking, a pair of the largest electric winders in the world. Indeed, this colliery is notable as being the first in South Wales, if not in Great Britain, to be so far entirely without boiler plant. The relative positions of the pits are seen in Fig. 1, which also shows the arrangement of high-tension feeders by which they are linked and the distribution of the generating plant. They only form a part of the companies' total number of collieries equipped with electric power. Another group in the adjoining Aberdare valley take power from a large generating station at Aberamman.

The working of the Bargoed colliery was commenced in 1877, and it now has an output of some 775,000 tons of coal per annum. Electric power for the use of this and other collieries of the group is generated by gas-engine driven alternators supplied by gas from a battery of 100 Köppers regenerative bye-product coke ovens, where sulphuric acid and sulphate of ammonia are produced from the impurities in the gas. The resulting gas is of a quality such that 31 cubic feet are required per kilowatt-hour on full load.

The engine-room is a fine light building, and the main generating sets consist of a pair of four-cylinder gas-engines of the four-cycle double-acting tandem type, running at 100 r.p.m., made by the Maschinenfabrik Augsburg-Nürnberg, direct coupled to 1,650-kw. flywheel A.E.G. alternator supplied by the Electrical Co., and a two-cylinder engine of the same type driving an 850-kw. alternator of the older A.E.G. external field design. They all generate current at 3,000 volts 50 cycles, at which pressure current is transmitted by overhead lines to the other collieries in the same valley. These sets were put in successively at different times, but the engines are all of exactly the same design, the older small one simply consisting of one line of cylinders instead of two, and corresponding parts are interchangeable, so that only a limited number of spares need be kept. In addition to these main sets there is a 300-h.p. Crossley gas-engine which drives a continuous current generator through ropes. The supply from this is used locally for certain continuous current motors used in connection with the screens and other surface plant, and also for lighting. Continuous current can also be obtained from another generator of the same size as that driven by the Crossley engine, which is driven by an induction motor from the 3,000-volt mains.

In view of a possible temporary shut down of the coke ovens, a 750-kw. steam-driven alternator is provided as a stand-by in a separate building, from which a certain amount of power can be obtained for emergency purposes. This is driven by a Yates & Thom horizontal cross compound engine that is not usually kept running.

The main high-tension switchgear is in a gallery overlooking the main engine-room, and the switchgear is of the A.E.G. withdrawable carriage pattern supplied by the Electrical Co. At the time of our visit the voltage regulation was being carried out by a Tirrill regulator, supplied by the British Thomson-Houston Co., with five sets of contacts in parallel connected to one of the large sets. The whole station is arranged to be run in parallel with the generating plant at the other pits described below, and we understand that later on the main regulation of the pressure will be effected by a Tirrill regulator on the 3,000-kw. turbo-generator at the Penallta colliery. The total output of the gas-engine station is from 11 to 12 million units per annum. Transformers are provided to raise the pressure to 10,000 volts for transmission to the Britannia pits.

Electric power is not used at the Bargoed pits for main shaft winding, nor for the main fans, but the main underground haulage is performed electrically, although for some of the subsidiary haulages and face conveyors compressed air has been considered more suitable. There are, however, electrically driven pumps aggregating a capacity of 60,000 gallons for hour from a depth of 1,620 ft. in the small pit, while 65,700 gallons per hour is pumped electrically in the Britannia pit. Electric motors are used for a variety of purposes on the surface, including the washing and screening plant, the workshops and for driving the rotary air-pump of the

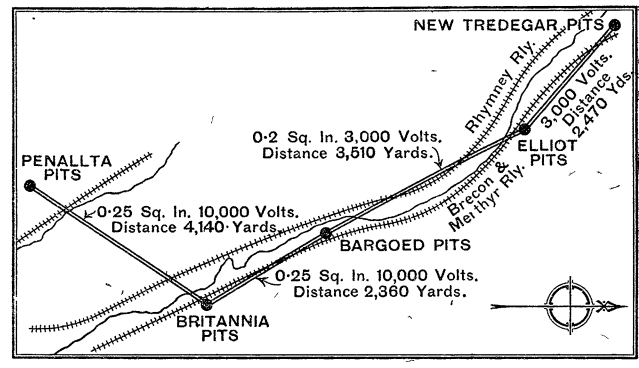

FIG. 1.—SKETCH MAP OF DISTRIBUTION SYSTEM.

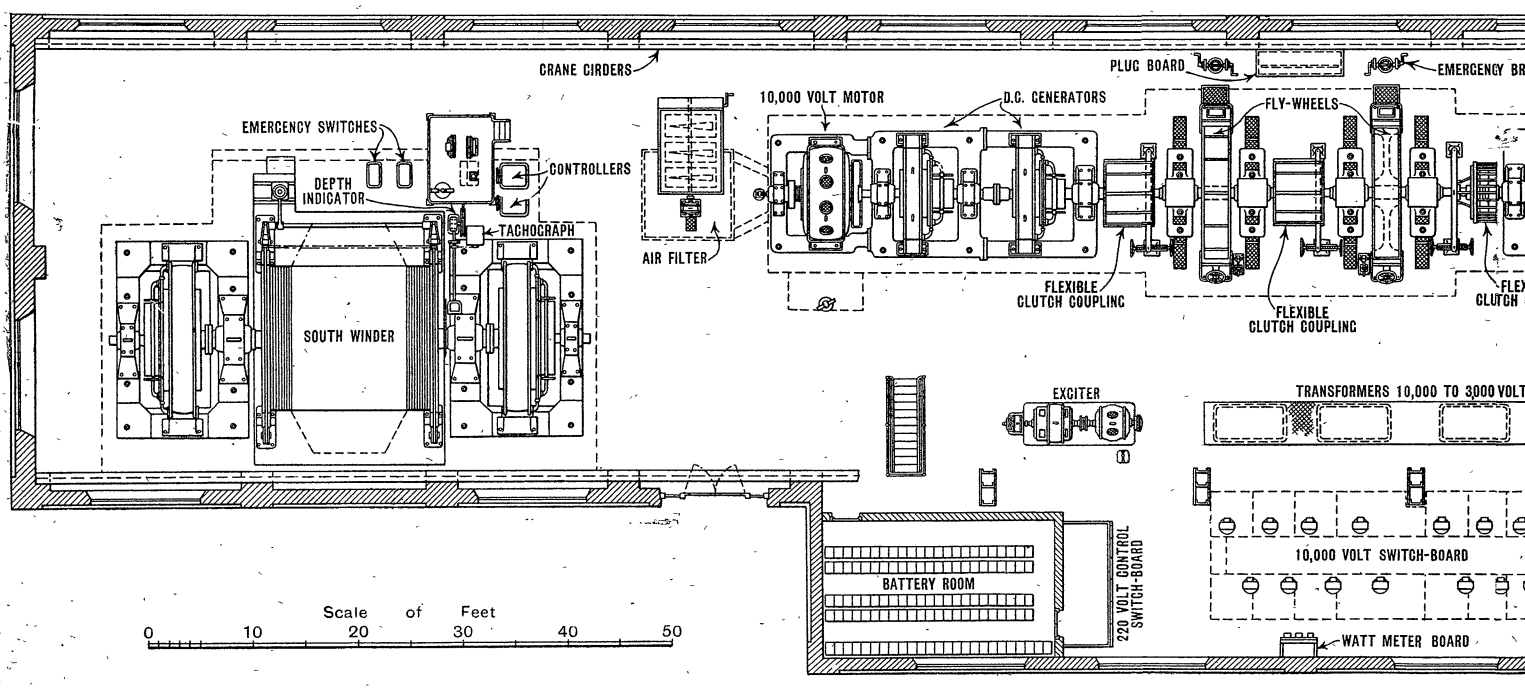
Westinghouse-Leblanc condenser, into which the winding engine of the South pit exhausts.



Waste heat is utilised in another form at the Penallta pits, where the principal item of the generating plant is a 3,000-kw. mixed pressure turbine, driven partly by the exhaust from the two large steam winding engines. At this colliery, which is situated in the Cylla branch of the Rhymney Valley, there are two shafts over 2,250 ft. deep, served by two Fraser & Chalmers steam winding engines, both situated in a large engine-house 300 ft. long by 70 ft. wide, containing all the machinery, including also the electric generating plant, under one roof. The original generating plant consisted of two 750-kw. A.E.G. alternators driven direct by slow-speed steam engines, and these were in use during the sinking of the shafts. Quite recently, however, the most important item of plant, a 3,000-kw. Westinghouse mixed pressure 10,000-volt turbo-alternator, has been put to work. This fine set is of the British Westinghouse Electric & Manufacturing Co.'s latest combined impulse and reaction design, and the alternator is rated at 3,000 kw., 10,000/11,000 volts, 50 cycles, at 1,500 r.p.m. three-phase. The alternator is self-ventilating, drawing air from conduits below the floor from an external intake, and expelling the warmed air from a "chimney" into the engine-room. An exact duplicate of this set is on order as a stand-by. The turbine takes the exhaust steam from all the steam plant in the engine-room, including the winding engines, which exhaust into a 36-in. main running the whole length of the building and connected to a large Rateau heat accumulator. It is anticipated that when the output of the colliery reaches 3,000 tons per day, during the coal winding shift, 1,700 kw. will be available from the exhaust steam, the balance of the 3,000 kw. being obtained by live steam. For this purpose

Hosted by Google

new boiler plant is being put down, and a large Babcock & Wilcox land type water tube boiler, capable of evaporating 30,000 lbs. of water per hour, the large size standardised in this type, has just been added to the eight smaller units of the same make, evaporating 10,000 lbs. of water per hour each. The new boiler is interesting as being fitted with a chain grate stoker capable of burning Welsh steam coal, an arrangement involving considerable deviation from the usual arrangement of the proportions of the furnace and boiler setting on account of the less readiness of this coal to give off gas during the earlier stages of its combustion as compared with more bitumenous fuel. Messrs. Babcock & Wilcox have for some time been experimenting with a view to this useful result, and this is one of the first large boilers which has been fitted up in this way, and demonstrates the success with which the difficulties have been overcome. The older boilers will all be fitted ultimately with mechanical stokers. The new boiler is provided with a short steel chimney, and works on the ejector induced draught system, in which a small jet of air is injected by an electrically driven fan in the centre of the chimney, avoiding passage of hot gases through the fan. This arrangement forms a great contrast to the tall brick natural draught chimney-shaft belonging to the older boilers. The water before reaching the boilers is treated by a Kennicott water softener.

The turbine exhausts into a surface condenser of 15,000 sq. ft. surface, with a Leblanc rotary air-pump, which together with the circulating pump are driven by a small steam turbine. A pair of Balcke cooling towers deal with the circulating water.

The switchgear in connection with the older alternators, like that at Bargoed, is of the A.E.G. carriage type, but the new 10,000-volt switchgear for the 3,000-kw. turbo-alternator was supplied by Siemens Brothers Dynamo Works, and is of the latest pillar pattern, with all operating handles, instruments releasing coils, &c., neatly mounted on cast-iron pillars on the engine-room floor level, and the actual oil switches and all other high-tension apparatus in fire-proof cells below. One of these pillars carries the Tirrill regulator by means of which, as already stated, the main voltage regulation will eventually be carried out. The connection between the 3,000-volt and 10,000-volt systems is made by a group of eight 1,000-k.v.a. Westinghouse water-cooled transformers, and 10,000 volts is the transmission line pressure from Penallta to the Britannia pit. At Penallta electric power is used to a considerable extent for pumping, and three 350-h.p. electrically driven Sulzer pumps for a head of 1,050 feet are provided in various parts of the mine. Eight fully enclosed motors are employed in connection with the tipplers and

screens, all driving through worm gears and entirely without belts. The underground haulage is at present worked temporarily by compressed air, but will ultimately be mainly electrical.

The only other generating plant at this group of collieries is a pair of 500-kw. exhaust steam turbo-alternators, and a 750-kw. set driven by a line steam reciprocating engine at the Elliot pit.

From an electrical point of view, the most interesting of the group of collieries is the new Britannia colliery at Pengham, which is now in process of sinking, and is at present entirely without steam plant, as power is derived entirely from the Bargoed and Penallta generating plants already described, and where a pair

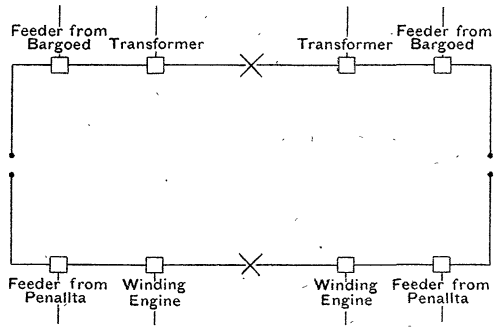


FIG. 3.—SKETCH SHOWING ARRANGEMENT OF BUS-BARS AT BRITANNIA PITS.

of the largest electric winding engines in the world are at work. As at Penallta, a prominent feature is the collection of all the machinery under one roof, but there is the important difference that the whole plant is electrical. The inclusion of winding plant in the same engine-room as other machinery is one of the points dealt with in the new Coal Mines Bill, and it is possible that if the Bill in its present form becomes law, that screens may have to be erected across the engine-room both here and at Penallta to isolate the winding engines from the rest of the plant, although it may be that in view of its quietness electrical plant may be ex-

Hosted by Google

empted from this requirement. A plan showing the arrangement of the plant is given in Fig. 2.

The sinking of these two shafts was commenced in June, 1910, with cranes, but when a depth of 185 feet was reached a pause was made till the completion of the electric winding plant, but sinking operations have

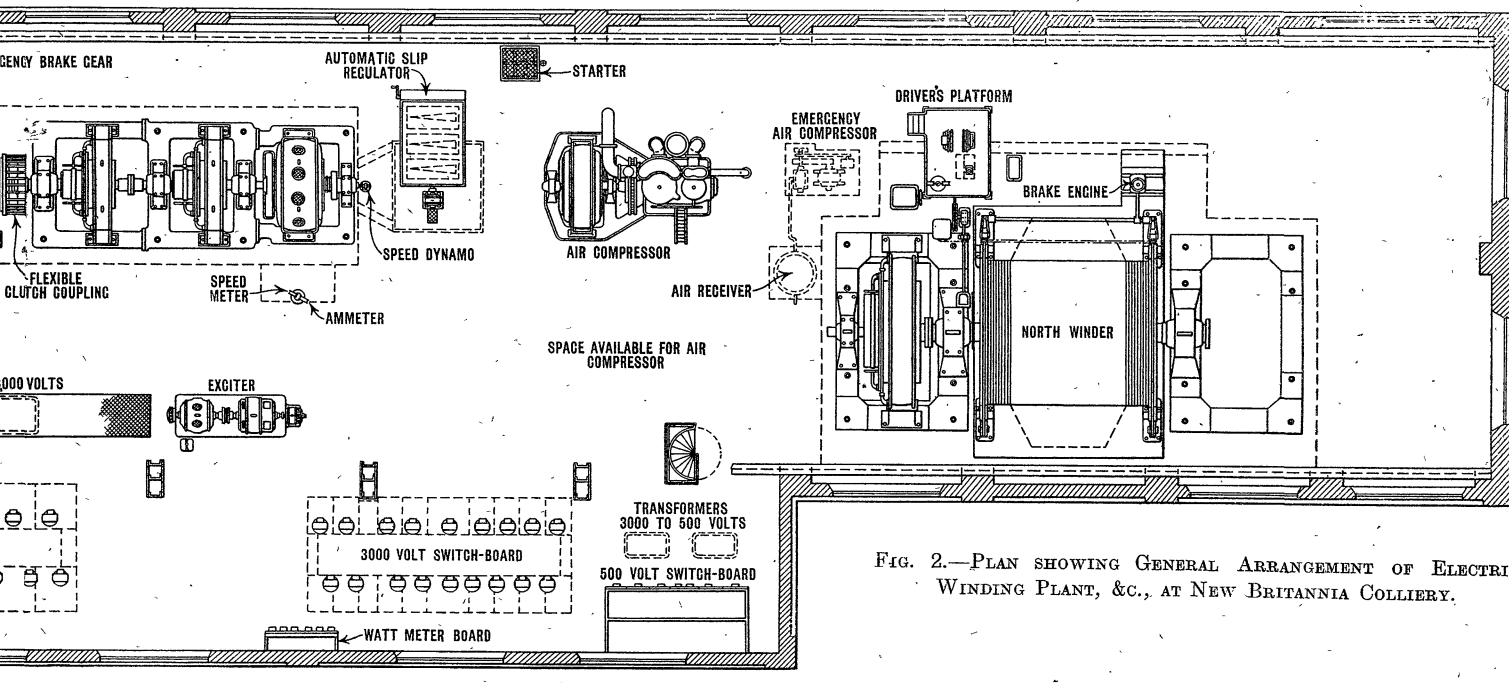

FIG. 2.—PLAN SHOWING GENERAL ARRANGEMENT OF ELECTRIC WINDING PLANT, &c., AT NEW BRITANNIA COLLIERY.

recently been recommenced with the winding engines, which have been fitted with temporary drums for the purpose. The winding plants are on the Ilgner system, and were supplied by Siemens Brothers Dynamo Works, Ltd., almost the whole of the electrical plant was made at the Stafford Works, and the mechanical parts of the gear, such as the drums, brakes, &c., were made by Messrs. Fraser & Chalmers as subcontractors. Indeed, it is notable that, with very minor exceptions, the whole of the new plant, both here and at Penallta, is of British manufacture.

The Ilgner system of flywheel storage, as applied to winding engines driven by continuous current motors with variable voltage control, is now well known, and is employed in a very large number of winding plants on the Continent as well as several in Great Britain The present plant is an example of the modification in which the flywheel is attached to a motor generator consisting of an induction motor of the slip-ring type driving a pair of continuous current generators, which supply current to the two large slow-speed motors direct coupled to the winding drum. The speed and direction of motion by the winding motors is controlled, as in the Ward-Leonard system, entirely by operating on the field of the generators, the armature circuits never being broken. The capability of the flywheels to store and give out kinetic energy is rendered available for storage of energy in the following way:—When the set is running light the flywheel runs at its full speed, the induction motor having as little slip as possible, but when a heavy call is made for power the "slip regulator" comes automatically into action, and switches resistance into the motor circuit, slowing down the set and allowing the flywheel to give up energy. When the demand for power decreases the converse takes place, resistance is switched out, and the motor and flywheel rise in speed, drawing power from the power station. Thus, notwithstanding the enormous peaks in the load on the winding motors, the current drawn from the station can be reasonably constant—and the plant capacity necessarily is far less than would be required were no such power storage available. Also it will be readily seen that the method of control by variation of the voltage applied to winding motors renders regenerative braking possible, with a considerable saving in power consumption, as well as permitting of a single lever to accomplish the whole of the starting, stopping, speed regulation, and electric braking.

This brief reminder of the general principle of the Ilgner system as applied by the Siemens firms will elucidate the relations between the ratings of the machines forming this equipment. Each winding drum is coupled to two motors, one at each end, and each is rated at a maximum horse-power of 2,160 and a normal output of 1,300 h.p., they run at a maximum speed of 62·8 r.p.m., and the voltage at the armature terminals varies from 0 to 600. They are separately excited from a 220-volt circuit derived from separate motor generators. They are 16 pole machines with interpoles as well as distributed compensatory windings to perfect the commutation, and the commutators are built in two portions, with ventilating channels between them.

The two flywheel sets, one for each winding plant, consist each of an induction motor, two continuous current generators, and a 33-ton solid steel flywheel running at a maximum speed of 500 r.p.m., and capable of storing 30,000 foot tons. The two sets are placed in line, and can be coupled together, so that when both plants are winding coal each will assist in dealing with the peaks of the other. Further couplings are provided between each motor generator and its flywheel, so that the set can be run in any one of the following ways:—Either motor generator alone with one or both flywheels or without a flywheel, both motor generators entirely without flywheels, or the whole coupled up together. The flywheels are cased in, and their bearings are water-cooled with forced lubrication. At present, during sinking, only one motor generator is in use, each of its two generators supplying a single motor on each winder. Also the induction motors have their stator circuits temporarily connected in mesh, with current transformed down to 3,000 volts on their terminals, whereas when winding is in full swing they will be star connected and supplied at the full transmission pressure of 10,000 volts. When coal is being raised from the full depth of 2,190 ft. at the full rate of one complete wind per minute, or 360 tons per hour, the maximum demand of the winding motors will be about 4,850 h.p., but the constant load put into each motor generator will

Hosted by Google

not exceed 1,850 h.p. The two generators (one for each winding motor) on each Ilgner set are designed for 1,730 kw., or 2,830 amperes maximum, and 1,035 h.p., or 1,720 amperes normal, at 425 to 500 r.p.m., and work up to 600 volts. They are eight-pole machines with interpoles, compensating winding and double commutators similar to those of the winding motors. The excitation of the generators is drawn from separate motor-driven exciters, but a battery is provided as stand-by capable of allowing the winding engines to continue working after a cessation of supply until the energy stored in the flywheels is spent. The battery serves also as a stand-by for lighting.

The induction motors are designed for 10,000 volts, 91 amperes per phase, and an output of 1,750 h.p. continuously. The slip-ring voltage reaches 700 volts and the machines are of the enclosed self-ventilating pattern, drawing air from below the floor and expelling it through apertures around the stator frames. The slip regulators are of the liquid type, controlled by series transformers in the motor circuits, the secondaries of which supply current to a small induction motor unable to revolve, but arranged to cut in or out more or less of the liquid resistance, according to the torque on the motors.

The winding engines are provided with devices for preventing too rapid acceleration and overrunning by mechanisms which interlock the depth indicator and the control lever, thus making it impossible for it to be put over too rapidly at starting, and returning it to the zero position automatically at the end of the wind and applying the brakes, should the driver omit to do so. Excellently arranged mechanical working and emerging brakes are provided, actuated mainly by compressed air and electrically interlocked with the current supply, in addition to the provision for electric braking.

The main switchgear is of the Siemens pillar type, similar to that at Penallta. The 10,000-volt bus-bars are arranged in a ring with two sections, as indicated diagrammatically in Fig. 3. Each section has one incoming feeder from Bargoed or Penallta, and if there should be a failure on any part of the board supply, can be continued through another portion. The 3,000-volt gear is of generally similar construction, and a separate 500-volt board provides for the smaller motors and a continuous current board contains the necessary connections and instruments for the winding engine circuits.

The duplicate overhead 10,000-volt line from Penallta is of 0·25 sq. in. copper, designed to transmit 2,000 kw. at 0·7 power factor with a 4 per cent. drop of pressure. Similar sized lines are brought from Bargoed, and the Merz-Price system of protection with Reyrolle relays is used for all the overhead lines as well as for the large transformers.

There is also in the main engine-room a Belliss & Morcom air compressor, driven by a Lahmeyer 3,000-volt 400 h.p. motor running at 290 r.p.m., and other electrically driven plant at the colliery includes temporary hoists for the staging, &c., used in the sinking of each shaft, driven by 130 h.p. motors, and another temporary air compressor driven by a 130 h.p. motor

The plant at these three collieries was visited on September 14th by a large party of members of the Institution of Mining Engineers and others on the occasion of the annual meeting at Cardiff, and the Powell Duffryn Company, who are justly proud of this example of up-to-date mining electrical engineering, showed much kind hospitality to the party. It is to the opportunity thus afforded and to the personal assistance of Mr. C. P. Sparks, under whose supervision as consulting engineer the work was carried out, that we are indebted for the material that has enabled us to compile this article, with the kind permission of Mr. G. Hann, the manager of these collieries.

THE ASSOCIATION OF MINING ELECTRICAL ENGINEERS

Conference in Glasgow.

THE Association of Mining Electrical Engineers held its annual meeting at the Scottish Exhibition at Glasgow on October 6th. The proceedings opened with a meeting of the General Council in the forenoon. A luncheon followed in the Atholl Restaurant at the Exhibition, and subsequently the annual meeting of the Association took place. In the evening members and lady friends attended a reception given by the Glasgow Corporation in the City Chambers. A varied programme of sight-seeing was arranged for the Saturday, including several large generating stations in the district.

Mr. W. Maurice (Nottingham), the President, occupied the chair at the luncheon, which was attended by about 200 members. Mr. A. Anderson proposed the toast of the Glasgow Corporation, which was replied to by Bailie Campbell. Mr. C. A. Carlow, President of the East of Scotland Branch of the Association, replied to the toast of the Mining Industry, proposed by Mr. W. C. Mountain, Newcastle, and referred to the great burdens which were now being put upon the coal trade.

Mr. D. M. Mowat (Coatbridge), gave the toast of "The Association," and the President, in his reply, emphasised that their Association was not a rival to any existing Society.

At the annual meeting in the afternoon, which was presided over by Mr. W. Maurice, the following office-bearers were elected:—*President*, Mr. W. Maurice (Nottingham); *Vice-Presidents*, W. C. Mountain (Newcastle) and Prof. W. Robinson (Nottingham); *Treasurer*, Mr. C. F. Jackson (Nuneaton).

The report of the Council was to the effect that the Association was making rapid progress during the year. Branches had been formed in East and West of Scotland, bringing the total number up to 10, and the total membership was now about 900. The first examinations were held at various centres on March 11th and 18th, 1911, and proved highly successful, the number of candidates being 74, of which number 32 passed for first-class certificates, 26 for second-class certificates, 5 for service certificates, and 11 failed.

The President, in the course of his address, said that the Association entered that day on the third year of its existence as a technical society, and upon its first full session as an incorporated body. He explained that the essential object of the Association was to encourage the use of right materials and right methods, and to cultivate a feeling for honest craftsmanship. What they as an Association wanted to produce was thoroughly capable and reliable colliery electricians.

Three forms of portable electric lamps fitted with a fire-damp detecting device were on view, and their working was explained by the inventor, Mr. Ralph, and thereafter Dr. Fries explained his apparatus for automatic artificial respiration. In recognition of his services as examiner for the Association, Dr. W. M. Thornton, Newcastle, was presented with a gold watch.

At the reception at the City Chambers in the evening there was a company of about 600 ladies and gentlemen.

The Lord Provost (Sir Archibald M'Innes Shaw), in welcoming the guests, said that electrical apparatus in mines got over the difficulties incidental to mining in a way that no other form of machinery would possibly do. He looked to the Association to improve the methods of installation and maintenance of electrical plant in mines, and prophesied that before long no man would be allowed to handle electrical apparatus in a mine who did not hold a certificate from the Association. Mr. W. Maurice, the President, replied.

West of Scotland Branch.

On October 20th the West of Scotland Branch of the Association held its opening meeting at the Technical College, Glasgow. Mr. Alexander Anderson, who has been elected local branch President for a second term, delivered his presidential address, in which he pointed out that many accidents attributed to electrical causes could have been avoided if a more widespread and general knowledge of the subject was held by those whose business it was to be identified with its use. The Association should make a special effort to assist motor men and others in charge of electrical apparatus and plant in collieries, as seven out of every ten breakdowns were due to a lack of superficial knowledge on the part of those in charge.

The Chairman (Mr. M. Brown) intimated that the Council had under consideration the giving of lectures at outlying collieries for the elementary instruction of those interested. A discussion of this suggestion was invited, and taken part in by Messrs. W. L. Spence, A. W. Jones, James Caldwell, H. McGuffie, and W. A. Wilson. The matter was afterwards further explained by Mr. Muirhead, who acted as secretary in Mr. Martin's absence.

East of Scotland Branch.

The opening meeting of the East of Scotland Branch was held on October 21st, at the Heriot Watt College, Edinburgh. Mr. C. A. Carlow (Fife Coal Co.), was in the chair. Mr. Davidson intimated his resignation as secretary of the branch. Mr. R. H. Willis (British Electric Plant Co.), was appointed.

A Paper, entitled "Electricity in Connection with Explosives," was read, in which the author (Mr. E. Kilburn Scott) emphasised the important part played by electric light and power in the safe manufacture of explosives. The equipment of an explosive factory with electrical plant was almost exactly the same as equipping a gaseous coal mine with electricity. The same precautions had to be observed as regards protecting the lamp bulbs by strong water-tight fittings, whilst cables had to be armoured and carefully laid, so that they would not be injured by moving machinery. Earthing was important, and was even more carefully carried out than in a colliery installation, as the risks were greater, so that even the workmen were earthed by wearing shoes with copper rivets in the soles. Although there was admittedly more risk in an explosive factory, as compared with a gaseous coal mine, the suggestion to do away with electric light and power at such factories, and to substitute miners' safety lamps and compressed air machinery would be ridiculous. It was the introduction of up-to-date electrical plant, and the careful study of the various risks of those familiar with electrical phenomena that had made modern explosives possible. The discussion was joined in by Messrs. G. Winthrop, R. W. Peters, R. H. Willis, and ultimately adjourned till next meeting.

Yorkshire Branch.

The first meeting at Leeds was held in the Enginering Lecture Theatre of the University of Leeds, on October 28th. Mr. R. Holiday was in the chair. Mr. E. Kilburn Scott gave an address, pointing out the objects of the Association, and what has already been done, &c., and also read his Paper on "Electricity in connection with Explosives," referred to above. A Paper was also down for reading by Mr. J. A. M'Lay on the use of turbine pumps in collieries.

Warwickshire & South Staffordshire Branch

A meeting of this branch was held on Saturday last, October 28th, at Birmingham. There was a good attendance of members. The Branch President gave a brief account of the annual general meeting of the Association held in Glasgow. He also exhibited a specimen of twin double armoured bitumen insulated cable, specially made for colliery use; where it is in use it has given every satisfaction. The discussion was then taken up by Mr. Willis's Paper on "Turbine Pumps for Mining Work." Some of the members considered the author was not very partial to the ram pump, which possessed several advantages over the turbine pump, although exceeding them in capital cost.

ELECTRICITY IN MINES IN SCOTLAND

IN a pamphlet circulated at the annual meeting of the Association of Mining Electrical Engineers at Glasgow, giving some general notes on the Scottish coal fields, it is remarked that the first electrical installation at a colliery in the world, was put down at Earnock Colliery in the Hamilton District in the year 1879. The late Lord Kelvin advised the erection of a dynamo to light the pit bottom of this colliery. A "Gramme" machine capable of lighting 30 lamps was supplied by Messrs. Anderson & Munro to the order of the late Sir John Watson, and was installed as an experiment under the direction of Professor Jamieson. It proved so successful that shortly afterwards three Siemens Dynamos capable of lighting 60 lamps each were introduced to light the pithead arrangements, and extending the pitbottom lighting to the stables and main roads. Practically every mine in Scotland has now adopted Electrical Power very extensively for lighting, pumping, hauling, coal-cutting, face conveying, and ventilation, and in a few cases for winding. The generating plants represent the latest developments in high speed engines; high pressure, mixed pressure, and exhaust turbines with all their latest adjuncts in the form of air filters, condensing and water cooling apparatus. The principal stations vary in capacity from 500 to 2,000 kw. and fairly well represent the leading makers of turbo-generating plant. Up till a few years ago the installations were entirely of the continuous current type, but in recent years, with the introduction of the central station for groups of collieries, high tension 3 phase transmission has become fairly common, and is now considered quite good practice from the switchboard to the coal face sub-stations. There is still a feeling, however, that in the case of small fields, not deep and requiring a moderate amount of power, the continuous current system at medium voltage is very suitable. Scottish mining companies, profiting by their early experience of having a wide range of direct current voltages, early recognised the necessity for standardising both voltage and periodicity in the case of alternating current, with the result that nearly all private installations have adopted 50 periods 500 volts as their standard for medium pressure. Unfortunately the same cannot be said of the principal power companies in the various Scottish coal fields, who have adopted different periodicities and voltages.

This has been a drawback in many cases, resulting, as it does, in apparatus not being interchangeable in the case of a colliery company which may want to augment their own supply from the Power Companies' mains, or who may have collieries situated in different areas of public supply. In a few cases current is supplied by one or other of the Power Companies exclusively, and collieries are already drawing coal, which are supplied entirely throughout from the coal cutter to the winding gear from the Power Companies' mains. The tendency, however, is for the Colliery Companies who use Electrical Power extensively to generate for themselves, and where it has been possible to instal Mixed Pressure or Exhaust Turbines the capital outlay has been justified by the good and economical results obtained.

THE AVOIDANCE OF ELECTRICAL ACCIDENTS IN MINES

MR. GEORGE GIBB presided at a joint meeting of the Scottish Branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers on the 30th September, in the Heriot Watt College, Edinburgh. The Paper submitted for discussion was that on "Electricity in Mines—the avoidance of Accidents," read by Mr. Robert Nelson, H.M. Electrical Inspector of Mines, in 1909 before the Institution of Mining Engineers (see ELECTRICAL ENGINEERING, Vol. V., page 527, and Vol. VI., page 59).

Mr. George L. Kerr (Glasgow), in referring to fire-damp explosions, said that the stringent regulations embodied in the new Coal Mines Bill regarding the installation and use of electricity in collieries was due to accidents suspected of having been caused by electricity. Fire-damp would ignite by the flame from a defective safety lamp, and as these lamps are considerably in excess of electrical apparatus underground, one could not help realising where the greater danger lay. Mr. M'Phee (Holytown) spoke in defence of compressed air for underground operations, and Mr. J. M'Luckie (Larkhall) mentioned that armoured cable, if properly installed, was better than unarmoured cable, but if it was faulty it was more dangerous. Mr. J. Parker (Cowdenbeath) was opposed to the introduction of electricity into collieries where there was any danger of an ignition of fire-damp. He considered compressed air as a means of transmitting power was not inferior to electricity, but some pneumatic tools produced were not capable of performing their work satisfactorily, due to faulty design and construction. Professor Baily (Heriot Watt College) said it ought to be recognised that the conditions of electrical engineering underground were much more difficult than those above ground, and safety could not be obtained until it was acknowledged that the cost of installations underground was bound to exceed those on the surface.

Steam v. Electric Winding.—A discussion on electric winding, arising out of a Paper by Mr. F. Thursfield, read at a former meeting, was held at the beginning of last month by the Midland Institute of Mining, Civil and Mechanical Engineers. A communication was read from Mr. G. Hann (Powell Duffryn Steam Coal Co.), who thought that where steam was already available steam winders in conjunction with exhaust steam turbines were more economical than electric winding, unless power could be obtained from a power company at less than 0·25d. per unit. The province of the electric winder was, in his opinion, at a colliery, where boilers could be entirely dispensed with and the generating plant could be concentrated at neighbouring collieries and power obtained from coke-oven gas or exhaust steam. The increased economy obtainable by adding exhaust steam turbines to steam winders was also referred to by Mr. J. A. Watts, and Mr. C. E. Rhodes emphasised the greater steadiness of electric winding. Mr. Thursfield, in his reply, said that it was generally admitted that with a well-designed electric winding scheme, the actual fuel consumption, taken over the whole year, would be less than with steam.

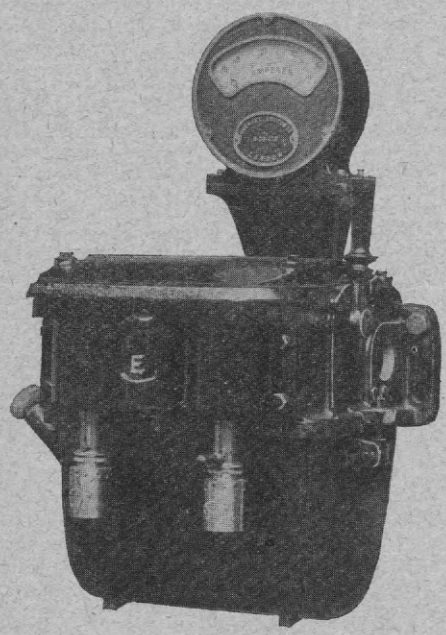
Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during October.

October 5th.—Monthly supplement on "Electrical Engineering in Mines," in which two illustrated articles on colliery generating plants and electrical equipment are included, and a new electric miners' lamp is described. An account is also given in the special exhibition supplement with the same issue of Messrs. A. Reyrolle & Co.'s exhibit of mining and other switchgear, including their striking experimental demonstrations of the flame tight qualities of the method of enclosure they adopt. Various exhibits relating to mining switchgear, cable boxes, instruments, telephones, &c., are also given.



October 12th.—Fourth Olympia exhibition supplement includes descriptions of a special design of motor for running under water, a special induction motor with enclosed sliprings, and several other exhibits of motor switchgear, &c., relating to mines.

October 19th.—Fifth Olympia exhibition supplement, including illustrated description of a cable sinking drum for mines. A new form of high-speed generator.

October 26th.—Illustrated description of a large Diesel engine set. Article on some new H.T. switchgear. Sixth notice of the Olympia Electrical Exhibition, containing illustrations of motor-control apparatus and other novelties.

PROPOSED ALTERATION IN THE CONSTITUTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

FAR-REACHING and drastic changes are proposed in the constitution of the Institution of Electrical Engineers, and will be submitted to a meeting of Members and Associate Members at 4.30 p.m. to-day (Thursday), and we urge all Members of these two classes who can attend to be present. Notices convening the meeting, and enclosing a draft of the new Articles of Association proposed, were only received last Thursday, and as the alterations are of considerable magnitude, an attempt will be made to induce the President and Council to adjourn the voting on the resolution to a subsequent meeting, to allow formal notice to be given of amendments. This proposal for adjournment to a later date will, we trust, be accepted, but in any event it will be in order to discuss the details of the proposed changes to-day. It is true that even if the new Articles of Association are accepted to-day *en bloc* as they stand, the resolution must necessarily be confirmed by a second special meeting, to be held from a fortnight to a month later, but at this formal confirmatory meeting it would only be possible to pass or reject the resolution.

The Committee to which the Council has relegated the revision of the Articles of Association has evidently attacked the arduous task in an earnest and painstaking manner, but it would have been almost impossible for the Committee to remodel the Articles in such a way that no detail in the new draft should prove unacceptable to some section of the membership, and it is the Associate Members of the Institution who will not approve of the innovations proposed. We may point out that more than two-thirds of the total Corporate Members are Associate Members, and although they have at present only one representative on the Council, it is certainly desirable that full consideration should be given to their views.

The Council proposes to make an effort to enrol as Associates more persons who are not electrical engineers, and also to create a new class of "Licentiates," whose only qualification is to be that they are over 23 years of age, of good education, and employed in an engineering or scientific capacity in the applications of electricity. Support must naturally be accorded to any effort to increase the power of the Institution by adding to its numbers all who are usefully connected with the industry in any capacity, but these new adherents with minor qualifications must not be permitted to have titles which will place them nominally, and in the eyes of the public, on an equal rank to the more experienced and fully qualified Associate Members. The title "Licentiate" implies recognition of proficiency and licence to practise, which the Institution has no right to accord to juniors with practically no experience. It is also proposed to give Associates who are not electrical engineers an absolute right to equal representation on the Council to Associate Members. Lastly, the Associate Members may also complain that the proposed new Articles indicate a desire on the part of the Council to elect as full Members gentlemen who do not possess the qualifications for Associate Membership. There are at present on the roll of the Institution a number of Members, elected in the days when the conditions were easier, who, if they sent in their application to-day, would not qualify even as Associate Members. Applications from additional persons with similar qualifications would under the existing Articles of Association meet with the reply that the Council had no power to elect them as Members, but under the proposed new Articles the Council is given far wider powers to elect non-engineering Members, and their reply would have to be one far harder to give, namely, that they would not (instead of that they could not) elect the candidate.

Another serious change indicated in the proposed new Articles of Association is in the method of election of Council. Hitherto the outgoing Council has nominated a Council for the ensuing year and has invited alternative nominations from the membership. Now it is proposed that any nominations from outside the Council Chamber must be made about three months before the election, and that if the Council's nominations, which are made about two months later, include these names, there shall be no ballot, so that the membership is placed in such a position that it is compelled to accept the outgoing Council's nomination of their successors, and is practically deprived of the power of electing its representatives. Such a proposition cannot possibly be agreed to; we can only believe that it has arisen through an oversight in drafting the proposed new Articles, and we do not doubt that the amendment opposing this new rule, and placing the election of Council on a more popular basis, will be cordially supported.

As has already been announced in the Council's report last summer, the subscriptions of Members, Associate Members, and Associates, are to be raised, and examinations for new Associate Members and Students are to be introduced in 1913. Other alterations proposed in the draft Articles of Association are the inclusion in them of the rules for "Professional Conduct" of Consultants, an arrangement by which each Local Section has the option of sending up either its Chairman or Past-Chairman to represent it at Council meetings, and an Article giving the Council unfettered discretion in arranging for the incorporation of any kindred society with the Institution.

We trust that every Member and Associate Member of the Institution of Electrical Engineers who reads this notice this morning will make an effort to attend the meeting at 4.30 at the Institution building on Victoria Embankment. The Council, we are convinced, will prefer to profit by this opportunity of ascertaining other views than their own on the new proposals, and if the attendance at the meeting indicates to them that it would be wise to postpone the adoption of the new Articles of Association until the 1,331 Members and 2,809 Associate Members of the Institution have had further time to express their opinions on them, we feel sure that they will do so.

Electric Chime-Striking Mechanism.—We are asked by Messrs. Gent & Co., Ltd. (Faraday Works, Leicester), to state that the clockwork chiming gear and striking mechanism exhibited by them at Olympia and described on page 582 of last week's ELECTRICAL ENGINEERING, are fully covered by patents.

Electrically-heated Bakers' Ovens.—According to the *Elektrotechnische Zeitschrift*, the Municipal Electricity Works of Vienna has offered to place electrically-heated ovens at the disposal of members of the Bakers' Association of that city free of charge, and to guarantee that their use will not entail any increase in the working costs. The experiment is being made to demonstrate the advantages of electric heating for this purpose, foremost among which are cleanliness, evenness and certainty of baking, and small space required.

The Generators.—This mystic society gathered in its full force of 66 units for the first dinner of the season on Friday last, October 27th, at the Imperial Restaurant, Regent Street, under the genial presidency of Chief-Generator Chisholm. It is an exceptional pleasure in these days to attend an electrical engineering function in which the staid formalities of evening dress and after-dinner speeches are expressly debarred by the rules. Dry toasts—dry, of course, only in the sense that they are unaccompanied by speeches—are the order of the day with The Generators, and even these are officially limited to two, though unofficially many a toast was spontaneously proposed and always well responded to. Owing to the exertions of the versatile Scribe Corneille, who, apparently, has an equally large circle of good and talented friends in the musical world as in the electrical world, the concert following the dinner was of a most varied and excellent character. We condole with those electrical men who have not yet been able to enrol themselves amongst the mystic 66.

A MOTOR CAR LIGHTING SET

AMONG the exhibits at the forthcoming Automobile Exhibition at Olympia is a new design of car lighting dynamo equipment, which will be shown by S. Smith & Son (9 The Strand, W.C.), and is produced by them in conjunction with the British Thomson-Houston Co., Ltd., of Rugby.

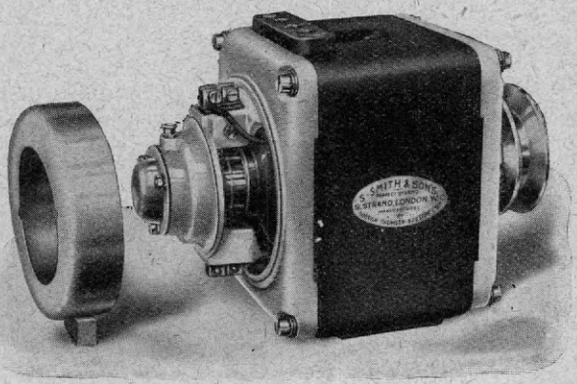

FIG. 1.—B.T.-H. CAR-LIGHTING DYNAMO.

The equipment, with the exception of the instruments, is of British design and construction, and for size, lightness, and output is claimed to be in advance of anything of the kind that has yet been put on the market. The dynamo itself differs from most of those at present in use in that it is an ordinary type of dynamo with no subsidiary poles or mechanical governors. Great reliability should therefore be secured. A view with the cover removed to show the brush

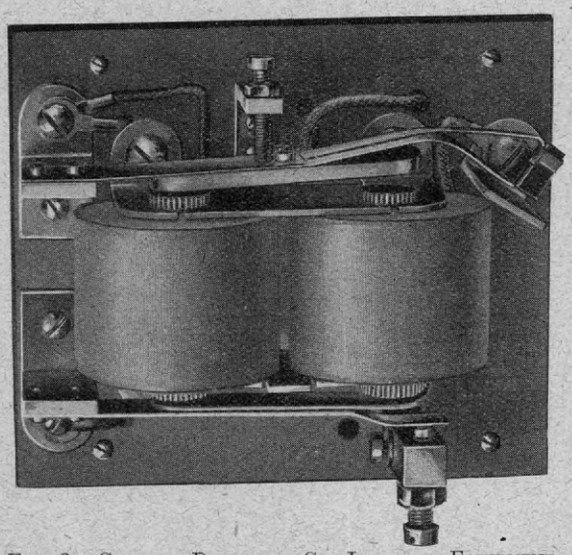

FIG. 2.—CONTROL DEVICE OF CAR-LIGHTING EQUIPMENT.

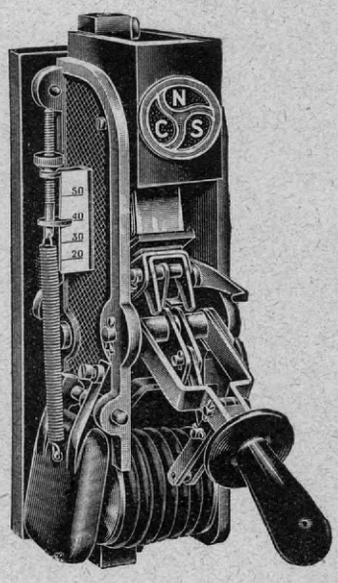
gear is given in Fig. 1. The patented automatic electrical control device, illustrated in Fig. 2, is a most ingenious piece of mechanism, and is designed to cause a constant output of 8 amperes to be supplied to the accumulator, whether the speed of the car be 12 or 50 miles an hour. This device is contained in a neat case on the dash-board provided with ammeter, voltmeter, and a row of six control switches. This equipment will be shown in operation.



The Batti-Wallahs.—This society of good fellows of the electrical industry has completed the arrangements for its programme for the season 1911-12. The programme includes four smoking concerts, four informal meetings, and the annual dinner. The first of the smoking concerts takes place on Friday next, November 3rd, as announced in our "Arrangements for the Week" column. The programmes at these smoking concerts are always excellent, and we have often wondered how it is they do not attract a very much larger audience. We are informed that the membership of the society has had a considerable recent increase, due to the excellent fare afforded by the committee during the past season, and we can thoroughly recommend membership of the society to anyone wishing to pass a pleasant evening with his fellow electrical men.

ELECTRICAL EXHIBITION AT BRIGHTON

THE Mayor of Brighton, Alderman C. Thomas-Stanford, J.P., opened an electrical exhibition at the Aquarium on Saturday last. In his opening speech, he recalled the rapid advance electricity had made in the town, and gave the following interesting figures; since 1892 the number of consumers had steadily increased from 213, until to-day there are no less than 5,239 connected to the supply. The lamps connected in 1892 numbered 11,000, whereas now there are 375,099, representing some 10¼ million units. He also said that the undertaking had always paid its way, and during the 20 years of its existence it had relieved the rates to the extent of £14,000. These returns, however, are chiefly due to lighting, and it is the object of this exhibition to bring home to the people the economy of using electricity for heating purposes. A special feature is, therefore, being made of electric cooking. Messrs. Muttons are cooking the whole of the requirements for their restaurant in the King's Road on the apparatus at the exhibition. Mr. Christie, too, has apparently put aside his characteristic modesty on this occasion, as he is, personally, giving practical demonstrations in using the apparatus three times daily. With the small unrestricted flat rate of 1d. per unit recently passed by the Council for heating and cooking, the latter should soon become popular with the people. The exhibits are fully representative of the many uses to which electricity can be put, and practically everything that was to be seen at the Olympia Exhibition is on view at the Brighton Aquarium. We are glad to hear that the exhibition, which has been advertised all over the town, has already met with a hearty response from the public.

A NEW CIRCUIT BREAKER

MESSRS. NALDER BROS. & THOMPSON, LTD., of 34 Queen Street, E.C., have just placed upon the market a circuit breaker, of the pattern illustrated here, of which examples were shown on their stand at Olympia. The apparatus is compact in design, although of robust construction, and is fitted with magnetic blow-out and loose handle, although carbon breaks can be supplied if preferred. The breaker can be supplied in various forms, either as an overload with or without time limit, reverse current, or overload and reverse current combined. The tripping mechanism is new; it possesses the advantage of being extremely light to trip. The effort required to release the breaker is extremely small, but at the same time there is not the slightest possibility of it opening accidentally. Being of the loose-handle type it cannot be replaced while the overload is still on. It can be tripped by hand, therefore it combines the properties of a circuit breaker with the advantages of a switch.

N.P.U. CIRCUIT BREAKER.

OBITUARY

J. C. FULLER.

WE regret to record the death at the advanced age of 91 of Mr. John Crisp Fuller, whose name is familiar to many in connection with the Fuller bichromate battery. Born in Bristol in 1821, Mr. Fuller early came to London and identified himself with electrical and telegraph matters, having been for a while a temporary assistant of Faraday. In 1854 he joined the Electrical and International Telegraph Co., and did pioneering work with batteries and land lines. Three years later he turned his attention to rubber-covering machines with Messrs. Silver & Co. (now the India-rubber, Gutta-percha, and Telegraph Works Co.), and before founding his own firm of J. C. Fuller & Son he was associated also with Mr. W. T. Henley.

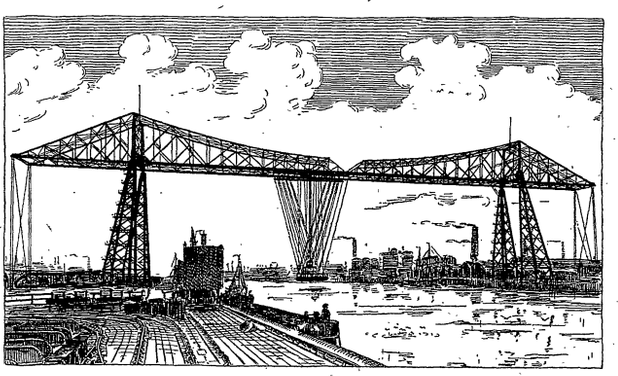
ENGINEERING EDUCATION

MR. W. CRAMP delivered his inaugural address as chairman of the Manchester Local Section of the Institution of Electrical Engineers on Friday last, and chose as his subject a general discussion of some of the problems of higher education, confining himself to engineering for purposes of illustration. As the importance of science as the basis of education had been realised, there had been a great tendency to carry matters too far, and to praise curricula crowded with disjointed science subjects, to the vital neglect of the "humanities." In a general scheme the consistent co-ordination of the various paths leading from the infant school to the finishing school or university should be aimed at with the planning of higher education, so that it is correlated with the succeeding paths in life. He pleaded for wider scientific knowledge and wider general culture. Higher education, as at present carried out, tended to produce a specialist at an impossibly early stage in his career, instead of a well-informed and broad-minded man. Reform in such directions would fit in with the scheme of education proposed by Dr. Pohl, for it would standardise a general curriculum in all technical schools and colleges throughout the country for the first three years of training, while higher training than this could be given at scholarship aided centres. Thus the advanced textile school could be at Manchester, and the advanced electrical school could be in London. In the general course no distinction between pure and technical science should be made. The method he advocated was the simultaneous teaching and correlation of all the usual subjects. Physical, chemical, and mechanical phenomena and relations should be linked up, and the similar principles pervading them should be traced in their different aspects. Mr. Cramp gave several examples illustrating his meaning in the laws of energy, transformation, current flow, &c. Passing on to the equally necessary parts of education which dealt more with social aspects and the development of qualities of mind, apart from the mere provision of the scientific materials required in the profession to be followed, Mr. Cramp outlined some of the conditions existing at the older universities, and dwelt on the difficulties in obtaining such advantages at non-resident "universities" of the newer type. He emphasised the importance of the principals and teaching staff being in the best sense of the words men and gentlemen, and pleaded for much greater freedom of action for the students, as developing a higher "co-efficient of self-instruction," greater power of initiative and individual responsibility. He urged the importance of good literary form being required in all such work as writing reports of experiments, &c.

In conclusion, his recommendations may be summed up as follows:—The division of technical colleges and universities into two sections, viz., the general and the specialised. The arrangement of a course suitable for each of the five great professions (medicine, law, engineering, architecture, and theology) at every "general" school. The teaching of the science appropriate to the profession to be as broad as possible. In non-residential colleges the provision of adequate social and æsthetic activities, giving special attention to: A most carefully selected principal and staff; avoidance of unnecessary restraint; an arrangement by which the student should know that he was dependent upon his own efforts to remain at college; proper opportunities for social intercourse, not only between student and student, but also between staff and student; and definite official encouragement of university unions, literary and debating societies, and æsthetic and athletic clubs.

The address was followed by a very successful smoking concert.



Sir William Ramsay and the Coal Supply.—The statements made by Sir William Ramsay, K.C.B., F.R.S., in his Presidential Address to the British Association (ELECTRICAL ENGINEERING, September 7th, p. 499) regarding the exhaustion of the coal supply of Great Britain have been brought to the notice of the President of the Board of Trade. In reply to a question by Mr. Touche on Monday, he stated that Sir William Ramsay had omitted to take into account the amount of coal in fields unproved at the time of the inquiry by the Royal Commission, and the amount of the coal lying below 4,000 ft., which it might yet be found possible to work. The suggestion that the Government should impose a penalty on wasteful use of coal would, added the Home Secretary, involve an amount of control over the industries of the country it would be impossible for any Government to undertake. On the question of limiting exports, Mr. McKenna quoted the report of the Royal Commission to the effect that the maintenance of the export trade was essential to the prosperity of the coal districts, and that they saw no reason to restrict it artificially.

THE MIDDLESBROUGH TRANSPORTER BRIDGE

SCHEMES for the improvement of facilities for the crossing of the River Tees at Middlesbrough have been in the air for some years, but it was not till July, 1907, that the Middlesbrough corporation finally obtained their Act for the construction of a transporter bridge. The contract for the construction was given in June, 1909, to Sir William Arrol & Co., Ltd. (Glasgow), and in August of that year the foundation-stone was laid, and on October 17th last the completed bridge was opened by H.R.H. Prince Arthur of Connaught.

The general arrangement of the bridge is shown in the sketch, and the following are some of the leading dimensions:—Total length of bridge and approach span, 850 ft.; span across the water between the centre of the towers, 570 ft.; height from the high-water mark to underside of girders over the river, 177 ft.; total height of towers, 225 ft. The total weight of the steelwork is 2,600 tons in the bridge and 600 tons in the caisson foundations.

The bridge is built on the cantilever principle, and the extremities of the main span are anchored and secured to concrete anchorage blocks on each bank of the river by

THE MIDDLESBROUGH TRANSPORTER BRIDGE.

sixteen wire ropes embedded in the concrete. Each rope is capable of withstanding a breaking strain of 300 tons. From the main span is suspended the travelling car, the floor of which is level with the roadway on either side of the river. The car, the dimensions of which are 44 ft. by 39 ft., is capable of completing the journey from shore to shore under two minutes, and has accommodation for 500 to 600 passengers and six vehicles. It is driven electrically from the power house, in which are two 60-h.p. motors, one serving as a stand-by. The consulting engineers were the Cleveland Bridge & Engineering Co., Ltd., Darlington, represented by Mr. G. C. Imbault, their chief engineer, under whose supervision the work was carried out, with the assistance of Mr. S. E. Burgess, Borough Engineer of Middlesbrough, and Mr. Robert Anderson, resident engineer. The electrical equipment was supervised by Mr. H. M. Taylor, Borough Electrical Engineer.

CORRESPONDENCE

NEW INDIAN PATENTS ACT.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—May I through the columns of your paper bring to the notice of such of your readers as are interested in Indian Patents the fact that a new Act comes into force in India on January 1st, 1912, which will alter the conditions under which valid patents are obtainable? The particular point to which I should like to draw attention is that, under the new Act, valid Letters Patent cannot be obtained for an invention which has been previously used or published (as by the printed British specification) in India. Under the present Act, however, it is allowable to file an application at any time within one year of the filing of the British application, or of the actual sealing of the British Letters Patent. Therefore any intending applicants for Indian patents, of which the corresponding British specifications are now published, or will be published by December 31st next, should take care to have their applications filed before that date.

Yours faithfully,

128 Culmore Row, Birmingham. CHAS. B. KETLEY.
October 24th, 1911.

ELECTRIC COOKING AT WARING & GILLOW'S

SUCH great interest was taken in electric cooking and other heating apparatus at the recent Olympia Exhibition, that Messrs. Waring & Gillow, Ltd. (164–8 Oxford Street), thinking that a further series of demonstrations would be welcomed in London, have set apart for the next few weeks one of their large departments, where a good selection of heating and cooking apparatus is on view, and they are to be congratulated on their enterprise.

An expert lady cook has been engaged to give a series of demonstrations daily from 10 a.m. to 5 p.m., and private demonstrations can be arranged by request. Besides the "Tricity" cooker, which is now well known, there is the new Jackson stove. This has two 8 in. hot plates and one 6 in. plate, besides a griller, which are all arranged on the top of the oven, the whole measuring 28 in. by 19½ in. The hot plates can be regulated for ¼, ½, and full heats, but the griller has only one heat, and takes 1,250 watts to heat up. The oven, measuring 23 in. by 15½ in. by 14½ in., is heated by elements fitted on iron plates, which are screwed on to, but are clear of, the sides of the oven, so that the whole of the elements are entirely inside the oven, and the hot air circulates round and round the interior. The terminals are arranged at the back and the connections pass between the walls, which are packed with slag wool. The normal consumption is about two units per hour when working at its full capacity, which is for about twelve people. The Marylebone Borough Council has erected a special switchboard over this stove, which comprises Diamond H switches and "Z" fuses for each hot plate, for the grill, and for each oven heat, the switches for the plates having four positions, off, medium, high, and low heats. When these are on, a red lamp glows, showing the cook exactly what she is doing, which also serves as a warning. A range of these stoves is being installed in the new Polytechnic, and also in the block of flats in Portland Place. Passing now to the other exhibits, we noticed a very handsome hot plate with a highly finished nickel plated extension piece, on which a kettle and saucepan can be boiled at the same time, one of which has been purchased by Queen Alexandra. A grill and toaster can also be used with it by removing the extension plate. Another domestic appliance was a Mary Ann, which has often been referred to in ELECTRICAL ENGINEERING. An improved hair-dryer has a switch for cutting the heating element in and out, instead of having to remove it when cold air is required. The Murray radiator, with an adjustable oval reflector for supplying heat locally, is also to be seen; this has one tubular lamp, which gives a temperature of about 240° F. It is largely used for roll-top desks. The special radiator, however, will be the new Ferranti type, described in ELECTRICAL ENGINEERING Supplement, Part II., of September 28th, p. 28. An interesting exhibit for motor-car owners will be the tyre pump, which is driven by a small motor. A large assortment of quartz heaters, kettles, bed-warmers, cigar-lighters, coffee percolators, vacuum cleaners, &c., are on view, besides a log fire made of special glass to take any heating element, and a Holmquist electric bath.

The power station is represented by a 2½-h.p. Hornsby oil engine coupled to a small dynamo machine. Adjoining this room Messrs. Waring and Gillow have furnished four other rooms, with decorated dining-tables, which originally represented their £750 fully furnished house. At the entrance there is an electric fountain, and the rooms, which are lighted with 240-volt metallum lamps, have telephones, Ozonair apparatus, radiators, Eureka clocks and fittings, the latter being a special feature with the company. In one of the rooms we noticed a carved alabaster dished fitting, from which the light was reflected from the ceiling. A visit to the electrical department revealed one of the biggest ranges of electrical fittings in London, and special rooms were devoted to French, old Dutch, and old English period fittings. Amongst the latter we specially noticed a copy of the grand old Louis XVI. candelabra, which has been adapted to electricity by neat wiring on the outside. A large assortment of glass and lustre fittings is arranged on a gallery, and on another floor a large quantity of cheaper fittings, amongst which was a particularly neat little Faraday lamp stand at the small cost of 7s. 6d. Messrs. Waring and Gillow are prepared to give estimates for a complete cooking installation on application.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

FOREIGN WEIGHTS AND MEASURES.—We have received from Rosenblum's Translation Bureau, 40 High Holborn, W.C., a convenient card giving tables of equivalents of British, metric, and Russian weights and measures, as well as British and foreign moneys.

BELLS, WIRES, &c.—A catalogue from The Wright Electrical Sales Co., Ltd. (Upper Mill Hill, Leeds), gives some details of bells, wires, motor-car accessories, and various electric novelties.

ELECTRIC RADIATORS AND MEDICAL APPARATUS.—A list of radiators in a variety of designs on the Dowsing-Huntley system, and some medical apparatus, including the Solarium bath, is to hand from the Dowsing Radiant Heat Co., Ltd. (115 Great Portland Street, London, W.).

LARGE COOKING APPARATUS.—A catalogue from the British Prometheus Co., Ltd. (Salop Street Works, Birmingham), gives particulars of their larger electric cooking ranges, ovens, and other appliances, for restaurant and hotel cooking, some of which were described in our exhibition supplement of October 19th.

DOMESTIC HEATING AND COOKING APPARATUS.—A collection of leaflets in a handsome cover is being issued by Ferranti, Ltd. (Hollinwood, Lancashire), to call attention to their heating and cooking apparatus, to some of which we referred in our exhibition supplement of September 28th. The items dealt with include irons, disc stoves or hot plates in several forms, special aluminium utensils for use with these, complete breakfast cooking outfits, and eight designs of their new "electric fire," with its glowing quartz centre and ornamental metal reflector.

THE O.S. WIRING SYSTEM.—Siemens Brothers and Co., Ltd. (Caxton House, Westminster, S.W.), are issuing a new edition of their pamphlet on this popular system of wiring, superseding the issue of May, 1910. This pamphlet gives an up-to-date and more or less popular description of the O.S. wiring system, and illustrations of the various applications of "Stannos" wiring; also illustrations of some typical buildings, in which the system has been used, giving the names of the respective contractors, consulting engineers, &c. Copies are available for the use of contractors without the name of the firm.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METAL FILAMENT LAMPS.—A new catalogue, including the latest types of Royal Ediswan metal (tungsten) filament lamps, is being issued by the Edison & Swan United Electric Light Co., Ltd. (36 and 37 Queen Street, E.C.). As we have already announced, reductions have lately been made in the prices of the most widely used sizes, and the new types now listed for the first time include a 100-130 volt 12-watt 9-c.p. lamp, and a 200-260-volt 24-watt 16-c.p. lamp. These are in smaller bulbs than heretofore, that of the 12-watt lamp being 4 in. long by 2¼ in diameter, while the 24-watt lamp is the same diameter and only ½ in. longer. The high-voltage 32-40 watt lamps are now also supplied in this bulb. Some new fancy lamps in small round bulbs have also been introduced.

ELECTRICAL SUPPLIES.—The new edition of the electrical supplies catalogue of Siemens Brothers Dynamo Works, Ltd., contains particulars in a convenient and compact form of a great variety of electrical apparatus, including tantalum, one-watt, and carbon incandescent lamps, arc lamps and carbons, installation accessories, bells, batteries, conduits, wires and cables, "O.S." wiring material, "Zed" fuses, switches, circuit breakers, lightning arresters, instruments, meters, heating and cooking appliances, electric horns, fans, small motors, vacuum cleaners, &c., &c. The wiring rules of the Institution of Electrical Engineers and a quantity of useful information on wires and cables are given at the end of the volume.

CABLES.—A leaflet from the St. Helens Cable & Rubber Co., Ltd. (Warrington), calls special attention to the substantial covering for cables, known as "cab tyre sheathing," which protects them from mechanical or chemical damage or the effects of moisture.

METAL FILAMENT LAMPS.—The Electric & Ordnance Accessories Co., Ltd. (Cheston Road, Aston, Birmingham), have advised us in a corrected leaflet of reductions in the prices of their "V. S. M." metal filament lamps. The prices of all the sizes above 60 volts are reduced, the 100/135-volt 16-50-c.p. lamps being now 2s. 3d., and the 200/260-volt 25-50-c.p. lamps, 2s. 9d.

RAILWAY SIGNALS.—Siemens Brothers & Co. (Caxton House, Westminster) are issuing a new pamphlet describing the battery-worked signal which was a conspicuous feature of their stand at Olympia. The latest form of this apparatus retains the general features of the earlier designs, but modifications have been made by substituting spur gearing for worm-driven machines. This has had the effect of increasing the efficiency considerably, for whereas with the old pattern machine the time taken was 8 to 9 seconds to lower a standard signal arm, with the new form of machine only 4 seconds are taken with the same expenditure of current for the time being, and, therefore, the life of the battery is proportionately longer.

SIGNS.—The Globe Electric Co., Ltd. (11 Farringdon Avenue, E.C.), have sent a leaflet illustrating an effective example of their new "Glob-o-lite" sign, in which solid glass spheres are let into suitable perforations in a metal sheet.

METAL FILAMENT LAMPS.—A neat leather-bound pocket memorandum book from the British Thomson-Houston Co. reminds us of the removal of their Mazda Lamp Sales Department to 77 Upper Thames Street, and of the good points of Mazda, Gem, and Edison incandescent lamps, besides being of use as a pocket-book and calendar.

ELECTRIC TRACTION NOTES

The report of the deputation appointed by the Corporation of Edinburgh to investigate systems of railless electric traction contains some interesting particulars of the working of the trolley omnibus services in Leeds and Bradford, at the latter of which towns the success of the 1¼ miles now running has led to the decision to equip an additional 9 miles at a cost, including 12 cars and depôt accommodation, of £26,500. A general description of the system was given in ELECTRICAL ENGINEERING, June 29th, page 363. The capital cost of the 1¼ miles already laid works out at £1,734 per mile, and the two cars cost £700 each. A 30-minute service is given each way, with 15-minute service on Saturday and Sunday afternoons. The running cost per car mile (partly estimated) is given as follows:—Current at 1d. per unit, 0·95d.; wages, 2d.; vehicles, 0·80d.; overhead work, 0·09d.; tyres, 1·50d.; total, 5·34d. At Leeds the current cost works out at 0·76d. per car mile, and the consumption is 0·87 unit per car mile (28 passengers) as against 1·75 unit for an ordinary tramcar (60 passengers). The capital cost was £1,246 per mile for the 4 miles and £700 per car. The running costs are estimated at 5½d. per car mile, and so far the revenue is 8·78d. per car mile.

As the result of a consultation with representative holders of both preference and ordinary shares, the Board of the British Electric Traction Co. have been able to put forward a modified scheme which disposes of the principal objections raised at the recent meeting. The nominal capital of the company, which is now £4,000,000, divided into £2,000,000 in £10 preference shares, and £2,000,000 in £10 ordinary shares will, if the new scheme is carried out, be divided into £500,000 cumulative preference stock, £1,000,000 non-cumulative preference stock, £1,500,000 preferred ordinary stock, and £1,000,000 deferred ordinary stock.

The Paisley Corporation and the Paisley District Tramways Co. have come to an arrangement, by which the company pays a flat rate of 1d. per unit for current for traction purposes. Under the arbitration award of Mr. R. Hammond (ELECTRICAL ENGINEERING, Vol. VI., December 1st, 1910, p. 765) it was found that the sliding scale awarded had the effect of causing the company, at special times, to give an insufficient service with a corresponding reduction in revenue for the Corporation Electricity Department.

In consequence of difficulties with the Board of Trade and the Commissioner of Police in regard to running coupled and trailer cars on the L.C.C. tramways, the Highways Committee recommend the Council to apply for Parliamentary powers. Such cars have been run experimentally on the Euston Road to Hampstead, but the Commissioner of Police has declined to allow their continuance on the ground of obstruction and danger to other traffic. The Highways Committee are particularly anxious to secure these powers for the purpose of increasing the carrying capacity of the Holborn-Strand subway. It is pointed out that no complaints are made against the technical arrangements for coupling the cars. The Council procured, at a cost of £410, the equipment required for coupling two single-deck cars, and this was passed by the Commissioner of Police. This, however, was prior to the experimental working, which is now stated to be dangerous to the other traffic. In their report the Highways Committee point out that trailer cars are extensively used on the Continent and in America, where much higher speeds are allowed than is the case on tramways in this country.

A touring car fitted with the Thomas electrical transmission gear, the working of which was fully described in an illustrated article in ELECTRICAL ENGINEERING May 4th, page 236, has completed an R.A.C. road trial from London to Edinburgh and back (794·5 miles) at an average speed of 19·5 miles per hour without any adjustments being made, with the remarkably low petrol consumption of 35·73 miles per gallon, or 67·92 ton miles per gallon, figures which we believe are above all previous records.

The car in question was a standard 13·96 h.p. (R.A.C. rating) Delahaze car (with four cylinders 75 × 110 mm.), to which the Thomas transmission had been fitted, and a Claudel-Hobson carburettor was used. Previous to the trial the car had covered some 24,000 miles. The weight was 3,219 lbs., increased by live and dead load to 4,258 lbs. The gear ratio was 5·42 to 1. The trial was completed in four days under rather adverse weather conditions. A 12-volt 50-ampere battery was carried on the footboard. This battery was automatically charged when running along on top speed, and in addition to providing current for starting up the engine from the driver's seat whenever required, it also supplied the following lamps:—Two powerful head lamps, two side lamps, a tail lamp, and a dashboard lamp. The lamps were in use altogether about eight hours, and the engine was started up approximately 50 times. The fact that the car had been in used for experimental purposes for about eighteen months, and had travelled in all 24,000 miles before the trial, should be taken as evidence of the reliability of the transmission rather than the comparatively short run from London to Edinburgh and back.

The Sunderland and District Electric Tramways Co. has been in the hands of a Receiver since the meeting of 1910. At the meeting held last week, it was stated that as a result three out of the five members of the Board resigned. A third director has since been appointed, however. The Receiver has reported the urgent necessity for more cars, and for the relaying of a large proportion of the track, owing to damage from subsidence due to the coal mines. In the past twelve months, the revenue was insufficient to meet the debenture interest and other expenses, to the extent of £1,598. Mr. H. R. Hogg, who presided, said that a good deal of economy would still have to be practised, but in the interests of the ordinary shareholders an effort must be made to keep the undertaking going.

The Brighton Corporation have decided in favour of adopting trolley omnibuses over the important routes at present monopolised by the Brighton, Preston & Hove Omnibus Co., and the Town Clerk has been instructed to prepare a Bill for promotion next session. On the other hand, the Hove Council, whom it was thought at one time would co-operate with the Brighton Council in this matter, have decided to take no further action.

The Sheffield Tramways Department are inaugurating a new system with regard to the collection of fares on their tramways, in order to keep the conductors of top-decked cars on the platform as much as possible. All passengers using the top deck will be required to pay as they enter the car. It is stated that as many as 1,060 accidents have occurred in the course of the year owing to the conductor being on the upper deck.

Mr. Robert Hammond recently sat as arbitrator to determine the dispute between the Gravesend & Northfleet Tramway Co. and the Gravesend Corporation as to the price which the former shall pay for traction current. Under an agreement which expired last year the company paid 2d. per unit up to 180,000 units, 1¾d. per unit for all in excess up to 350,000 units per annum, and 1½d. per unit for all additional units. Mr. C. P. Sparks and Mr. C. W. Little were the technical witnesses for the tramway company, whilst the chief witnesses for the Corporation were Mr. J. F. C. Snell and Mr. C. F. McInnes. One of the main points in the case for the Corporation against the reduction was that the tramway supply of recent years had tended to diminish, whilst the tramway company's argument was that the tramway supply was from 40 to 50 per cent. of the total units sold by the Corporation. The arbitrator reserved his award, but we understand that negotiations are proceeding between the parties on the basis of abiding by the existing price on the understanding that the tramway company shall have a reduction on the price paid on the higher number of units taken per annum.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

We are able to state that in view of the success of the new Anglo-Belgian telephone cable, the laying of other and longer "loaded" cables will be undertaken in the near future.

In Jersey the telephone system is owned by the National Telephone Co. (while Guernsey has successfully worked its own telephone system for many years), and there is a feeling in Jersey that the telephone rates there will be increased on the Post Office taking over the system at the end of the year. On Saturday last a well-attended meeting under the auspices of the Jersey Chamber of Commerce and the Jersey Commercial Association passed a resolution in favour of the States of Jersey (the governing authority of the island) purchasing the telephone system from the Post Office. Mr. A. R. Bennett was one of the principal speakers at the meeting.

It is stated that the conference of municipal authorities to discuss matters connected with the transfer of the telephones to the State, which was to have been held at the Guildhall

Hosted by Google

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Oct. 26, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,162/10. **Brush-holders.** S. BEETON and THE MORGAN CRUCIBLE CO., LTD. In combination with the usual tension device on brushes, the inertia of which often prevents it acting quickly, a brass plate is attached to the side of the brush, and bent over the top and back again upon itself clear of the brush, to form a spring, on which the ordinary tension device bears. The brass plate may be attached as in the Battersea connection, described in our last issue, page 583; or with tubular-spun rivets passed through the brush and flattened over the plate. Four figures.

709/11. **Dynamo Connection.** H. LEITNER. To facilitate the work of connecting dynamos to the external circuit, especially on motor-cars, boats, or trains, the connections are all brought to a plug made in two parts. The shunt field and armature are connected to sockets in one half, which is attached to the dynamo, and the external connections are taken to studs in the other half, which fit the corresponding sockets. The studs are of different sizes, so that no mistake can be made in connecting up, and they are split to ensure good contact. Three figures.

1,544/11. **Metal Filaments.** W. C. HERAEUS G.M.B.H. and C. TRENZEN. A process of sintering partly decarbonised metal filaments consists of placing them in a tube of pure iridium, which is heated to a temperature between 1,400° and 1,600° C. by passing currents up to 1,500 amperes through it, in the presence of a reducing gas. Means for passing the current, reducing gas, &c., are also covered by this patent Two figures.

1,914/11. **Fusible Cut-out.** H. HIRST and F. M. CHAPMAN. An improved form of cut-out has a base in the form of a cylindrical china box, which has two raised portions. Spring contact plates are mounted on these, and clamped by the terminals. The former project beyond the raised portions, and are folded to give resilience. The lid is also provided with contact pieces, and so arranged that when slightly rotated it makes contact with the plates in the base. The fuse wire is carried in a channel formed in a separate wall in the lid, so that it can be easily renewed. Four figures.

Opposition to Grant of Patents

14,615/08. **Dry Cell.** H. HUNTE. The appeal referred to in ELECTRICAL ENGINEERING, January 20th, 1910, p. 50, which was lodged against the decision of the Comptroller to grant this patent, has been abandoned. It relates to a dry cell with vertical air-passages through the depolariser open at the top and bottom. The specification was abstracted in ELECTRICAL ENGINEERING, September 30th, 1909, Vol. V., p. 859.

Restoration of Lapsed Patents

8,421/04. **Railway Signalling.** F. H. HIGLEY. An application for the restoration of this patent has been granted. It relates to crossing permit apparatus to enable the working on a single line of wire, together and in combination with tablet apparatus.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Names in italics indicate communicators of inventions from abroad.

Distributing Systems, Cables, and Wires, Insulating Materials: TURNER [Insulating sheets] 23,621/10; JAMES and JONES [Fastening conductors to walls, &c.] 25,846/10; DUNNING [Circuit controlling devices] 13,830/11.

Dynamos, Motors, and Transformers: MILLER [Portable D.-C. transforming devices] 25,065/10; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Dynamo brushes, connections] 76/11; WALKER [Brush-holders] 1,338/11.

Electric Ignition: LUX, 325/11.

Heating: LOFQUIST [Water-heating] 15,302/11.

Instruments and Meters: HARDINGHAM (*Hartmann and Braun Akt.-Ges.*) [Recording apparatus] 8,612/11; SPRAGUE, and CHAMBERLAIN & HOOKHAM, LTD. [Prepayment mechanism] 11,929/11.

Switchgear and Fittings: HATTON [Lamp reflectors] 23,085/10; FOSTER [Automatic switch for accumulator charging] 23,377/10; ECKSTEIN and HEAP [Switches] 23,525/10, and [Spring contacts for switches, fuses, &c.] 23,526/10, and [Switchboards] 23,894/10; WELFORD [Switches] 23,622/10; CHAPMAN and MASON [Grip for flexible cords] 26,909/10; TUCKER [Switches] 27,903/10; ROBINSON [Combination locks for switches] 2,722/11.

Telephony and Telegraphy: SCHIESSLER [Apparatus for electrical vibrations] 24,696/10; MAGINI [Rectification of alternating discharges] 3,865/11; THOMPSON (*Ges. für Drahtlose Telegraphie*) [Producing oscillations by D.C.] 6,682/11; MACKENZIE (*American Transmitter & Manufacturing Co.*) [Telegraph transmitters] 10,043/11; CROWE and BRITISH L. M. ERICSSON MANUFACTURING CO. [Telephone transmitters, receivers, &c.] 11,132/11.

Traction: PRATGINESTOS DE BONAPARTE [Safety interrupter for trolley trams] 7,645/11; HARHORN [Hub-motors] 5,870/11.

Miscellaneous: KOOPMAN, and PONTELEC WELDING PATENTS [Electric welding] 23,735/10; MARTIN [Extracting iron from ores] 24,052/10; ALCOCK & Co. PROPRIETARY, LTD. [Drying timber, electrical process] 25,175/10; MORRISON [Primary batteries] 25,315/10; HEATH [Combined bell-push and temperature alarm] 27,508/10; MACKEY [Treating liquids] 1,327/11; BEY [Electric signs] 3,789/11; RAILING and KRAUSE [Fans] 3,918/11; TOUSEY [X-ray tubes] 7,076/11; ROGERS [Alarm signal] 8,044/11; SCHAEFFER [Motor-driven air propeller] 13,623/11; NEUDOERFFER [Pocket lamps] 14,604/11; WARIN [Electric letter-box signal device] 365/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: ROBERT BOSCH [Starting device] 18,082/11.

Telephony and Signalling: MANSON [Signalling devices] 15,138/11; AKTIEBOLAGET L. M. ERICSSON & Co. [Common battery system] 21,924/11; MCLARN [Switchboards] 22,046/11.

Miscellaneous: ROBERT BOSCH [Condensers] 17,438/11; PLANIAWERKE A.-G. KOHLEN-FABRIKATION [Carbon electrode] 18,733/11.

The following amended Specification can now be obtained.

LACHMAN [Electric welding] 23,077/05.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

25,519 of November 2nd, 1897. **Electrodes.** J. HARGREAVES. Pieces of gas-retort carbon with true or rough surfaces are arranged in the form of walls, columns, or arches. These are secured by screws or wedges in a cell of Portland cement or other material, and supported by the walls of the cell. To ensure good contact, powdered plumbago is inserted in the spaces between the pieces of carbon.

25,816 of November 6th, 1897. **Insulator.** D. SINCLAIR and W. AITKIN. An insulator for supporting telegraph, telephone, and other wires, and intended for use in connecting branch or leading-off wires from the main lines without lowering the insulation, consists of two parts. The inner has a groove cut up the sides and across the top to take a portion of the covered conductor. The outer part, which is of the usual material, is threaded, and fits into a corresponding thread on the inner part, so that good protection is obtained from the weather.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: E. R. VIALE, 15,481/03; J. O. GIRDLESTONE [Multiple-carbon] 15,857/07; J. C. CHALMERS and W. A. ROBERTSON, 16,027/07.

Distributing Systems: W. E. EBERT [Distribution] 15,634/07; W. FENNELL and W. P. PERRY [Distribution] 15,846/07.

Dynamos, Motors and Transformers: C. A. PARSONS (*C. E. L. Brown*) [Regulating, by prime mover] 15,431/02; ELECTRIC & ORDNANCE ACCESSORIES Co. and R. F. HALL [Suspension gear for driving] 15,532/03; M. J. E. TILNEY [Speed control] 15,989/06; J. BRUNCKEN [Induction motor control] 15,648/07; C. A. PFANSTIEHL [Transformers] 15,810/07; LA COUR [Controlling motors] 15,834/07.

Electrochemistry: J. HARGREAVES [Producing alkalies by electrolysis] 15,502/98; A. G. BETTS [Obtaining antimony, &c., by electrolysis] 15,294/04, and [Anode slime, treating] 15,298/04.

Storage Batteries: M. J. E. TILNEY [Regulation] 15,988/06.

Switchgear, Fuses, and Fittings: H. M. DARRAH and L. A. HACKETT [Lamp holders] 15,247/03; M. B. FIELD, C. C. GARRARD and FERRANTI, LTD. [Cut-outs; switches] 15,455/04; VERITYS, LTD. and E. E. GOTT [Starter resistances] 15,648/04; BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Switches] 15,984/06.

Telephony and Telegraphy: Q. MAJORANA [Microphones] 14,314/05; A. W. SHARMAN and DE FOREST WIRELESS TELEGRAPH SYNDICATE [Adjustable capacity-inductance] 15,615/06; ELECTRIC & ORDNANCE ACCESSORIES Co. and R. F. HALL [Line selecting switch] 15,704/06; C. F. SCOTT and T. BOULEVARD [Telegraph and telephone systems] 14,752-3/07; A. ANKER [Hygienic receiver attachment] 15,755/07; W. W. POWLES and E. E. MOORE [Two-tone sounder] 15,773/07; SIEMENS BROS. & Co. and G. S. GRIMSTON [Selective switch] 15,878/07; J. W. MACKENZIE (*C. Lorenz*) [Telephone call bell] 16,087/07.

Traction: M. and P. DALEY [Railway station indicator] 15,636/07; L. BEECHER [Conduits, collectors] 15,769/07.

Miscellaneous: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Resistances] 15,985/06; T. P. POLLITT [Winches] 15,922/07; W. THOMSON [Pocket lamps] 16,034/07.

Hosted by Google

this month, has been postponed, and in all probability will not be called together until the price which the Government will pay is known.

In consequence of the threat of the National Telephone Co. to remove certain telephone poles in Hythe (see ELECTRICAL ENGINEERING of October 19th and 26th), a Hythe subscriber named Dickens applied in the Chancery Division on Friday for an injunction to restrain the company from cutting off his service. After some discussion it was agreed between the parties that the company should not disconnect service at any rate for a week, when a further application will be made to the Courts.

According to the Paris correspondent of the *Morning Advertiser*, an ambitious scheme for connecting France with her possessions in all parts of the world by wireless telegraphy is under consideration. The estimated cost of this colonial scheme is £480,000, and, if decided upon, it would be completed in about three years.

The proposed increase of the Marconi Wireless Telegraph Co.'s capital of 250,000 £1 ordinary shares was sanctioned at an extraordinary general meeting on Wednesday last week. Mr. Godfrey C. Isaacs, managing director, who presided, surveyed the position of the company. In addition to Capt. Adrian Simpson, a member of the company's staff, having been appointed managing director of the Russian company, Mr. Marconi and Mr. Isaacs have joined the Board. The company's offer to construct a number of stations in Chili has been accepted by the Government there, and he hoped that he would be able shortly to announce that the construction of the stations involved in the Imperial scheme had been commenced. According to newspaper reports, these stations will, in all probability, be under the direct control of the General Post Office, and the Postmaster-General himself will fix the rates for the transmission of messages. The number of stations will be about twenty-five, and the average cost £60,000 per station. As already announced, the stations will be Malta, Cyprus, Aden, Adelaide, Bombay, Colombo, Singapore, Perth (Australia), Sydney, and Wellington, with an extension later to Singapore and Hong Kong. In this way Great Britain would become quite independent of the submarine cable system.

The various happenings in the telegraph world to be brought to the notice of our readers this week are not of a very exciting nature. The Kedah route was down on October 24th, and on the following day the Teneriffe—St. Louis cable failed, and messages will be sent until repair via the Brest—Dakar route. On October 27th the Kotonou—Gradbassam cable ceased working, and the Bhano route was down on 30th. As from the 31st ulto communication with Mogador was again normal. Owing to the Chinese revolution private telegrams for all places in China, with the exception of Shanghai, Foochow, and Amoy, should only be accepted at sender's risk, and telegrams for Hankow can only be accepted when written in plain English. Telegrams for Hongkong are circulating as usual. The cable between Assab and Perim, which has been down since July 8th, 1909, is still on the sick list, as is also the cable between Lattaquie and Cyprus, which has been down since May 24th, 1910. Communication with Alaska is still interrupted, and the cable between Bissao and Bolama has been broken since September 26th last.

LOCAL NOTES

Brighton: *Charge for Heating.*—The Council have adopted the recommendation of the Electricity Committee to charge a flat rate of 1d. per unit for current for heating and cooking purposes.

Cardiff: *Electricity Undertaking.*—For the June quarter the revenue from the electric light undertaking increased by £750 over the corresponding quarter last year, whilst the working expenses increased by only £100. Mr. Arthur Ellis, the Electrical Engineer, reports that builders are now recognising the value of wiring houses.

Chester: *Electrical Extension Scheme.*—The Electricity Committee recommend the Council to retain Mr. J. F. C. Snell to inquire fully into the financial and engineering conditions of the electricity undertaking at a fee of 250 guineas. The Finance Committee, however, express the opinion that it is not desirable to make this appointment owing to the large expense involved.

Douglas (I.O.M.): *Electric Lighting.*—At a public meeting held in the Town Hall last week, the question of proceeding with the scheme prepared by Messrs. Handcock & Dykes, referred to in our last issue, was discussed. After some discussion, the matter was adjourned.

Eccles: *Lighting Small Houses.*—The Borough Electrical Engineer has reported upon the experiment of lighting a number of small houses in Corporation Road. The houses were built by the Corporation, and are supplied with light at 6d. per week per house, this charge being included in the rental, and the supply being unrestricted. The report states that the Health Committee have made a slight profit on the transaction, and that the experiment must be regarded as satisfactory.

Edinburgh: *Fire in Cooling Tower.*—A considerable portion of the woodwork of one of the new cooling towers now in course of erection at the electricity works was destroyed by fire last week. The fire, which was confined to the inside of the tower, received considerable assistance by the fact that the woodwork is creosoted. The walls of the tower consist of cast-iron plates, and it is thought possible that the fire was caused by the dropping of a red-hot bolt by the riveters working at the top. Mr. F. A. Newington, City Electrical Engineer, is at present unable to estimate the damage, but, providing none of the outside structural plates have buckled and the main wooden stanchions are uninjured, the delay will not be serious.

Heckmondwike: *Supply from Power Company.*—For some time the Council have been discussing whether to add to their own generating plant or take a supply in bulk from the Yorkshire Electric Power Co. After considerable negotiation, the latter course has been adopted.

Leigh (Lancs): *Lighting Small Houses.*—The Electrical Engineer recommends a scheme for supplying electric light to cottages on the lines of the experiment at Eccles mentioned above! The Committee have asked for further details.

Oldham: *Electrification of Mills.*—It was reported to the last meeting of the Oldham Electricity Committee that Messrs. W. H. Haigh & Co. have under consideration the conversion to electric driving of their Lowermoor works, and the Borough Electrical Engineer has been in consultation with the company with regard to the scheme. If the experiment is satisfactory, the firm might next year also convert their Plane Street works.

Stoke-on-Trent: *Electricity Accounts.*—The first year's report of the working of the electricity undertakings belonging to the new County Borough of Stoke-on-Trent has just been issued. At Burslem there has been an increase in sales of 180,000 units; in Hanley, 230,000 units; Longton, 90,000 units; and in Stoke, 250,000 units. After meeting capital charges, the Burslem Electricity Works show a profit of £825; Hanley, £259; Stoke, £275; and Longton, £195. In all cases, with the exception of Stoke, the profit has been transferred to reserve, whilst the balance at Stoke has been devoted to wiping out the loss on the previous year's working.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Argentine.—The Direccion General de Obras Hidraulicas, Buenos Aires, has been authorised to proceed with the erection of workshops at the harbour of Concepcion del Uruguay. It is proposed to instal generating plant as well as electrically-driven machinery, cranes, &c.

Bootle.—Extensions to the generating plant are proposed.

Bradford.—A Local Government Board inquiry was held last week concerning a loan of £16,940 for electricity extensions. There was very little opposition.

Bridlington.—Application is to be made to the Local Government Board for sanction to borrow £3,000 for mains and services.

Erith.—The Electrical Engineer has submitted an estimate showing the prospective expenditure during the next few years as follows:—Mains and cables, £4,000; house services, transformers, and sub-stations, £3,258.

OSRAM-LAMPS

Hosted by Google

Hastings.—A loan of £2,000 for mains extensions is to be applied for.

Java.—The Ankola Tea & Rubber Co., which has just been formed, proposes to erect an electric generating plant upon their estate.

London: *Fulham.*—The Finance Committee of the London County Council recommend a loan of £9,500 for extensions to the electricity undertaking.

Salford.—The Electricity Committee have submitted a scheme for extensions of the generating plant at a cost of £35,000. In addition, it is recommended that application be made for powers to borrow £15,500 for two 1,000 kw. turbo-generators. The Corporation have adopted the whole scheme.

Stretford.—Tenders are invited by November 13th for electric mains and accessories. Particular from the Electrical Engineer.

West Ham.—An application is to be made to the Local Government Board for a loan in connection with the provision of three 5,000-kw. two-phase 6,000-volt turbo-alternators, and twelve boilers each with an evaporative capacity of 37,500 lbs.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Birmingham.—Considerable extensions to Council House and Art Gallery.

Croydon.—New public library at Thornton Heath.

Eastbourne.—New wing at Queen Alexandra's cottage homes.

Heywood.—Tenders are invited for an electric light installation at the offices of the Heywood and Middleton Water Board. Architects, Messrs. J. Diggle & Son, Heywood.

Leicester.—New public hall. Town Clerk.

Rochdale.—It has been decided to light the Smith Street baths by electricity.

Swansea.—Fifteen houses, Maesteg Street, Mr. D. W. A. Saunders.—Eighteen houses, Ysgol Street, E. Murphy.

Warrington.—A new boys' department at the Bolton Council school. Architects, Messrs. Wright & Hamlyn. Tenders by November 10th.

MISCELLANEOUS

India.—The Secretary of State for India invites tenders by November 14th for electric cranes. Particulars from W. G. Butler, Director-General of Stores, Whitehall.

Newport (Mon.).—An automatic electric lift is required at the workhouse infirmary. Architect, H. J. Griggs, Metropolitan Bank Chambers, Newport.

Tasmania.—Tenders are invited by the Deputy Postmaster-General, Hobart, by December 11th, for 4-nauts of india-rubber-insulated submarine telegraph cable. Further particulars at 72 Victoria Street, London, S.W.

TENDERS RECEIVED AND ACCEPTED

Bradford.—Subject to the Local Government Board's sanction, a third Curtis turbo-generator is to be supplied by the British Thomson-Houston Co., Ltd., at £10,292.

Glasgow.—The tender of Messrs. Richardson, Westgarth & Co., for a turbo-alternator (Brown Boveri alternator) for the Pinkston power station at £13,413, has been accepted.

Hastings.—The following tenders have been received for the electric wiring, &c., at the workhouse. In the case of those firms where two prices are quoted, the second includes the use of Stannos wire. The other price is for ordinary wood casing. Edmundson's Electricity Corporation, £1,026 and £986; Harland, Bowden & Co., £755 11s.; Bruce & Co., £775; Taylor & Co., £870; Sherrard Bros., £535 and £500; Tredegar & Co., £412 and £348 5s.; Galliers & Co., £609 17s. and £704 18s.; A. H. Wood, £796 14s.; Savill & Walton, £928 18s. and £983; Newbald & Co., £758 and £775; Electrical Co., £600; F. G. Pettitt, £672 and £785; Fryer & Co., £1,255 10s.; Price & Co., £401 and £380; Tilley Bros., £560 14s. and £595 14s.; Besant & Co., £750 and £765; Hancock & Rickson, £568 5s. and £489 15s.; Weston & Co., £608 8s. and £690; Reed & Sons, £695 11s. and £687 9s. The tender of Messrs. Tredegar & Co., for Stannos wire, at £348, has been accepted.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 7s. 6d. to £57 12s. 6d. (last week £57 15s. to £58 5s.).

Switchgear and Cowans (1911), Ltd.—The business of Cowans, Ltd., will in future be carried on in conjunction with that of The Switchgear Co., Ltd., for which purpose a new company under the above name has been registered. The business will be carried on at the Springfield Lane Works, under the personal control of Mr. J. G. Statter, as managing director, who heretofore controlled the business of the Switchgear Co., Ltd.

G. Braulik.—We are informed by G. Braulik that he is now supplying under licence under the Bremer-Westinghouse patents his old type D.C. flame arc lamp, which can be supplied from stock. The firm are opening a branch office at Prince's Chambers, 16 John Dalton Street, Manchester, under the charge of Mr. Wyndham Wadsworth.

Liquidations.—The trade creditors of the Davis Electrical Co., Ltd., 17 Moor Street, Cambridge Circus, London, find themselves in a somewhat awkward position. The total unsecured liabilities of the trade creditors amount to £3,333, but they find themselves prevented from participating in any distribution owing to the existence of a debenture, which entails first charges amounting to £3,100. This debenture, moreover, has been created in respect of arrears of salary of Mr. Davis, and the circumstance caused a good deal of discussion at the meeting of creditors last week.

The Beck Flame Lamp, Ltd., is to be wound up voluntarily with a view to reconstruction. Mr. H. J. Page, 21 Ironmonger Lane, is liquidator.

The Winchester Electric Light and Power Co., Ltd., having been acquired by the Winchester Corporation, is now to be wound up voluntarily. Mr. F. E. Gripper and Mr. A. R. Dyer are liquidators.

A meeting of the Aluminium Corporation, Ltd. (1907), will be held at 60 London Wall, on December 6th, at 12 noon, to hear the liquidator's account of the winding up. This notice does not refer to the Aluminium Corporation, Ltd., which was incorporated in 1909.

The Economic Electric Co., Ltd., is to be wound up voluntarily, and Mr. F. T. Deyes, 5 Cook Street, Liverpool, is liquidator.

A meeting of creditors of the Doncaster Electrical Co., Ltd., was held at 13 Printing Office Street, Doncaster, on Monday. A. E. Stringer, Cheapside Chambers, Bradford, is liquidator.

Dissolution of Partnership.—J. Williamson and F. Woodfin, electrical engineers, 138 Northgate Street, Chester, have dissolved partnership.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. W. Marshall's agreement with the Hammersmith Borough Council as canvasser and agent for the Electricity Department has been terminated, and a fresh appointment is to be made.

Mr. J. R. Garner, for eight years works manager of the Electric & Ordnance Accessories Co., Ltd., Aston, Birmingham, has resigned in order to take up a similar position with the Lancashire Dynamo & Motor Co., Ltd., Manchester. On Friday last, at a farewell smoking concert, Mr. J. D. Morrison, on behalf of the staff, made a presentation of a specially designed roll-top desk to Mr. Garner, which was represented by a model made by the pattern-makers in their spare time.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Calcutta Electric Supply Corporation.—An interim dividend at the rate of 7 per cent. per annum has been declared for the June half-year upon the ordinary shares.

Toronto Power Co.—This company is offering for subscription £821,917 4½ per cent. consolidated debenture stock at 96.

Companies Struck Off Register.—The names of the following have been struck off the register of joint stock companies: Macclesfield Electric Light & Power Co., Penarth Tramway Syndicate, Phœnix Electric Heating Co. Notice is also given that the name of the British Electric Co., Ltd., will be struck off the register in three months unless cause is shown to the contrary.

SUMMARY

The Council of the Institution of Electrical Engineers has consented to the consideration of the proposed new Articles of Association being adjourned, and the meeting last Thursday resolved itself finally into an informal discussion, in which, however, valuable suggestions for the amendment of the Council's proposals were put forward, and met with cordial support by the members present. We have formulated a list of objections to the proposals which we have sent to the Council, and to which we have obtained numerous signatures. These objections are set out in our article, and we invite our readers to co-operate. In the Provinces the opposition is even more marked than in London, and in addition to the objections to the name "Licentiate," proposed for the new class of members, and to the unfortunate mistake the Council has made in proposing an unacceptable method for the yearly election of Council, feeling runs very high against the proposals for increasing subscriptions. (Pages 605 and 611.)

The Electrical Apparatus Co.'s new works is described in an illustrated article. The principal manufactures carried on there are motor starters, ironclad switches, fuses, and ampere-hour meters, including a prepayment pattern. (Page 605.)

Three Papers on electrometallurgy of iron and steel, read at a previous meeting, were discussed at the last meeting of the Faraday Society. In these Mr. J. Härdén described his combined arc and resistance furnace; Mr. D. F. Campbell gave a general survey of recent progress; and Mr. E. K. Scott described the Hering "pinch effect" furnace. (Page 606.)

Mr. J. F. C. Snell's address to the Manchester Students' Section of the Institution of Electrical Engineers contained some words of advice to young engineers and a description of a power scheme at Bahia Blanca. (Page 607.)

The Borough Council of Southwark has installed a turbo-generator in the power station at Walworth. The turbine is of the mixed pressure impulse type, and the generator is designed to give either D.-C. or A.-C., the commutator of which is specially cooled. A cooling tower has had to be installed, and this is erected over the boiler house. (Page 608.)

After a long debate at the meeting of the St. Marylebone Borough Council on Thursday, it was decided to instruct the Electric Supply Committee to report as to the advisability of continuing the Sales and Publicity Department upon its present lines. A not unimportant feature of the debate was the expressed desire of the opponents of the Sales Department that their action should not be construed into any attack upon the officials who, as a matter of fact, received credit for the manner in which their work is being carried out. (Page 609.)

The application by a consumer for the appointment of an electrical inspector at St. Pancras was further discussed at the Clerkenwell Police Court last week. The Magistrate expressed the opinion that he ought to appoint an inspector but on the application of the St.

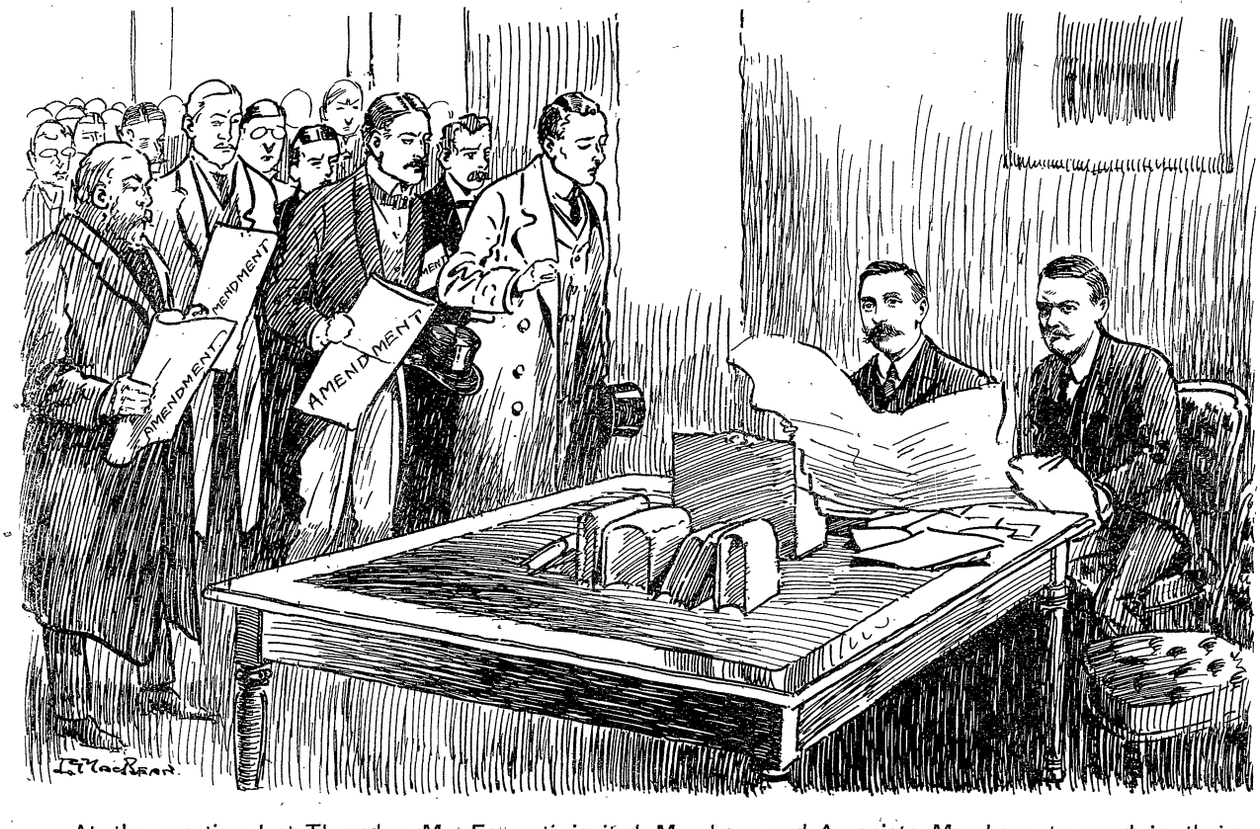
Hosted by Google

Pancras Borough Council he again adjourned the hearing of the application. (Page 609.)

Professor W. C. Unwin's Presidential address to the Institution of Civil Engineers dealt largely with engineering education. (Page 610.)

The appeal against the arbitrator's award in connection with the substitution of Parson's for Westinghouse turbines at the Lot's Road generating station has been heard this week. The Westinghouse Co., object to the decision that they are to bear the whole cost of the Parson's turbines, plus the difference between the actual and contract steam consumptions of the Westinghouse machine. In this way they claimed that the Underground Electric Railways Co. is placed in a more favourable position than it would be had the Westinghouse machines been up to contract and continued to work. (Page 611.)

In our Electric Traction Notes we give a report of an important arbitration, which is now proceeding, to determine the price which the L.C.C. has to pay for the London lines of the London United Tramways Co. The Dundee Corporation have accepted the tender for the installation of a trolley-omnibus system.—An amalgamation is proposed between the London General Omnibus Co., the London Electric Railways Co., and the Metropolitan District Railway Co.—A tube scheme for Manchester is in course of preparation. (Page 613.)



Under Telegraphy and Telephony (including Wireless) we refer to the suggested co-operation between the London Borough Councils to oppose the Postmaster-General on the question of overhead wires; and the laying by the Postmaster-General of an underground telephone cable at Hythe. (Page 613.)

An improved method of connecting flexible conductors to carbon brushes, by the British Thomson-Houston Co., and another for lamp-holders, in which an angle grip is provided on the cup and ball principle, were published by the Patent Office last week. Liquid instead of metal electrodes for drying timber, and an improved construction for hair dryers, are also protected. A process for welding metal plates together is covered by E. B. Koopman and the Pontelec Welding Patents, Ltd., as well as a new form of electric sign by H. Bey. (Page 614.)

An inquiry is to be held into the working of the Elland Electricity Works for the past year's work.—The Mayor of Marylebone (Mr. E. R. Debenham) spoke highly of the manner in which Mr. A. Wright had put the supply undertaking upon a sound foundation. With regard to the work of the Sales Department he said that the officials were only carrying out the declared policy of the Council, and that every effort was made not to interfere with the work of contractors.—The Luton Electricity Committee are to spend £200 upon the purchase of electric cooking apparatus for hiring out.—The Finance Committee of the L.C.C. suggest that a programme should be arranged for the future development of electric supply in London in view of the purchase of the Companies' undertakings.—The new works of Metalite, Ltd. at Derby were opened on Monday. (Page 615.)

The Wolverhampton Corporation are to spend £21,000 upon electrical extensions, of which £10,000 is to be provided from reserve.—Two 1,000-kw. turbo-generators are required at Salford; an electric tramway, lighting and power works at Napier (N.Z.); an electric power station in Jerusalem; stores at Bournville; and boosters at Sydney.—New mains are to be laid at Llandudno and Walsall.—The New Zealand Government is conducting an inquiry with a view to large extensions of the telephone system. (Page 615.)

For Arrangements for the Week, see p. 610.

At the meeting last Thursday, Mr. Ferranti invited Members and Associate Members to send in their suggestions and amendments to the Council's proposals for alteration of the Articles of Association of the Institution of Electrical Engineers. We predict a hearty response.

OBJECTIONS TO THE PROPOSED CHANGES AT THE INSTITUTION OF ELECTRICAL ENGINEERS

THE Council's proposed new Articles of Association are meeting with strong opposition. At the meeting called to pass these new Articles last Thursday, there were nearly a hundred members present, most of whom had evidently come for the purpose of objecting to the new proposals. In fact the opposition would have been strong enough to have defeated the Council's Resolution by an overwhelming majority had not the President announced that the Council would defer to the wishes of a large number of members from all parts of the country, and would adjourn the formal meeting to discuss the proposals. This formal meeting will not be held until November 30th, possibly later, but in the meantime there will be an informal meeting at the Institution in London on Thursday next (Nov. 16th), to discuss the matter, and discussions are taking place in the provinces at the Local Sections. Never before has any proposition of the Council given rise to so much dissatisfaction.

The alterations proposed by the Council may be summarised as follows:

THE COUNCIL'S PROPOSALS.

Candidates for Associate Membership may be called upon to pass examinations.

The Associate class to be confined to men who are *not* electrical engineers.

A new class of members to be formed, called "Licentiates," and permitted to use the abbreviation Licentiate I.E.E., whose only qualification is that they are educated persons engaged in electrical engineering or science.

The Council to be free to elect any man of science as a (full) Member.

One hundred eminent lawyers or commercial men who have rendered important services to electrical engineering to be eligible for (full) Membership—fifty at first and then ten a year.

Candidates for membership of any class, if they reside abroad, to require only one signature instead of five to their application form.

The rules for Professional Conduct to be embodied in the Articles, and members breaking them to be liable to expulsion.

The Ordinary Members of Council to consist of 12 Members, 3 Associate Members, and 3 Associates.

A Past-Chairman as well as the Chairman of each Local Section to have a seat on the Council, but the two may not vote simultaneously.

In the ordinary course the new Council for the following session is not to be elected by the membership, but is to be nominated by the Council. The only exception is to be if twenty-five Corporate Members have, previously to March 1st, (*i.e.*, nearly three months before the annual general meeting) nominated candidates to whom the Council object.

The Council to be allowed to delegate all its powers to any Committee, whether appointed from their own body or not.

The Council to have absolute discretion to incorporate any other society whatsoever with the Institution.

The subscription of every class of members, except students, to be raised: Members to pay 4 guineas instead of 3; existing Associate Members and Associates, 2½ guineas instead of 2; new Associate Members and Associates 3 guineas. The subscription of "Licentiates" to be 2 guineas, of students over nineteen 1½ guineas, and students under nineteen 1 guinea.

In view of the heavy drain on the funds of the Institution on account of the acquisition and rebuilding of the Institution's palatial home on the Victoria Embankment, an increase in the subscriptions may be necessary to meet current expenses and the growing activities of the Institution, although it was formally announced when the scheme for the new building was adopted that it would entail no increase of subscription. Apparently the Council has been more lavish than was originally contemplated, and omitted to take account of the possibility of the upper part of the building being untenanted, a possible contingency against which they now find they must make provision. If a mistake has been made in providing the Institution with more luxurious quarters than it can afford, it is too late to mend it, and we can only enjoy our luxury and pay for it. In view, however, of the possibilities of an increase in revenue from recruits to both the non-engineering and the newly-proposed junior grade, it would appear that the provincial members might, at any rate, be relieved of the burden of increased subscriptions.

The proposed examinations for new candidates for Associate Membership will only come in force in January, 1913, and we can reserve our comments until a more definite programme is published. Examinations are free from objections if the submission of a thesis is offered as an alternative. The insistence on observance of the rules for Professional Conduct is good, but the wording of the preamble does not make it clear that they are intended only to apply to members practising as consulting engineers; an amendment has been suggested which doubtless the Council will accept. That Local Sections may send a Past Chairman to represent them on the Council when the Chairman cannot conveniently attend is an extremely sensible arrangement.

Our approval of the proposed new Articles goes no further, however. We object most strongly to all the other innovations. We have formulated our objections in the form of a series of amendments, and have already been supported by a number of Members and Associate Members.

OBJECTIONS TO THE COUNCIL'S PROPOSALS.

We contend that—

(*a*) **Only Members and Associate Members must be permitted to use the Official Abbreviations.**

(*b*) **"Associates" must henceforth be called "Affiliated Members." [Members of this class, not being engineers, should have a name which will avoid confusion with Associate Members.]**

(*c*) **The new class of Members must be called "Subscribers" instead of "Licentiates" [for this new class will be composed of men with limited qualifications and experience].**

(*d*) **Not more than two persons whose only qualification is eminence in science and who are not engineers must be admitted annually as Members. [Others can be elected as Affiliated Members or Subscribers.]**

(*e*) **Eminence in law must only qualify for Affiliated Membership and not for Membership.**

(*f*) **In the case of foreign candidates for Membership, the same number of personal recommendations must be required as in the case of British subjects, and not less.**

(*g*) **There must be four Associate Members and only two Affiliated Members (Associates) on the Council, instead of three of each.**

(*h*) **The Council's proposals for new Members of Council must be sent to every Corporate Member six weeks before the Annual General Meeting, inviting further nominations within three weeks.**

(*j*) **Committees containing non-members of Council must be Advisory only, and must not possess the full powers of the Council.**

(*k*) **The Incorporation of other societies must not be effected unless allowed by a Special Resolution of Corporate Members of the Institution of which twenty-one days' notice has been given.**

In order that concerted action may be taken, and that the Council may not be embarrassed by receiving numbers of slightly conflicting amendments, we beg every Member and Associate Member who is in agreement with the above objections to the proposed new Articles to

Hosted by Google

inform us on a postcard, and we will send them a form for their signature.

The Council, as will be seen from the report of the meeting which follows, is disinclined to make any alterations whatsoever in the proposed new Articles, and pressure can best be brought to bear upon them by the force of numbers. Some of our readers may have other criticisms to offer, but practically all of them will agree that, at any rate, the recommendations we have made in large type must be adopted.

The matter is urgent: the prestige of the Institution itself and of the Members and Associate Members individually is at stake, and we beg our readers to communicate with us at once.

REPORT OF THE MEETING.

An Extraordinary General Meeting of Members and Associate Members of the Institution of Electrical Engineers was held at 4.30 p.m. on Thursday, November 2nd. Seven days' notice of the meeting had been given, accompanied by a draft of the proposed new Articles of Association, and a notice of a resolution that they should be adopted.

The President (Mr. S. Z. de Ferranti) said that the Council believed that the amended Articles were in every way good from the point of view of the interests of the Institution, but they thought that a mistake had been made by making the time too short to enable a proper consideration of the Articles by the members. He therefore proposed: "That this meeting stand adjourned to a date to be notified not being earlier than the 30th November." After this resolution had been passed he would say a few words on the subject of the new Articles, and would invite suggestions from other speakers.

Mr. ROBERT HAMMOND (Honorary Treasurer), who was chairman of the committee entrusted by the Council with the revision of the Articles, seconded the proposal.

The PRESIDENT: I will now put it to the meeting.

Mr. A. J. MAKOWER suggested that the time of the meeting should be 8 p.m. and not 4.30.

This was opposed by the President, Mr. Hammond, and Mr. Siemens, but on Mr. Makower insisting, supported by Mr. A. P. O'Brien and the meeting generally, the President agreed to the change of time.

Mr. F. C. RAPHAEL pointed out that if the meeting were adjourned and notices were sent out in the same terms as for the present meeting, it would only be competent to discuss the entire Articles *en bloc*, and it would not be possible for any amendments to be proposed. The point was important, for Members and Associate Members were desirous of having a great many amendments made, and he trusted that they might have an assurance that at the next meeting steps would be taken so that these amendments should be in order.

Mr. Maurice Solomon supported Mr. Raphael, and after much discussion, in which the President, Mr. Alexander Siemens, and Mr. Sydney Morse took part, this was conceded.

Mr. MAKOWER: If the meeting stands adjourned, are we correct in going on discussing the proposals?

The PRESIDENT: It would be an informal meeting, of course.

Mr. A. J. CRIDGE asked whether, as the meeting would be an informal one after the resolution for amendment had been passed, any record would be taken of it. Otherwise the discussion would be useless.

Mr. A. H. DYKES urged that the resolution for amendment should be passed and the discussion proceeded with.

The PRESIDENT said that as members of the Press were present, the informal discussion would doubtless be reported and circulated.

Mr. RAPHAEL, who is Editor of ELECTRICAL ENGINEERING, said that only those members of the Press were present who are Members and Associate Members. He had been refused permission to send his shorthand reporter, and now requested that the shorthand notes of the official reporter should be placed at the disposal of the Press.

The PRESIDENT agreed to this; and after some further discussion the motion for adjournment was passed.

The PRESIDENT then said that there were two outstanding things to be considered in the new Articles. The first was the amount of subscriptions. He wanted to bring the Institution more into touch with the needs of the industry, in order to get more prosperity in electrical work, but the difficulty he met at every turn was that the Institution was working on so narrow a margin that there was no money for anything it wanted to do. The second question was that of the new membership or the alteration of membership. He had been largely responsible for trying to force home the idea that the Institution wanted to be not only a scientific society, but also a body which dealt generally with the whole wide interests of electrical work in this country. In order to put the Institution in such a form that it could be really useful to the interests of all concerned in electrical work, it was desirable not to limit the membership to the purely technical people. They wanted to bring in many able men who were not purely electrical engineers, and to get them to help to conduct the business of the Institution. He then called on Mr. Hammond to speak first as the Chairman of the Articles Committee.

Mr. HAMMOND's remarks, with amplification, have already been printed, and sent by the Institution to every Member and Associate Member, so that they need not be reported at length here. He reviewed some of the alterations which the Council proposed to make in the Articles of Association (summarised on page 603), and mentioned that the Committee appointed to revise them consisted of 12 Members, and included six Chairmen of Local Sections. He said that an increase in subscriptions was not necessitated by the new building *per se*, although he admitted (in the subsequent additions made in the printed report), that the present small margin was contingent upon the letting of the upper part of the building on similar terms to that paid by present tenants, who are leaving next June; otherwise there might be a liability of about £3,000 a year to meet. To meet this possible liability a number of past and present members of Council have generously formed a guarantee fund, amounting to about £7,500, but the increased subscriptions would certainly be a welcome addition to the credit side of the account. He mentioned a number of proposals which would be possible to carry out if the revenue were greater, namely, the establishment of an employment and information bureau, a lending library, additional meetings and lectures, summer meetings, additional staff, more frequent publication of the journal, &c., which he estimated (in his statement made subsequently to the meeting), would involve an initial expenditure of about £2,000, and an annual expenditure of over £2,000 per annum. Finally, he said (amid cries of "No, no") that the proposals were not new, but had been mentioned in the Council's Annual Report.

Mr. MAURICE SOLOMON, who was the next speaker, and who may be taken to give expression to the opinions of members of the Birmingham Local Section, objected to the introduction of a new class of members, and the splitting up of the Institution into so many classes and divisions. The Institution could be made a purely professional body, or an Association of all concerned in electrical engineering trade or industry. But it was not possible to do both, and the Council's endeavour to do so was destined to failure. To be a professional Institution three classes of members only were required: Members who are at the top of their profession, Associate Members, who are the great average of the people in the profession (both classes strictly professional men), and Associates, including all the non-technical men. The other and broader ideal would entail only two divisions: Members, including the most distinguished people, whether technical or non-technical, and Associate Members, including the great run of people, whether technical or non-technical. Mr. Hammond, in his statement for the reason of the increase of the fees, Mr. Solomon continued, had made a financial statement in which not one figure whatever was put before them. If they were to be asked to raise their subscriptions they should be shown what the additional income was to be used for. Consideration should also be shown for the fact that country members cannot enjoy the same advantages as town members, for the palatial Institution was of no practical use to them. Mr. Solomon also criticised the representation of Associates on the Council as not being in keeping with the remainder of the proposals, and objected strongly to the new method put forward in the Articles for the selection of new members of Council. Finally, he said that the Local Sections and individual members were very anxious to propose amendments, and a good discussion on them by the members all over the country was necessary. At Birmingham a meeting had been hastily called on the previous Tuesday, and a resolution was sent in requesting the Council to submit these Articles for discussion at the local centres. He hoped the Council would accede to that request, which was signed by most of the leading members of the Birmingham Section. He understood that similar resolutions had been sent in from many of the other branches.

Mr. CRAMP pressed for some definite decision as to the mode of procedure, especially with regard to discussion and amendments by the Local Sections.

Mr. E. H. RAYNOR asked that an explanatory letter should be sent out dealing with the effect of the Council's proposals [a similar request had been sent in by others], and a review of the present and future financial situation. He asked that a *résumé* of the Treasurer's statement should be sent out to all members. Incidentally he also criticised the method of calculating the fees for life membership.

Mr. ALBERT CAMPBELL suggested a referendum on the subscription question. He considered that the present subscription of Associate Members was sufficiently high.

Mr. F. C. RAPHAEL expressed his approval of the desirability of enrolling every useful member into the Institution, and said that if an increase of subscription was necessary it must be paid. Mr. Hammond had spoken about the representation of Local Sections on the Committee, but had forgotten all about the representation of the Associate Members not only on the Committee, but on the Council. There is, Mr. Raphael pointed out, only one single Associate Member on the Council, and

THE VAUXHALL WORKS OF THE ELECTRICAL APPARATUS CO.

WE had an opportunity recently of inspecting the new works in South Lambeth Road, into which the Electrial Apparatus Co., Ltd., moved last spring, and where now the whole of their manufacturing activites are carried on. The company was founded in 1907 for the manufacture of meters of the well-known design of Mr. E. B. Schattner, as well as a considerable range of motor starters and other switchgear of moderate size. The original Milford Works at Battersea after a few years proved inadequate for the rapidly growing needs of the business, and the construction of the present works upon a site suitable for still further extensions was decided upon.

The works are arranged all on one floor, and at present about 130 men are employed. The main shops are in parallel bays, without partitions, except those by which the test-room is shut off; the offices run along the front of the building, and the stores for material, parts, and finished apparatus run along the back. The machinery is concentrated at one end, the assembling benches for starters, &c., are in the centre, while the meter department and the test-room occupy the other end. Thus all work, in passing through its various stages, continually travels towards the test-room, adjacent to which is the packing and despatch department. The whole organisation is very systematic and the arrangement of designs permit of a large variety of forms of apparatus being turned out without undue multiplication of standard parts. Fig. 1 gives a good idea of the shops with the assembly benches in the foreground and the machinery to the right.

The machine tools are of a fairly light character suited to the size of the work put through, and are all driven through shafts and belting by one 15-h.p. single-phase motor off the mains of the South Metropolitan Electric Light and Power Co. This also drives a couple of small D.-C. machines for supplying current and charging accumulators for the testing department. The machines include drilling and tapping machines of various patterns, light semi-automatic turret lathes for making small parts, studs, special screws, &c., and a few stamping presses. The firm also cut all their small gear wheels for meter mechanisms on a particularly ingenious form of gear-cutter. There are also special winding lathes for resistance coils and for the flat former wound coils of the E.A.C. meter, to which we refer below. The company believe in making as many small parts as possible themselves, and we even saw small hexagon nuts going through in very large quantities. Some of the details show remarkable ingenuity, and we were particularly struck by the neat method

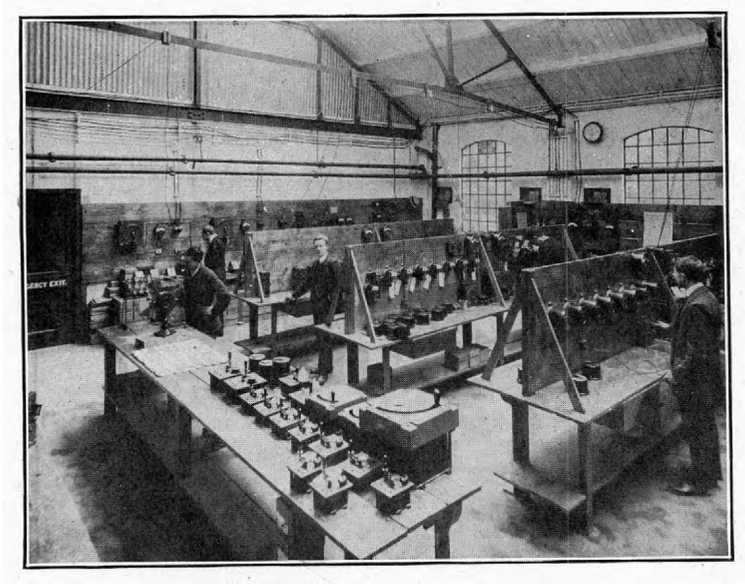

FIG. 2.—TESTING ROOM.

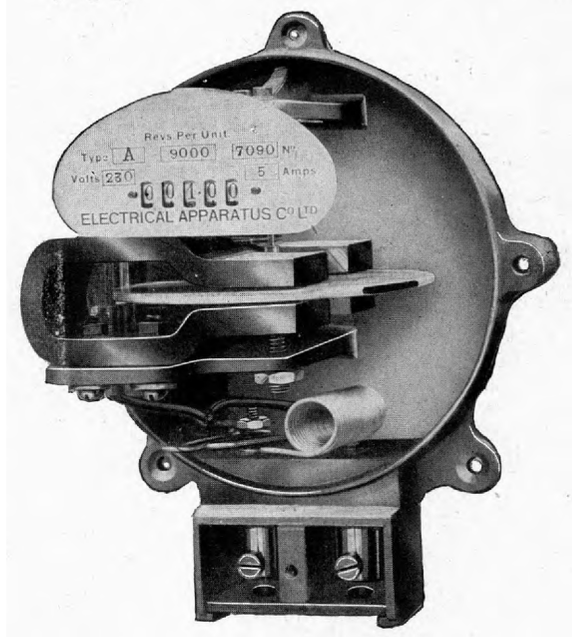

FIG. 4.—E.A.C. HIGH TORQUE METER WITH COVER REMOVED.

Hosted by Google

by which what corresponds to a steady-pin on the starter contacts is stamped out from the other side of the blank. Templates and jigs are largely made use of, and parts are made as interchangeable as possible.

The meter department is at the other end, and here the E.A.C. high-torque meter is put together both in its standard form and with the addition of a prepayment mechanism. A few precision machines are in use at this end, but the chief work is assembling at the bench. This part of the works is specially well lighted by 110-volt metal filament lamps, which are placed nearer together here than in the rest of the works.

The whole of the apparatus made passes through the test-room, of which a view is given in Fig. 2, where the resistance of the starter rheostats is checked, the insulation resistance of every piece measured, and a 2,000-volt flash test applied. The setting of all releases, &c., is also thoroughly tested. The meters are tested and calibrated in the same department, and an ingenious system is adopted for testing the cyclometer dial trains for friction by mounting little propellers on their shafts and blowing them round by a large electric fan.

Having thus sketched the general characteristics of the works, we will add a few words as to the apparatus made there. With many of the special forms of starters emanating from this works our readers are already familiar, including the slow-motion starter illustrated in an account of the company's stand at the Olympia Exhibition (ELECTRICAL ENGINEERING, fourth Exhibition Supplement, October 12th, page 67), with its cleverly arranged zig-zag guide ensuring a step by step motion, the automatic solenoid starters, and the special lever-type starter for single-phase induction motors (see ELECTRICAL ENGINEERING, June 15th, p. 331). Other special forms include reversing starters, combined starters and speed regulators, &c. Attention may also be drawn to a new form of ironclad fused switch, provided with a special arrangement of springs, giving a quick make as well as a quick break, and equipped with the company's "Koolark" cartridge fuse. The details of this switch, which is being made in large quantities, are shown in Fig. 3.

The E.A.C. high-torque meter, with its three flat armature coils held between two aluminium discs, forming also the brake, and moving in the field of two permanent magnets, is now well known; over 150 supply authorities now order them regularly, and they are being sold at a rate of over 6,000 per annum. When they first introduced a commutator ampere-hour meter the company had to face strong distrust of this type, due probably to experience with designs originating on the Continent which were not suited to English conditions, for the climate here destroys in a few months insulating and other materials that will last for years in dry places. The main insulation of the imported meters was fibre; that of the E.A.C. meter is mica. Moreover, in the construction of the E.A.C. meter the greatest care is taken to use nothing that can deteriorate. Only the very best enamel-insulated wire is used, phosphor-bronze is used for the spindle in the gears in place of steel, the brushes and commutator are actually made of 18-carat gold. An important feature of these meters is that they use three or four times as many turns in the armature as there are in any other meter. It is therefore claimed by the makers that as the torque is thus three times as great, where another make is really accurate and reliable down to say ¼-load, the E.A.C. meter is the same on 1/12th load. The prepayment meter was also illustrated in ELECTRICAL ENGINEERING in connection with the company's stand at the Olympia Exhibition. Briefly, the prepayment mechanism provides means whereby the insertion of each coin permits of the controlling wheel being wound up a certain amount, by which it has to be overtaken by the meter train before it releases the switch, and the mechanism is so arranged that the force required to release the switch is supplied by the spring which is wound up when the coin is inserted, and not by the meter.

The "Corona" Loss on H.T. Transmission Lines.—The *Elektrotechnische Zeitschrift* of Oct. 26th last contains the results of tests made at the Dresden Technical University to determine the "Corona" loss which is to be expected on the 110,000-volt transmission system of the Lauchhammer Aktiengesellschaft, described in ELECTRICAL ENGINEERING, Sept. 28th last. The experiments were made with conductors 0·065 sq. in. in section, as used in the actual installation. The results compared well with those of Ryan, published recently in the *Proceedings* of the American Institute of Electrical Engineers. With the spacing of 175 cm. between the conductors of the three phases, a temperature of 17° C. and a barometric pressure of 750 mm., the loss was found to be 2·2 kw. per km. at 100,000 volts, 4·5 kw. per km. at 105,000 volts, 8·5 kw. per km. at 110,000 volts, and 13 kw. per km. at 115,000 volts. It will be remembered that the total length of the transmission line is 50 km., so that a total "Corona" loss of nearly 200 kw. will be occurring at all loads.

ELECTROMETALLURGY

THREE Papers relating to electric furnaces were read at a meeting of the Faraday Society on October 3rd, and were discussed on October 17th. The first, by Mr. J. Härdén, described the latest form of his "Paragon" combined arc and resistance furnace in which the surface of the slag is heated by means of arcs, and the bath is also heated from the sides and beneath by means of side-plates as in the Röchling-Rodenhauser furnace. A small melting-furnace known as the "Helberger," consisting of a plumbago crucible heated by induction to temperatures up to 3,000° C. was also described. The subject was treated in a more general way by Mr. D. F. Campbell in a Paper entitled "Progress in the Electrometallurgy of Iron and Steel." In Scandinavia and Western America, where the conditions were exceptional as regards the absence of coke and cheap water power, he said that the electric smelting of iron had been proved to be able to compete with small blast furnaces, and this development would do much to compensate for the exhaustion of the wood supplies. The electric refining of steel was less dependent on the cost of power. He reviewed the advances that had been made in California, and dwelt on the superior quality of steel made in the electric furnace. Great improvements had been effected in details, and the power consumption for melting and refining soap had been reduced to 600 kw.-hours per ton. In the third Paper, Mr. E. K. Scott gave a description of the Hering "pinch effect" furnace, in which the electromagnetic force acting from the circumference to the centre of a conductor carrying a heavy current is utilised to cause a vigorous circulation of the charge, and enables a very simple and inexpensive design of furnace to be used. The current enters and leaves the bottom of the furnace through vertical metallic electrodes contained in resistor tubes, which are very small compared with the bulk of the furnace. The circulation of the molten mass takes place above and around the resistor tubes, on account of their lower ends being closed by the electrodes.

The discussion on all the Papers was opened by Mr. C. Hering, who gave some further particulars of his furnace, which was now being made up to 10 tons capacity with resistor tubes of magnesite or alundum. Mr. W. M. Morrison, in a written communication, anticipated trouble with corrosion of the metallic electrodes of the Hering furnace, and thought that they would have to be water-cooled. Mr. C. C. Gow suggested that the risk of erosion of the resistor tubes by the flow of steel would be serious. Mr. D. F. Campbell also criticised the construction of the Hering furnace, and said that Mr. Härdén's Paper amounted to a confession that the induction principle might be done away with, and that arcs were absolutely necessary for refining, as slag reductions must take place if the electric furnace was to have any considerable use.

AUTOMATIC CONTROL GEAR FOR MOTORS

WE have received from the British Thomson-Houston Co. an advance proof of a pamphlet dealing in a general way with the functions of the various forms of automatic motor control gear which they have developed. The advantages of automatic control in the greater uniformity of operation secured, reduced cost of attendance, and economy due to running plant only when actually required, are pointed out, and the leading features of time, counter E.M.F. and current control are discussed to show the advantages of the last mentioned, which ensures a rate of acceleration dependent on the load. In the smallest and simplest solenoid starters time control by a dash-pot is used, and various float switches, pressure gauge relays, and other control devices for special purposes are described. Above 15 h.p., however, the company recommend contactor equipments with current limit control, and this class of apparatus is made in panel form for both alternating and continuous current motors up to very large sizes. (A panel of this nature was illustrated in ELECTRICAL ENGINEERING, May 11th, page 251.) The contactors themselves are similar to those employed in very large numbers under the very trying conditions of electric railway work.

Physical Society.—The annual exhibition of apparatus will be held on Tuesday, Dec. 19th, and will be open both in the afternoon and evening.

The Institution of Post Office Electrical Engineers.—At the next meeting (at the Institution of Electrical Engineers' Building), on Nov. 13th at 6 p.m., a Paper will be read by Mr. W. S. Mountain on "Departmental Contracts." Subsequent papers down for reading are: "Distribution by means of Parallel Cables," by E. A. Pink (Dec. 11th); "Precautions against Fire," by A. J. Stubbs (Jan. 8th); "Economics of Telephone Transmission," by A. W. Martin (Feb. 12th); "Machine Switching in Telephony," by B. O. Anson (Feb. 26th); and "Telegraph History," by H. R. Kempe (March 11th). The annual general meeting is fixed for April 22nd.

Hosted by Google

MR. J. F. C. SNELL'S ADDRESS TO THE MANCHESTER STUDENTS

A South American Power Scheme

THE inaugural address to the Manchester Students Section of the Institution of Electrical Engineers was given on Tuesday last by Mr. J. F. C. Snell. In his advice to young engineers about to commence their careers, he expressed the view that in years to come all engineers would have to learn the fundamentals of electrical engineering, and there would be a smaller proportion of specialists. It

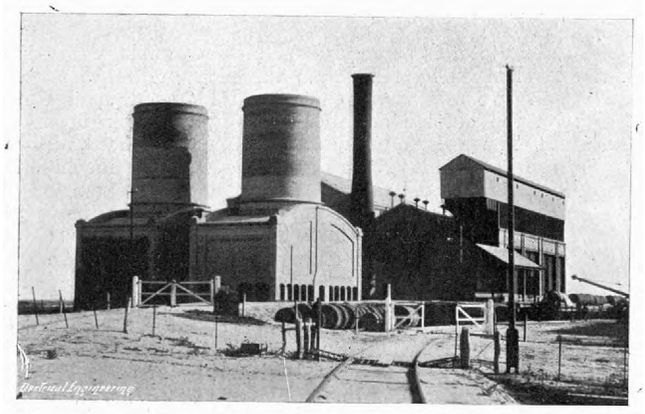

FIG. 1.—BAHIA BLANCA GENERATING STATION, SHOWING BRICK COOLING TOWERS, &C.

was of the utmost importance that the training of electrical engineers should not be too narrow. What he wished to emphasise particularly, however, was that in this country more electrically trained young men were being turned out from universities and technical colleges than there were places for them to fill. Young engineers must be prepared to go abroad much more than they do. The engineer was the pioneer of civilisation, and could also act as the missionary of British influence. It was necessary to broaden one's experience as much as possible. He also emphasised that spirit of true economy which was the basis of sound commercial engineering. It was one of the main functions of the engineer to get the most he could out of the money spent. He dwelt further on the necessity for breadth in the engineer's training, and gave a word of warning against the very common desire of running before they had learned to walk.

The latter part of the address was devoted to some impressions of a recent visit to South America, and a description

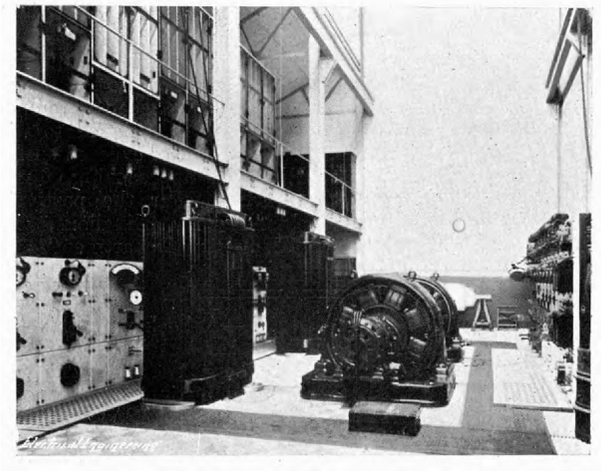

FIG. 2.—INTERIOR OF TYPICAL SUB-STATION.

of the electric supply and traction system of Bahia Blanca, for which Mr. Snell was responsible, and a number of interesting lantern slides were shown. A general description of this system appeared in ELECTRICAL ENGINEERING, May 19th, 1910, page 321, but through the kindness of Mr. Snell we are now able to reproduce one or two photographs of the plant. The scheme involves a large power station at Paraguaya at present containing three 1,000-kw. Browett-Lindley-Westinghouse triple expansion steam alternators, forming the first quarter of the ultimate equipment, and a few smaller sets. Babcock Wilcox boilers are used, burning Welsh coal in stokers of the underfeed type, and the consumption of coal has worked out to 2·7 lbs. per unit generated on a 32 per cent. load factor. Features of the station are

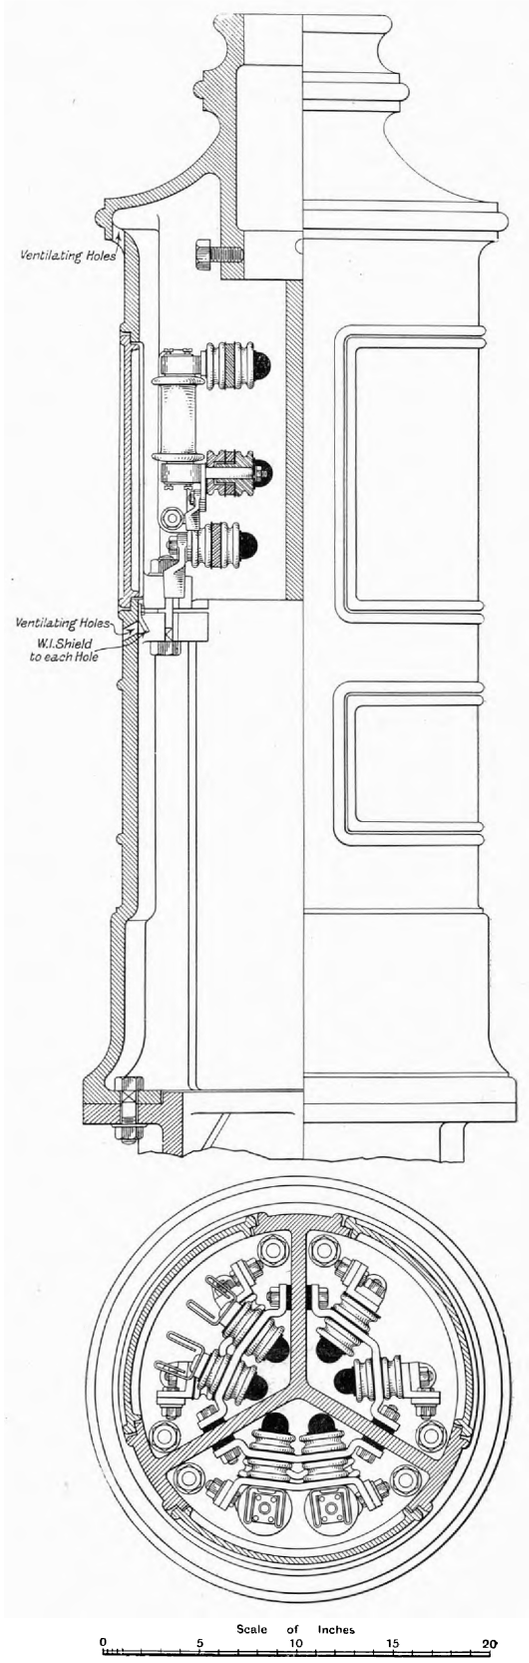

FIG. 3.—COMBINED FEEDER PILLAR AND ARC-LAMP POST BASE.

the use of Westinghouse-Leblanc condensing plant and the Balke natural draught cooling towers of brickwork and ferro-concrete, which figure prominently in Fig. 1. The alternators generate at 6,600 volts three-phase 50 cycles, and special care was taken with their insulation in view of the

Hosted by Google

heat and moisture of the climate. The switchgear is of the remote control pattern, with desk-pattern operating boards, and, like the whole of the plant, was supplied by the British Westinghouse Co. Energy is supplied from this station to several sub-stations, and a three-phase four-wire system is

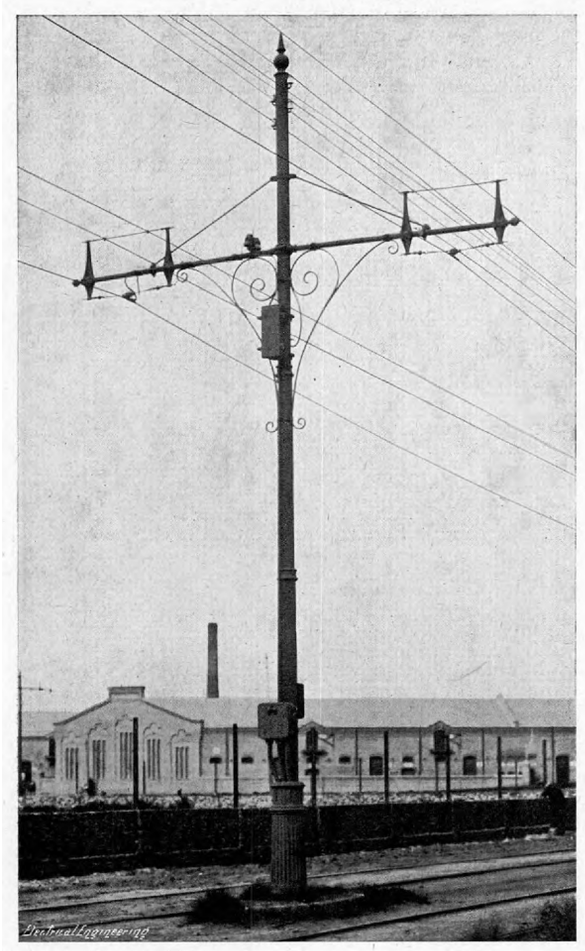

FIG. 4.—TRAMWAY POLE, SHOWING BOWSTRING SUSPENSION AND FEEDING ARRANGEMENTS.

used, both for the tramway and lighting supply. There is also a considerable power load in connection with the docks and railway workshops, and tramway extensions are contemplated. A view of one of the tramway sub-stations, with rotary converters, is given in Fig. 2, while Fig. 4 shows the bowstring suspension and guard wire mounting used on the tramway overhead work. The whole of the public lighting is by A.C. arc lamps, worked in connection with constant current transformers. A special combined feeder pillar and lamp column is employed, supplied by W. T. Henley's Telegraph Works Co. Details are given in Fig. 3.

EXTENSION OF PLANT AT THE SOUTHWARK ELECTRICITY WORKS

IT speaks well for the electricity supply in Southwark that it has been found necessary by the Council to instal additional plant at the generating station in Penrose Street, Walworth, S.E., to cope with a great increase in demand for energy, both for lighting and power. This takes the form of a mixed pressure turbine made by Messrs. Belliss & Morcom, Ltd., which will be supplied with steam at 160–170 lbs. per sq. in. from the exhaust of two 700-h.p. Willans engines, which are coupled to Siemens dynamos of 450 kw. each. High and low pressure governor valves are provided, so that it can run on different circuits to the reciprocating sets, supplying the exhaust steam when required. The governing arrangements follow the firm's usual practice, and consist of separate oil relay systems for both the main and emergency valves. The turbine will drive a generator designed by the General Electric Co. to give an output of 600 kw. at 500 volts at a speed of 1,500 r.p.m. This is of the enclosed type with self-contained fan ventilation, the air being drawn through a duct in the foundations and expelled from an outlet at the top of the frame. The magnet poles are made of laminated charcoal iron plates of high permeability, which are rigidly bolted to the cast steel frame. Four commutating poles and a compensating winding, distributed over the whole face of the main magnet poles to neutralise the armature reaction, are also provided. The armature is made up of steel stampings. These are supported and keyed on the shaft, and are clamped together by two cast steel end plates, which also form a support for the projecting portion of the armature winding. This is secured in slots by means of strong maple wedges, and is also bound down at the ends to prevent movement. The armature is thoroughly cooled by means of fans, which give both axial and radial ventilation, and is balanced both dynamically and statically.

The commutator is assembled on steel cones keyed to the shaft and clamped by large nuts threaded on the shaft. It is made in two sections, each secured by solid steel rings shrunk on the outside and insulated by a thick layer of micanite. The segments, which are made of hard, drawn copper, are insulated by pure mica plates. The machine is cooled in quite a novel way: A fan fixed on an extension of the shaft sends air through a pipe, which terminates in nozzles under the commutator. This also serves to remove any carbon or other dust sticking to the surface. The extremely high speeds of the armature and commutator, namely, 14,000 and 8,500 feet per minute at the periphery respectively, renders a special brush gear necessary. Each brush is independent and can be adjusted by itself in any direction, whilst the whole gear is moved round by a special hand wheel fitted on the top of the collecting gear. Arrangements are made so that the holders and brushes can be adjusted in the event of the segments wearing. Tappings are taken off the back of the armature to three slip rings, so that an A.-C. current is also available, though the main portion of the output will be D.-C. only. The condensing plant has been supplied by the Workington Pump Co., to deal with 25,000 lbs. of steam per hour, maintaining a 27-in. vacuum. It is also arranged so that the existing reciprocating engines can be run condensing if required, when the turbine is not being used. The condenser is of the rectangular surface type with 3,600 sq. ft. of cooling surface, and with about 1,530 brass tubes. These are a little over 12 ft. long, representing a total length of over 3½ miles of tubing. The air pump is of the well-known Edward's type, with three cylinders, 13½ in. by 12 in., and is driven by a 15-h.p. motor. There is also a 12 in. centrifugal pump driven by a 40-h.p. motor, which circulates, continuously, 2,400 gallons of water per minute, or 650 tons per hour, through the condenser to a cooling tower. This is 55 ft. high from the base, and has been erected over the boiler house on heavy stanchions placed between the Babcock & Wilcox boilers, which are stayed and held so that only dead-weight is transmitted to them. The wind pressure on the tower is taken entirely by rolled steel joists. The cooling tower was built by the Davenport Engineering Co., Bradford, under Holehouse's patent system, and contains a number of hurdles, each provided with rails secured without nails. These are so arranged that the water is suspended in the tower long enough to reduce the temperature to about 60 or 70° F. It has been designed to withstand a wind pressure of 40 lbs. per sq. in. of exposed surface, and has already been subjected to gales approaching 60 miles per hour without appreciably moving. For the particulars contained above we are indebted to Mr. Kinghorn, Chief Engineer and Manager to the Electricity Department of the Borough of Southwark.

Small Switches and their Circuits.—A book with this title, by M. W. Perren Maycock, is being published jointly by S. Rentell & Co. and A. P. Lundberg & Sons. The work, although of great utility to all planning installations, deals, of course, entirely with the deservedly well-known manufactures of Messrs. A. P. Lundberg & Sons. A good deal of general information on wiring and the arrangement of switches is given, with fully illustrated descriptions of the vast variety of apparatus made by the firm. The almost endless possibilities of control of single or groups of lights by the ingeniously contrived duplex, intermediate, "Marvel," and other types of switch are fully gone into with numerous diagrams, and a large variety of special forms of switch, plugs, and combinations of the two are described. A glance at these pages cannot fail to open one's eyes to arrangements of switches opening up new possibilities, and the whole is arranged in a form pleasanter to read than a trade catalogue, but with a completeness such as few catalogues possess. The work is published at the price of 2s. 6d.

MARYLEBONE SALES DEPARTMENT

AT the meeting of the Marylebone Council on Thursday, the following motion was moved by Councillor Oswald Lewis :—"That with a view to the fact that this Council does not desire to continue competitive trading, the Electric Supply Committee be instructed to report to the Council as to the advisability of discontinuing the execution of contracts for wiring and the sale of electric fittings."

In proposing the motion, Councillor LEWIS said that after very careful inquiries in all directions he felt quite satisfied that the result of the continuance of the sales department upon its present lines would be the ruin of the small electrical contracting firms in Marylebone. It was claimed by the department that the work of the contractors was not interfered with, and that they did not tender for work already in the hands of private contractors unless specially asked to do so. Whilst dissociating himself entirely from any reflection upon the way in which the officials of the department carried out the declared policy of the committee, he thought it was an exceedingly different thing to employ a number of canvassers and ask them, on the one hand, to push the work of the department in wiring and fittings, and, on the other hand, to tell them that they were not to interfere with other people who were doing the same work. It was, in fact, an impossible position, and it was for this reason that he did not wish to reflect upon the action of the officials in any way. But there was no doubt that the information gained by the electricity undertaking as suppliers of electrical energy was being used by them in the pushing of the Sales Department. This, he contended, was distinctly unfair to the electrical contractors in the Borough, and was not a policy that should be continued by the Council.

Councillor J. H. INCE seconded the motion.

Alderman DENNIS moved an amendment to the effect that the Electricity Committee should be asked to report as to the advisability or otherwise of continuing the Sales and Publicity Department on the present lines, particular regard being paid to the question raised by the Electrical Contractors' Association in their recent communication to the Council. This was seconded by Councillor H. H. Dunn.

Councillor J. A. BEAUMONT said that in various directions the impartiality of the Electricity Committee had been questioned, and he suggested that it might be better to have a report from a committee independent of the Supply Committee.

Councillors RUSSELL, GARROULD, and WHITE supported the amendment by Alderman Dennis, the latter expressing the opinion that the electrical contractors in the Borough seemed to have got into a "holy terror" without any reason at all. Personally, he did not think that the electrical contractors had much to fear. One of the proudest things he ever did was to destroy one of the most gigantic municipal trading concerns London ever had, viz., the London County Council Works Department, and if he could destroy the Marylebone Sales Department without doing injury to other people he should not see much objection to do it. The fact was, however, that they had paid a fabulous price for the undertaking, and if only in atonement for that blunder they should now do their very best with the undertaking in the interests of the ratepayers. He could not believe, for instance, that Mr. Duncan Watson had lost the business of one single point through the operations of the Sales Department.

Councillor DUNCAN WATSON said he quite agreed with this remark. He had, however, investigated this matter very closely, and had ascertained that there were sixty electrical contractors in the Borough, and their annual turnover was something like £43,000, out of which the Sales Department now did £16,000 annually. Could it be said that that work could be legitimately taken away, and no one suffer? The suggestion was preposterous and absurd. If the Council left the work to contractors, they had a large body of unpaid canvassers. He hoped the Council were not going to buy something at a very great expense which they could get for nothing. In only four places in the country were municipal wiring departments carried on, viz., Sheffield, West Ham, Ipswich, and Hackney. As showing the peculiar circumstances of the electrical contractors in Marylebone, he pointed out that there were 59 contractors there to one in West Ham; 74 to one in Ipswich; 44 to one in Sheffield; and 47 to one in Hackney. He submitted that the circumstances in Marylebone were so entirely different that the question called for very serious consideration.

Colonel HOPKINS (Chairman of the Electric Supply Committee) said he was perfectly indifferent as to whether the Council appointed a Special Committee to report, or whether it was left in the hands of the Electric Supply Committee. The whole desire of the Committee was to prevent the undertaking making a loss. He was curious to know how Mr. Duncan Watson arrived at his figure of £43,000. Did he go round to all the contractors inside and outside the Borough to ascertain their turnover? Further, when Mr. Duncan Watson referred to £16,000 as the work done by the Sales Department, he had not pointed out that it also included the revenue from the hiring out of apparatus. He strongly deprecated the members of the Council ventilating their grievances in the newspapers, as it prevented him, as Chairman of the Committee, from properly replying to the charges which had been made against the department.

Eventually Alderman Dennis's amendment that the Electric Supply Committee should report upon the question was adopted by the Council.

During a discussion upon the revenue account for the June quarter, Councillor J. H. Ince asked for full particulars of all cases of the free loan of apparatus and free current to either members or officials of the Council, and when any of these people last returned the apparatus to the Committee, and whether any records of reports upon tests with the apparatus stand on the minutes of the Electric Supply Committee.

Colonel HOPKINS said that Dr. Bokenham, a member of the Electric Supply Committee, had had various pieces of apparatus for testing from time to time since January, 1909, which were returned to the department when sufficient tests had been made. For such tests a free supply of current was given, and the value of it during the past three years amounted to less than 30s. Mr. Seabrook, the general manager, and Mr. Hind, the assistant sales manager, have had the free use of pieces of apparatus for testing, but only Mr. Seabrook had a free supply of current for this purpose, as Mr. Hind did not reside in the Borough. Reports were made to the Electric Supply Committee from time to time, but they did not appear on the committee's minutes.

DISPUTE re MUNICIPAL WIRING RULES AT ST. PANCRAS

THE application to Mr. Bros, magistrate to the Clerkenwell Police Court, for the appointment of an electrical inspector, referred to on p. 559 in our issue for October 12th, was further discussed on Thursday, when Mr. R. Tweedy Smith (solicitor to the Electrical Contractors' Association) made a speech on behalf of Mr. A. E. Evans, of 38 Fitzroy Street, Fitzroy Square, and Messrs. McDonald, Syer & Co., Ltd., of 295 Gray's Inn Road, W.C., who are now both named in the application. The grounds for the application were stated in our issue referred to above.

Mr. Tweedy Smith explained that whilst the magistrate had no power to appoint an electrical inspector under the St. Pancras Electric Lighting Order of 1883 for the testing of anything except the mains of the undertakers and the meter of the consumer, the Board of Trade Regulation No. 31 provided that "any consumer who is dissatisfied with the action of the undertakers in refusing to give or in discontinuing a supply of energy to his premises," has a right to apply for the installation to be tested by an electrical inspector. In the case of Mr. Evans, he had 60 lights and four radiators in his house, a 7½-h.p. motor in his factory, and two radiators in his office. A Tucker fuse-board had been provided for some of the radiators, but the St. Pancras Borough Electrical Engineer (Mr. Sydney Baynes) had refused to connect this fuse-board on the ground that it did not comply with his regulation as to fuses. These were given in our issue for October 12th. Mr. Baynes seemed to be under the impression that he could insist upon a particular type of fuse, notwithstanding the fact that all other Metropolitan Borough electrical engineers were accepting the one which he was rejecting. There had, he said, been several faults on the St. Pancras mains, resulting in the consumers' lamps being burned out, and Mr. Baynes was really trying to protect the consumers' premises from leakages on the mains. Under the St. Pancras Provisional Order, Section 59, the Council were bound to observe the following regulations :—"The supply of electricity to any premises shall be capable of being turned off at some point outside such premises. All service lines and positive and negative poles of service lines upon the premises of any consumer shall be at a distance of not less than three inches from one another respectively." These provisions were not being complied with, and in insisting upon a larger break in the fuses the Council were really guarding against defects in their own mains. Tucker fuse-boards had been passed by the Board of Trade, and the application now was that the magistrate should appoint an inspector to examine the fuse-board and the installation at Mr. Evans's premises, to test the meter at the premises of Messrs. McDonald, Syer & Co., and the mains of the Council's.

After Mr. Syer had given evidence, Mr. Bros, the magistrate, remarked that he thought he ought to appoint an electrical inspector, but on the application of Mr. Barrington Ward, counsel for the St. Pancras Council, the hearing was again adjourned.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 9TH.

British Electrical and Allied Manufacturers' Association.

2.30 p.m. Council Meeting at 36 Kingsway, W.C.

Institution of Electrical Engineers.

8 p.m. Presentation of Premiums. "Modern High-voltage Power Transformers in Practice, with Special Reference to a 'T' Three-unit System," by W. T. Taylor. In the absence of the author, the Paper will be read by Mr. J. F. C. Snell.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At Royal College of Science. "Electric Heating and Cooking," by S. L. R. Price.

FRIDAY, NOVEMBER 10TH.

Institution of Electrical Engineers: Birmingham Section.

7 for 7.30 p.m. Annual Dinner at Grand Hotel.

SATURDAY, NOVEMBER 11TH.

Birmingham and District Electric Club.

7 p.m. At Colonnade Hotel. "Light and Illumination," by H. Wheat.

MONDAY, NOVEMBER 13TH.

Institution of Post Office Electrical Engineers.

5 p.m. At Institution of Electrical Engineers. "Departmental Contracts," by W. S. Mountain.

TUESDAY, NOVEMBER 14TH.

Institution of Electrical Engineers: Glasgow Section.

8 p.m. At 207 Bath Street. Chairman's Address.

Institution of Civil Engineers.

8 p.m. At 25 Great George Street, Westminster. (1) "The Loch Leven Water Power Works," by A. H. Roberts. (2) "The Hydro-Electric Plant in the British Aluminium Co.'s Factory at Kinlochleven," by F. B. Sonnenschein.

WEDNESDAY, NOVEMBER 15TH.

Institution of Electrical Engineers: Yorkshire Section.

7.30 p.m. At Hotel Metropole. Chairman's Address; to be followed by Smoking Concert.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At Liverpool. Joint Meeting with Liverpool Engineering Society. "The Function of the Laboratory in the Training of an Engineer," by Prof. E. W. Marchant.

Institution of Electrical Engineers: Students' Section.

7.45 p.m. At Victoria Embankment. Opening Address by Mr. C. P. Sparks, Chief Engineer, County of London Electric Supply Co., Ltd.

THURSDAY, NOVEMBER 16TH.

Institution of Electrical Engineers.

8 p.m. Informal Meeting to discuss proposed alterations to Articles of Association.

THE LOT'S ROAD TURBINES

IN the Appeal Court on Tuesday, before Lords Justices Vaughan-Williams, Kennedy, and Buckley, the appeal of the British Westinghouse Co. in respect of the price to be paid for the Westinghouse turbines at the Lot's Road power station was commenced. We gave the history of this case in our issue of January 19th, 1911, page 32. Briefly, the facts are that, between 1902 and 1906, eight Westinghouse turbines were installed by the Underground Electric Railways Co., of London, but they failed to come up to the contract figures for steam consumption. Consequently, it was agreed that, owing to the very superior steam consumption figures guaranteed, Parson's turbines should be substituted at a cost of about £220,000. The Hon. Alfred Lyttelton, K.C., was appointed arbitrator to settle the basis upon which the dispute between the Westinghouse Co. and the Underground Co. as to the price and damages for breach of contract should be settled. Owing to an important difference of opinion, the arbitrator appealed to the High Courts for direction upon the matter, when it was decided that he should proceed upon the basis that the Westinghouse Co. should pay to the Underground Co. the full cost of the Parson's machines, plus the difference between the actual and guaranteed steam consumption of the Westinghouse machines whilst they were at work. The arbitrator consequently made his award in this form. Against this the Westinghouse Co. appealed to a Divisional Court, which held that the basis adopted was the correct one.

Sir ALFRED CRIPPS, in opening the appeal for the Westinghouse Co., pointed to the fact that whereas the Westinghouse Co.'s turbines were 5,500 kw., the Parson's turbines were 6,000 kw. each, whilst the saving from the reduced steam consumption amounted to £20,000 per annum. In this way, he argued, the Underground Co. were being put in a better position than they would have been had the Westinghouse turbines come up to contract, and this "betterment" should be taken into account in favour of the Westinghouse Co. in the arbitrator's award. In answer to Lord Justice Buckley, he agreed that if the Underground Co. had preferred to have continued to run Westinghouse machines for their full life at the inferior steam consumption, they could have claimed a very much larger sum of money by way of compensation than was at present involved, but such a procedure would not have been reasonable, and the action of the Underground Co. in this connection should not entitle them to consider the cost of the new turbines as wholly irrelevant to the issue. In determining the price which the Westinghouse Co. should pay to the Underground Co., he claimed that the following were important elements which must be considered in favour of the Westinghouse Co.: (1) Greater efficiency of the Parson's turbines; (2) longer life; (3) greater capacity; and he argued that the matter should be remitted to the arbitrator.

The case is still proceeding.

Illness of Dr. Glazebrook.—Our readers will learn with regret of the serious illness of Dr. R. T. Glazebrook, F.R.S., Director of the National Physical Laboratory, who is suffering from typhoid. He has been ill for about a month, and it is thought that he contracted the disease during a visit to Switzerland. From inquiries we understand that Dr. Glazebrook is now maintaining a gradual improvement, and has had rather better rest at night during the last few days.

Faraday House Old Students' Association.—It has been decided to hold informal meetings of members of the Faraday House Old Students' Association. The next reunion will be held on Friday, Nov. 24th, at Faraday House, at 8 p.m., when it is hoped that many members of the Old Students' Association, and also those old Faradians who are not yet members, will be able to attend. A musical programme is being arranged.

City Street Lighting.—According to the *City Press*, the Streets Committee of the Corporation has under consideration an improved scheme for street lighting in the City of London. This is expected to come before the Court of Common Council early in December. We understand that the idea is to employ gas and electricity in equal proportions, and to hang the lamps centrally, wherever possible, so as to enable the standards to be done away with. The gas and electric lamps that have been recommended for use are the same as can be seen at the end of Cannon Street and in Cheapside respectively. In cases where the lamps cannot be suspended, brackets will be used, and only failing this will the standards be again resorted to. It is said that should the scheme be adopted there will be an increase of nearly 50 per cent. in the illuminating power, and a saving of some thousands of pounds per annum.

PROFESSOR UNWIN'S VIEWS ON ENGINEERING EDUCATION

DR. W. C. UNWIN, in his presidential address to the Institution of Civil Engineers, on Tuesday last, said that the great obstacle to the progress of technical education in this country was the want of any definite aim and the unsuitable character and poor average quality of our secondary education, in which respect he quoted Lord Haldane's opinion that Germany were far ahead of us in educational matters. He pointed out that it was highly essential that the student should have a good preliminary education in order to be able to take, with advantage, the technical education that was to follow. With regard to the latter, it was desirable for the pupil to obtain his first degree before going into works, as otherwise he would have to cram for it, which, he thought, was inferior to a systematic course of study. In another part of the address, he discussed the research work that had been carried out in connection with the strength of materials, and mentioned the good work that had been done in Germany on this subject. In conclusion, he ventured to urge the claims of engineering schools in preparing the engineer for service in shaping the destinies of the Empire.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

FUSES.—An attractively got up list from the British Electric Calibrated Fuse Co. (Luton) gives particulars of several special forms of fuse which this company have developed, including the Weekes "Safetee" enclosed indicating fuse and two composite fuse wire and strip materials known as Pyrotin and Pyrocopper.

CONDUITS.—A revised price list of light and heavy gauge conduits has been sent to us by Simplex Conduits, Ltd. (116 Charing Cross Road, London, W.C.), which came into force on November 1st. Their new type, the Elektroduct, which is a specially brazed tube with a smooth interior, the dimensions of which can be made much more accurate than is possible with the welded tube, is cheaper than the latter type.

Hosted by Google

OBJECTIONS TO THE PROPOSED CHANGES AT THE INSTITUTION OF ELECTRICAL ENGINEERS

(*Continued from p.* 604.)

there are 2,809 Associate Members to 1,331 Members, a majority of more than two to one. Mr. Hammond had said that in the report of the Council last April, full notice had been given of practically the whole of the provisions put forward in the proposed amendment of the Articles. He asked him was there any mention that there was to be a proposal to have an absolutely new class of members? Was there any mention that there was to be a very serious alteration in the method of electing the Council? Was there any mention of the Council seeking powers to delegate its own powers to non-members of the Council? All these things were included in the proposed new Articles. The Council also took power in the new Articles to incorporate any other association whatsoever with the Institution without seeking permission of the members. These should not be things of which only a week's notice was given, and given in such a way as to indicate that the Council proposed the acceptance of them *en bloc* without opportunity for discussion. They had heard from Mr. Ferranti that the class of Associates was to be largely increased by as many new members as possible who are not electrical engineers. They had also heard that there was to be a new class called "Licentiates," in which everybody who were electrical engineers would be eligible, men with limited experience, who certainly could not be licensed to practice as the word "Licentiate" obviously implied.

The PRESIDENT: Cannot you suggest a name?

Mr. RAPHAEL reminded the President that he had suggested the name "Subscribers" in the amendment he had put in. They would subscribe to the funds and obtain the benefits of membership, but they would have practically no qualifications, and did not need to have an abbreviated title. Again, if there were to be a large number of new Associates, obviously the position of the Associate Members would be prejudiced. To the general mind there was very little difference between Associate and Associate Member. He also proposed that Associates should be called "Affiliated Members." They were members of an affiliated profession; they were not electrical engineers. The next point was the representation on the Council. In one of the amendments he had submitted he had proposed that, instead of there being three Associate Members and three Associates on the Council, there should be four Associate Members and two Associates. It was only fair the Associate Members should have better representation. The question of the election of the Council had already been referred to. It was perfectly clear what the proposals meant. Unless people had sent in nominations before March 1st, the Council simply nominated its successors; and even if they had sent in names, unless they had sent in so many names as to embarrass the Council, the Council would still nominate its successors. For instance, if six names had been sent in, there would remain twelve members to be elected. The Council would nominate twelve members themselves, and would incorporate the six proposed, and not a single Member or Associate Member would have the right to object.

Mr. W. R. COOPER quoted a statement made by Mr. Mordey at the meeting at which it was decided to take over the building: "One important thing I must not omit to mention; no increase of subscription will be necessary nor any general levy on the members." Would it not be possible, he asked, merely to raise the subscriptions of new members, and to make a distinction between country members and town members? He agreed with the criticisms directed against the "Licentiate" class, and was afraid the public would esteem Licentiates more fully than the full members. He suggested that, after a certain age has been reached, their subscription should be made equal to that of the Associate Members, so as to tend to make the Licentiates transfer to the higher class. Finally, he suggested that there should be another informal meeting for further discussion before the formal meeting on November 30th.

Mr. A. P. O'BRIEN strongly opposed an increase in subscriptions.

Mr. T. H. ROBERTS-WRAY suggested that it might not be legally admissible to increase any member's subscription if he objected.

Mr. A. J. MAKOWER mentioned that the charge of eighty guineas for compounding for a four-guinea subscription meant, at 5 per cent. compound interest, that one's expectation of membership was exactly an infinite number of years. He suggested fifty guineas, which would represent about twenty years' purchase.

Mr. A. A. C. SWINTON supported Mr. Cooper's suggestion that there should be another meeting held before the formal meeting.

Mr. A. H. PREECE blamed the Council for giving such short notice, but expected that the Council's proposals would eventually be accepted practically as they stand. Mr. Hammond had spoken in glowing terms, but he had scorned facts, and Mr. Preece suggested that some estimate of the future expenditure and future income should be issued to the members.

Mr. HAMMOND said that as a money grant was made annually to each Local Section, which, added to travelling expenses and the cost of printing Local Section papers and discussions in the *Journal*, brought the total expenditure on Local Sections to more than one-third of the subscriptions of their members, it would be fair to fix the subscription at the same figure all round.

The PRESIDENT said that it had now been decided to have another meeting between then and the more formal meeting, namely, on Thursday, November 16th, at 8 p.m. He also requested that any suggestions should be sent in by to-day (Thursday, November 9th). At the next meeting the remarks from the Local Sections would also be available.

The meeting adjourned at 6.40 p.m.

FEELING IN THE PROVINCES.

The Provincial Members are all up in arms against the Council's new proposals, and feeling runs very high against the proposal for increased subscriptions. We have received letters from country members in districts not attached to Local Sections intimating their intention of resigning from the Institution if country subscriptions are raised, and a large proportion of the letters from influential men accompanying the form of protest on p. 603 say that their main objection is to an increase in subscription, as they contend that the advantages offered by the Institution do not warrant the imposition of higher fees.

Meetings of the Committees of the Local Sections at Manchester, Glasgow, Birmingham, Leeds, and Dublin were held on Tuesday night (this in some cases being the second or third meeting), and we are in a position to state that the opinions of the members of these Committees is, in all cases, adverse to the Council's proposals. In some cases, forms of petition or protest have already been drawn up and signed. At the meeting at Manchester on Tuesday night, the following resolution was passed unanimously:—

The Committee of the Manchester Local Section again protest against the short notice given of the date by which the suggested amendments should be sent in, particularly as the letter dated the 3rd inst. was only received on the 7th inst. They are calling a General Meeting at the first opportunity, with the object of considering the Articles as drafted. The decisions arrived at, at this meeting, will be at once forwarded to the Secretary.

Among the letters we have received is one from Mr. Maurice Solomon (Birmingham), who urges that concerted action should first be directed to securing amendments of principle, and hopes that the adjourned meeting will be arranged to allow this course to be followed. He urges the abandonment altogether of the "Licentiate" class and the deletion of the sub-clauses which permit the admission of non-professional men to full membership. He insists that better reasons should be shown and a complete financial statement issued before the subscriptions are raised, and that there must be a discrimination between town and country members in this direction. He endorses our views as to the method of electing the Council, but goes further, and suggests that the Council's nominees should always exceed the number of vacancies, so that a ballot would always be necessary, and the nomination of other candidates by the membership less invidious.

Finally, we take pleasure in publishing the following letter which we have received from Mr. M. C. Olsson:—

To the Editor of ELECTRICAL ENGINEERING.

SIR,—The informal discussion which took place on Thursday last at the Institution indicated a strong conviction upon the part of many of the members that the Council has not, in its proposed amendments to the Articles, reflected the ideas and feelings of the majority of the members themselves. I am personally in agreement with some of the objections raised, and am of opinion that in some respects the Council has erred grievously, but I do deprecate as strongly as I can the induction of any other spirit than that of grateful friendliness towards the Council into the controversy. It is to be borne in mind that these men, all of them eminent and all of them busy, have devoted time and thought for years to the affairs of the Institution with no hope of reward except in its continued progress and success. The Institution having grown to such dimensions, it is not surprising that the Council should fail on occasion to feel the pulse of the whole body; in such a case it is the duty of the members to enlighten them, for it is enlightenment they seek. If they are fully informed, I, for my part, knowing the past record of these gentlemen who have served so faithfully, look forward to a speedy and businesslike crystallisation of all that is best in the proposals put forward to improve their work.

I am, Sir, yours faithfully,

MARTIN C. OLSSON.

We associate ourselves entirely with our correspondent's views. Our "agitation," as it has been termed, has been solely initiated to obtain, as we are in a position to do, the feelings and opinions of the general body of Members and Associate Members, and to recommend the Council, with all the force in our power, to abstain from pressing their own views forward with too much earnestness until this had been ascertained. We recognise, as do all who are constantly in touch with the individual members of Council, that the eminent men who have given their time and energy to the conduct of the affairs of the Institution deserve the utmost gratitude and assistance.

ELECTRIC TRACTION NOTES

An important arbitration commenced in London on Monday to determine the price which the London County Council has to pay for the 5¼ route miles of tramway in the County of London belonging to the London United Tramways Co. The lines in question are the sections linking up Shepherd's Bush with Askew Arms (Uxbridge Road) and Young's Corner (Chiswick High Road) and Hammersmith Broadway. The London County Council's powers to purchase the lines were exercisable in 1909. The arbitrator is Mr. R. Elliott-Cooper, whilst Mr. Balfour-Browne, K.C., Mr. John Roskill, K.C., Mr. H. Lloyd and Mr. L. Macassey appear for the Tramways Co., and Mr. C. C. Hutchinson, K.C., and Mr. C. Munroe for the L.C.C. For the company, Mr. H. F. Parshall and Mr. S. Sellon have been retained as expert witnesses, whilst the L.C.C. have Mr. J. F. C. Snell and Mr. A. Dickinson. The L.C.C. have to purchase all "lines, buildings, works, materials, and plant suitable to and used by the company for the purposes of their undertaking within the district," and the total claim amounts to no less than £386,443. This is made up as follows:—Permanent way, £42,278; overhead equipment, £3,076; ducts, cables, and manholes, £21,843; cars, £25,905; special expenditure, £16,833; street widenings, £41,010; road lowerings (agreed figure), £1,250; Parliamentary expenses, £25,250; depot and power station, £208,997.

The Dundee Corporation have accepted a tender by the Railless Electric Traction Co., Ltd., for the installation of the trolley omnibus system between Maryfield and Strathmartine Road at a total cost of £2,657 16s. Two cars will be supplied at £700 each, which is included in the total figure given above.

The adjourned extraordinary general meeting of the British Electric Traction Co., to consider the amended scheme for rearrangement of capital, was held on Friday. After some criticism, the amended scheme was carried by 66 votes to 13.

A scheme is under consideration, which, if carried out, will result in the amalgamation of the London General Omnibus Co., the London Electric Railways Co., and the Metropolitan District Railway Co. According to reports, the idea is to convert the ordinary stock of the Omnibus Co. either into debenture or preference 6 per cent. stock, the dividend on which would be paid after the prior charges on the three undertakings. The available profits after meeting these charges will be distributed *pro rata*. The scheme has still to be discussed by the shareholders of all concerns.

The West Hartlepool Town Council have definitely decided to purchase all the tramways in the Borough. It will be remembered that the Council have already purchased certain lines.

The promoters of the proposed scheme for constructing a tube railway in Manchester at an estimated cost of £1,000,000 are proceeding with their negotiations, but, according to the Manchester local papers, doubts have been expressed owing to the unsettled state of the money market, as to the advisability of promoting a Bill in the next session of Parliament. Mr. J. W. Welch is the engineer to the scheme.

At the last meeting of the L.C.C., the proposal to run tramways over the new St. Paul's Bridge was referred back to the committee. The reason for this is that the Council anticipate that a much larger expense will be necessary upon widenings than was originally contemplated, and that their expenditure of £350,000 will be considerably increased. In these circumstances, the Improvements Committee expressed doubts as to whether it would be advisable to contribute to the scheme at all.

On Tuesday, Mr. S. Sellon explained the process by which he arrived at the various values. From Mr. Hutchinson's cross-examination, it is clear that the L.C.C. will strenuously oppose having to purchase the Chiswick power-house as being necessary to the Hammersmith lines. In this connection, of course, it is not without interest to mention that at the present time the London United Tramways Co. take power for all their Surrey lines from Lots Road.

In consequence of the refusal of the Hove Council to promote a scheme for the use of trolley omnibuses in their Borough, the Brighton Corporation have come to arrangements for extending their own proposal in this connection. It is proposed that the Brighton Corporation should run trolley omnibuses through Hove to Shoreham.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

According to the *Evening Standard*, negotiations are proceeding at Pittsburg with a view to giving an English syndicate the control of the New Jersey, Pennsylvania, West Virginia, Ohio, and Indiana Independent Telephone Companies, as well as part of the Illinois telephonic service. The price is stated to be £2,000,000 in cash and £4,400,000 in bonds.

The Post Office have commenced laying an underground telephone cable at Hythe along the overhead route about which there has been so much dispute between the Council and National Telephone Co.

In view of the activities of the Post Office in the erection of overhead wires for telephone purposes, the Camberwell Borough Council is endeavouring to obtain the opinions of the other London Borough Councils on the question. There is a desire for co-operation in order to take united action against the Postmaster-General.

The telegraph line between Teheran and Kermanshad is interrupted beyond Hamadan. Telegrams to Kermanshad and the Ottoman frontier, the region of Pozenderan or Masanderan, comprising the towns of Barfrouch, Mechedesser, and Sari, can be accepted and are forwarded by post from Teheran. —The line between Bagdad and Bassorah was down again for a short while on the 6th inst.—New telegraph offices have been opened at Gründorn, Tsumis, and Khanmine in German South-West Africa.—Official notification has been received that the Belgian Congo has become an adherent to the International Telegraph Convention of St. Petersburg, and will be included in the sixth class of contributors towards the expenses.

In the House of Lords on Monday the Telegraph Construction Bill was read a second time. The object of this Bill is to enable the Postmaster-General to take over telegraphs constructed across railways and canals. All the great trunk lines have agreed, except two Scottish railways.

Fire at Mazda House.—A serious fire broke out at the British Thomson-Houston Co.'s offices and stores at 77 Upper Thames Street on Tuesday last. We understand that it originated in the top floor, which, with the floor beneath, was burnt out, destroying a large quantity of material, rubber, lamps, &c. Reconstruction will take place as soon as possible, and in the meantime we are asked to state that business, as usual, will be carried on on the ground floor. The cause of the fire is not at present known.

The Victoria Palace.—We were permitted through the courtesy of the management, to view the premises of this variety theatre on Saturday last. Though the installation was in a very unfinished state with regard to the stage, the whole of the house was well lighted with Brimsdown metal filament lamps. The supply is taken from the mains of the City and Westminster Electric Supply Co. A pressure of 400 volts is employed for power, and 200 volts for lighting. Special mains are brought into the back of the building for the stage lighting, and into the front for the lighting of the house. The stage equipment consists of the usual dimmers, battens, floats, and arc lamps. The dimmers are of the metal resistance type, arranged on a special switchboard on the stage. The arcs, which are of the Digby hand-fed type, are supplied at 80 volts by a special motor generator. A 50-volt battery has also been installed as an additional supply, to comply with the regulations should the supply fail. The lamps in the floats and battens are also Brimsdown. The fittings do not call for special mention, but there is a very elaborate heating system, with which an even temperature can be kept throughout the winter, and a sliding roof is provided to cool the house during the summer.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 2, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

23,735/10. **Electric Welding.** E. B. KOOPMAN and THE PONTELEC WELDING PATENTS, LTD. The plates to be welded together are bridged by welding pieces of small cross section, which can be of almost any shape, and placed either on alternate sides or on the same side of the plates. Current is passed through them to the plates, and is automatically stopped when the weld is complete. When the desired temperature is reached, the welding pieces are incorporated with the plates by pressure. Six figures.

25,175/10. **Drying Timber.** ALCOCK & COMPANY PROPRIETARY, LTD. In this process liquid electrodes are used instead of metal to avoid burning, especially when H.-T. currents are used. These are carried in receptacles which allow the liquid to be against the timber. Short logs are stored in a trough containing the liquid, and into the upper end a ring is driven, which holds the other electrode into which the current wires are immersed. For drying in a horizontal position the receptacles have their sides next the timber open, and are secured one upon each end of the log, with a liquid tight joint. In the case of stacked planks, short lead electrodes are arranged at regular intervals at the sides of, and in between, the planks. The liquid may be ordinary rain-water or a solution of soda, sulphate of zinc or copper, or any other having a preservative effect on the timber. An ammeter is placed in the circuit to indicate the amount of moisture present, a zero reading indicating that the timber is dry. Six figures.

26,909/10. **Flexible Cord Grip.** A. J. CHAPMAN and H. E. MASON. This is a ball and socket arrangement with the cord grip contained inside a hollow ball, which can turn freely in the cup at any angle, there being enough room in the cup to take sufficient slack wire. In this way the wire itself is not turned at an angle, so that chafing is avoided. To prevent the ball turning a complete revolution, a pin is inserted into a hole in the ball, and fixed to the cup, which is itself secured by an ordinary coupling ring. One figure.

76/11. **Carbon Brush Connections.** BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*). In a method of connecting flexible conductors to brushes, a hole is drilled in the brush, into which a loop of the conductor is placed and secured by a cement, which in hardening expands, and makes good contact with the brush. Any cement which expands on hardening can be used. A cement, known as "Smooth-on," and consisting of 70 per cent. of cast-iron filings, 25 per cent. plaster of paris, and 5 per cent. of free carbon, gives very good results. Three figures.

3,789/11. **Electric Signs.** H. BEY. A glass panel on which the letters or figures are printed directly, is provided with the desired number of holes forming the letters or figures. The face of each of the lamp holders is flush with the surface of the glass to which they are cemented. Another type, however, is preferably used, threaded on the inside and outside, the open end of which is turned back to form a flange. This is adapted to lie on the front surface of the glass, where it is held by a rubber washer, and screwed against the back of the glass by a nut. The holders are connected by very thin tinned copper wires, and insulated with shellac. The panel is framed, and a second panel, not drilled, can be placed at the back to render it weather proof, which can at the same time, by having the lettering reproduced on it, conceal the wiring of the front panel. Three figures.

13,623/11. **Hair Dryer.** A. SCHAEFFER. A motor-driven fan is so arranged in a single casing of the usual shape, that the blades extend laterally, and utilise the whole available space between the casing and the driving device. Three figures.

Amendments

9,802/98. **Electric Driving of Printing Presses.** W. A. CLATWORTHY and J. H. HOLMES. This patent has been amended by cutting out the first and second claims, which were decided in the Appeal Court to be too wide to be valid. (ELECTRICAL ENGINEERING, February 3rd, 1910, p. 74.) The original claims, one and two, are for a method of driving printing machines, which gives a first slow running speed, and a gradual acceleration until full speed is reached without any shock. This is effected by using two motors, a main motor for driving the machine direct, and an auxiliary motor connected to the main motor shaft through worm gearing, and a free-wheel clutch, so that the main motor can over run the auxiliary motor. Further details appeared in ELECTRICAL ENGINEERING, August 4th, 1910, p. 510.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: SIEMENS BROS. DYNAMO WORKS, 14,127/11.

Cables and Wires, Insulating Materials: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Insulating material] 5,165/11; GES FÜR ELEKTROTECHNISCHE INDUSTRIE [Conductors] 5,569/11; SCHAIRER [Moving conductor contact devices] 17,481/11.

Dynamos, Motors and Transformers: FLETCHER and GATEHOUSE [Methods of starting induction motors] 27,119/10; HEYLAND [Starting and regulating methods] 4,627/11; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Current-transformer] 17,208/11; INRIG and GAVAN INRIG, LTD. [Dynamos] 20,904/11.

Heating: MIETH [Electrically-heated vessel] 14,222/11.

Incandescent Lamps: HORVATH, 27,401/10.

Instruments and Meters: KILROY, NEEDHAM, and EVERSHED & VIGNOLES, LTD. [Magnet armatures for vibrating diaphragms] 24,272/10; STRELOW [Meters on Ferraris principle] 8,032/11.

Switchgear and Fittings: HÖFLE [Automatic reversing starters] 23,757/10; TAYLOR [Automatic switches] 24,611/10; ROBERT BOSCH [Circuit interrupter contact pins] 72/11; LEONARD [Lamp-holders] 3,746/11; HARTMANN & BRAUN AKT.-GES. [Push-button switches] 6,147/11; ODGERS [Switch control from a distance] 14,704/11; LARZELERE [Electromagnetic switches] 17,142/11.

Telephony, Telegraphy and Signalling: WILLIS [Telephone receivers] 24,583/09; SANCHEZ [High-frequency apparatus] 24,143/10; FISHER [Sending signals electrically through conductors] 2,686/11; MCBERTY [Automatic telephone selectors] 3,452/11.

Traction: MUNRO and RAILLESS ELECTRIC TRACTION CO. [Fittings for overhead system] 24,475/10; SHEEHY [Electro-magnetically-operated collectors] 11,740/11.

Miscellaneous: WALKER [Clocks as electric alarms] 23,780/10; PENNER [Time-alarm apparatus] 23,947/10; G. A. SCHULTZE [Resistance measurement connection] 29,465/10; TOUSEY [X-ray tube] 7,067/11; BACHE [Electric instruction apparatus] 14,999/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: CARL ZEISS [Reflector searchlights] 21,658/11.

Distribution: BRANDENBURG [Automatic sectioning in station supply] 21,001/11 and 21,149/11; HARRIS [Circuit interrupters] 21,903/11.

Electric Ignition: PODSZUS, 3,821/11; UNTERBERG and HELMLE, 21,785/11.

Heating: MONNOT, 22,315/11.

Incandescent Lamps: ALLGEMEINES CHEMISCHES LABORATORIUM OSKAR H. ARENDT [Repairing metal filaments] 22,235/11.

Instruments: BROWN, 20,452/11.

Telephony and Telegraphy: SIEMENS & HALSKE AKT.-GES. [Automatic telephone systems] 19,573/11 and 19,645/11; SOC. D'ELECTRICITÉ MORS [Telescoping aerial masts] 22,403/11.

Miscellaneous: BRÜLL [Grab-hoisting gear] 8,798/11; MORRISON [Reversible galvanic batteries] 18,360/11; SOC. D'ELECTRICITÉ NILMELIOR [System of alternating magnetic flux] 22,053/11.

The following are the more important Patents that have become void through non-payment of renewal fees.

Insulating Materials: H. MCPHAIL [Insulation] 16,372/07.

Dynamos, Motors, and Transformers: W. L. WISE (*C. O. Mailloux, U.S.A.*) [Cooling and ventilating] 16,513/07; ALLGEMEINE ELEKTRICITÄTS GES. [Step-up transformer] 16,618/07.

Electric Ignition: SOC D'ELECTRICITÉ, "NILMELIOR," and A. MICHEL [Transformer] 14,959/05; OSTERREICHISCHE DAIMLER MOTOREN GES. and F. PORSCHE, 16,226/07.

Electrochemistry: J. BAILEY [Plating by electrolysis] 15,735/02.

Incandescent Lamps: C. A. STEVENSON [For lighthouses, buoys, &c.] 16,301/07.

Switchgear and Fuses: W. C. MAYO and J. HOULEHAN [Cut-outs] 16,364/07; R. LENNER [Cut-outs and switches] 16,485/07.

Telephony, Telegraphy, and Signalling: J. N. MASKELYNE [Wireless signalling] 16,113/03; J. G. BALSILLIE [Electro-magnetic receiver] 15,022/05; SIEMENS BROS. & CO. and G. S. GRIMSTON [Selective switch for type-printing receiver] 16,334/07.

Traction: G. H. JELFS [Controlling and locking signals] 14,789/99; W. GRIFFITHS and B. H. BEDELL [Surface contact system, switches, and conductors] 15,778/04; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Operating points and switches] 15,869/04; T. W. BARKER and M. T. MEDWAY [Railway signals] 16,051/06; P. ROJCSIK [Point and switch control] 16,252/07; W. C. MAYO and J. HOULEHAN [Brakes, &c.] 16,365/07; A. H. NICHOLSON [Signal contacts] 16,488/07.

OSRAM WEEK

COMMENCES SATURDAY NOVEMBER 11th 1911

The most gigantic advertising campaign ever attempted in the annals of the Electrical Industry.

"OSRAM WEEK" announcements will impress the superiority of this wonderful lamp upon every Electric light user throughout the British Isles.

ASSOCIATE YOUR NAME WITH THE SALE OF "OSRAMS" —*the trade will follow!!*

Write at once for FREE Advertising matter to distribute in your district.

THE GENERAL ELECTRIC CO., LTD.

Head Office: 67, Queen Victoria Street, LONDON, E.C.

Branches: Manchester, Glasgow, Birmingham, Newcastle-on-Tyne, Cardiff, Dublin, Belfast, etc.

LOCAL NOTES

Bognor: *Electric Light.*—The Council are recommended to agree to Mr. W. Tate, J.P. (Chairman of the Council), applying for an electric lighting provisional order for the district.

Derby: *New Electric Lamp Works.*—The new electric lamp works of Metalite, Ltd., were formally opened by the Mayor on Monday. It is expected that from 700 to 1,000 hands will be employed when the works are fully occupied.

Elland: *Electricity Works.*—On the motion of a Councillor, an inquiry is to be held into the working of the electricity undertaking. Certain complaints appear to have been made as to the cost of production.

Greenock: *Electrical Exhibition.*—A very successful electrical exhibition was organised last week by Mr. J. A. Robertson, Borough Electrical Engineer. Following the general tendency just now, particular attention was concentrated upon the application of electricity to household purposes, and an electric home formed an important feature of the exhibition.

London: *Marylebone: Electricity Undertaking.*—During the course of his review on the past year's working at the meeting of the Council on Thursday, Alderman E. R. Debenham, the Mayor, paid a hearty tribute to the work of Colonel Hopkins, Chairman of the Electric Supply Committee, and also to the officials. He pointed out that the net profit for the past year of £6,712 brought the accumulated profit to £31,696. The profit last year had been made notwithstanding an increase of £8,500 per annum in rates. Much of this success was due to the originality of Mr. A. Wright in designing and completing the station in the circumstances which he did. There had been, he said, a good deal of criticism of the Electric Supply Committee, but he asked the critics to think whether they really saw the whole position in its true proportions as did those who had been through the stress of the last ten years. The Council paid £1,355,000 for goodwill upon an output of 6½ million units, which amounted to 2·65d. per unit. By March, 1909, the output had increased to 9 millions, and the goodwill charges reduced to 1·9d. per unit. At present the output was 13½ millions, and the goodwill charges 1·3d. per unit. At this rate in six years the goodwill charges will be reduced to 0·9d. per unit. The Sales Department was the settled policy of the Council, and therefore the officials were only carrying out the Council's instructions. Great care was taken not to injure the contractors; no new houses were wired, and he was not surprised that none of the charges made against the department had been proved. There were eleven canvassers, and it redounded to their credit that they had put their personal gain on one side and kept so closely to the Council's instructions. He thought a gross profit of from 30 to 44 per cent. upon the Sales Department showed that there was no price cutting, and no work was taken away from a contractor except at the expressed desire of the consumer.

Marylebone: Consulting Engineer.—The Electric Supply Committee have served notice on Mr. Arthur Wright to terminate his agreement as Consulting Engineer to the Council, and have also conveyed to him an expression of their high appreciation of the services rendered by him to the undertaking.

Luton: *Electric Cooking.*—As a result of the visit of the Electricity and Tramways Committee to the Olympia Electrical Exhibition, the Council has been recommended to sanction an expenditure amounting to £200 for the purchase of an electric cooking apparatus to be hired out. The recommendation has been adopted, but before the larger expenditure is incurred a number of cookers are to be purchased and experimented with in order to ascertain which are the most suitable.

Rochdale: *Electric Supply.*—Arrangements are being made for the supply of electricity in the Whitworth district.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Barnsley.—The Local Government Board have sanctioned a loan of £12,503 for electrical extensions.

Biddulph.—Messrs. Crews & Handford, Consulting Engineers, of Manchester, have reported to the Council with regard to an electric lighting scheme. Messrs. Heath have offered to supply the Council with current at 1½d. per unit.

Holmfirth.—The Council have decided to apply for an electric lighting provisional order, and also to the Local Government Board for sanction to borrow £8,000 for the undertaking.

Jerusalem.—Tenders are invited for an electric power station. Particulars may be obtained by British firms, 73 Basinghall Street, London, E.C.

Leigh (Essex).—The Council have been discussing the advisability of undertaking an electric lighting scheme.

Llandudno.—A Local Government Board inquiry was held last week concerning a loan of £500 for new mains.

London: *Stepney.*—The Finance Committee of the L.C.C. have sanctioned a loan of £15,700 for electricity purposes.

Walsall.—Mains extensions are to be carried out at an estimated cost of about £350.

Wolverhampton.—A Local Government Board inquiry was held last week concerning a loan of £11,000 for extensions to the electricity undertaking. The Town Clerk explained to Mr. H. R. Hooper, the Inspector, that the Council had authorised an expenditure of £21,700, of which £10,000 will be provided from reserve, £700 from revenue, and £11,000 out of capital. This latter sum includes £5,000 for building, £1,900 battery room, £800 sub-station, £1,440 workshop and stores, £760 for offices, £540 travelling crane and steel work for sub-station, and £160 contingencies. There is also £400 for workshop equipment, and £5,000 for generating machinery and switchgear. The large storage battery is to be provided with the sum taken from reserve.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Accrington: *New Church.*—Architects, Messrs. Grimshaw & Cunliffe, Birch Street, Accrington.

Bournemouth.—New elementary schools in Cranley Road. Education Committee.

Broughty Ferry.—New school. Architect, Mr. J. A. Langlands, 31 Murray Gates, Dundee.

Dublin.—The Waterworks Committee invite tenders for electric lighting and fire signalling apparatus at the new fire station, Thomas Street. Particulars from City Electrical Engineer, and tenders by November 21st.

Glasgow.—Training college at Jordan Hill to accommodate 1,200 students. Director of Studies, Technical College, Glasgow.

Hamilton.—New schools at an estimated cost of from £10,000 to £15,000.

Inverness.—Wiring new science and art school.

Stafford.—Public library. Borough Engineer.

MISCELLANEOUS

Birmingham.—Tenders are invited by Messrs. Cadbury Bros., Ltd., for stores at Bournville, including electric cables, lamps, &c.

London: *L.C.C.*—An expenditure of £9,000 is recommended by the Highways Committee in respect of additional tramway tracks on Dog Kennel Hill.

TENDERS RECEIVED AND ACCEPTED

London: *L.C.C.*—The offer of the British Westinghouse Co. for the supply and erection of four sets of electrical equipments car traversers **at £664** per set is recommended for acceptance.

The following tenders have been received for plant for the new tramway sub-station at Vauxhall:—High-tension electric cables:—Siemens Bros. & Co. (recommended), £9,761 19s.; W. T. Henley's Telegraph Works Co., £9,897 17s.; Callender's Cable & Construction Co., £10,062 6s.; British Insulated and Helsby Cables, £10,070; Western Electric Co., £10,188; Johnson & Phillips, £10,504; W. T. Glover & Co., £11,103 13s.; Foote & Milne, £12,143. Low-tension electric cables:—Western Electric Co. (recommended), £15,161 19s.; Callender's Cable & Construction Co., £15,401 10s.; W. T. Henley's Telegraph Works Co., £15,499 12s.; Johnson & Phillips, £15,522; Foote & Milne, £15,610 17s.; British Insulated & Helsby Cables, £15,800 11s.; Siemens Bros. & Co., £16,202 18s.; W. T. Glover & Co., £16,802 16s. Rotary converters:—

Hosted by Google

Dick, Kerr & Co. (recommended), £6,089 10s.; General Electric Co., £6,149; British Westinghouse Electric & Manufacturing Co., £6,185 and £6,002; British Thomson-Houston Co., £8,240, £5,848, £6,161, and £6,260; Electric Construction Co., £8,307; Bruce Peebles & Co., £14,646.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £57 15s. to £58 (last week, £57 7s. 6d. to £57 12s. 6d.).

Bankruptcies and Liquidations.—A meeting of the Electric Fog Signal Co., Ltd., will be held at 1 Vine Street, Uxbridge, on November 27th, at 7 p.m., to hear the liquidator's account of the winding up.

Plant Wanted.—A small motor generator or transformer is required. (See an advertisement on another page.)

Scholey & Co., Ltd.—Mr. H. Scholey and Mr. C. W. Hill have started business as electrical and mechanical engineers at 151 Queen Victoria Street, E.C. A note appears opposite.

The Record Electric Co., Ltd.—Mr. J. W. Record, late manager of the instrument department of the General Electric Co. (Salford), and Mr. T. J. Boorne, late under-manager of same company's switchgear department (London), have commenced business under the above title, and have opened new works for the manufacture of instruments, &c., at Broadheath, Manchester, under the control of Mr. Record, while Mr. Boorne will look after the firm's interests at their London office, Caxton House, Westminster.

Agency.—Messrs. Richardsons (Billiter Square Buildings, E.C.) have been appointed London representatives of Messrs. Tait & Co., Kobe, Japan, who are opening an engineering department. Firms are invited to send catalogues in duplicate to Messrs. Richardsons' export department.

For Sale.—An electrical contractor's business in Westcliffe-on-Sea is for sale. (See an advertisement on another page.)

"Osram Week."—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), are starting on Saturday next a special week's advertising campaign on a scale not previously attempted in the electrical industry, which should assist the electrical industry generally in the fight against gas. The chief feature of the campaign will be to make use of the great dailies throughout the Kingdom to create the personal interest of electricity consumers in Osrams and Osram lighting. The scheme also includes the principal wholesale houses and local traders, so that the public enthusiasm can be followed up by a practical response in the supply of these lamps. As a further encouragement, the local traders will be making a special shop-window display of Osrams, which will be attractive by day and brilliant to a degree by night.

APPOINTMENTS AND PERSONAL NOTES

Mr. W. C. Mountain has retired from the firm of Ernest Scott & Mountain, and has commenced practice as a consulting engineer at 8 Sydenham Terrace, Newcastle-on-Tyne, specialising more particularly in colliery equipment. He has also been appointed arbitrator by the Coal Trade to represent a number of counties in connection with the use of electricity in mines, and is acting as consulting engineer to a number of collieries.

Mr. G. F. Gregory, of Darlington, has been appointed Second Engineer-in-Charge at the Ilford Electricity Works.

Mr. E. Dormann, Chief Engineer of Aron Electricity Meter, Ltd., is leaving his present position next week in order to take up an important appointment in Sweden.

An experienced traveller is required to sell shades, globes, and accessories. (See an advertisemnt on another page.)

A canvasser is required in the Southend Electricity Department. (See an advertisement on another page.)

The salary of Mr. H. L. Mills, Chief Assistant Electrical Engineer at Southampton, is to be increased from £250 to £300 per annum, by annual increments of £10.

Mr. J. A. Cawthra, Borough Electrical Engineer at South Shields, has resigned his appointment on receiving a post with the Victoria Falls and Transvaal Power Co., at £1,400 per annum.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Edison & Swan Electric Light Co.—The ordinary general meeting was held last week. Mr. H. Wolfenden, who presided, said that the directors did not recommend a dividend out of the credit balance of £25,856, as they wished to conserve their profits. It was proposed to increase their representation abroad and also to increase their stocks, working capital, and probably the plant. If the present position was maintained, he had no doubt that the directors would next year recommend a dividend.

The Imperial College Union.—The students of the Royal College of Science, the School of Mines, and the Central Technical College gathered in great force under the presidency of Mr. Taylor at the opening of this new club-house on Friday last by Sir Thomas Holland, in the unavoidable absence of the Right Hon. G. W. Balfour. The speeches were very short, there being a heavy musical programme to be got through. Sir Thomas Holland said that great credit was due to Mr. Acland for bringing the students of these three large colleges together, and he congratulated Sir Aston Webb, who was responsible for the building, for which £12,000 had been realised, and raised to £18,000 by the Governors. The building is situated behind the Albert Hall, in the Prince Consort Road, and is provided with a large dining-room and smoking-room on each side of the central door, and above these there is a library and gymnasium. The library is not yet equipped, and an appeal was made for funds for this purpose. The musical arrangements were excellent; to avoid overcrowding, a concert was arranged in the library while a play was taking place in the gymnasium. There were two performances of each, with an interval for refreshments, which were served in the dining-room. Altogether the evening was a most enjoyable one, and the students are to be congratulated on their new headquarters.

Scholey & Co., Ltd.—Mr. H. Scholey (late of Dick, Kerr & Co., Ltd.) and Mr. C. W. Hill (late of the Bournemouth Tramways) invited the editors of the leading electrical newspapers to dinner last Friday, and explained the objects of the new business they are starting (Scholey & Co., Ltd., 151 Queen Victoria Street, E.C.). There are British manufacturers who specialise in particular types of plant and apparatus, and who can manufacture these to compete not only in quality but also in price with any foreign firm. By co-operation in such a way that each firm supplies only the particular kind of plant or apparatus for the manufacture of which he is most advantageously placed, Mr. Scholey contends that this country might acquire a far greater share of foreign and colonial orders than at present, and his new firm is being established so as to be the link by means of which this co-operation can exist.

In the course of his remarks, Mr. Scholey explained that he had in mind those manufacturers who specialise on a particular article, and, being able to reap the benefit of repetition work in their factories, and not being encumbered with heavy establishment charges, can produce a first-rate article at a comparatively moderate cost. Moreover, it should never be overlooked that by far the largest proportion of the capital invested in manufacturing is invested in the small and scattered works of the country. But, Mr. Scholey continued, the strength of the small manufacturer is his weakness. So long as his trading is, comparatively speaking, local, he invariably succeeds, but directly he attempts to widen the area of his operations, he runs the risks of his prices going up by virtue of his increased selling expenses. The specialist manufacturer, however, deserves a wider market on account of the quality and comparative cheapness of his wares, and Scholey & Co., Ltd., is to be an organisation which can undertake the selling for a group of specialist manufacturers. The firm has already entered into definite agreements with some manufacturers, and in time expects to add others. The proposition is that the new firm shall devote itself entirely to the development of suitable markets, and the manufacturer shall confine himself to making material, looking to the new firm to effect the sales. It is expected that considerable trading will be done at home, but the main desire is for further trade abroad, for which purpose the eventual establishment of agencies, both in this country and in the most prominent towns in the British Colonies and South America, is contemplated. In the course of further conversation, it was explained that the large manufacturers in this country are exceedingly friendly to the idea, and in three or four cases have made definite offers of help. The new Company is not confining itself to electrical work, but will actually engage in the selling of various mechanical appliances and machinery.

Mr. Scholey is one of the most popular men in the electrical industry; there are indeed few with a wider circle of friends, and he is held in high esteem by all who have had to do with him in business. We feel that we are expressing the sentiments of many of our readers, as well as our own, when we wish him and his partner every success in his new undertaking.

SUMMARY

A Special Literary Supplement is included in this issue, containing notices and reviews of books, and a carefully revised list of selected works on electrical engineering and allied subjects.

The electric equipment of the new London Opera House in Kingsway presents several points of interest. Metal filament lamps are used exclusively for stage lighting, a special form of metallic dimmer is employed, and extensive use is made of concealed lighting in the auditorium. (Page 619.)

A number of motor-car lighting dynamos were shown at the Olympia Motor-car Exhibition, including special machines giving constant voltage over a large range of speed or mechanical speed regulating devices. (Page 620.)

Our detailed objections to the new draft Articles of Association submitted by the Council of the Institution of Electrical Engineers, are receiving strong support. In addition, there is decided opposition from all quarters to the proposals for increasing subscriptions. We publish extracts from the mass of correspondence which we have received. There is little doubt that the Council will amend its proposals. Another meeting of the Institution will be held this evening, and we urge all Members and Associate Members who can do so to attend. (Page 621.)

A Paper on high-tension transformers by Mr. W. T. Taylor was read by Mr. J. F. C. Snell at last Thursday's meeting of the Institution of Electrical Engineers. Various points in the construction and operation of transformers were considered, and particular attention was drawn to a three-transformer modification of the Scott system of converting from three to two phase. Several points in the Paper were severely criticised in the discussion. (Page 624.)

Twenty per cent. of the entrance fees is to be returned to exhibitors at the recent Electrical Exhibition at Olympia. A report by the Organising Managers suggests certain modifications in policy for future exhibitions. (Page 625.)

A Paper was read by Mr. R. J. Roberts on the mechanical design of D.C. turbo-generators before the Manchester Local Section of the Institution of Electrical Engineers, bringing out a number of points in connection with ventilation, commutator construction, and general design. (Page 626.)

The Edison and Swan Co. are now making metal filament lamps under licence from the Osram Lamp Works. (Page 627.)

At the Annual Dinner of the Birmingham Section of the Institution of Electrical Engineers, Mr. Ferranti acknowledged that the Council had done "something foolish," but said that they now intended to take full advantage of the "contentious interest" which had been awakened in the affairs of the Institution. Mr. Patchell mentioned the serious effect which the Coal Mines Bill would have on the electrical industry if it were passed as it stands at present, and Mr. Chattock pointed out that electric supply Authorities must be prepared to hire out cooking apparatus. (Page 627.)

A new flexible insulating material has been patented by the British Thomson-Houston Co. Two other patents published by the Patent Office last week include one for an arc lamp with means for keeping the arc from creeping up the carbons, and another for a method of supporting metal filaments. An improved construction of vibrating armature, for use with diaphragms, is also protected, as well as an electrically-heated vessel, in which the heating coil is arranged round the base and sides. A specification relating to arc furnaces for the treatment of gases has been restored, and a patent for a fusible cut-out has expired after a full life of fourteen years. (Page 628.)

The appeal in connection with the substitution of

Hosted by Google

Parsons turbines for Westinghouse turbines at the Lot's Road generating station was concluded in the High Court on Thursday, judgment being reserved. The case for the Underground Railways Co. is that by the installation of the Parsons machines they brought to an end a very heavy bill of damages for breach of contract against the Westinghouse Co., and that, therefore, they were entitled to the full cost of the Parsons machines. (Page 627.)

In our "Electric Traction Notes" we give the Board of Trade's report upon the Lewisham tramway accident in September. The driver of the car is partially blamed for the accident. A tramway collision occurred on the Rawtenstall tramways on Saturday, in which two cars were smashed and 16 passengers injured. A proposal of the L.C.C. to dispense with the consent of the Borough Councils in regard to the use of the overhead system is to be strongly opposed. The L.C.C. is to be asked to urge the Government to constitute a Traffic Board for London. The use of trolley omnibuses is being considered in various parts of the country. (Page 630.)

Under "Telephony and Telegraphy (Including Wireless)" we refer to an injunction restraining the Hythe Corporation from interfering with the National Telephone Company's pole lines, and to a report upon the Melbourne telephone system, in which carelessness is attributed to the operators. (Page 631.)

The Board of Trade have recommended the Belfast Electricity Department to ventilate their 2,300 street boxes.—The Finance Committee of the L.C.C. have refused a loan for electric lighting extensions at Bermondsey on account of the refusal of the Borough Council to furnish certain financial information.—The Marylebone Council propose to continue the experiment of lighting small property at a fixed charge per lamp per week, and all wiring in connection with it is to be given to contractors.—The Finance Committee of the L.C.C. recommend that the Highways Committee should report as to the policy of the Council with regard to electrical loans, having in view the purchase of the London companies' undertakings. (Page 631.)

The Blackpool Corporation require a 1,500 kw. and an 800 kw. turbo-generator, and a jet condenser. Loans of £8,500 are to be taken up at Dartford, £3,000 at Dolgelly, and £6,316 at Islington. Two 1,000 kw. D.C. turbo-generators are required at Salford, and an electric lighting, tramway, and power works at Napier (N.Z.). The North Eastern Railway Co. require electrical stores; the Islington Council contemplate an expenditure of £2,400 upon pressure testing stations, and the New Zealand Government have in view considerable extensions of the telephone system. (Page 632.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 16th.
Institution of Electrical Engineers.
8 p.m. Informal meeting to discuss proposed alterations to Articles of Association.

FRIDAY, NOVEMBER 17th.
Northampton Institute Engineering Society.
5.45 p.m. At the Institute. "Design of Electric Power Stations," by A. H. Perrett.
Illuminating Engineering Society.
8 p.m. At Royal Society of Arts. "Notes on the Design of Motor-Car Headlights," by Dr. R. H. B. Hickman.

MONDAY, NOVEMBER 20th.
Electro-Harmonic Society.
8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

TUESDAY, NOVEMBER 21st.
Institution of Electrical Engineers: Manchester Students' Section.
7.30 p.m. At Municipal Technical School. Debate on "Would Co-Partnership be Preferable to Trade Unionism for the Electrical Industry."

THURSDAY, NOVEMBER 23rd.
Institution of Electrical Engineers.
8 p.m. "Automatic Reversible Battery Boosters," by R. Rankin.

BUTCHER *(who has bought second-hand dynamo and intends purchasing oil-engine for driving same)*:—"What, four horse-power to work this! Why, I can turn it with my hand."

PUBLISHERS' NOTICE:—Books containing 48 Reprints of the Cartoons from Oct., 1910, to Sept., 1911, may be obtained, Price* 8d. *net (post free 9½d.).

THE LONDON OPERA HOUSE

MR. HAMMERSTEIN'S addition to the playhouses of London, although by no means the largest, is certainly one of the most palatial. It is intended to fill a gap which has been evident for many years, and at last London is provided with a theatre which is to be devoted solely to the performance of Grand Opera.

Situated on the east side of Kingsway and near the south end, the Opera House presents an imposing appearance, the frontage being no less than 265 feet in length, while the total area occupied is 24,500 square feet. Portland stone on a granite base has been employed for the exterior façade, and this is decorated with statuary.

The electrical installation, with which we are more particularly concerned in this article, embodies the most modern principles, and has been carried out in strict accordance with London County Council Regulations. Energy is derived from two distinct sources, and these are not interchangeable in any way. There are five intakes altogether; at two of these the Charing Cross, West End and City Electricity Supply Co's mains are tapped, and at the others the Metropolitan Electric Supply Co.'s supply is available. The wiring is so arranged that the respective suppliers are responsible for lighting the same parts of the building, with the exception of the stage, which is supplied by the Charing Cross Co. only. Even on the stage, however, there is a special effect switchboard connected to the Metropolitan Co.'s mains, as is also the dressing-room board, and the large lighting board in the front of the house. All lighting is carried out at a pressure of 100 volts. there being a pressure of 200 volts between the outers of the three-wire system, and this latter pressure is employed for power purposes.

Starting from the Charing Cross intake, vulcanised, rubber-insulated, lead-covered, steel-armoured cables, each of 0·9 sq. in. cross section, are taken to the stage switchboard. The board itself is situated on a platform above the prompt corner, and gives one the impression of being allotted much too small a space. It consists of black enamelled slate panels mounted on an iron framework, and divided into four circuit panels, and one "black-out" panel, the latter carrying switches for stage and a portion of the auditorium lighting. All connections are made on the front of the board, the total number of circuits controlled being 78, while the capacity approximates to 1,500 amps. Each circuit is provided with a single-pole knife switch and a "Zed" fuse in each pole.

On the same platform as the switchboard are the dimmer regulators of Siemens Brothers Dynamo Works' special metallic type. These are arranged in three horizontal rows, one above another. Each wheel can be rotated independently of the others, or they can all be locked on to the shaft and rotated slowly by means of worm gear, or rapidly by a lever. All are provided with scales which enable the operator to tell exactly how many volts are absorbed by the resistance and how many are across the lamp terminals. It was originally intended to fix the dimmer resistances on the same horizontal level as the regulator wheels, but lack of space prevented this, and they are therefore arranged in two sets above the switchboard platform. This has resulted in a certain amount of complication with the tracker wires, and the arrangement possesses few features to recommend it. Liquid resistances are not used, but asbestos-covered resistance wire is connected to a number of small copper contact pieces, each insulated from the next by mica, the whole presenting the appearance of the developed surface of a commutator. Over these contact pieces there moves a switch blade carried on a vertical rod. When the switch blade has moved to such a position that practically all the resistance is in, and the lamps are therefore black, it actuates a small

Hosted by Google

switch which, on opening, breaks the circuit, and thereby prevents overheating of the resistance. An interesting feature of the switch is a magnetic blow-out for extinguishing the spark. There are altogether 25 regulators, and these control 32 circuits on the stage, and 20 in the auditorium. In addition to these, the stage-board carries twelve circuits for stage arcs and fourteen circuits for the general lighting of the stage.

Arc lamp resistances are all permanently fixed under the stage, and the old system of carrying about a portable resistance with every lamp is entirely abolished. Each horizontal row of regulating wheels controls a particular colour of lamp, there being fifteen wheels for white lamps, six for blue and red lamps, and four for amber lamps.

Quite apart from the main stage switchboard there are also power and "special effect" boards on the stage. Cables from the Metropolitan Co.'s network are carried to a main power board itself, situated in the intake room, and there the following distribution takes place: two 100-amp. and one 25-amp. circuits, through double-pole fuses and cut-outs to ironclad distribution-boards in various parts of the building.

One of the 100-amp. circuits supplies the motor-driven deep-well pump, situated at the north-east corner of the building. An artesian well of 450 ft. in depth has been sunk, and water is pumped from this into two 800-gallon tanks on the roof, one at either end of the building. From these tanks water is conveyed to two 500-gallon tanks at the Portugal Street end, one being for the lavatories and the other for the heating installation, and to two 200-gallon tanks for supply to the dressing-rooms. Three armoured cables are carried from the same intake room to the "special effect" board situated at the back of the stage. This board has a capacity of 250 amps.

Apart from arcs and special effects, the lighting of the stage is done entirely by metal filament lamps, mostly of 32 c.p., the total number employed being about 2,500. There are eight battens in all, and they are probably among the longest in the metropolis, being no less than 60 ft. in length; each carries 200 lamps. Two have white lamps only, while the remaining six each have 100 white lamps, 34 red, 33 blue, and 33 amber. In the float are 250 lamps of four colours, while the proscenium is provided with 50 of three colours. Each hanging length, of which there are fourteen, carries 25 lamps, and there are besides bunch lights, projector lamps, and perch lamps. A feature of novelty arises in connection with the lightning arcs. These are six in number, and consist of small open arc lamps situated at various points on the stage. They are worked from the prompt corner by means of a rotary switch, and the stage manager is thus provided with absolute control over the elements.

All wiring on the stage is carried in screwed solid-drawn steel barrels, fitted with special draw boxes and inspection boxes at intervals. The barrel was all fixed first, and the wires were drawn in afterwards, the total amount of barrel used being upwards of 30,000 ft.

Coming now to the auditorium, it must be said that considerable skill and ingenuity have been displayed in dealing with the problem. Those responsible have realised to the full the enormous advantage of concealed lamps, and we know of no theatre in London where there is less direct lighting. In the centre of the ceiling is a large glass sunlight disc which covers a four-tier fitting, specially designed by Verity's, Ltd., to accord with the style of decoration, and over 9 ft. in diameter. In this large centre fitting are fixed 160 lamps, and the whole, which weighs about a ton, can be lowered to the ground. Special precautions are adopted to prevent falling glass in event of breakage of a panel. Surrounding the disc is a large oval expanse of ceiling, beautifully painted, and this is bordered by a spacious cornice. On the cornice are fitted 400 lamps, with Siemens' reflectors, but none of these lamps are visible from the auditorium. In addition, there are numerous fittings and flambeaux of exquisite design, also by Verity's, Ltd. For the control of a good deal of the front of house lighting, a large switchboard is fitted in a room on the left of the main entrance, provision being made for 78 circuits on the board. Some 3,000 lamps are installed in the front of the house. The ante-rooms, &c., are all fitted with dish lights.

The wiring of the dressing-rooms, workrooms, and auditorium staircases is carried out on the Stannos system, and is very neat and effective. Two distinct wires are used for each circuit, and the metal covering is not employed as a return conductor.

For purposes of ventilation the Plenum system has been installed, the fan being driven by a 20-kw. motor. A main duct is formed at each side of the house below the level of the stalls floor. From these ducts branches are worked in with the concrete partitions, or are constructed of galvanised iron, and carried to all parts of the house. Extraction is effected by four electrically-driven fans fixed in a horizontal position in the roof.

The various pendants, brackets, and fittings were designed and supplied by Verity's, Ltd., and are notable for their excellence from the æsthetic point of view. Siemens Brothers Dynamo Works, Ltd. supplied the switchgear, &c., while Messrs. Malcolm and Allan, to whom we are also indebted for much of the information in this article, were the electrical contractors.

ELECTRIC LIGHTING OF MOTOR CARS

A GOOD deal of progress has been made during the last two or three years in the application of electric lighting to motor-cars, due largely to the appearance of the metal filament lamp, which has much reduced the size of the apparatus required, and not the least interesting of the exhibits at the Motor-car Exhibition, which closed its doors at Olympia last Saturday, was the collection of car-lighting dynamos in the accessory section in the gallery. In these a variety of different devices are employed to enable a reasonably constant voltage to be applied to the battery for charging, irrespective of the speed of the engine, and to disconnect the dynamo when it is not giving a suitable voltage.

One of the best-known lighting dynamos is that of Messrs. C. A. Vandervell, Ltd., the latest form of which dispenses entirely with electrical or mechanical cut-in or cut-out devices by providing the armature with a free wheel clutch, allowing it to run light as a motor off the battery when the speed of the driving pulley is too low for a sufficient voltage to be generated. A nearly constant voltage over a large speed range is given by a combination of permanent and shunt-excited field magnets. A combination of permanent and wound magnets is also used in the Ducellier machine, shown by A. A. Godin, but this is used in conjunction with a simple electromagnetic cut-in switch. Messrs. Lodge Bros., Ltd., who are famous for their ignition apparatus, were showing a lighting outfit for the first time. This employs a magneto machine, in which the armature reaction is relied upon to prevent the voltage rising at high speeds, the only auxiliary apparatus being a simple electromagnetic cut-in switch. The firm also showed lamps with filaments specially arranged not to throw shadows on the reflector. Another permanent magnet machine is the Mira Magnetolite, but here the cut-in contact is worked by a centrifugal arrangement inside the driving pulley.

A new machine is that of Trier & Martin, Ltd. This gives a very constant voltage owing to an arrangement of auxiliary circuits and extra brushes, but the principal feature is a device which is practically a centrifugal mercury switch, which cuts the dynamo out of circuit when the speed falls. The Blériot dynamo is also a special constant-voltage machine with a large speed range, and employs an electrically-actuated cut-in switch. Another constant voltage machine requiring only an electromagnetic cut-in switch is the Leitner car-lighting dynamo shown by the Rotax Co. Messrs. Peto & Radford use a machine with no special electrical features, and prevent the speed rising by a centrifugal slipping clutch, but the usual electromagnetic cut-in is employed. Messrs. J. Lucas & Sons also employ a plain shunt-wound machine with an electromagnetic cut-in, and rely on a slipping clutch to prevent the speed rising above 1,500 r.p.m. A somewhat different principle is embodied in the "Magician" dynamo of United Motor Industries, where the field system is pivoted and pulled round by the torque of the armature against a spring, this working the cut-in switch and regulating the voltage by the equivalent of shifting the brushes.

We have already illustrated and described the car-lighting dynamo made by the British Thomson-Houston Co. on Messrs. S. Smith & Son's stand, and it will suffice to say here that its method of control is entirely different from any of the foregoing, depending on what is virtually a miniature form of the well-known Tirril regulator, in which a vibrating tongue short-circuits for a greater or less portion of the time a resistance in the field circuit. A form of automatic field regulator is also used in the machine shown by Seabrook Bros.

Other electrical accessories shown included lamps, electric horns, signalling devices to the driver, &c., and, of course, a vast display of ignition apparatus was made. This did not present so much novelty as in previous years, although the total volume of exhibits was greater, mainly owing to the fact that high-tension magneto or "dual" ignition is now almost universal, the bright exception being the Lodge battery and coil system, which is as prominent as ever. Among the closely packed rows of complete cars in the hall and annexe we failed to find a single example of an electric car or even one with electric transmission, but it is only fair to say that the exhibition does not pretend to represent the fields that these forms of traction are specially suited for. Petrol-electric systems are making great headway in several quarters, but more especially in connection with heavier work than is represented here.

REVIEWS OF BOOKS

Illumination: Its Distribution and Measurement. By A. P. Trotter. 292 pp. 8¾ in. by 5¾ in. 210 figures. (London: Macmillan & Co.) 8s. 6d. net; abroad 9s. 2d.

WE have no ordinary book to deal with in this case, and the volume before us fills a position long vacant in our list of standard works.

The art of illumination may be said to have commenced in the last century, and as the rapid improvements in recent years of the sources of artificial light have resulted in a general desire for increased illumination, it is somewhat extraordinary that the subject has not received more attention, and that definite standards have not been universally accepted. If light is defined as the absence of darkness, or darkness as the absence of light, any recent improvement, say in street lighting, might be described as "not so bad as it used to be," and illumination might be expressed in terms of degrees of darkness. We are accustomed to hear that a certain street or hall is well lighted, but we seldom hear that the illumination is good. We read daily accounts of street accidents, and although the drivers of vehicles are always going dead slow—on their own estimate—they frequently blame bad lighting. There is, therefore, an urgent need for the public recognition of some standard of illumination. The speed of street traffic will not be reduced, but, on the contrary, the tendency will be for all vehicles to move faster and to take crossings and corners at a speed which would send any ordinary horse off its legs. The illumination, however, of minor streets, and even main streets, remains much the same as it was before the advent of petrol propulsion, and certain places in each street have been held sacred to the erection of a post which frequently serves as a monument to the past and is provided with a beacon to indicate its presence at night. In the early years of last century such lighting was doubtless considered to be good, but no attempt was made to define it as illumination, and in now describing it as bad, we can adopt standard measurements of illumination to define what we mean. The savage emerges into civilisation as soon as he can express his sensations in some quantitative standard, for it is then possible to say how much of a savage he still remains, and without a standard treatise on the great subject of illumination we should have continued to remain in the dark.

This good work has been undertaken by an author well qualified for the task, for he deals with the subject with the zeal of the student combined with the thoroughness of the expert. In 1892 Mr. A. P. Trotter read an historic Paper before the Institution of Civil Engineers, and in the preface to the volume now before us he modestly describes his work as an expansion of this Paper. At that time the subject was new to most of his audience, and although this Paper still remains a bright spot in the proceedings of the Institution, it is a matter of regret that 19 years have elapsed before we have been able to welcome a complete treatment of this important matter. The book will prove of fascinating interest to all who appreciate

Hosted by Google

successful efforts to remove darkness, and being written in an easy conversational style, the author talks and the book speaks with a clear authority free from mathematical gymnastics. The author states that the scope of this book is limited to the principles and methods of distribution and the measurement of illumination, and he approaches the subject by easy stages from standards of candle-power to units of illumination. After dealing with distribution we have a description of various forms of photometers and accessory apparatus, followed by a short chapter on distribution of light from a source, and then further chapters dealing with the photometry of coloured lights, and the measurement of illumination with practical examples; the concluding chapter is on the subject of dioptric distribution and reminds us of much early work of the author, which reappears from time to time in modern apparatus.

Mr. Trotter has taken great trouble not only in referring to previous authors on kindred subjects but also in preparing a useful index to the works of other writers.

This book will be welcomed for its opportune appearance at a time of the greatest need for the information it contains, and as a standard work of reference it will be an invaluable addition to every library.

FRANK BAILEY.

The Law Relating to Electrical Engineering in India. (The Indian Electricity Act, 1910). By J. W. Meares. 426 pp. 9½ in. by 6¼ in. (Calcutta: Thacker, Spink & Co.) 15*s*. net.; abroad 15*s*. 11*d*

WE commend this book to the lawmakers of the mother country. It was our first intention, in reviewing it, to make a complete comparison of the law governing applications of electricity in India and in this country, and to investigate to what extent the differences in the two were the outcome of the different social, administrative and climatic conditions, and to what extent they were due to the fact that the Indian Government, guided by Mr. Meares, has actually improved upon the patchwork legislation by which electric lighting, power, and traction in Great Britain is controlled. Space will not permit us to do this, however, but we may say that there is much in the Indian Electricity Act of 1910 that might well be copied at home. Mr. Meares' explanation of the Act and its application, as well as the reasons for and effect of its various provisions, are not only clear, but afford most interesting reading. To those who are interested in important electrical work in India the book is indispensable.

The Electric Propulsion of Ships. By H. M. Hobart. 167 pp. 8¾ in. by 5½ in. 43 figures. (London, Harper Brothers). 5*s*. net., abroad, 5*s*. 4*d*.

THE desirability of employing higher turbine speeds and lower propeller speeds than those necessitated by direct coupling if the highest efficiency is to be obtained from steam turbine drive for marine propulsion is very generally admitted, and the author sets out to investigate the capabilities of electrical gear for supplying this want. He also describes a good deal that has been done in the application of mechanical gear to this purpose, but insists that however efficient these may be there are other advantages which can only be secured by electrical systems. These include the possibility of still running the turbines at their most efficient speed for all propeller speeds, better manœuvring power owing to ease of starting, stopping and reversing the propellers and avoidance of separate reverse turbines. The first half of the book lays a thorough ground work by setting forth the mechanics of ship propulsion generally, after which various aspects of the improvement in efficiency which electrical gear can introduce are discussed, and reference is made to its special suitability for use with internal combustion engines. Passing on to electrical detail, Mr. Hobart gives his views as to the relative merits of continuous and alternating systems, preferring the former for moderate generator speeds such as those given by gas and oil engines, and the latter for very large units and steam turbine speeds. Various patented systems of control are then described, including several where the speed variation of the squirrel cage induction motors is obtained by alterations of frequency, alterations of effective motor pole numbers, alterations of the phase system, or combinations of these methods. Mr. Hobart's clear exposition of the subject should be of considerable use in paving the way for the realisation of the hopes of the little band of engineers who have so persistently advocated electrical transmission gear for the propulsion of ships.

Second Edition. ***Revised and Extended.***

THE PRINCIPLES OF ELECTRIC WAVE TELEGRAPHY AND TELEPHONY.

By J. A. FLEMING, M.A. D.Sc. F.R.S.

Pender Professor of Electrical Engineering in the University of London, etc.

With 7 Plates and Numerous Illustrations. 8vo. **28s.** net (Inland postage **6d**).

'There is no doubt that this book should be regarded as the standard work on the subject, for there is no other volume with anything like its completeness, or with as thorough a treatment of the theoretical side of the subject.'—ELECTRICAL ENGINEERING.

By the Same Author.

AN ELEMENTARY MANUAL OF RADIO-TELEGRAPHY AND RADIO-TELEPHONY FOR STUDENTS AND OPERATORS.

8vo. With 187 Illustrations. **7s. 6d.** net (Inland Postage **5d.**).

Shop Management. By F. W. Taylor. 207 pp. 8¾ ins. by 5¾ ins.; four figures. (London: Harper Bros.) 5s. net; abroad, 5s. 6d.

THE author is a well known American engineer, and the joint-inventor of the Taylor-White self-hardening steel of eleven years ago, which gave rise to the important development of the new industry of high-speed tool steels. From beginning to end, the book treats only of the human side of the workshop, and it is, we believe, the first systematic treatise on the important question of "speed up" production. Various devices known as "premium bonus systems" are carefully dealt with, and the importance of accurate time records for every kind of work, no matter how complex, is insisted upon. Examples are given of records in such widely divergent fields as checking bicycle balls, drainage work, and building operations, and some of the investigations have taken over six years to complete. The ideal workshop, the author pictures, is certainly a very grim one of strenuous life, in which the worker of moderate attainments and the aged have no place.

The examples given of increased output due to the author's methods are certainly remarkable, as the following illustration will show:—

Original Output.	*Output under Taylor's System.*
120 girls sorting and checking bicycle balls.	Reduced to 35 girls for same output.
Working hours 10½ per day.	Reduced to 8½ hours.
Average weekly wage, 3½ dollars to 4½ dollars.	Increased to 6½ dollars to 9 dollars.

The author considers in turn most of the premium bonus systems in use, and finally recommends his own, whereby a very energetic workman at his maximum rate may earn double the ordinary rate of pay. The book is an interesting one, and should be read by all engineers dealing with cheap production. Its arrangement, however, is rather curious, as the whole 202 pages form one long chapter, undivided into sections in any way; apparently the work is to be read at the same rapid rate as recommended for workshop production, and the division into chapters might be an excuse for useless loitering on the way.

Mill and Factory Wiring. By R. G. Devey. 197 pp. 6½ in. by 4¼ in. 128 figures. (London: Constable & Co., Ltd.) 2s. net; by post, 2s. 2d.

WE congratulate both the author and the publisher in having provided a book which was really needed. It is evidently the work of a practical man who has had experience in the subject with which he deals. He assumes that the wireman or wiring contractor for whom it is intended knows the fundamental principles of his trade, and explains, without unnecessary introduction, the essentials of mill and factory work. He has not succumbed to the temptation, which most writers on wiring cannot resist, of filling his book with long extracts from wiring rules and manufacturers' catalogues, and there is hardly a page in the book which is not of direct practical utility. Apparently the book, although only published last month, has gone to press before the issue of the latest edition of the Wiring Rules of the Institution of Electrical Engineers, and the old wiring table is embodied, but we do not doubt that the author will very soon have the opportunity of remedying this in a new edition.

Electrical Mining Installations. By P. W. Freudemacher. 118 pp. 6½ in. by 4¼ in. 36 figures. (London: Constable & Co.) 2s. net; by post, 2s. 2d.

THIS is another useful volume of Messrs. Constable's "Electrical Installation Manuals"; it should be serviceable to workmen and junior engineers engaged in the electrical departments in mines. A small handbook of this kind cannot cover the subject completely, but a good idea is given as to the nature of the material required and the methods of installing it. A chapter on repairs, maintenance, and systematic supervision and inspection would enhance the value of the book. We notice that the maximum permissible currents given in the conductor table are not those in the last edition of the I.E.E. Rules, but are those of the previous one; this is, however, not serious, as the new rules permit maximum current densities higher than would be suitable in the majority of cases in mines.

Treatise on the Gas Engine. By H. Haeder. 317 pp. 9½ in. by 7¼ in. 23 figures. (London: Crosby, Lockwood & Son.) 18s. net; abroad, 18s. 5d.

A WORK embodying German gas engine experience appears here in a translation, and the scope of the work is best expressed in the translator's words as being to assist those engaged in the application of scientific principles to internal combustion engine design. Considerable trouble has been taken in adding equivalent dimensions in inches for the benefit of those who are not yet able to think in millimetres, and the completeness of the original has been extended by the addition of various tables. Long chapters are devoted to the mechanics of the subject, and the effect of inertia of the reciprocating parts on the crank effort diagram is discussed at considerable length. The construction of the various engine parts is then dealt with very practically, and many useful dimensions are given and methods of calculation set forth. A short but interesting final chapter deals with working costs, and in an appendix a description is given of the Humphrey gas pump. The whole book is for the practical designer, and is quantitative rather than qualitative throughout.

The Steam Turbine. By Sir Charles A. Parsons, K.C.B. (The Rede Lecture, 1911.) 57 pp. 7½ in. by 5 in. 51 figures. (Cambridge: The University Press.) 1s. 6d. net; by post, 1s. 8d.

A REPRINT is here given of a "Rede" lecture given by Sir Charles A. Parsons at Cambridge this year. Opening with some historical matter, the general principles of the reaction turbine are followed out, and the relations between steam and blade velocities are made clear. A few words follow as to the design of suitable high-speed dynamos for turbine drive, limited, however, to early experimental machines. The impulse turbine is then briefly treated, and the advantage of one or two impulse wheels as the first stages is pointed out. It is, however, insisted upon that the highest efficiency has been attained with the pure compound reaction turbine of large size where the high pressure portion is contained in a separate casing of great rigidity and short length. The latter part of the lecture is devoted to marine turbines, and in conclusion the extended use of gearing to obtain the desired speed reduction from the turbine to the propeller is prophecied. The whole is most interesting reading, even if it does not contain much with which the engineer who follows these matters is not already familiar.

Public Ownership of Telephones in Europe. By A. N. Holcombe, Ph.D. 482 pp. 8¾ in. by 6 in. (London: Constable & Co.) 8s. 6d. net; abroad, 9s. 1d.

WE trust that this book will reach the numerous self-constituted critics of the telephone system of this country. It will convince them how little they know of the subject, and yet the work, which is written by a student of economics, deals mainly with the question of ownership, broad matters of organisation, the policy as to rates, and the labour problems which arise, and touches on technical and engineering matters as little as possible. For instance, the difficulty of determining an equitable telephone tariff and the various considerations that govern it are well brought out; but as no detailed figures are given as to the cost of plant or its probable life nor estimates of operating expenses, the would-be framer or critic of telephone rates will not find what he requires. When the author does deal with technical matters he is not always fortunate. For instance, he is not to be commended for the dogmatic statement that "the determination of the conditions under which the condition of automatic switchboards will produce a saving in the expenses of operation is purely a matter of mathematical computation." The author's method, guided by the motto "Je ne propose rien . . . j'expose," becomes tedious at times, and the fact that the work deals only with countries on the Continent of Europe and not with Great Britain and America diminishes its value to the student of telephone politics.

Heat. By R. W. Stewart and J. Satterly. 480 pp. 6¾ in. by 5 in. 40 figures. (London: W. B. Clive.) 4s. 6d. net; abroad, 4s. 10½d.

THIS book is intended to provide a course on the theory of heat of the intermediate University standard. A large number of experiments suitable for laboratory work are included in each chapter. After a brief introduction, the book opens with a chapter describing the construction and use of various forms of thermometers. The next chapter is given to approximations, to bring home to the student the fallacy of using more figures than one is sure of when calculating from observed quantities. The expansion of solids and liquids are dealt with in an exhaustive manner, the former being treated graphically. The chapter on

London: CROSBY LOCKWOOD & SON,
7, Stationers' Hall Court, E.C., and 121a, Victoria Street, S.W.

the expansion of gases thoroughly investigates Boyle's and Charles's laws, and a clear treatment of the phenomena of specific heat is followed by a chapter on the laws of fusion. The determination of vapour density is discussed with the practical methods of Gay Lussac (or Hoffman), Dumas, and Victor Meyer. Besides other chapters on hygrometry, conduction of heat treated graphically, and the mechanical equivalent of heat, isothermal and adiabatic curves are dealt with at great length, and an account is also given of some of the latest methods in pyrometry and the liquefaction of gases. Answers to the various examination questions appear at the end of the book.

Quaternions as the Result of Algebraic Operations. By A. Latham Baker. 92 pp. 8½ in. by 5¾ in. (London: Constable and Co.) 6s. net; abroad, 6s. 3½d.

THE author, who is head of the department of mathematics at the Manual Training High School of Brooklyn (New York), remarks rightly in his preface that beginners are apt to be bewildered by the arbitrary manner in which the subject of quaternions is developed. New magnitudes are arbitrarily assumed, subject to arbitrary laws, and the reader, although he finds the logic consistent and the results concordant with those of his previous knowledge, hardly knows why. He feels himself in a new country, but is uncertain how he got there. This small book is intended to lead the student from the known to the unknown by familiar steps.

Smoke Prevention and Fuel Economy. By H. W. Booth and J. B. C. Kershaw. 231 pp. 8½ in. by 5½ in. 79 figures. Second edition. (London: Constable & Co., Ltd.) 6s. net; abroad, 6s. 5d.

THE first edition of this work, which appeared about seven years ago, was largely based on a German work by E. Schmatolla, although a good deal of alteration was made in view of English practice. Some revision has been made for the present edition, and a new chapter dealing with the legal position, and the work of voluntary agencies has also been added. The nature of the book may be gathered from the titles of the principal chapters, which are:—The Chemistry of the Combustion Process; Present Methods of Burning Fuel; Improved Methods of Burning Fuel; and Examination of the Waste Gases. An appendix illustrates the subject by a selection of abstracts of patents of smoke-preventing apparatus.

An Elementary Course on Practical Applied Electricity and Magnetism. By D. H. Ogley. 134 pp. 7½ in. by 5 in. 68 figures. (London: Longmans, Green and Co.) 2s. 6d. net; by post, 2s. 9d.

A USEFUL treatise for the physical laboratory is provided as a guide for the student to apply his theoretical knowledge to practical purposes. There are sixty-four experiments, typical of any up-to-date laboratory, which can be studied beforehand, so that all the time in the laboratory can be usefully occupied. The last dozen experiments relate to the motor and dynamo, and the use of the photometer is also discussed.

Heat and Steam. By S. G. Wheeler. 224 pp. 7½ in. by 5 in. 85 figures. (London: E. Arnold.) 4s. 6d. net; abroad, 4s. 10d.

WE have here a collection of notes on heat and steam, arranged in condensed form, originally intended as a text-book for naval students. As mentioned in the preface, the object aimed at throughout is to present a reasoned argument to illustrate the underlying principle in the use of heat in engines, rather than a collection of facts and formulæ with which to work out problems unlikely to happen in practice. Examples are given at the end of each chapter, and suggestions are made as to the methods of tackling them. The variation of the total heat and internal energy with change of temperature and pressure are shown on charts, which can be used instead of steam tables for rough calculations.

"Mechanical World" Pocket Diary and Year Book for 1911. 388 pp. 6¼ in. by 4 in. (Manchester: Emmott & Co., Ltd.) 6d. net; by post, 8½d.

IN preparing the twenty-fifth annual edition of this popular sixpennyworth, a good deal of revision has again been made, the section on steam turbines in particular having been extended and brought up to date. New matter has also been introduced regarding milling machines, roller bearings, and other subjects; some freshly arranged tables appear, and there has been extensive revision throughout. Electrical matters are, as usual, reserved for a companion volume.

White's Engineering Pocket Book. 93 pp. 5 in. by 3½ in. Wigan: Thos. Wall & Sons, Ltd.) 1s. net; by post, 1s. 1d.

THE greater part of the contents of this pocket-book is devoted to mechanical matters, and as much as 30 pages, or about one-third of the text, deals with screw threads. There is, however, a certain amount of electrical information, including Sir William Preece's fuse tables, sandwiched in between a table of round steel wire ropes and a description of a patent water-tube boiler. There is also a somewhat lengthy exposition of the relations between E.M.F. current and resistance under the heading of applied formulæ, but much of this space is wasted in working out rather obvious examples. After a few words on efficiency and losses in generators and motors, however, the author returns to the subject of steam boilers, in which he is evidently more at home.

The "Cole" Code. 123 pp. 10 in. by 7½ in. (Wigan: Thos. Wall & Sons, Ltd.) 15s. net; abroad, 16s. 1d.

THIS code has as its basis a set of 21,000 five-letter combinations, each with a distinguishing number, some representing single words, others phrases and complete sentences. The selection is such that it is possible to code messages of any kind verbatim with surprisingly few code-words, as well as to send the more usual kind of commercial messages. Special methods for applying the code-words to the needs of any particular business form a part of the scheme, thus considerably extending its usefulness. Special code-words are employed for indicating what combination of such extra books is to be read from, and other additional code-words extend the applicability of the code to seven-figure numerals. We understand that this code is used by Messrs. Willans & Robinson, of Rugby.

Pitman's Shorthand for Electrical and Engineering Correspondence. 90 pp. 6½ in. by 4¼ in. (London: Sir Isaac Pitman & Sons, Ltd.) 1s. 6d. net; by post, 1s. 8d.

THIS is an adaptation of Pitman's shorthand to the requirements of electrical and engineering correspondence. The long list of phrases and expressions, together with the information as to specifications, contracts, &c., should not fail to be of material assistance to the young shorthand typist entering the services of a firm engaged in the electrical or engineering trade. In one or two matters strict accuracy has not been observed, as, for instance, in the list of abbreviations at the end. There is also an obvious printer's error, s.w.g. being given as representing "standard *wine* gauge."

THE PROPOSED CHANGES AT THE INSTITUTION OF ELECTRICAL ENGINEERS

WE have received masses of letters from correspondents with regard to the Council's proposed changes in the Articles of Association of the Institution of Electrical Engineers, so many that it has been impossible to answer them individually.

THE SUBSCRIPTION QUESTION

While we are supported on all sides in our objections to the proposed name for the new class of members, as well as to the constitution and proposed method of nominating the Council, and to other vital alterations put forward by the present Council, there is equal dissatisfaction with the proposals for increasing subscriptions. So strong and definite are the views expressed on all sides that there is little doubt that the Council will find it necessary to keep the subscriptions at their present level so far as country Members and Associate Members are concerned, otherwise there will be wholesale resignations, and the main object of the increased subscription—viz., to obtain an immediate increase in revenue—will be defeated. From the speech made by Mr. Ferranti at the dinner of the Birmingham Local Section (reported on another page), it is clear that the Council is now anxious to defer to the wishes of the membership, and we have no doubt that they appreciate the efforts that are being made to obtain the collective expressions of views which will enable them to ascertain what the wishes of the members actually are. The Council will be represented by Mr. Ferranti and Mr. Hammond, at the open meeting to be held in Birmingham on Wednesday, Nov. 22nd., to discuss the proposals, and possibly a similar course will be taken at other centres. In the meanwhile, as already announced, there is to be a meeting at the Institution in London at 8 o'clock to-day, to discuss the matter. The Council acknowledge that a mistake has been made in their assumption that there would be so little disagreement in their proposals that their adoption could be considered a purely formal matter, and they now desire to profit to the fullest extent by the interest that has been awakened in the Institution and its organisation, so that the changes eventually made shall be those which have the approval of the Institution as a whole. It appears probable, therefore, that the new draft Articles will be considerably modified before they are again laid before the Members for formal adoption at the Extraordinary General Meeting, which was adjourned to a date "not earlier than Nov. 30th." To obtain and collate all the proposals will entail a considerable amount of labour, and although the Council will naturally desire to hold this meeting, and the subsequent necessary confirmatory meeting, as soon as possible, so that any increases in subscription that are agreed upon may come in force from the beginning of next year, it is doubtful whether it will now be possible to hold the first of these two formal meetings before Dec. 7th.

STRONG SUPPORT OF OUR AMENDMENTS

As announced in our last issue, we invited Members and Associate Members to signify their concurrence in the following amendments:

(*a*) Only Members and Associate Members must be permitted to use the Official Abbreviations.

(*b*) "Associates" must henceforth be called "Affiliated Members." [Members of this class, not being engineers, should have a name which will avoid confusion with Associate Members.]

(*c*) The new class of Members must be called "Subscribers" instead of "Licentiates" [for this new class will be composed of men with limited qualifications and experience].

(*d*) Not more than two persons whose only qualification is eminence in science and who are not engineers, must be admitted annually as Members. [Others can be elected as Affiliated Members or Subscribers.]

(*e*) Eminence in law must only qualify for Affiliated Membership and not for Membership.

(*f*) In the case of foreign candidates for Membership, the same number of personal recommendations must be required as in the case of British subjects, and not less.

(*g*) There must be four Associate Members and only two Affiliated Members (Associates) on the Council, instead of three of each.

(*h*) The Council's proposals for new Members of Council must be sent to every Corporate Member six weeks before the Annual General Meeting, inviting further nominations within three weeks.

(*j*) Committees containing non-members of Council must be Advisory only, and must not possess the full powers of the Council.

(*k*) The Incorporation of other societies must not be effected unless allowed by a Special Resolution of Corporate Members of the Institution of which twenty-one days' notice has been given.

One hundred and fifty Members and Associate Members have attached their names to the above. The signatures received and sent in by us to the Secretary of the Institution are as follows:-

MEMBERS.

F. Ayton	T. Hesketh	A. H. Pott

If any more of our readers (who are Members or Associate Members) desire to have their names added to the list, we shall be pleased to send them forms for signature.

The Local Sections are acting independently, and are each drafting a set of amendments. They are all, we believe, taking exception to an increase in subscriptions, and their objections on the other points are to a large extent similar to ours.

Hosted by Google

CORRESPONDENCE RECEIVED

Extracts from a few of the letters we have received are given below. We have, however, been inundated with correspondence, and many exceedingly interesting letters must remain unpublished.

Mr. Frank Bailey, M.Inst.C.E., Engineer-in-Chief of the City of London Electric Lighting Co., Ltd., writes: The draft is so unsatisfactory that I am convinced no small amendments can make it acceptable. The whole thing requires re-modelling on modern lines so as to meet the present and future requirements of the Institution. The proposed alterations are ridiculous, and no attempt has been made to bring the thing up to date. I therefore propose that all Members should negative their adoption, and not attempt to amend them in any way. The Revising Committee have not shown any aptitude for the work, and to submit a re-draft for their consideration would be absurd.

Mr. Percy Still, M.Inst.C.E., Chief Engineer to the Chelsea Electricity Supply Co., Ltd., writes: I am prepared generally to support your objections to the proposed new Articles of the Institution of Electrical Engineers, but am inclined to object altogether to the formation of the suggested new class of "Licentiates." I fail to see why the old class of "Associates" should not be sufficiently comprehensive to include all persons who are not students or who have not the qualifications for admission to the class of "Members" or "Associate Members." But if, for reasons which I do not at present appreciate, it is thought desirable to create a new class, the designation "Licentiate" is, I think, most objectionable, as it would certainly convey to the public the idea that the person in question is a duly qualified electrical engineer licensed by the Institution. The term "Subscriber," which you suggest, would be more appropriate, but I can understand that it would not suit the purposes of the Council, as there would probably be no great amount of competition to become mere subscribers to the Institution if such subscription did not carry with it the right to use the designation "Licentiate" with which to dazzle the eyes of the public. In my opinion the present "Associates" should include the proposed new "Licentiates," and they would all be better described as "Subscribers." I agree with you that the official abbreviations should be confined to "Members" and "Associate Members." With regard to the subscriptions, if it is shown to be necessary to increase these slightly, it is not likely that many "Members" or "Associate Members" would object, provided that their views are met in regard to other suggested alterations. The formation of a class to be termed "Licentiates" in the manner which is suggested would very probably lead to a certain number of members discontinuing their subscriptions altogether.

Mr. W. A. Vignoles, Borough Electrical Engineer, Grimsby, writes: A strong protest should be made against the increase of country members' subscriptions from three to four guineas. This increase would make the subscription considerably higher than that of the Civils, and notwithstanding what Mr. Hammond says, I am sure a very large proportion of the country members are not within reach of the Local Sections. Take, for instance, the municipal electrical engineers. I should think not one in ten could attend meetings of local sections without making a very considerable train journey. If the new building is the cause of the increase of the subscription, it seems to me that the town members who will benefit from the building should bear a larger proportion of the cost than country members who cannot use it.

Another leading municipal electrical engineer in one of the eastern counties writes: Before I can agree to sign the printed form you have enclosed, I must know that some stand is going to be made on the question of raising subscriptions; that is, that there should be a difference between the subscriptions of town and country members. If I attend a Local Centre meeting I not only have railway fare to pay, but in addition stay at an hotel for the night, as there are no late trains back. The consequence is that I have only attended one meeting of a Local Centre and one in town during the years I have been a Member of the Institution.

A Borough electrical engineer in the north-west of England writes: It certainly seems to me that the alterations proposed by the Council would not tend to raise the status of Members of the Institution, and unless some attempt is made to do this I feel sure that a considerable number of existing Members will begin to consider seriously whether it is worth while continuing their Membership at the increased subscriptions which are now proposed, when probably the only advantage which many of them derive is receiving a copy of the *Proceedings*.

A Borough electrical engineer on the south coast says: If the suggested rules are not very materially modified, quite a dozen of my friends in the provinces and myself intend to tender our resignations, as we get no value whatever for the money we pay. I have never been to a meeting of the Institution since I have been a Member, and the *Proceedings* are pretty dear at the price charged for our subscription.

A Bradford correspondent writes: I know a number of good men in Bradford who have not joined the Institution because they consider the benefits inadequate under the present terms.

A Reading correspondent expresses his views as follows: Surely the new building is regarded as something in the nature of a club, and hence either town Members are getting too much for their money or country Members are getting too little. It seems quite reasonable that the former should now be asked to pay an increased subscription, but the latter are asked to pay something for nothing. Have you also observed, from the last annual report, that the income from subscriptions is now rather more than *double* what it was ten years ago? I hope your efforts will be successful in hindering this hasty legislation and in preventing the passing of so much power from Corporate Members to the Council.

The General Manager of a large Electrical Manufacturing Firm in Northumberland says: I have often thought the confusion between Associates and Associate Members very unfortunate, as in the mind of the general public there is practically no distinction. I return herewith your paper duly signed.

A Glasgow correspondent says: It seems to me that the Institution has been made altogether too cheap. Many men are Members who are really not qualified to be even Associate Members.

A Dundee correspondent writes: A few of us here had a meeting as soon as possible, and some of us are signing the sheet and returning same herewith. Discussion on the matter has brought out many rather interesting, if somewhat depressing, views. Even those of us who have signed the enclosed are of opinion that it does not go far enough, although on the right lines. The general opinion is that it is very little use to an engineer, of whatever grade, to belong to the Institution; with the exception of occasional Papers, there are no other benefits arising from membership. The Juniors are evidently particularly exercised from this point of view. They say, and many of us agree with them, that it is absolutely useless joining the Institution, as it carries with it no prestige such as some other Institutions afford, with the result that many of the younger men in this district, who should have been joining the Institution of Electrical Engineers, have joined by examination or are preparing to join the Institution of Civil Engineers; and our little meeting yesterday fully bore out the increasing popularity of this attitude. Another remark that was made by several was that they would be prepared to join the Institution more readily if there were really advantages to offer, even had they to pay as much as double the present subscription. We are going to try and get up another meeting of men who either are Members or ought to be connected with the Institution.

A Member in Wolverhampton says: I am strongly opposed to the new Articles of Association proposed by the Council of the I.E.E. The alterations that you suggest do not, in my opinion, go anything like far enough.

An Associate Member in Wrexham says: I consider the list of alterations to the Articles as submitted by you are excellent indeed—far in advance, much more adaptable, than the Council's proposals.

Mr. Frank Ayton, Chief Engineer and Manager of the Ipswich Corporation Electric Supply and Tramways Departments, writes: I am very glad to find that you are opposing the apparently autocratic methods which the Council of the Institution have adopted. I sincerely hope that the opposition which is being shown will teach the Council that they must not trifle with the general body of Members in this way. Immediately on receiving the notice of the meeting, I wrote to the Secretary recording my objection to the proposal to increase the subscription.

An Associate Member in Ipswich suggests: Members, or, at any rate, Associate Members, who are situated at a considerable distance from headquarters or a branch association, should have their subscriptions *reduced* instead of being increased.

A Dublin correspondent writes: The Institution, by its unfortunate purchase of the lease of the Embankment premises, has locked up over £70,000 in a building which is quite useless to all but London Members, and—the deal having apparently turned out more costly than was anticipated—finds itself short of funds. The proposed Articles of Association tend to lower the qualifications accepted, and at the same time to increase the fees of those already qualified. They offer, in fact, *less* value for *more* money in order to raise funds to keep up a building which is of no earthly use to at least nine-tenths of its Members. I do not think the Institution is housed one cut stone beyond its deserts, but I am afraid it is housed several storeys beyond its means. If it really is—as I believe it is—a question between belonging in the near future to a profession in the real sense, or belonging to an Association which has a grand building on the Embankment, and little else—and paying more for the latter than for the former—then I am for the profession. The new Articles of Association propose to sacrifice the profession to the building, and are, I think, professionally disastrous, though possibly financially sound; therefore I oppose them. The amendments which you have sent me for signature would make for the raising of the status of the profession, but this does not meet the question of finance. You want *both* the raised status and the building on the Embankment. I doubt if both are possible in our time. You could not expect the Associates to continue paying, and it would almost require a police-regulated queue of

Hosted by Google

altruistic gentlemen begging for admission as "Licentiates," or whatever name you suggest, to save the financial situation. Now, what is to be done? What would be the wisest course of action for a gentleman of ample means who yet found himself in straitened circumstances through the possession of a mansion in Park Lane? Sell it and move into Kensington.

A Belfast Member says: The proposals would seem to me to emanate from the fertile brain of a treasurer who is anxious to improve the immediate finances of the Institution, without too scrupulous regard for its ultimate best interests, in the sense that the new rules will tend to open the door to a number of very estimable persons who will not be associated very closely with, or rank highly in, the profession.

Another Irish Member writes: It appears that the necessity of increasing the income is solely due to the fact that the Institution has acquired new premises. We country members feel that we are now being asked to pay for privileges which can only be enjoyed by members resident in London or adjacent thereto. It seems rather unreasonable in these hard times, when many of our members find a great difficulty in earning a livelihood at all, and that the cost of living has advanced in every way, that our own Institution should also be the means of increasing our professional expenses. I think that the proposed increase should only apply to new members elected after the new Articles become an accomplished fact. I hear that many of our local members will resign rather than pay an increased contribution. I hope that, in making representations to the Institution, you will not fail to mention this matter.

An Electrical Engineer of one of the Railway Companies says: I have signed the amendment, and return it herewith. I notice no amendment dealing with the necessity for extending the minimum notice for a meeting empowered to deal with the Articles of Association, which has led to the present trouble. It seems to me that three months is quite a short time for notice of a meeting of this kind, and that the meeting should be held in the evening.

Another correspondent says: The point I feel is wrong is the Institution breaking faith with its old members by altering the subscriptions. Even a golf club does not do this in such a barefaced way!

"One who has belonged for 28 years" writes: I agree with all your points; but there are others. It is not the slightest use to pretend that the increase of subscriptions all round is not directly caused by the absurd white (marble) elephant that the Council have invested in, in such a hurry that the body of members, who objected to it, could not prevent it. Those new and in most ways admirable objects of expenditure which are referred to in the Chairman's speech have been just as admirable and just as urgent for many years past. The Council, instead of carrying out these things, appropriated our balance each year to the building fund. *Now* there is no yearly balance, as it is swallowed up by the extra expense of that building, and the Council ask us all to raise our subscriptions in order to provide funds for their doing, now, what they neglected to do all the years that they had ample funds for the purpose.

The following suggestion has been received from another correspondent: If it is absolutely necessary that the subscription should be raised, I certainly think opportunity should be given to members who have to work all day to have some chance of using the new buildings. To the best of my knowledge, they are closed at about 5 or 6 p.m., except on meeting nights, which, of course, gives the majority of members no opportunity whatever of getting any benefits from membership except from meetings and the printed matter which comes by post.

A Westminster consulting electrical engineer has sent us a long letter, in the course of which he says: The proposed Articles as to "Professional Conduct" are quite insufficient for the purposes indicated. Subsection (*c*) of Clause 42 obviously does not go far enough. A consultant who is a shareholder in a contracting firm may have a remote personal interest in the placing of contracts, but such interest is not comparable with that of the official of a company who is allowed to practice as a consultant, although his directors, whose servant he is, are also directors of large contracting companies. There is nothing to prevent him from advising clients regarding the placing of contracts, &c., with companies of which his own directors are principals, and he can do this without disclosing the fact. As another example, I would mention the issue by the boiler and plant insurance companies of printed circulars with the names of their engineers in large type. Not only do these circulars enlarge on the qualifications of the companies to act as "consultants," but in addition their officials or agents personally canvass clients on the plea that as their company may insure the works, the company's engineers are the proper people to specify them. May I suggest the following additions to subsections (*c*) and (*e*) of Clause 42:—(*c*) He shall not, without disclosing the fact in writing to his client, be a salaried official to any company, having a board of directors, which includes directors or members of contracting or manufacturing firms, with which he may have to deal on behalf of his clients. (*e*) He shall not allow his name and degree to be published by any company or firm which issues circulars or employs or permits officials or agents to canvass for professional work.

Another consulting engineer with a large practice says: While I remain a Member of the Institution of Electrical Engineers, I have long since ceased to be interested in the organisation, not because I am not actively interested in all electrical matters, but because of the wide divergence of views as to what an institution representative of professional men should be.

Another consulting engineer suggests that an Article should be added under the heading "Professional Conduct," which prohibits manufacturing or insurance companies, or consulting engineers, from undertaking work of an advisory nature without charging the recognised fees, and that minimum fees should be specified.

Considerable objection is also being raised, by this correspondent and others, to Article 66, which gives the Council powers to borrow money without first obtaining the consent of the Members.

Another Westminster Member says: As to the incorporation of other societies, I think that is too important a matter for a twenty-one days' notice to suffice. I would rather say three or six months.

Another old Member writes: We are called upon to pay an increased rate of subscription for the privilege of belonging to an Institution, the professional standing of which is bound to be depreciated by the proposed changes. On the other hand, this unsatisfactory position is solely due to the apathy of the general body of Members and Associate Members at the time the lease of the present building was purchased, because the purchase involved heavy commitments and liabilities. I fear there is no other practicable alternative. Being committed to the building, and an increased revenue being a matter of absolute necessity, the increase in the subscription has got to be faced, together with additional—as you very aptly said—subscribers. And we can only hope that the decrease in the present Membership which will certainly ensue, will not turn out to be a serious matter. With regard to the inadequate representation of Associate Members, this is a great injustice to that class, and I hope that you, and the other technical papers, will drive this home. Similarly, the proposed change in the rules governing the nomination of Members of Council is exceedingly objectionable, and ought to be strongly resisted. If we are to judge from what we heard at the last meeting, certain Members of the Council consider that the dignity of the Institution is inseparable from the possession of a large building. How fallacious this argument is becomes apparent when one considers the position of, for instance, the Iron and Steel Institute, which is very modestly, but sufficiently, housed in Victoria Street. Yet that Institute represents one of the most powerful industries in the country, and is of international reputation and utility.

Mr. Percy Good writes: It seems desirable to make a ballot essential for all future alterations. It would also be advisable to alter the Articles so that for the election of the Council the nominees of the retiring body must be in excess of the requirements, and any nominations sent in by private members to be added to the list without any distinguishing mark.

Two Manchester Students have written us at great length, One of them, Mr. A. R. Stelling, objects to the more stringent rules as to admission of Students, and contends that the transfer to Associate Membership should be made easier by omitting the examination in the case of Students whose Papers have obtained premiums or have been accepted for publication in the *Journal*. He also suggests that present Students on being transferred should not be called upon to pay the higher entrance fee, and should be treated as old and not new Associate Members as regards subscription. The other Student correspondent, Mr. H. A. Carney, who has been a Student since 1905, deals with a number of other points, to most of which reference has already been made.

The Institution's Thanks to the Civils.—At the opening meeting of the session of the Institution of Civil Engineers last Tuesday evening, a deputation consisting of Mr. S. Z. de Ferranti, President of the Institution of Electrical Engineers, Mr. R. K. Gray, Past-President, Messrs. W. Duddell, F.R.S., W. H. Patchell, J. F. C. Snell, and Major W. A. J. O'Meara, C.M.G., Vice-Presidents, Mr. Robert Hammond, Honorary Treasurer, and Mr. P. F. Rowell, Secretary, presented to the Council and Members of the Institution of Civil Engineers an illuminated address of thanks, as follows, on behalf of the Institution of Electrical Engineers:—

"We, the President, Council, and Members of the Institution of Electrical Engineers, desire hereby to express to the Institution of Civil Engineers our deep sense of gratitude for the privilege so generously granted to us from February, 1872, to April, 1910, of holding the ordinary meetings of this Institution, more than five hundred in number, in the hall of the Institution of Civil Engineers. The hospitality extended to us during this long period of thirty-eight years has conferred a material and lasting benefit on the development of the Electrical Profession, and will always be held in our memories with sincere appreciation and thankfulness."

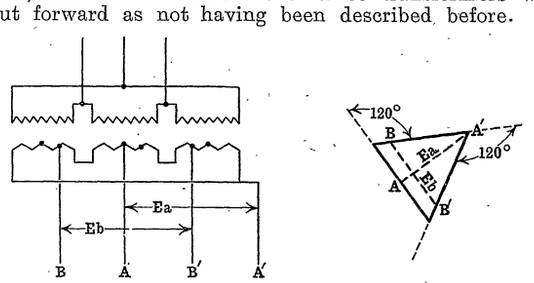
HIGH-VOLTAGE TRANSFORMERS

A PAPER by Mr. W. T. Taylor on modern high-voltage transformers was discussed at the meeting of the Institution of Electrical Engineers last Thursday. In the absence of the author, an abstract of the Paper was read by Mr. J. F. C. Snell. Opening with some figures showing the magnitude of the subject, the Paper proceeded to outline generally some of the conditions which transformers have to fill, and pointed out the superiority of water-cooled oil-immersed transformers over those of the air-blast type. The relations of core and copper losses, temperature, regulation, and efficiency were then considered at some length, and their influence on operating costs was discussed generally. Tables of efficiencies, oil and water quantities, &c., were also given of a range of typical oil and air-blast transformers. Indifferent frequencies and the recent introduction of transformers with forced-oil circulation and oil-cooling apparatus in a separate compartment was referred to.

Constructive details were then dealt with, and the method of building up a particular design of three-phase core-type transformer was first followed through. A few details were then given of the method of assembling shell-type transformers, which, it was remarked, are built in larger sizes than the core type. The large number of edges and sharp corners, however, render them more difficult of insulation, and a lower space factor than with core-type results. The author then gave some practical hints on the installation of transformers, dwelling particularly on the advisability of placing them where a burn out of a coil, or boiling over or burning of the oil in one unit will not affect the continuity of the service, simplifying the H.T. wiring as much as possible, earthing the tank, allowing plenty of space for access and great care in the drying-out process. Several methods of drying out were described, including passing sufficient current with one winding short circuited to raise the temperature to 80° C., while the transformer is out of the tank, making the tank air-tight and applying a vacuum pump or causing heated air to circulate in the tank. Methods of getting rid of moisture in the oil by the vacuum system or by blowing heated air through it were also referred to. The qualities required of a good transformer oil were briefly alluded to.



The vexed question of the relative merits of core and shell designs was next taken up, the author showing a strong preference for the latter, setting out its advantages as follows:—Greater radiating surface of coils; interlacing of coils, resulting in closer regulation; mechanically stronger and more able to withstand the electromagnetic stresses; satisfactory series-parallel operation. The only advantage admitted for the core type was the greater ease of removing a coil for repair, whereas the following disadvantages were urged for the core type:—With low-voltage winding designed for 22,000 volts and above, the amount of insulation next to the core means a larger mean turn of winding, the temperature and the I^2R loss being increased; radiating surface on the low-voltage winding very poor, resulting in higher temperatures; the concentric arrangement of coils results in poorer regulation and higher reactance voltages; less mechanical bracing; not possible to operate a three-phase (delta-delta) transformer when one winding becomes damaged.

In dealing with practical points in transformer operation, the author referred to the difficulties met with due to corona discharge within the transformer itself. He put the main requirements in the following order: reliability, safety, and efficiency; and suggested automatic alarm appliances for signalling an excessive temperature rise or a stoppage in the flow of cooling water. Passing on to different methods of connection, the advantage was claimed for delta connections that with one grounded conductor the service need not be interrupted, except perhaps if the ground is an arcing one, which might set up continuous high-frequency surges, producing high-voltage stresses on the transformers in circuit. A table of transformers working in America at above 62,000 volts showed that the star and mesh connections are about equally favoured. The author expressed the view that three-phase transformers would ultimately be as usual as groups of single-phase transformers, but admitted that the single-phase transformer is at the present time preferable where only one group of transformers is installed, and the expense of a spare transformer would not be warranted as in the delta-delta connected system. The three-phase transformer possesses the advantage of requiring less material, and is more efficient than any other single-phase combination of transformers of the same kilowatt capacity.

The relative merits of delta-delta and delta-star connections were summed up as follows:—Delta-delta (non-grounded): When one phase is cut out the remaining two phases can be made to deliver approximately 58 per cent. of the full load rating of transformer (in case of a three-phase shell type) or transformers. Delta-star (neutral grounded): Advantage of reducing the cost of high-voltage line insulators for equal line voltage, as their size need be only 57 per cent. of those used on a line with transformers connected in delta. It is possible, under such conditions, to operate and deliver three-phase current when either one-phase or one-line conductor is cut out. Delta-delta disadvantage: larger transformer or transformers and larger line insulators for the same line voltage. Delta-star disadvantage: Not always in a position to operate when one phase or one line conductor is cut out.

The question of running differently connected installations in parallel for consolidations of large power schemes was discussed, and some of the conditions were laid down by the aid of diagrams of several alternative arrangements.

The Paper then discussed methods of converting from three- to two-phase, describing the well-known "Scott" (or, as the author preferred to call it, "T") connection with two transformers, and a modification with three transformers which he put forward as not having been described before. This

THREE TRANSFORMER CONNECTION FOR CONVERTING FROM THREE TO TWO PHASE.

arrangement is shown in the figure and is coming into use extensively in America. The following advantages are claimed over the two transformer Scott connection:—Larger factor of safety for continuity of service; with one transformer disabled the system can still be operated; a spare transformer need not necessarily be kept as a spare; a spare transformer need only have a rating of about 67 per cent. of that of a spare transformer for the two-transformer system; able to obtain symmetrical two-phase and three-phase voltages from the same winding; improved regulation and efficiency; better balancing of voltages under load; for the same total kilowatt rating, only a ratio of 100 to 108 in favour of the three-transformer system is required. Its disadvantages from the standpoint of first cost and available connections for apparatus are:—The first cost is higher; it is not possible to operate interconnected motors and generators on the two-phase secondary system; greater floor space and wiring are required.

In conclusion, the author writes:—"The experience of recent years seems to point out that the larger we build our stations, machinery, and apparatus, the better results we get. Not very long ago the economical limit placed on the size of a station was in the neighbourhood of 20,000 kw., but to-day there are stations equipped with machinery and apparatus of practically 200,000 kw. Transformers of 10,000-kw. capacity are more economical than units of 5,000 kw., and a system using ten 10,000-kw. transformers is more economical than another using twenty 5,000-kw. transformers."

DISCUSSION.

Mr. W. B. WOODHOUSE (Chief Engineer, Yorkshire Electric Power Co.), in opening the discussion, pointed out and severely criticised several errors and inaccuracies in the Paper, as did several subsequent speakers. Dealing with the subject of the Paper, he said that the most important losses to consider are no-load losses. The author considered efficiency one of the most important points, and rather underrated the importance of pressure regulation. It had been more or less general experience that a transformer with close regulation is not robust enough to stand heavy overloads. At the same time, close regulation was desirable, but over long distances he suggested that the best course was to use a transformer with poor regulation with some external means of regulating the pressure, such as a synchronous motor. With very big units, local heating was an

Hosted by Google

important element, and whilst three-phase transformers had certain considerable advantages, the single-phase transformer did not have such a large bulk of metal, and consequently the difficulties of cooling equally all through the core and all through the winding were not so great. There was room for enormous development in the cooling of large oil-insulated transformers. Some makers arranged that part of the cooling was carried out in a separate tank. One very good measure of ascertaining whether a transformer was thoroughly dried out was to take periodical readings of the core losses, which were very much increased if the core was damp. The comparison between the shell and core types of transformer was rather like flogging a dead horse. It all depended upon what one was prepared to pay. He saw no difficulty in obtaining equal good examples of either type. The interconnection of the phases of a transmission line where they stepped up and stepped down was a most important point. There was considerable diversity of opinion, but the balance was apparently in favour of star connection of the high-voltage line. At the same time, with long transmission lines at high voltage the earth neutral seemed to be of doubtful value. During the dry weather this summer there was an enormous change in the resistance of the earth.

Prof. S. P. Thompson, F.R.S., objected to the misuse in the Paper of the term "regulation," and pointed out the absurdity of the expression "good regulation" for a low percentage of voltage drop when the best "regulation" was no "regulation" at all. He asked for opinions as to the advantage or disadvantage of putting in a resistance between the neutral point and earth with a view to avoiding difficulties for a rush. The method of connecting from three to two phase described by the author as the "T" connection with two transformers, was no different from that known by the name of Mr. Scott, of the Westinghouse Co. He was rather surprised to find the three-transformer method spoken of as a novelty. It had been publicly described in this country as far back as 1892, in Prof. Arno's book, and it certainly was used in some high-voltage power schemes in Italy. The advice in the Paper to use units as large as possible ought to be passed on to those people who, in a little congested district such as Bethnal Green, were arguing whether they should set up a station for themselves or take a supply in bulk. [Bethnal Green is the only London borough in which no supply of electricity is available. Many years ago Mr. Robert Hammond reported to the Council, but no definite steps were taken. During the past few weeks, the Council retained Mr. J. F. C. Snell to report upon the advantages of erecting a power station or taking a bulk supply.—Ed. *E.E.*]

Mr. C. H. Merz said one of the chief difficulties was to make a transformer that would stand the mechanical shocks sustained in working and at the same time to give good regulation. It was in the distribution system that good automatic regulation was essential, unless they wished to have attendants in every sub-station. He emphasised the necessity for designing transformers so that there shall be no hot spots. In America he did not think they had such a high standard as was the case in England, on account of the intense competition in this country. Here we aimed at getting a transformer which would operate for years without requiring cleaning, whereas in America it was not unusual to clean them once in six months or once a year.

Mr. J. S. Peck (British Westinghouse Co.) said that whilst the practical part of the Paper was all right, there were many points in connection with the design and internal arrangements of transformers with which he entirely disagreed with the author. There were also many inaccuracies. It was said that hysteresis was greater in hard steels, whereas it was known that many steel alloys which were very hard had a very low hysteresis loss. The author's descriptions of a core-type transformer related to a design which he did not think would be accepted in this country. Again, the efficiency of an air-blast transformer was not as good as that of an oil-cooled transformer on account of the greater amount of insulation required and on account of the larger air ducts, but the author suggested just the opposite. That might be so, but if the air-blast transformer had a higher efficiency, it was made with a higher efficiency in order to enable it to dispose of its heat. The real reason why oil with a lower flash-point was used for water-cooled transformers was because they had much less tendency to throw down deposit when heated. Some of the three-phase transformer connections shown in the Paper were impossible. He was surprised that the author advocated two-phase distribution, as this had been gradually displaced here by three-phase. With regard to the so-called "T" system with three transformers, this had been known for many years, but it had not come into general use because it had many disadvantages. The author's argument was fallacious, and was based on the assumption that there was no greater loss in these transformers than with three single-phase transformers operating star to star or delta to delta. That was not the case. The loss was considerably increased by the connection, and was about 16 per cent. above that in the ordinary three-transformer star or delta connection.

Mr. J. F. C. Snell said he would see that the author's attention was called to the very trenchant criticisms which had been made. To some extent, he admitted, he personally was responsible for some of the errors which had been pointed out, in that he had partly edited the Paper. But he was in no way responsible for the Paper. In defence of the author, with whom he was not acquainted, he said that he was a practical man with a wide experience, and there was much in the Paper which would be found of value on this side.

Mr. W. E. Burnand also criticised the Paper. He referred to the influence of the very high frequencies of the superposed current rushes at the time of switching on transformers in limiting the strain on the insulation practically to the end turns. The shock to the end turns was practically in proportion to the square of the voltage. Increasing the reactance entailed an increased leakage field, and although decreasing the short-circuit current did not lessen the destructive mechanical forces as much as might be expected.

A communication was received from Mr. C. J. Hopkins, who described a method of taking the H.T. leads through the cover in which these consisted of bare copper rods supported in cylinders of oil at a point near their centre in the cover of the tank. The cylinders were built up of sections of varnished cambric and press-board collars.

THE ELECTRICAL EXHIBITION

At the last meeting of the Executive Committee it was agreed that, subject to the accounts being audited, approximately 20 per cent. of the space money is to be returned to all exhibitors.

A report to the Executive Committee of the Olympia Electrical Exhibition by the Organising Managers has been issued, and deals with the various criticisms and suggestions which were made during the Exhibition by exhibitors and in the Press. The managers point out that they spared no endeavours to obtain more exhibits of machinery in conjunction with electrical apparatus, more exhibits of popular interest, or collective exhibits, but did not meet with much support. They also complain that the exhibitors themselves did not support the management in the matter of advertising. In conclusion, the management advise that for future electrical exhibitions the policy of the recent Exhibition might be modified in the following terms:—

That the half-crown days be abolished. That exhibitors be supplied with tickets in unlimited quantities, with the liability that all such tickets as reach the management through the turnstiles of the Exhibition shall be paid for at the rate of sixpence each. This probably, however, would tend to a reduction of revenue on ticket account. That the duration of the Exhibition be restricted to three, or conceivably two, weeks only. This is specially recommended in view of the small amount of heavy machinery that is exhibited. That before another Electrical Exhibition is decided upon, definite arrangements should be made with the Supply Authorities to ascertain exactly the amount of support by way of purchase of tickets they are willing to accord, it being recommended that for a large Exhibition such as that recently held this purchase of tickets should be not less than one hundred and fifty to two hundred thousand. It is further recommended that the arrangements with the Supply Authorities should be for the sale to them of tickets outright at threepence each. Were arrangements made with the Supply Authorities that they would be liable to pay for all tickets used at the rate of sixpence each, it is most probable that such a method would considerably curtail a large distribution of tickets.

Electrical Contractors' Association.—The inaugural dinner of the East Yorkshire and District Branch of the Electrical Contractors' Association was held on Friday at Hull. The chairman of the branch, Mr. W. L. Harrison, presided, and among those present were representatives of the Hull Corporation and the officials of the Electric Supply Department. Mr. E. M. Parsons, the Local Secretary, in proposing the toast of "The Mayor and Corporation," congratulated the section upon the manner in which they were working together amicably with the Corporation. They ought, he said, to congratulate themselves that they were not governed by a Corporation like that at Sheffield. Mr. H. Hyde, who proposed the toast of "The City and Trade of Hull," urged the Electricity Committee to reduce the charges for power in order to encourage the day load, and incidentally give contractors a little more encouragement in pushing the use of electricity for cooking and heating.

THE MECHANICAL DESIGN OF D.C. TURBO-GENERATORS

A PAPER on this subject by Mr. R. J. Roberts was read at a meeting of the Manchester Local Section of the Institution of Electrical Engineers on Tuesday of last week. The most common defects of such machinery not arising from electrical causes was found in the collector gear due to unsuitable brush gear, want of balance generally, or unstable construction of the commutator. Another common defect was in the possibility of accumulation of dirt bridging the creeping surface where conductors were exposed, and a further source of trouble was in the armature bands. The stators gave less trouble than in the case of A.C. machines, as the forces acting on the conductors on short circuit were not so great. The stator construction most favoured in this country was a solid cast magnet system, with laminated pole-shoes, which carry the compensating windings in slots. The general design is largely settled by the scheme of ventilation used. The ventilating scheme usually met with entails the entrance of air at the back end (away from commutator) by means of fans affixed to the rotor at that end. Part of the stream of air goes direct to the stator and thence out through the top outlet; whilst the greater part goes through into the rotor by axial ducts in core along the shaft. Part of this stream goes out through the radial ducts in rotor and stator and thence out; whilst another is drawn through the rotor core right to the commutator, whence it is driven by some fan up to the stator end windings and so out through the top outlet. The author was, however, in favour of employing axial ducts only. Dust screens are usually fitted to the air ducts and the quantity of air used is from 80 to 100 cu. ft. per minute per kw. loss.

After some remarks on shafts and balancing, including a word of warning against allowing excessive vibration during the balancing process, the author passed on to the rotor core. This, he said, is always of stampings, and in complete circles. Neglecting tooth stresses, the stresses occurring in these discs are similar to those occurring in disc flywheels, and are capable of similar treatment. The maximum stress is always at the centre next to the shaft, and if this stress is appreciable there will be a tendency for the whole core to be loose at full speed. The core should therefore be so fixed to the shaft that it cannot become loose. Shrinking the plates on to the shaft may increase the core losses, and the stampings cannot satisfactorily be pressed on. However, this may be overcome by suitably designing the shaft and core so that the diametrical strains of shaft and core are equal. In speaking of the wedges for holding the conductors in the semi-closed slots that are now universal, the suggestion was made that the disadvantages of wood and metal wedges might be avoided in a combination of metal and insulating fibre after the manner of reinforced concrete. Some notes were given on insulation of end connections and the necessity for equalising rings. Sometimes they are built in as part of the commutator, and sometimes arranged under the commutator end winding with connections taken to the commutator risers. The best position, to the author's mind, is at the back end under the band. The equalisers are made of complete rings of copper with projecting tags that are sweated on to the armature conductors. The whole is first firmly packed up with insulating strips of presspahn or fibre and then banded, which holds everything absolutely rigid and well covered up.

The rotor end-plates and winding supports should be of some non-magnetic material, to reduce eddy currents set up by the field around the armature conductors. The author expressed a preference for wire bands to solid metal rings for taking the centrifugal forces of the end armature winding.

High-speed commutators are usually of the shrink-ring type, and their construction calls for great care in workmanship. The segments, after proper preparation, are assembled in jigs in the usual manner, whilst care is taken that the segments lie parallel to the axis of the cylinder. The insulating segments contain as a rule a quantity of superfluous varnish, and this is got rid of by successive bakings and tightening of clamps. The whole, whilst still in clamps, is next turned for the insulating bands under the rings, and banded with temporary bands of steel wire upon that portion of face where the shrink rings do not come. These bands must not be thick enough to prevent the shrink-rings passing freely over them. The insulating bands are next built up in place, banded with fine steel wire, and the clamps removed. The shrink rings are then shrunk on and the whole cylinder is machined where needed and mounted upon the rotor. For insulating commutator segments, there has recently been put upon the market a form of micanite that has no varnish in its composition, and although dearer, is much to be preferred to the ordinary quality. This micanite is stoved at a red heat during its process of manufacture. The micanite insulating bands under the shrink rings should preferably be built of strips of segments of pure mica of 20 or 30 mils thickness.

The Paper then passed on to an investigation of the mechanical theory of commutator construction, and it was pointed out that with some designs of commutators it is not possible to have sufficient shrinkage allowance on the rings. This difficulty may be overcome by using a hydraulic press to make the rings smaller while still hot and in place on the commutator. Although these presses are reported to be in use on the Continent the author has not heard of them being used in England.

Some notes were then given on commutator risers, commutator cooling, and brush gear, and the curves reproduced here were suggested for current density and brush pressure.

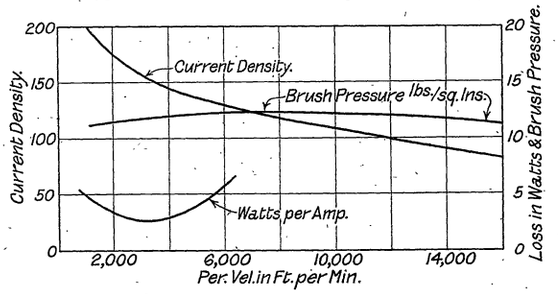

FIG. 1.—CURVES OF BRUSH DENSITY, &C.

The Paper concluded as follows :—To look forward to probable improvements of construction we see that one of the ultimate aims is the decrease in span between bearings. This may lead to a reversion to the Eickemeyer or butterfly winding for armature, with the equalisers possibly combined in the end connections. The core may be mounted and the slot wedges constructed as suggested above, or some new material of construction may be found. The radial type of commutator is possibly the ultimate general design, but it will be some years before this type is generally adopted, and in the meantime we may effect great improvements by the use of higher brush pressures and higher current densities and peripheral speeds. A suggestion for mounting of commutator is shown in Fig. 2. The brush-holders are yet very

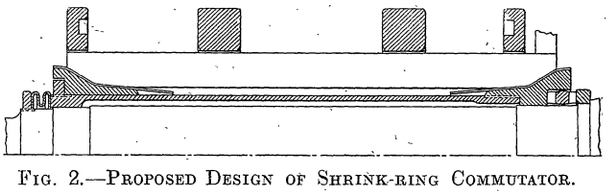

FIG. 2.—PROPOSED DESIGN OF SHRINK-RING COMMUTATOR.

far from perfect, and possibly the present almost universal box-type holder will disappear for some form of the old lever-type holder. The present ventilating schemes need much improvement, and an air-cooling system with a separately driven circulating fan is a probable solution. The author is far from taking a pessimistic view of the future of direct-current turbo-generators, and he believes that it is possible to make them as reliable as any other electrical machine. He is of opinion that their mediocre performance in the past has been caused by an inadequate comprehension of the mechanical problems.

DISCUSSION.

Mr. R. LIVINGSTONE (Dick, Kerr & Co.) mentioned troubles occasioned by bad design of oil-throwers, and pointed out that more efficient speeds could be used with independent than with rotor fans. He also raised some points connected with shaft and rotor core design, and did not see that it was possible to so design them that the diametrical stresses were equal. He suggested the use of laminated brass wedges in the slots, and expressed a preference for solid-end bells to binding wire.

Mr. J. K. CATTERSON SMITH (Liverpool University) took up the question of shaft design at some length, and said that the curves of brush densities given were misleading, as they were based on results for brushes on a steel ring and not on a commutator, and gave current densities too high for commutation

Hosted by Google

conditions, where the figure should not exceed 45 amperes per sq. in. He also gave some estimates of the size of apparatus for artificially cooling the air used for ventilating turbo-generators. He preferred thin steel bands to binding over the mica for the reception of the shrink rings.

Mr. A. R. EVEREST (British Thomson-Houston Co.) pointed out that the filtering of intake air was as important in D.C. as in A.C. machines. He thought that the author had exaggerated the looseness which could occur in a rotor due to expansion of the plates from centrifugal force.

Mr. W. HOULT (Siemens Brothers Dynamo Works) emphasised the importance of keeping the commutator cool, and thought that an entirely separate supply of air for this purpose was desirable. Filtering the air was most important, and he suggested the cooling of the air by a fine water spray, which would at the same time remove the dust. He agreed with a previous speaker in preferring solid end-covers to banding.

Mr. G. W. WORRALL (Liverpool University) said that the mechanical problems of commutation depended largely on the friction tending to tilt the brush on to its rear tip. There was also a temperature effect. The rear tip was cooled by the air drawn round by the commutator more than the front tip, and the expansion of the contact surface caused it to lift and to set the brush vibrating. He also referred to trouble with mica segments rising.

Mr. F. H. WHYSALL (Manchester Corporation Electricity Department) advocated reduction of the mica to slightly below the commutator surface, and referred to the very satisfactory running of the D.C. turbo-generators at Dickinson Street.

Mr. F. H. CLOUGH (British Thomson-Houston Co.) was not quite clear whether the author desired to design shafts so that the critical speed was not passed through, and commented on the theory of commutator stresses put forward. He advocated preventing the mica from becoming displaced by making it slightly wedge-shaped or by roughening the bars by grooves, the first of which could be so situated that it formed an indication when the commutator had been turned down to a safe limit.

Mr. R. HARRISON discussed methods of calculating stresses in a revolving disc, and criticised Mr. Roberts' arrangement of equalising rings as lengthening the distance between bearings unnecessarily. He also thought the author's enclosed soldered joints would get hot. The equalisers must be fitted before any tests were carried out. The stresses in a commutator were a little uncertain, because the rings have to be shrunk on to mica, and it was impossible to judge the amount of mica so that it would compress exactly to the calculated figure.

The author replied briefly, reserving his full reply for the Journal.

OSRAM AND EDISWAN LAMPS

OUR readers will be interested in an announcement in our advertisement columns that the Edison & Swan United Electric Light Co. Ltd., have recognised the validity of Patent No. 23,899/1904, and others owned by the Osram Lamp Works, Ltd., and are now manufacturing under licence. The above patent has frequently been referred to in our columns; it is one of those which figured in the action against G. M. Boddy & Co., who were then agents for the Philips lamps.

The patent, which is in the names of Dr. A. Just and F. Hanaman, of Vienna, describes a process of manufacturing filaments of pure tungsten by mixing finely divided tungsten or tungsten compounds such as tungstite, tungstic acid, or tungstic sulphide with an organic binding medium such as collodion, or a solution of cellulose in chloride of zinc or cupreous ammonia oxide. The filaments squirted from the resulting paste are then carbonised (in some cases after denitration), and the carbon is then removed by passing current through the filament and raising it to a high temperature in an atmosphere of steam and hydrogen. The carbon is oxidised to form carbonic oxide, and a filament of pure tungsten is left. The filaments are then rendered uniform by submitting them to the action of current in an atmosphere of volatile tungsten compounds in the presence of a large quantity of hydrogen, whereby the tungsten deposited equalises the filaments.

The patent was published in full in ELECTRICAL ENGINEERING of Sept 9th, 1909, after the grant of an amendment by the Comptroller.

The agreement between the Osram Lamp Works, Ltd., and the Edison & Swan Co. was signed on Monday. We understand that besides dealing with the question of licence, it covers certain arrangements which will ensure that the latter company comes into line with the General Electric Co., and the other lamp firms who are in agreement, on the question of price.

DINNER OF THE BIRMINGHAM SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

The Council's Attitude on the Opposition to the New Articles

Mr. Patchell on the Coal Mines Bill

THE Council's proposed alterations in the Articles of Association were referred to at the annual dinner of the Birmingham Section of the Institution of Electrical Engineers on Friday, and an important announcement was made by Mr. Ferranti

The CHAIRMAN of the SECTION (Mr. Max Railing), who is chairman for the second year in succession, in proposing the toast of the Institution, said that he was convinced that the Council would welcome any practical method by which they might keep continuously in closer touch with the feelings of the members of the Local Sections. It had just been arranged that a meeting of the Birmingham Section should be held on Wednesday, November 22nd, for the purpose of discussing the proposed new Articles of Association, and that Mr. Ferranti and Mr. Hammond would be present at it. Mr. Railing urged the members to consider the welfare and aims of the Institution as a whole, and not to consider the question merely as it would affect their district or their own pockets.

Mr. S. Z. DE FERRANTI, in his reply, lost little time in coming to the subject upon which he had been expected to speak. He admitted that in giving only a week's notice of their proposals the Council had done something foolish, but said that what it had done was not so silly as it looked, as it was the first time the members of the Institution had taken a real interest in anything. It was the endeavour of the Council to make the Institution more valuable than it had ever been in the past. The Institution should be so organised that it could make representations to Parliament which could not be neglected, and that it should be a means by which the industry could come in contact with the Government. He wished to have a means of getting into the Institution business men who, although not qualified to be electrical engineers, are yet very much connected with the industry, and would be of use to strengthen the position of the members—for instance, it would be desirable to have a representative in the House of Commons. A switchboard attendant could at present be an Associate, and it would be hard to ask his manager to be in the same class. The Council gladly accepted the awakening of a "contentious interest" in the affairs of the Institution which had been brought about by their mistake, and they desired to take full advantage of it.

Mr. W. H. PATCHELL, in the course of his speech proposing "The Birmingham Local Section," referred to the Coal Mines Bill. As it stands at present, he said, the use of electricity is actually prohibited in positions where naked lights are permitted. The number of fatal accidents due to electricity was only 1½ per cent. of the total number of accidents in the year. If electricity were turned out of the mines so that there was more of the manual work which was responsible for 98½ per cent. of the accidents, the number of fatalities would, of course, increase and not decrease. He hoped that the Local Sections would create a more active interest in electrical engineering matters, and would send up electrical engineers to Parliament.

Mr. A. M. TAYLOR responded.

Mr. R. A. CHATTOCK proposed the toast of "Electrical Industries and Our Guests." As an instance of the growth of the industry, he mentioned that the annual output of the Birmingham Corporation generating station had risen from five million units to thirty-three millions since the year 1904. He next referred to the fine display of cooking apparatus at the recent Electrical Exhibition at Olympia, and said that supply authorities must be prepared to follow the example of the gas companies, and must hire out this class of apparatus to consumers. Lastly, he said that, as a purchaser of plant, he welcomed the reorganisation of the Manufacturers' Association and the campaign it would commence against cut-throat competition. Such competition must result in dangerous economies in manufacture, which would increase the probability of breakdown and threaten continuity of electric supply. He hoped, however, that the formation of so many associations within the industry did not mean the formation of mutually antagonistic groups.

Mr. ROBERT HAMMOND and Mr. J. E. KINGSBURY briefly responded.

Mr. MAURICE SOLOMON, in proposing the health of the Chairman, quoted a passage from Mr. Railing's speech a year ago, in which he had emphasised the fact that the electrical industry was not prosperous. He was glad to see that things had changed so much for the better during the year that the Council had come to the conclusion that Members of the Institution could afford an increase of 33 per cent. in their subscriptions.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 9, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

24,272/10. **Vibrating Armatures.** W. D. KILROY, J. C. NEEDHAM, and EVERSHED & VIGNOLES, LTD. An armature for attaching to a diaphragm for use with magnets is made, in one form, by riveting together, between iron cheeks, a number of soft iron laminations insulated with thin sheets of mica, which is set in a recess in a thickened portion of a diaphragm by brazing, welding, or hard soldering. It is found, by this method, that the mica is not damaged by the heat used, so that the laminæ maintain the insulation at their faces. The laminations can be formed with key projections to fit a slot in a standard, which is rigidly secured to the vibrating body. Four figures.

27,401/10. **Metal Filament Supports.** S. HORVATH. The filament lengths are passed through closed links, which are freely suspended on the usual supporting arms. The link can be made of carbon, tungsten, &c., in which case the arms are connected in the usual way to the central glass stem. If, however, as can be done by this method, the arms are taken through a hollow glass stem bunched together, then the link must be made of mica or other insulating material. Two figures.

5,165/11. **Insulating Material.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). This comprises a sheet of fibrous material, which is impregnated with a composition containing a phenolic aldehyde condensation product, and a stearin pitch. These are dissolved in a common solvent, such as amylacetate, the solvent being allowed to evaporate after impregnation. This gives a flexible material, which maintains its resistivity.

14,127/11. **Arc Lamps.** SIEMENS BROTHERS DYNAMO WORKS, LIMITED. With non-combustible electrodes to prevent the arc climbing up the carbons, the upper electrode is formed with a rim overhanging its projecting tip, so that when the lamp is in operation, this rim deflects the ascending gases sideways, forming eddies, which keep the arc steady. Two figures.

14,222/11. **Electrically-heated Vessel.** H. MIETH. This comprises an inner and outer casing between which a continuous heating coil is double wound on the surface of the inner casing, from which it is insulated. It commences at the centre of the base, and is coiled up the sides to two terminals near the top. The turns are insulated from one another, and the space between them and the outer casing is packed with a heat non-conducting material. Three figures.

Amendments

12,790/09. **Radio-telegraphy.** A. W. SHARMAN. As a result of the extended investigation under Section 8, the above-mentioned specification has been amended by way of disclaimer. It describes a method of producing a periodic variation in the amplitude of high-frequency alternating currents suitable for musical signalling, in which an oscillating circuit, tuned to a frequency within the limits of audible sound, is coupled to a circuit feeding a second high-frequency oscillating circuit connected to an aerial.

Restoration of Patents

4,557/03. **Arc Lamps.** F. M. LEWIS. An application has been made for the restoration of this patent, which expired last February owing to the non-payment of the renewal fee. It relates to improvements in connection with electric arc lamps.

7,320/07. **Arc Furnaces.** SALTPETERSÄURE INDUSTRIE-GESELLSCHAFT G.M.B.H. As desired by the patentee, this patent has been restored. It deals with the electrical treatment of gases. A number of high-tension spark gaps are arranged in series, and a resistance is placed between the electrodes of each of them except one. When a discharge is started across the latter gap, a high tension will be set up across the gaps on either side of it in succession, the velocity of these discharges being very high.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Distributing Systems, Cables and Wires: BRITISH THOMSON-HOUSTON Co. and WHITCHER [Distribution protective devices] 17,177/10 and 21,662/11; DOEL and CLARKE [Cable connector] 26,124/10; KAESEN [Wire terminal clips] 18,375/11.

Dynamos and Motors: SOC. ANON. "PHI." [Regulation of dynamos] 25,026/10.

Electric Ignition: BLOXAM (*Robert Bosch*) [Carbon holder for distributors of ignition machines] 8,224/11; ROYCE and ROLLS-ROYCE, LTD. [H.-T. distributors for] 17,204/11; ROBERT BOSCH [Short-circuiting device] 19,233/11.

Electrometallurgy: LAKE (*Florence*) [Furnaces] 8,998/11.

Incandescent Lamps: RITZMANN, WOLFKE, and LISSY [Electric vapour lamps] 27,163/10; SCHALLER, 9,719/11.

Instruments: CAMBRIDGE SCIENTIFIC INSTRUMENT Co. and PEAKE [Determination of low voltages] 24,457/10; SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Ammeters of dynamometer type] 13,801/11.

Switchgear and Fittings: ELECTROMOTOR EQUIPMENT Co. and MEACOCK [Variable-speed reversing mechanism control] 21,807/10; WILLIAMS and STEVENSON [Switch contact devices for lowering gears] 24,294/10; BAILEY [Regulating switches] 24,858/10; SPAGNOLETTI, LTD., and JOYCE [Switches] 25,076/10; STEPHENSON [Switches] 463/11; BOOTH and BOOTH [Lamp reflector] 9,806/11; LUNDBERG, LUNDBERG and LUNDBERG [Electrical terminals] 16,514/11.

Telephony, Telegraphy and Signalling: BOWMAN [Party line telephone system] 26,440/10; BOLDT [Railway signalling devices] 5,559/11; SCHIESSLER [Electric capacitative inductive couplings] 13,968/11.

Miscellaneous: PARSONS and BALL [Electric striking and chiming mechanism] 24,533/10; ROSS [Miners' safety lamps] 24,735/10; WESTINGHOUSE BRAKE Co. (*Westinghouse Air Brake Co.*) [Electrically-actuated compressors, regulating devices] 24,912/10; COCHRANE [Fastener for train-lighting accumulator lids] 26,696/10; WATMOUGH [Electric signs] 27,981/10; SIEGEL [Counter-current economisers] 28,403/10; WORSNOP [Motor lamps, connections, and focussing device] 28,457/10; FITZ [Electric lighting system] 2,727/11; JONES and DAVIES [Miners' lamps] 4,722/11; HECHT and DOWDELL [Electric signs] 4,821/11; KEITH and TUSON [Centrifugal fans] 8,776/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Signalling: HERMSDORF, 22,123/11.

Miscellaneous: SOC. ANON. FRANÇAISE DITE BANQUE DU RADIUM [Sterilising apparatus] 15,010/11.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

27,380 of Nov. 22nd, 1897. **Cut-outs.** G. M. SELLICK. This invention relates to a fusible cut-out, in which the metal pin for securing the cover is replaced by one of porcelain, which engages with a threaded opening in the bridge piece. This prevents liability to leakage or arcing after fusion, as there is no conducting material between the terminals.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: G. FORBES [Search-lights, signal lamps] 16,719/07; H. E. ANGOLD and MAXIM ELECTRICAL Co., 16,956/07; E. R. GROTE and M. V. ELY [Feeding mutually-inclined carbons] 17,059/07.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: SIEMENS BROS. & Co. and W. DIESELHORST [Conductors, preserving] 16,711/02; E. WEINTRAUB [Distribution] 16,257/04; A. G. BROOKES (*Asbestos Wood Co., U.S.A.*) [Waterproof insulating material] 16,865/07.

Dynamos and Motors: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Motors, controlling] 16,664/04.

Electric Ignition: ELECTRIC IGNITION Co. and F. H. HALL [Contact-breakers] 16,911/07, and [Electric ignition] 16,912/07.

Electrochemistry: H. C. HARRISON [Electro-deposition of copper] 16,735/07.

Incandescent Lamps: C. O. BASTIAN and G. CALVERI [Coating the leading-in wires with glass] 16,736/07.

Switchgear and Fittings: H. HIRST and F. BOYES [Conductor conduits] 15,155/01; F. R. BUTT and H. W. C. COX [Induction coil contact breaker] 16,426/04; BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Switches] 16,602/06; A. HARE [Switches] 16,862/07.

Telephony, Telegraphy and Signalling: A. J. BOULT (*A. Neelemans*) [Railway signals] 14,952/01; W. H. WHEATLEY (*Lorenz*) [Telephone systems] 16,627/06; W. E. LAKE (*Brown Automatic Indicator Co., U.S.A.*) [Electric telegraphs] 16,959/07; J. C. BARCLAY [Telephone insulators] 27,177/07.

Traction: R. BRAUN [Electromagnetic brakes] 16,793/06.

Miscellaneous: P. M. LINCOLN [Apparatus for indicating A.-C. phase difference] 14,969/01; H. S. HATFIELD [Electrolytic rectifiers] 17,193/07; N. B. LE FEVRE [Electric massage appliance] 17,254/07.

THE LOT'S ROAD TURBINES

THE appeal by the British Westinghouse Co. against the arbitrator's award concerning the substitution of Parsons for Westinghouse turbines at the Lot's Road power-house was continued in the Appeal Court on Wednesday and Thursday last week, judgment being reserved. The previous proceedings were reported on page 610 of our last issue.

Mr. J. D. FitzGerald, K.C., for the Underground Electric Railways Co. of London, first argued that the arbitrator's award was not appealable—a contention with which the Court agreed—unless there were special circumstances. Sir Alfred Cripps, for the Westinghouse Co., admitted that an arbitrator's award could not be appealed against unless stated in the form of a special case. In this instance the arbitrator had given the decision of the High Court as to the principle upon which he should base his award as part of his award. This, in his opinion, brought it within the category of a special case. There being so much to be said on both sides, the Court decided to reserve their decision on the point, and Mr. Fitzgerald proceeded to deal with the main part of the case. He said that the breach of contract on the part of the Westinghouse Co., by reason of their machines not giving the guaranteed figures of steam consumption, had compelled the Underground Co. to purchase the Parsons machines. The purchase of these machines brought to an end a large bill of damages against the Westinghouse Co., and any advantage which the Underground Co. might have obtained could not be argued against them in mitigation of damages, especially as the Parsons machines in question were the only ones which the Underground Co. could have purchased which gave results anywhere near those originally guaranteed by the Westinghouse Co.

On behalf of the Westinghouse Co. it was urged that the Underground Co. did not purchase the Parsons machines solely to reduce the damages against the Westinghouse Co.; indeed, it was not inconceivable that, as a matter of business prudence, they would have installed them even had the Westinghouse turbines been up to contract.

"OSRAM LAMP WEEK"

THE "Osram Lamp Week," organised by the General Electric Co., Ltd., which commenced last Saturday, has been wonderfully successful. The company commenced its campaign on Saturday with a full-page advertisement of the reduced prices of Osram lamps on the front page of the *Daily Mail*, and followed this with similar advertisements in the *Daily Telegraph* and the leading provincial newspapers. They invited electrical contractors in every town to send orders for 150 Osram lamps of assorted sizes, in return for which the company undertook to insert the contractors' names in the *Daily Mail* and in one of the other advertisements as local agents, and to supply them with free advertising matter for the decoration of their windows. About 650 firms responded to this offer. The advertisements were well designed and displayed, and the result has been eminently satisfactory both to the General Electric Co. and to the contractors who are agents for their Osram lamps. We congratulate Mr. H. Clifford Palmer, the manager of the company's Publicity Department, on having arranged the most boldly-schemed and successful electric lamp advertising scheme of the year.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

DISTRIBUTING BOARDS.—A list from V. G. Middleton (Broadway Chambers, Westminster) contains particulars of the "Kartret" patent distributing switch- and fuse-boards, which are fitted with a special laminated edgewise switch and a porcelain enclosed fuse of novel design.

RADIATORS.—Some new designs of luminous radiators are illustrated in a leaflet from the Armorduct Manufacturing Co., Ltd. (Farringdon Avenue, E.C.).

FITTINGS AND SIGNS.—A handsome four-lamp ceiling fitting with cut-glass bowl, and a metal shop-window sign, are illustrated on a card from Simplex Conduits, Ltd. (Garrison House, Birmingham).

METRIC TABLES.—The Central Translations Institute (16 Eastcheap, E.C.) send us a card containing 50 metric equivalent tables arranged in convenient form.

ELECTRIC CLOCKS.—A booklet from Gent & Co., Ltd. (Faraday Works, Leicester), contains particulars of their "waiting train" movement as applied to electric clocks, with illustrations of a number of large public and other clocks erected by them.

SWITCHES, FUSES, AND DISTRIBUTION BOARDS.—Many of the "M.E.M." switches, fuses, distribution boards, &c., described and illustrated in a neat list, just received, seem to be particularly applicable to cases in which ironclad apparatus of inexpensive patterns are required. For instance, "Dot" single-pole ironclad knife switches rated at 15 amperes are listed at only 4s. 6d. (subject), and the corresponding open pattern at only 1s. 6d. Motor-control panels and house-service panels are also included in the list, and we notice a compact combined switch and cartridge fuse designed for the Bradford Corporation.

SWITCHES, INSTALLATIONS, MATERIAL, &c.—J. H. Tucker & Co. (King's Road, Hay Mills, Birmingham) include in the comprehensive catalogue of electric lighting and power accessories manufactured by them an extensive range of tumbler and other switches, bell pushes, plugs, sockets, adaptors, &c., and a number of patterns of distribution boards, fuses, and fuse boxes, lamp holders, &c., as well as many larger forms of switches, complete switchboards, &c.

ARC LAMPS.—A leaflet from G. Braulik (8 Lambeth Hill, Queen Victoria Street, E.C.) describes the Eclipse flame arc lamp, which is now sold under license under the Bremer-Westinghouse patents, as well as various accessories.

ARC LAMPS.—The Electrical Co., Ltd. (122–4 Charing Cross Road, W.C.), has issued a new list of "Sunshine" flame arc lamps and accessories, a coloured illustration of which is given.

FITTINGS.—Simplex Conduits, Ltd., send a 144-page pamphlet containing a numerous selection of well-illustrated electric light fittings. A large quantity of designs is shown, but we understand that any other special design will be submitted on application. A range of fittings for Holophane glassware, and some useful data in connection with the spacing of various reflectors, their proper application, and distribution of light are also included in their Holophane catalogue.

HEATING AND COOKING APPARATUS.—Two small booklets have also been issued by this firm. One relates to radiators and convectors, including the patent Murray type with the moving parabolic reflector for locating the heat, and the other gives some details of electric ovens, cookers, grills, toasters, kettles, hot plates, irons, &c.

FUSES.—A gaily-coloured pamphlet from Parmiter, Hope & Sugden describes by the aid of effective illustrations their "Honeycomb" fuse, of which details were given in ELECTRICAL ENGINEERING, October 26th, page 581, and includes prices of complete distribution boards fitted with this type of fuse.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

COOKING APPARATUS.—A card from the British Prometheus Co., Ltd. (Salop Street Works, Highgate, Birmingham), gives particulars of a new table cooker, comprising oven grill, omelet pan, simmering plate, and boiling plate, which they are putting on the market at a moderate price.

ELECTRICAL SUPPLIES.—A collection of leaflets from the Reason Manufacturing Co., Ltd. (Brighton), gives particulars of a new form of hand-lamp, electric clocks, outside lanterns for metal filament lamps, electrolytic meters, ironclad switches, and a combined service outfit, with sealing chamber, main fuses, and electrolytic meter all in one compact case.

AUTOMATIC STOKERS.—A very comprehensive catalogue is to hand from the Underfeed Stoker Co. (Coventry House, South Place, Finsbury), setting forth the principles upon which this firm's well-known system of stoking is founded, and giving illustrations of their underfeed stokers applied to various different types of boiler. The company were awarded a Grand Prix and two gold medals for their exhibits of underfeed stokers, air heaters, and CO_2 thermoscopes at the Turin Exhibition.

INSTRUMENTS.—A leaflet from the Allgemeine Elektricitäts-Gesellschaft describes a simple form of electrostatic potential indicator for high voltages.

TRAMWAY MATERIAL.—The same firm also send pamphlets dealing with interfall tramway motors, trolley-wire ears, and self-propelled tower wagons.

ALUMINIUM.—A leaflet from the British Aluminium Co. (109 Queen Victoria Street, London, E.C.) calls attention to the extensive use of aluminium for car-building and electric traction in general, including aluminium field coils, of which over 8,000 are in service.

TELEGRAPH APPARATUS.—British Insulated and Helsby Cables, Ltd. (Prescot, Lancashire), have issued a pamphlet describing the B.I. Pole-changer, which is capable of transmitting perfect Wheatstone signals at a speed of over 400 words per minute. These are stocked in five different patterns, and are polarised according to Vyle's patents, when they are worked direct in the line circuit. One of these is used as a sounder in connection with their new system of closed circuit working, which is also described.

WIRES AND CABLES.—Details of vulcanised wires and cables of 600 and 2,500 megohm grade, bell and fuse wire, flexible cords and jointing accessories are contained in a catalogue from the Metallic Seamless Tube Co., Ltd. (Wiggin Street, Birmingham).

TESTING SETS.—A new catalogue has been issued by Evershed & Vignoles, Ltd. (Acton Lane Works, Chiswick, London, W.), fully describing the well-known "Megger," with various diagrams of connections for measuring insulation and conductor resistances. In a separate booklet a full description is also given of the Potential Ohmmeter, known as the Ducter, the firm's latest manufacture, a full account of which appeared in ELECTRICAL ENGINEERING, March 23rd, 1911, p. 149. It is designed for measuring low resistances by direct reading, and has a range from 10 microhms to 5 ohms. We are asked to state that all previous catalogues are cancelled, and that a copy of

Hosted by Google

the new issues will be gladly sent on application to those interested.

TELEPHONES.—We have received from Messrs. Siemens Bros. & Co., Ltd. (Caxton House, Westminster), a copy of their new catalogue of Telephone Apparatus, which supersedes previous telephone publications. This comprises some seventy pages, and deals with all classes of apparatus, including competitive battery telephones, intercommunication sets, magneto telephones, C.B. instruments, portable, loud-speaking, high-tension, and water-tight instruments; switchboards, arresters, condensers, &c., and concludes with a comprehensive telegraphic code and index. Special attention may be drawn to the intercommunication sets with metallic circuits, the metal-cased C.B. instruments, the theatre pattern loud-speaking telephones, mining telephones, and other specialities which are too numerous to note.

STANNOS WIRING.—A leaflet forming an addition to Siemens Bros. & Co.'s Stannos catalogue describes a twist or bond for concentric work and thin "biscuit" imitation wood blocks.

ALUMINIUM.—A pamphlet from the British Aluminium Co., 109 Queen Victoria Street, describes the uses of aluminium in motor-car and railway-carriage building.

ELECTRIC TRACTION NOTES

The Board of Trade report of Colonel von Donop on the tramway accident at Lewisham on September 2nd, when a double-decked L.C.C. car, weighing nearly 10 tons, became derailed on a curve at the junction of Shardeloes Road and Lewisham High Road, and, crossing the road, subsequently fell on its side, causing the death of one passenger and injuries to about thirty-five, has now been published. After giving particulars of the car and circumstances, and summing up the evidence, the inspector finds no fault with the condition of the car or the track, nor is he prepared to attribute the accident to the grooves of the rails being full of hard sand, as had been suggested. He also points out that at the speed at which the car was travelling centrifugal force alone would not account for the overturning, and attributes the accident to the sudden and forcible application of the magnetic- and hand-brake, which brought the car to a momentary stop, and locked the wheels, whilst the sudden movement of the live load to the outside of the curve under the action of centrifugal force caused the car to tilt over towards the right, so that its near side wheels were lifted off their rail; the car then skidded quickly forward for a short distance along the outer rail, and then the off side wheels also ran off the line to the outside of the curve. The car then slid across the wood pavement on its two off side wheels, gradually heeling over more and more to the right, due to the continued shifting of the live load in that direction. The forward movement of the car continued until it reached the tram rail in Lewisham High Road; at this point the car fell completely over, its final overturning being possibly accelerated owing to its forward movement being suddenly checked by the tram rail. The sudden stoppage of the car which led to this accident, he continues, was undoubtedly due to the sudden application of the brakes to their full extent, and this sudden application of brake power was in turn due to the fact that effective steps had not been previously taken to sufficiently check the speed of the car. Finally, he recommends that the position of the stop-post be altered so that it may be immediately opposite the commencement of the curve, and that steps be taken to ensure that the practice of drivers not bringing their cars to a stop before passing it be strictly prohibited.

There was a net profit of £8,485 on the working of the Norwich Tramways Co., for the year to June 30th, compared with £5,909 in the previous twelve months. The sum of £2,500 is added to reserve, and a 2 per cent. dividend declared upon the ordinary shares, carrying forward £1,013. The revenue per car mile was 8·23d., and the expenses 5·65d.

There was a net profit of £2,622 on the past year's working of the new St. Helen's and District Electric Tramways Co. After allowing a dividend of 2½ per cent. on the preference shares, a balance of £624 is carried forward.

There is a deficiency of £3,825 on the East Ham Corporation Tramways for the year's working to March 31st. The main reason for this deficit is the large expense which has had to be incurred during the year upon track renewals, and which has been met out of revenue.

There was a net balance on the working of the Preston Municipal Electric Tramways last year of £4,369, after meeting capital charges against £3,994 in the previous year. The number of passengers carried, however, decreased from 8,484,589 to 8,412,567.

The Hastings Corporation have decided to undertake certain repairs to the tramway track, and charge them to the Tramway Co., if the latter does not undertake the work itself within seven days.

The proposal of the L.C.C. to construct a tramway along the Euston Road to connect up with the lines at King's Cross does not meet with the approval of the St. Pancras Borough Council. The Works Committee of that body recommend that the proposal be refused until some decision can be come to with regard to the widening of Euston Road. The Council have adopted this recommendation.

The Parliamentary Committee of the Swansea Corporation recommend the promotion of a Bill next session for certain important tramway extensions.

The Highways Committee of the L.C.C. propose the construction of a tramway from Marble Arch to Cricklewood by Edgware Road, Maida Vale, High Road, Kilburn, and Shoot-up Hill. They also propose to introduce in the next Parliamentary session the proposal, rejected last session, for the construction of a loopline at the Finsbury Park terminus.

Notice has been given by Mr. Holland, in the London County Council, of his intention to move a resolution urging the Government to constitute a Traffic Board for London as recommended by the Royal Commission on London Traffic. Mr. Thomas has also given notice of a motion to the effect that the Highways Committee Report as to the advisability of the L.C.C. applying for Parliamentary powers to run omnibuses to link up existing tramway routes.

A tramway collision occurred on the Rawtenstall Corporation tramways on Saturday night, in which two cars were smashed and sixteen passengers injured—fortunately, none seriously. The accident was caused through a car getting out of control whilst descending the long slope into Accrington. According to newspaper accounts, the application of hand and magnetic brakes was futile. About half a mile down the slope another car was standing at a cross-over, and the runaway car, missing the points at the loop, dashed into the standing car, with the result that both cars were thrown off the lines.

Mr. J. B. Hamilton, the Leeds Corporation Tramway Manager, has visited Brighton, and has been over the routes contemplated by the Tramways Committee for the installation of trolley omnibuses. The result of his report to the Committee is that they recommend the Council to promote a Bill. It is understood that the Hove Council will not co-operate, but will oppose the Brighton Corporation running trolley omnibuses in their area.

The Stepney Borough Council is appealing to the other London Borough Councils for support in opposing a proposal by the London County Council to apply to Parliament for general powers to use the overhead trolley system without the consent of the Borough Council, who are the Road Authorities. In the L.C.C. Tramways Act of 1902 is a clause binding the L.C.C. to obtain the consent of the Borough Councils to the system of traction being adopted in any particular district. This has been found to be detrimental to the County Council as the Tramway Authority.

The arbitration to determine the price which the London County Council shall pay for the Hammersmith lines of the London United Tramways, Ltd., has been continued daily since our last issue. Mr. Stephen Sellon, the first witness for the Company, has been under cross-examination by Mr. C. C. Hutchinson, K.C., for the L.C.C. for several days. Mr. Hutchinson's questions indicate that the parties are not agreed upon any of the principles which should be followed in determining the price. The Company's method of arriving at the wear of the rails, and the price taken for the rails when new, are objected to. Similarly with the life of plant. The Company claim sixty years for ducts and twenty years for cables, whereas the County Council will only accept forty and fifteen respectively. On the question of the number of cars to be purchased, the L.C.C. officials, as the result of the examination of the Company's traffic records, say that forty and not fifty should be the number. Further, the Company's intention of handing over all open top-deck type cars was the cause of a long discussion, and it was eventually agreed that one-eighth of the number of cars ultimately determined by the arbitrator shall be covered-deck cars. The Company have put in £514 per car as the price, but the L.C.C. will not agree to more than £323.

In the same way considerable discussion is taking place concerning the Chiswick power house and depôt, the view of the L.C.C. apparently being that as these are only used

Hosted by Google

partially for the Hammersmith lines, they should not be taken over at all. The repair shops are said to be used for the whole of the Company's rolling stock, whilst the generating station supplied lines far in excess of the Hammersmith tramways. The argument of the L.C.C. appears to be that anything "unsuitable" is to be taken over, but against this the Company's case is that everything suitable, whether excessive or not, must be purchased.

Mr. Hutchinson concluded his cross-examination of Mr. Sellon on Tuesday by suggesting that the present value of the plant in the Chiswick station was £54,024 instead of £107,704 estimated by Mr. Sellon. In re-examining Mr. Sellon, Mr. Balfour-Browne emphasised the point that the station and plant was insufficient in capacity for its present work, but was now used and was suitable for the supply of the Hammersmith lines. Mr. J. T. Wood was then examined on a valuation of the permanent way prepared by him, which substantially confirmed that of Mr. Sellon. Mr. Wood was severely cross-examined by Mr. Hutchinson as to the origin of his prices. On Wednesday Mr. Wood was re-examined, and Mr. H. F. Parshall then gave evidence for the Company.

Under "Electric Traction Notes" in our issue of November 2nd we stated, in reference to the arbitration between the Gravesend Corporation and the Gravesend and Northfleet Electric Tramways, Ltd., that "negotiations are proceeding between the parties on the basis of abiding by the existing price, on the understanding that the Tramway Company shall have a reduction on the price paid on the higher number of units taken per annum." We are informed by the Company that this is incorrect, and that up to the present no such negotiations have taken place.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

According to the *Elektrotechnische Zeitschrift*, the Hamburg Observatory has arranged an apparatus in connection with their chief clock, which sends out time signals every minute by means of a special signalling circuit to the main telephone exchange of Hamburg. Means are there provided for switching on to subscribers, who can thus regulate their clocks to standard Continental time. The different minutes of the hour are distinguished by different signals.

It is stated in the *Melbourne Age* that Mr. H. W. Ramsay Sharp, who has, at the request of the Government, been carrying out tests on the Melbourne telephone system, has issued a report which severely condemns the present arrangements. The cross talk on the lines is said to be very bad, and is attributed to carelessness on the part of the operators. He also complains of the laxity on the part of the operators in dealing with calls, and has found in some cases that, although both subscribers had rung off, their lines were still left connected.

According to the *Madras Standard*, the extension of wireless telegraphy in India is now to be carried out systematically. A route from Calcutta to Jutogh, Simla, by way of Allahabad and Delhi was chosen in the first instance, and the installations are nearing completion. The next station to the north will be at Lahore, and this will be put in touch with Karachi. Later on Peshawar will doubtless be included in the system. In the west an installation is to be given to Bombay and another to Nagpur. Necessary funds will be provided next year.

In the Chancery Division on Friday, Mr. Justice Swinfen-Eady granted an injunction, upon the application of the National Telephone Co., restraining the Hythe Corporation from revoking the license now held by the company for maintaining telephone poles along the bank of the Royal Military Canal, and also from removing or interfering with the company's poles or cables. The wayleaves to erect these poles, it was pointed out, were granted in 1889, and now the Corporation had ordered their removal by December 27th. The point was made on behalf of the company that, by this action of the Corporation, the company would be deprived of the value of the line, which, in the ordinary course, will have to be purchased by the Postmaster-General next year. Mr. Justice Swinfen-Eady, in giving judgment, said he could not understand what was behind this dispute between the company and the Corporation, and granted an injunction, as stated above, and at the same time made an order preventing the company from removing the poles, an order which disposes of an application by a subscriber for an injunction preventing the company from disconnecting his telephone instrument.

The Hanekin route is interrupted on Ottoman territory, and lines were also down between Alep and Bagdad and between Diarbekir and Mossoul on the 13th inst. There is no change in the state of affairs in China and Tripoli, and disturbances also continue in Mexico.

LOCAL NOTES

Acton: *Electric Pumping.*—The Metropolitan Electric Supply Co. have quoted a standing charge of £400 per annum and ¾d. per unit for the supply of electricity for pumping purposes at the sewage works. The quotation was made subject to the supply not being taken during the hours of maximum demand. The offer has been refused.

Barrow-in-Furness: *Ice Factory.*—There is every probability of an ice-manufacturing industry being established in Barrow. The plant will be electrically driven, and it is calculated that the quantity of electricity used will amount to about £400 per annum.

Belfast: *Street Boxes.*—The Board of Trade have recommended the ventilation of all the Electric Supply Department's street boxes. It appears that there are about 2,300, of which only 350 are ventilated. The carrying out of the recommendation of the Board of Trade will involve an expenditure of £1,350, and the Engineer has been instructed to make inquiries as to the practice in other towns.

Brighton: *Electrical Exhibition.*—On account of the great success of the Electrical Exhibition described in our issue for November 2nd, it has been decided to keep it open until Saturday next, a week longer than originally anticipated.

Canada: *Electric Water Heaters.*—It is stated that the Winnipeg Electric Water Heating Co. is in process of formation for the purpose of manufacturing the "Gray" instantaneous electric water heater. The capital of the company will be £10,000, but none of the capital is to be offered to the public.

Fareham: *Electricity Works.*—The Council's Consulting Electrical Engineers, Messrs. May & Hawes, report that the Electricity Works have been completed at a total expenditure of £9,320, which is £680 less than the original estimate. The thanks of the Council were accorded the Consulting Engineers on the result of their work.

Greenock: *Electricity Accounts.*—There was a gross profit of £17,471 upon the working of the municipal electricity undertaking last year, and after meeting capital charges the sum of £1,500 has been placed to reserve. The balance carried forward is £4,021.

London: *L.C.C.: Position of Electric Supply.*—The Finance Committee, in a report upon the financial relations between the Council and the London Borough Councils, deal specially with the sanctioning of loans for electricity supply purposes. After detailing the powers of the Council, the Committee go on to say that, having in view the purchase by the Council of all the London companies' undertakings twenty years hence, it is desirable that some policy should be laid down as to the basis of future loans to the Borough Councils. They point out that after the purchase of the companies the County Council will be the authority for supplying electricity in London side by side with Borough Councils, and that it is desirable that all extensions should be carried out with a view to the development of the whole supply to the Metropolis. The Committee suggest that the Highways Committee might formulate a comprehensive policy as to the action which the Council should take under these circumstances. The immediate point for consideration is the question of the development of the various electric supply undertakings in the most effective and economical manner in view of the powers of co-operation conferred by the London Electric Supply Act of 1908.

Hosted by Google

Bermondsey: Loan Refused.—The Council recently applied to the London County Council for sanction to borrow £18,563 for extensions at the electricity works. The L.C.C. applied for information as to certain terms recently offered the Council by two companies for giving a supply in bulk, and from a report of the Finance Committee, the Engineer has merely replied that he is of an opinion that the offers do not in any way compare with the advantages and economy derived through the extensions of the Council's own plant. The Borough Council will not give more specific information, and disputes the right of the L.C.C. Committee to interfere with the policy which has been adopted. The Finance Committee apparently take a serious view of the matter, and holds the opinion that, as the loan-sanctioning authority, the County Council has the duty of self-guarding the interests of future ratepayers, and in this capacity must have regard to the financial aspects of applications for loans. As the Bermondsey Borough Council have refused to supply information which will make clear the financial aspects of their proposal, the Finance Committee feel that they have no alternative but to recommend the Council to decline to sanction the loan.

Marylebone: Electric Lighting Tariffs.—The Council have adopted a report by the Electric Supply Committee recommending that a 6d. flat rate shall be extended to any consumer who desires to adopt it.

A scheme has been prepared for the electric lighting of dwellings in John Street, without meters, at 6d. per week per 25 c.p. Osram lamp in living rooms, or 5d. per week per 16 c.p. lamp; 4d. per week per 25 c.p. Osram lamp in bedrooms, or 3d. per week per 16 c.p. Osram lamp, or 2d. per week per 8 c.p. carbon lamp. These dwellings have been lighted experimentally at a somewhat higher charge during the past twelve months, but the success of the experiment has induced the Electric Supply Committee to approach owners of smaller dwellings. A sum of £500 from the revenue balance has been set aside to cover the cost of any work of this description, all of which is to be given out to contractors.

Melbourne: *Charges for Power Supply.*—It is proposed that the charge now made by the Municipal Electricity Department for power and heating purposes shall be reduced from 2d. to 1¾d. per unit.

Wednesbury: *Municipal Electric Time Service.*—An electrically operated clock, supplied by the Synchronome Co., Ltd., was put into service last week. It forms part of a Coronation memorial tower which the Council have erected.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The New South Wales Government Railway Department, Sydney, require tenders by December 4th for two return boosters. Particulars from the Electrical Engineer, Office 61, Hunter Street, Sydney. The time available renders the above information only of use to firms who have resident agents in Australia.

Blackpool.—Tenders are invited by November 29th for a 1,500-kw. turbo-alternator, a barometric jet condenser, and a 800-kw. steam turbo-generator (mixed pressure). Particulars from Borough Electrical Engineer.

Clayton.—The Council are in negotiations with several authorities with regard to electricity supply.

Dartford.—Extensions at an estimated cost of £8,500 are contemplated. The estimates are made up as follows:—engine, balancer, switchboard, superheaters, piping, feed pump, and buildings, £5,700; cables, £1,000; boiler, £1,600; contingencies, £200.

Dolgelly.—The Council have decided upon an electric supply scheme at an estimated cost of £3,000.

London: *Islington.*—The Finance Committee of the L.C.C. have sanctioned a loan of £6,316 for electrical extensions.

New Zealand.—The Napier Corporation invite tenders for an electric tramway, lighting, and power works. Copies of the plans and specifications may be seen at 73 Basinghall Street, London, E.C.

Portsmouth.—The Corporation have passed the Tramway Committee's recommendation to extend the tramway system.

Salford.—Two 1,000-kw. D.-C. turbo-generators are required. Particulars from Town Clerk and tenders by November 27th.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Bexhill — School. Architect, H. P. Burke-Downing, 12 Little College Street, Westminster, S.W.

Edinburgh.—Extensions to central telephone exchange. H.M. Office of Works, London.

Glasgow.—Catholic institute. Professor J. S. Phillimore is chairman of the Organising Committee.

Greenock.—New public school.

Nottingham.—Cinematograph theatre at Pinxton. Architect, J. Tomlinson.

West Ham.—Tenders are invited by December 4th for the electric wiring of the Gainsborough Road Schools. Architect, W. Jacques, 2 Fen Court, Fenchurch Street, E.C.

MISCELLANEOUS

London: *Islington.*—The Council contemplate an expenditure of £2,400 upon the construction of testing stations in order to comply with the L.C.C. regulations.

L.C.C.—The Highways Committee recommend the construction of tramways from Forest Hill to Rushey Green at an estimated cost of £52,580.

New Zealand.—The Government intend to bring the telephone system of the country fully up-to-date, and special attention is to be devoted to the installation of telephones in private houses. Mr. T. Buckley, Chief Electrician to the Government Post and Telegraph Department, is now making a tour in this connection, and British firms desirous of communicating with him can do so c/o the High Commissioner for New Zealand, 13 Victoria Street, London, W.

In the recent Annual Financial Statement of the Minister of Finance, it was pointed out that inquiries are being made by the Government with a view to establishing new electro-chemical industries in New Zealand which will take their power from the Government water-power electricity works. It was also stated that plans are being prepared for the conversion to electric traction of the railway through the Lyttleton Tunnel.

North-Eastern Railway Co.—Tenders are invited for general stores, including electric lamps, wires, cables, &c. Particulars from Stores Superintendent, Gateshead, and tenders by November 21st.

Russia.—It has been decided to erect seven wireless stations at various points on the Russian Far East coast.

TENDERS RECEIVED AND ACCEPTED

Atherton (Lancs.).—The Council have accepted the tender of the Brush Electrical Engineering Co. for two 30-k.v.a. single-phase, core type, oil-cooled transformers, 2,400/240 volts and 50 periods.

Nelson.—Two additional tramways have been ordered from the United Electric Car Co., Ltd.

West Hartlepool.—The Electrical Engineer has been authorised to purchase from Messrs. Crompton & Co., under their existing contract, meters and switchboard panels as required.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £58 15s. to £59 (last week, £57 15s. to £58).

Metal Filament Lamps.—Ship Carbons, Ltd. (67 Adersgate Street) have been appointed sole agents in the United Kingdom for the "Monowatt" lamp, made by the Watt Electric Lamp Works, of Vienna.

Dissolution of Partnerships.—H. T. Byford and H. Speight, carrying on business as Byrds Electrical Co., 2 Inner Temple and 24 Dale Street, Liverpool, have dissolved partnership.

C. E. Harrison and L. J. Aron, carrying on business as the British Electric Time Co., have dissolved partnership. L. J. Aron continues.

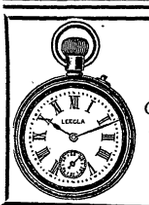
Liquidations.—The creditors of the Davis Electrical Co., Ltd., the liquidation of which was referred to in our issue for November 2nd, have been offered 2s. 6d. in the £1, but no definite statement having been prepared, the offer is not being considered. A resolution has been passed to the effect that the appointment of Mr. G. E. Corfield be not confirmed, the opinion being held that the case was one for compulsory liquidation.

Hosted by Google

The creditors in the winding-up of the Winchester Electric Light and Power Co. should send particulars of their claims to F. E. Gripper or A. R. Dyer, Broad Sanctuary Chambers, Westminster, by November 30th.

W. H. Howard, Electrical Engineer, 17 Russell Road, Finsbury Park, lately carrying on business as the Holborn Electrical Co., 5 Featherstone Buildings, Holborn, has been adjudicated bankrupt.

Thames Ironworks & Shipbuilding Co.—On the application of a debenture holder in the Chancery division on Tuesday, Mr. Justice Joyce appointed a receiver and manager.



Messrs. Siemens Bros. Dynamo Works, Ltd., Tyssen Street, Dalston, London, N.E., have just furnished us with some particulars of their advertising campaign for the present lighting season. Although the final arrangements have been delayed somewhat owing to the fact that they have been considerably increasing the manufacturing capacity of their works, we have no doubt that contractors will have realised that the usual enterprising technical paper advertising scheme has been kept going, whilst special arrangements have been provided for. Great interest has been stimulated in the pictorial designs selected as a result of the "Tantalum" Showcard Competition, and, as previously announced in these columns, four designs were selected. As usual, a very wide provincial poster campaign has been adopted, and posters are appearing in practically every town of importance throughout the country. Very humorous showcards of the "Little Bill" design have been reproduced in several colours, and many thousands of these have already been circulated among their trade customers, together with a wide selection of literature which can be over-printed with the name and address of contractors. Facsimile reproductions of the poster on postcards can now be obtained in quantities for contractors' use as correspondence cards, and Messrs. Siemens Bros. Dynamo Works, Ltd., will be glad to send a consignment. to any contractor who would care to circulate them. New and attractive pamphlets are in the press, and these will also be supplied in quantities to contractors. In addition to these arrangements, a large provincial newspaper campaign is already in operation, and hundreds of thousands of actual electricity users are being circularised in order to stimulate the demand for "Tantalum" lamps. It should be obvious to the trade generally that by displaying these showcards about their premises they will obtain their fair share of the large demand for "Tantalum" lamps which will be created by such a comprehensive circularisation. In addition to these schemes, the London ground is well provided for, as the usual underground and electrical railway systems are carrying their pictorial advertisements, whilst many of the carriers' vans covering Greater London are also displaying posters of the "Little Bill" design. This very exceptional campaign has been organised with a view to assisting the trade generally, and with a view to increasing contractors' sales in "Tantalum" lamps and accessories for use in conjunction with same without the imposing of any conditions or stipulations as to the value of the orders placed. Such arrangements are calculated to bring "Tantalum" lamps into even greater prominence with the public than previously, and it is interesting to note that the effect of these schemes is already resulting in greatly increasing the turnover of the lamps in question. The lamps themselves have maintained their long reputation for strength, durability, and efficiency, and consumers thoroughly realise their sterling worth.

APPOINTMENTS AND PERSONAL NOTES

We understand that Mr. C. C. F. Monckton is giving up his consulting practice at Parliament Mansions, Victoria Street, S.W., to take up the newly established post of superintendent of Telegraphs and Telephones, Fiji, and that he left England yesterday. His business will be carried on by Mr. Arnold G. Hansard, of the same address, in conjunction with whom he has worked for the last five years.

In consequence of the decision of the Newport (Mon.) Council to separate the management of the tramways from the Electricity Department, the salary of Mr. H. Collings Bishop, Borough Electrical Engineer, has been fixed at £400 per annum as from March 1st, 1912. Mr. Bishop's present salary is £500 per annum.

The South Shields Corporation invite applications by November 27th for the appointment of electrical engineer. The salary is £400 per annum.

LEECLA WATCHES.

Guaranteed five years.

SUMMARY

The name "Licentiate" for the new class of member proposed by the Council of the Institution of Electrical Engineers has been abandoned. This was the only concession announced at the meeting held in London last Thursday. We review the Council's proposals with regard to the change in subscriptions, and put forward an alternative scheme under which a greater revenue could be made to accrue without raising the subscriptions of existing members. The local sections have made strong protests against the Council's proposed new Articles, and meetings have been held at Manchester, Leeds, Dublin, and Birmingham. (Page 637.)

The report of the last Council Meeting of the British Electrical and Allied Manufacturers' Association shows signs of considerable activity. Members of Parliament are being circularised with a view to preventing the use of electricity in mines being restricted by the Coal Mines Bill, which is about to be read a third time. (Page 639.)

The electric light and power supply for the new building of William Whiteley, Ltd., is taken entirely from the firm's own steam-driven station, which has been enlarged and rearranged. The lighting is principally by arc lamps, but in some departments metal filament lamps are used, and with Holophane shades. Electric power is used for machinery driving, lifts, vacuum cleaners, and pneumatic tubes, and a very complete fire alarm system is provided. (Page 640.)

After considerable experimenting, Messrs. Thomas Tilling, Ltd., have decided to use only petrol-electric omnibuses for the future. In conjunction with Messrs. W. A. Stevens, Ltd., they have produced a vehicle with which they hope to reduce expenses to 7½d. per car-mile. Arrangements are being made to manufacture these in quantities in the Midlands. A demonstration of one of these omnibuses was given on Tuesday. (Page 641.)

Some new arc lamps for photographic purposes are described and illustrated. (Page 642.)

The water-power electric supply plant at the British Aluminium Co.'s works at Kinlochleven was described in two papers by Mr. A. H. Roberts and Mr. F. B. Sonnenschein, read last week before the Institution of Civil Engineers. The capacity of the plant aggregates over 30,000 h.p. (Page 643.)

An improvement in a balanced feeder protective system, in which a compensating winding is provided to overcome capacity effects, has been patented by the British Thomson-Houston Co., and an electric resistance furnace, arranged so that the crucible wall is heated to a high incandescence, is also protected. Other patents published by the Patent Office include a new type of cable coupling, with a metal bush, and a cheap and simple form of lamp reflector. Three patents expire during the coming week, after a full life of fourteen years; one deals with a fusible cut-out, another with a train-lighting system with means for changing the polarity of the external circuit, when rotation is reversed, and a third relates to a surface contact system of traction, in which the magnet on the car has two windings. (Page 644.)

Hosted by Google

AN important scheme for converting the North London Railway to electric traction, and linking it up with the L. and N. Western lines and all the London tube railways, is referred to in our "Electric Traction Notes."—The Central London Railway have also an important extension in view.—It is expected that the arbitration in connection with the Hammersmith lines of the London United Tramways will conclude next week.—At the Board of Trade inquiry into the accident upon the Rawtenstall tramway system it was stated that the shunt coil on one of the motors of the car had broken down.—We also refer to recommendations as to the railway and tramway systems of Melbourne, and the placing of an order in America by the Newcastle Corporation for tramway rails. (Page 645.)

UNDER "Telephony and Telegraphy (Including Wireless)" we give some points from a report of the Engineering Standards Committee dealing with experiments upon the mechanical properties of hard-drawn copper and bronze wires which have been carried out with the co-operation of the Post Office and National Telephone Co.—The Constantinople Telephone Co. is inviting subscriptions to its capital. (Page 646.)

MR. S. L. R. PRICE'S inaugural address to the Dublin Local Section of the Institution of Electrical Engineers dealt with electric heating and cooking. (Page 647.)

AT a joint meeting last week of the Manchester local section of the Institution of Electrical Engineers and the Liverpool Engineering Society, Prof. E. W. Marchant read a paper on the functions of engineering laboratories. (Page 647.)

THE Sheffield Corporation have included a clause in a Bill which is to be promoted next session, asking for powers to wire and fit consumers' premises for electric lighting. The National Electric Construction Co. is also promoting a Bill to legalise the free wiring agreements which have been entered into with a number of local authorities. (Page 647.)

THE London County Council have decided to appoint a committee to make a full inquiry and obtain expert advice in connection with electric supply.—The Board of Trade have sanctioned the system of supplying a group of houses from one service at Farnham.—The Finchley Electricity Committee are appealing against their present assessment of £4,300 gross and £1,800 rateable.—An improvement of £1,780 is shown in the accounts of the Leeds Electric Lighting Department for the half-year to September. (Page 649.)

CABLE is required at Warrington, Hackney, Hastings, and Hammersmith; transformers at Fulham; water-tube boilers at Norwich; a 500 D.C. reciprocating engine set at Darlington; a 3,000 kw. power-house is to be erected in Siam, and loans of £10,000 at Hammersmith and £3,500 at Mansfield are to be raised.—The tender for a Howden-Siemens 5,000-kw. exhaust steam set is recommended for acceptance by the Manchester Council. (Page 649.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 23RD.

Institution of Electrical Engineers.

8 p.m. "Automatic Reversible Battery Boosters," by R. Rankin.

FRIDAY, NOVEMBER 24TH.

Institution of Electrical Engineers: Newcastle Section.

7.30 p.m. Special meeting at Armstrong College to discuss proposed new Articles of Association.

Institution of Electrical Engineers: Scottish Section.

8 p.m. At 207 Bath Street. Special meeting to discuss proposed new Articles of Association.

SATURDAY, NOVEMBER 25TH.

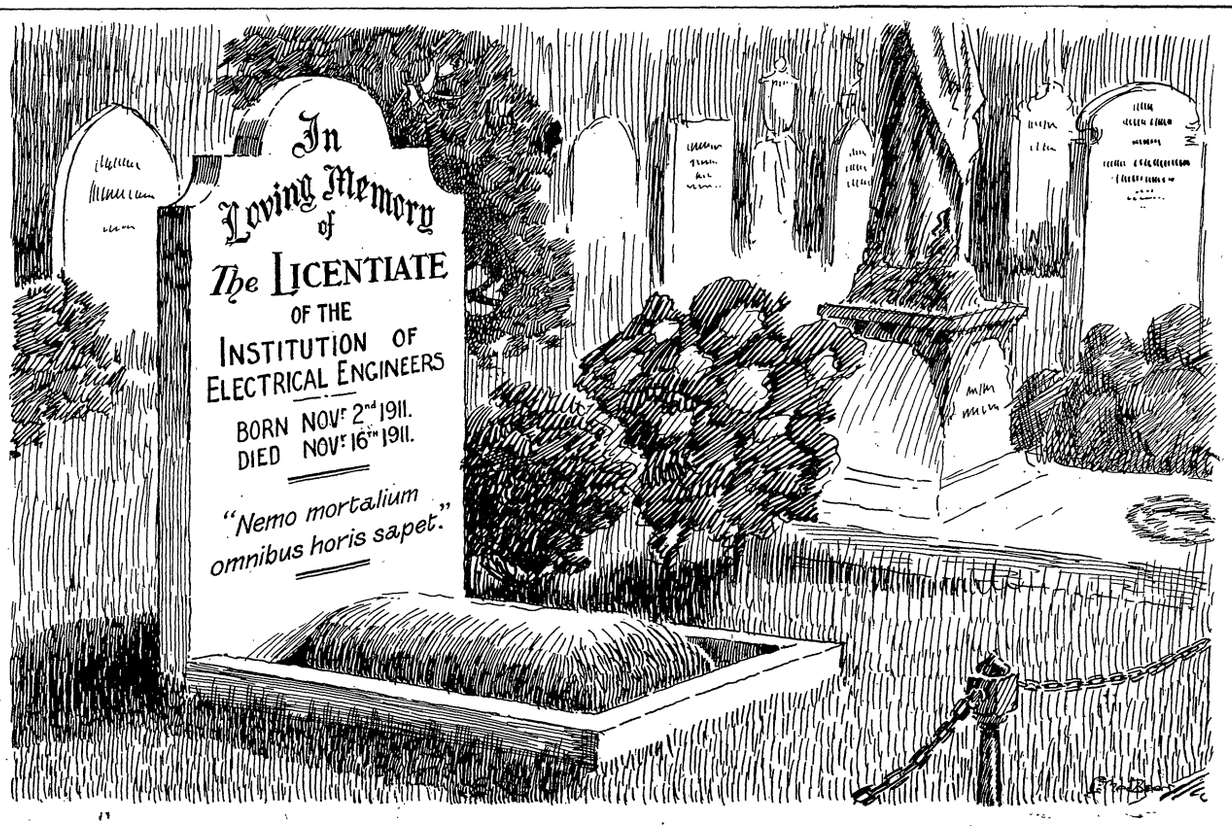
Association of Mining Electrical Engineers.

5.30 p.m. Warwickshire and S. Staffs Branch. At Imperial Hotel, Birmingham. "Electricity in Connection with Explosives," by E. K. Scott.

MONDAY, NOVEMBER 27TH.

Institution of Electrical Engineers: Newcastle Section.

7.30 p.m. At Armstrong College. "The Principles of Radio-telegraphy," by A. S. M. Sörensen.



TUESDAY, NOVEMBER 28TH.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "Automatic Reversible Battery Boosters," by R. Rankin.

Institution of Civil Engineers.

8 p.m. "Electric Lighting of Railway Trains: the Brake Vehicle Method," by Roger T. Smith.

At the Institution of Electrical Engineers on Thursday, Mr. Ferranti referred to the "late" Licentiate. R.I.P.

Hosted by Google

THE INSTITUTION OF ELECTRICAL ENGINEERS

The Name "Licentiate" Abandoned: Critical Review of Subscription Proposals and a Suggested Alternative: Strong Protests at the Local Sections

THE informal meeting, held at the Institution of Electrical Engineers last Thursday under the auspices of the Council at the suggestion of Mr. W. R. Cooper, was a dreary waste of time. The President was at the outset asked by Mr. Trotter to regulate the discussion so that the main points of the Council's proposals might be debated one at a time, but Mr. Ferranti did not accede to this request, and the result was a desultory and rambling discussion. There were, however, a few outstanding points to which we will refer.

The first of these was a reference by Mr. Ferranti to the "late Licentiate," which shows that the Council has acknowledged at any rate one of its mistakes. Another feature of the debate—which was a regrettable one—was the attitude adopted by Mr. Ferranti towards the main amendments received, which, as our readers know, had been sent in with a long list of signatures, including those of many influential members. Instead of announcing these and making clear the policy of the Council with regard to them, Mr. Ferranti read out a "summarised" list of all amendments received, in which the serious ones dealing with vital matters of principle were jumbled up with irresponsible and in some cases flippant suggestions sent in by a few individual members, in such a way that one was forced to doubt whether the Council had really been sincere in its announcement that proposals emanating from the membership would receive proper consideration.

In marked contrast to this was a dignified appeal by Mr. Trotter, pointing out how unfair it would be to raise the subscriptions of country members, and thus to make them contribute a larger share than the London members towards the lavish expenditure on the new building from which they themselves would derive little advantage. Mr. Trotter also supported the name "Subscriber" for the class which the Council had proposed to designate as "Licentiates," candidly putting forward as a reason that the title must be one that the man in question cannot write after his name.

Mr. Frank Bailey spoke as one of the extremists in opposition to the Council's proposals. In a violently aggressive speech he denounced and ridiculed the whole of the new Articles that had been drafted, and urged members to make no attempt to amend them, but to reject them as a whole.

Besides Mr. Ferranti, there were three speakers from the Council table: Mr. J. F. C. Snell, who is a Vice-President of the Institution and a member of the Revision of Articles Committee, confessed that they had recognised, before submitting the draft Articles to the members, that the name "Licentiate" was not a good one for the new class proposed. Mr. J. E. Kingsbury seemed rather to glory in the fact that £73,000 had been spent on the building and alterations, although the original estimates previously announced to the members had amounted only to £56,000, and yet he refused to adopt the view that country members should not have their subscriptions increased at the same time as London members. He admitted that the Council wanted increased subscriptions partly on account of the new building, and that the margin of annual expenditure over receipts was now too small for safety. Finally, Mr. Hugo Hirst appealed for general support of the proposals for broadening the basis of the Institution and increasing its utility to the industry.

Whether the scope of the Institution should be broadened in this manner or should be narrowed down to be a professional body was discussed to some extent, there being speakers both of one opinion and the other. If carefully done, with proper safeguards and without too much precipitancy, we believe that the Institution could be made to represent the whole industry, and not merely the technical and professional element, without any loss to its status—in fact, with ultimate increased prestige in this direction; and since this alteration will help to relieve the present financial difficulty as well, we think that those who favour the narrowing down policy would be well advised to waive their objections, and to concentrate their attack upon those features of the Council's proposals (summarised in our last two issues) against which there is practical unanimity.

Practically the only other question discussed at the meeting was the Rules for Professional Conduct: Mr. McGregor Duncan suggested that all consulting electrical engineers should be registered by the Institution. Mr. J. G. Lorrain wanted an addition of a rule preventing members from adding "Past President" or "Member of Council" after their signatures in signing reports to clients. Mr. A. H. Dykes was so insistent on making it clear that he adopted a conciliatory attitude to the Council's proposals that it was not quite evident whether he considered the Rules for Professional Conduct adequate or inadequate.

Besides Mr. Dykes, Mr. W. L. Madgen was the only member not at the Council table who expressed approval of the Council's revised Articles. Mr. Madgen was unstinting in his praise.

THE SUBSCRIPTION QUESTION

We have already pointed out that the financial question dominates the whole position, but we are now able to assert positively that a general increase in the subscriptions of existing members would not only be contrary to the wishes of the large majority of members, but would defeat its object by bringing about so many resignations that the income of the Institution would be decreased instead of increased. The Council proposes not only to increase subscriptions, but also to increase the entrance fees, including those payable on transfer from one class to another. Yet they intend to bring pressure to bear upon the older and more experienced of the existing Associate Members to transfer to the Member class. Let us examine how these transfer proposals will work out. At present an Associate Member who becomes a Member has to pay one guinea entrance fee and three guineas instead of two guineas subscription. The Council is not satisfied with this, but insists that any one transferred after the end of this year shall pay three guineas extra entrance fee, and a subscription raised from two to four guineas. The Associate Member would therefore be faced with this difficulty: he could remain Associate Member, and have his subscription raised by half a guinea, while his rank would yet be of less value to him than hitherto, owing to the new ("Licentiate") class created, and a large influx of non-engineers as Associates; or he could move up to Membership and pay a large extra entrance fee and double his old subscription. The majority of the Associate Members would adopt neither course. They would simply resign; a few might request to be transferred to the new ("Licentiate") class, continuing to pay the same subscription as now, and would then clamour for the return of half the entrance fee they had paid, for the entrance fee proposed for the

Hosted by Google

"Licentiate" is one guinea, whereas the Associate Members have paid two guineas. A few of the more wealthy or more extravagant among the Associate Members, and those with growing consulting practices, would prefer to be transferred to Membership, and a few would remain Associate Members, but the loss from resignation would be enormous. That Members, too, would resign in large numbers is evident from the mass of letters we have received, typical ones of which we published last week. We repeat that the loss of revenue to the Institution resulting from an increase in subscriptions and transfer entrance fees would be enormous.

It is positively astounding that the twelve men who constitute the Revision of Articles Committee, and the other Members of Council who adopted their recommendations, should not have foreseen this effect before they published their present proposals and aroused discontent throughout the membership. In this connection, however, we hasten to add a word of approval for one of the Council's other proposals. From what we have said above, it would certainly appear to be desirable that business men eligible for admission on the Council should be admitted as soon as possible.

We trust that the Council will adopt a simple alternative which will overcome the subscription difficulty in a very practical manner, and should enable the Institution to obtain an immediate increase in revenue if its acceptance by the Council is announced before the discontent becomes even more widespread than at present. Our suggestion is as follows: That there be no changes in the subscriptions of Members of each class until January 1st, 1913, and that only the subscriptions of Associate Members elected after January 1st, 1913, and Members elected, or transferred from Associate-Membership after that date, be in accordance with the higher scale. Also that the increase in entrance fees be postponed until the same date.

The result of this would be that all Associate Members eligible for transfer would immediately take steps to obtain it so as to benefit by the existing transfer entrance fee and the existing subscription. At the same time there would be a large number of new candidates for election both as Members and Associate Members during the next twelve months, so that they might come in under the lower entrance fees and subscriptions. Further, in the scale for subscriptions of new members, a difference between town and country members could be made, so that the rates would be as follows:

SUBSCRIPTIONS.

Members elected before Jan. 1, 1913	3 guineas.
Associate Members elected before Jan. 1, 1913 ...	2 guineas.
Members elected after Jan. 1, 1913 (London) ...	4 guineas.
Members elected after Jan. 1, 1913 (country) ...	3½ guineas.
Associate Members elected after Jan. 1, 1913 (London)	3 guineas.
Associate Members elected after Jan. 1, 1913 (country)	2½ guineas.

ENTRANCE FEES.

Members elected before Jan. 1, 1913	3 guineas.
Associate Members elected before Jan. 1, 1913 ...	2 guineas.
Fee payable on transfer from Associate Member to Member before Jan. 1, 1913	1 guinea.
Members elected after Jan. 1, 1913	5 guineas.
Associate Members elected after Jan. 1, 1913 ...	3 guineas.
Fee payable on transfer from Associate Member to Member after Jan. 1, 1913	2 guineas.

LOCAL SECTIONS

MANCHESTER.

A Special Meeting was held on Tuesday evening. Mr. Ferranti, Mr. Hammond, Mr. Hirst, and Mr. Pearce (together with the Secretary), were present on behalf of the Council, and Mr. W. Cramp occupied the chair.

Various suggestions were put forward on behalf of the Committee of the Manchester Local Section by Mr. Cramp, and the whole were very favourably received. The following were the chief recommendations made:—

"Licentiates" (Clause 15).—It was decided to recommend that this name should be dropped, but that a new class be formed to cover the type of man included under this clause.

Eligibility of men of business, finance, and law as Members (Clause 12 d).—It was agreed to recommend the Council to delete this sub-clause.

Subscriptions.—Recommended as follows:—(1) That London members pay a higher rate of subscription than Provincial members. (2) That members who can attend meetings of Local Sections should pay a higher rate of subscription than members who cannot attend.

Vice-Presidents.—That Chairmen and past Chairmen of Local Sections be eligible as Vice-Presidents, even if they have not been Ordinary Members of Council.

Representation on Council.—This to be modified in accordance with a recommendation outlined by Mr. S. L. Pearce, and to be submitted later.

The Manchester Students' Committee held a meeting on Monday, November 13th, at which the Council's proposals were discussed, particularly in so far as they affect the Student class. A number of "proposed amendments" were formulated, which it was resolved should be placed before a general meeting of Students to be held on Tuesday, November 21st.

YORKSHIRE.

Mr. Robert Hammond and Mr. J. E. Kingsbury represented the Council at a meeting of the Yorkshire Section held at Leeds on Monday. They heard some very plain speaking by the Yorkshire members.

The hurried manner in which it had originally been proposed to pass the amended Articles was commented on. The finances of the Institution also came in for severe criticism, and the relative benefits obtained by London and country Members. The proposed raising of subscriptions was condemned, as also was the new arrangement of the classes of membership. It was urged that there should be an alteration in the proportion of country Members to town Members on the Council, and the wide powers proposed to be given to the Council as to dealing with the property of the Institution, and disagreement with the proposed method of election of Members of the Council, and other matters in the new Articles was expressed. There was a strong feeling that the membership could easily be increased without lowering the prestige of the Institution, one leading Member offering to be responsible for a dozen "good men and true."

Mr. Hammond and Mr. Kingsbury replied to much of the criticism with their usual eloquence, but it was clear that the Meeting was not to be converted by the explanations given, and after a sitting lasting 2½ hours, it was unanimously decided that the representatives from London, who were heartily thanked for their attendance, be requested to "ask the Council to defer the question of amending the Articles of Association for a period of 12 months from this date."

BIRMINGHAM, GLASGOW, AND NEWCASTLE.

Yesterday evening Mr. Ferranti was at a general meeting in Birmingham, and on Friday he will attend one at Glasgow. Mr. Kingsbury and Mr. Hammond will, it is expected, address a meeting at Newcastle to-morrow (Friday). At all these centres there is strong disagreement with the Council's draft Articles of Association.

DUBLIN.

A general meeting of the members of the Dublin Local Section was held at the Royal College of Science at 8 p.m. on Tuesday last week to consider the proposed new Articles.

The Secretary announced that when the Council heard that the meeting was to be held, they sent a wire to the effect that such a meeting was contrary to the rules for the government of Local Sections. It was then pointed out that a similar meeting was being held in London on the 16th inst., and finally the Council gave permission to the Section to hold the meeting, but it was announced that the President had specially desired that no resolutions should be passed at the meeting. In deference to this wish, no resolutions were put.

The members of Committee, however, raised point by point the opinions which they had proposed as resolutions at the Committee meeting held on the previous day, and each point so raised was discussed. After the ideas of the Committee as to revision were exhausted, suggestions were asked for, and one such (No. 10) received sufficient support to be included with the others as opinion widely held. At the close of the meeting the members present were invited to sign such opinions as they agreed with—each opinion being on a separate sheet.

Hosted by Google

There are 15 Members and 33 Associate Members attached to the Dublin Local Section. Of these 48, no less than 33 have signed the Memorandum below, either during the meeting or during the next few days, representing 70 per cent. of the membership of the Section.

The wording of the Memorandum, which has been sent to the Council with the signatures, is as follows :—

We are of opinion :—

(1) That the proposed changes in the Articles of Association which lower the professional standard for admission to existing grades, the proposed change which creates a new class (Licentiate) with low professional qualifications, and proposed changes which tend to increase the number of non-professional members beyond the provision for this purpose under the heading of Associates, are against the spirit of Section 3 of the Memorandum of Association, are not in the interests of the Institution as a professional Institution, and tend to lower the status of the professional members, and that the new Articles should be referred back to the Council for amendment in these particulars.

(2) That subscriptions be not raised to members of any class, and that entrance fees and subscriptions of new members of any class joining after July 1st, 1912, or transferring after February 1st, 1913, be according to the new schedule as far as London members are concerned, and at the old rate for members living more than 20 miles from the Institution Buildings.

(3) That the last paragraph of Article 13 should read :—The Council shall require candidates for Associate membership to pass an examination unless in possession of diplomas or degrees of teaching bodies approved by the Council.

(4) That Article 15 [relating to the Licentiate class] be deleted.

(5) That a time limit for remaining a student should be enforced.

(6) That if it shall be found through loss, or feared loss of revenue from any cause that the retention of the building on the Embankment necessitates the lowering of the professional status of the Institution in order to provide increased revenue, then that the building should be sold and the professional standing of the Institution not sacrificed to it.

(7) That in the proposed new Articles 66 and 69 [respectively empowering the Council to effect loans and to incorporate other societies] the clause subject to the sanction of two extraordinary general meetings be inserted.

(8) That the final decision of the Institution should be taken by postal vote of Corporate Members in the British Isles on the leading points in the proposed new Articles to which exception has been taken after sufficient interval for discussion by the Local Sections.

(9) That Article 80 be amended to read :—"14 clear days notice" instead of "7 days notice" [of all Annual and Special General Meetings].

(10) That the ordinary members of Council should be :—Twelve members, four Associate members, and two Associates.

CORRESPONDENCE RECEIVED

We have received a number of further signatures to the amendments which we have sent in to the Council. The amendments and first list of signatures were published in our last issue. Forms will be sent to any other Members or Associate Members desiring to place on record their concurrence with our objections to the Council's proposals.

Dr. C. C. GARRARD has sent us a long letter objecting to examination for Associate Membership.

Mr. A. H. DYKES sends us a still longer letter on the Rules for Professional Conduct in the new draft Articles. He regards these only as "a few guiding rules," and insists on the necessity of an Association of Consulting Engineers. [We may mention that Mr. Dykes, in conjunction with some others, has been endeavouring for some time past to form such an Association, but it is not receiving entirely cordial support from electrical engineers, as it is proposed that only Members of the Institution of Civil Engineers shall be eligible for membership.]

Mr. E. W. COWAN writes us with regard to the election of Council, proposing the issue of two nomination lists, one containing the names of the Council's nominees, and the other alternative nominations which have been put forward by the membership.

A POWER STATION MANAGER, in returning us our amendments with his signature, adds that he considers that the bulk of the town members would have the same ground for complaint as the country members if the subscriptions are raised, as the average town member only makes use of the building on meeting nights.

Mr. THOMAS ROLES, City Electrical Engineer and Manager, Bradford, has sent us a letter giving interesting statistics showing the relative contributions of London, country, and foreign Members to the funds of the Institution. We shall deal with this in our next issue.

B.E.A.M.A. ACTIVITIES

A MEETING of the Council of the British Electrical and Allied Manufacturers' Association (Incorporated) was held at the Association's offices, 36 Kingsway, W.C., on the 9th inst.

The following firms were elected members : British Thomson-Houston Co., Ltd., British Electric Transformer Co., Ltd., Browett, Lindley & Co., Ltd., Dick, Kerr & Co., Ltd.

Messrs. Feld Bros. & Co., Ltd., were elected associates.

We are informed that since that date the Secretary has received applications for membership by several other important firms.

The Secretary reported that the following gentlemen had assented to their election as Vice-Presidents of the Association : S. Z. de Ferranti, J. McDonald Henderson, M.P., Hugo Hirst (Managing Director, General Electric Co., Ltd.), John Kerr (Chairman of Directors, Dick, Kerr & Co., Ltd.), N. Kilvert (Chairman, Lancashire Dynamo & Motor Co., Ltd.), C. A. Park (Managing Director, British Westinghouse Co., Ltd.), O. H. Smith (Director, British Thomson-Houston Co., Ltd.), W. T. Stubbs (Director, Electromotors, Ltd., and President, Manchester Chamber of Commerce), G. A. Touce, M.P., Lord Vaux of Harrowden, and Douglas Vickers (Director, Vickers, Ltd.).

The following gentlemen were elected Vice-Presidents of the Association : Sir Wm. Mather, Sir Andrew Noble, Sir C. A. Parsons, Mr. Alex. Siemens, Colonel Crompton, and Lord Furness.

Reports from various sub-committees were considered and adopted, including that of the sub-committee on the Coal Mines Bill, under the recommendation of which a letter was despatched to every Member of Parliament. This letter called attention to a clause in the Bill which would seriously restrict the use of electricity in mines, and would, in fact, even prohibit its employment in certain cases in which even naked lights are permitted. Reference to this matter was made by Mr. Patchell at the recent Birmingham dinner (see ELECTRICAL ENGINEERING of November 16th, page 627), and an article on the subject was published in our supplement, "Electrical Engineering in Mines," on September 7th. We propose to return to the matter in our next mining supplement. The sub-committee on the "Model General Conditions," proposed by the Institution of Electrical Engineers, recommending the transmission to the Institution of amendments provisionally agreed by the Association, was also adopted.

In order to provide for the more prompt despatch of ordinary and pressing business than customary under the monthly meetings of the Council, an Executive and Finance Committee of five members was elected. One of the immediate duties of this Committee will be to prepare for the Annual General Meeting (January), at which a new Council will be elected.

Applications for support from certain bodies desirous of projecting electrical exhibitions were considered, and the Secretary was instructed to inform the applicants that the Council were unable to depart from the standing rule.

It will be of interest to those not yet working in the Sectional Groups to know that most of the important business of the Association (excepting matters of policy and questions affecting it as a whole) is conducted by these groups, which are at present as follows : (*a*) arc lamps and carbons, (*b*) accessories (light, power, and other electrical), (*c*) accumulators, (*d*) conduits and conduit fittings, (*e*) dynamos and motors, (*f*) fittings (including heating and cooking apparatus), (*g*) instruments, (*h*) meters, (*j*) incandescent lamps, (*k*) switchgear and controllers, (*l*) transformers, (*m*) telephone, telegraphic, and signalling apparatus and primary batteries, (*n*) wires and cables, (*o*) engines (reciprocating, turbines, gas and oil engines). Arrangements are in progress for the early meeting of each of the groups.

The new offices of the Association at 36 Kingsway, W.C., afford good facilities, particularly for country members and their friends, for meeting and conducting correspondence. ELECTRICAL ENGINEERING and practically all the other weekly technical papers are to be found on the table of the Reading Room.

Each member of the Association is requested to send to the Secretary at an early date a bound set of his complete catalogues for reference by visitors from abroad.

In view of the fact that Mr. Hawes resigned the position of Secretary as from the 9th inst., and that Mr. Dunlop assumed full responsibility as from that date, members should bear in mind that all correspondence should be addressed to him at 36 Kingsway, W.C.

Electric Supply Advertising.—A further issue of new pamphlets, &c., has been made by the Electric Supply Publicity Committee, laying special stress on cooking and vacuum cleaning, both dealt with by the aid of attractive illustrations. These publications are intended as a follow-up to the Exhibition at Olympia. A new poster has also been designed, showing a statue of Liberty dressed as a housemaid, with an electric lamp in one hand and a radiator in the other, symbolising the fact that electric lighting and heating give freedom from smoke, dirt, and work.

ELECTRICAL EQUIPMENT OF THE NEW PREMISES OF WILLIAM WHITELEY, LTD.

THE latest and one of the most sumptuous of the commercial palaces which form so prominent a feature of the centralised business undertakings of the capitals of the world is the new building in Queen's Road, Bayswater, which William Whiteley, Ltd., have completed on the site of the old Paddington Baths for the accommodation of the departments of the business hitherto housed in the original premises in Westbourne Grove, as well as for new developments and extensions of their activities. The building itself, for which the architects are Messrs. Belcher & Joass (9 Clifford Street, W.), and the contractors Messrs. Holloway Brothers, Belvedere Road, S.E., contains many features of interest as regards its construction, arrangement, and appearance, but it is only the purpose of this article to call attention to the ways in which electricity is used in the new part of the establishment. The arrangement provides for a ground, first, and second floors, with a fourth floor over a part of the area and a handsome dome. The premises were opened by the Lord Mayor on Tuesday.

The electric supply is provided entirely from the firm's own steam generating station in the basement behind the older Queen's Road premises, and considerable alterations and additions have been made owing to the extensions. No stand-by connection or auxiliary supply of any kind is obtained from the supply company serving the district. The decision to trust entirely to their own steam-driven station was due largely to the fact that steam was already, and is now still more extensively, required for such purposes as heating the buildings, cooking in the provision department, &c., so that in any case extensive boiler plant would be necessary. Considerable economy is secured by using exhaust steam for these purposes, and throughout the new building the heating is carried out on the low pressure or "atmospheric" system of Messrs. H. J. Cash & Co. It was found, on going into the matter and bearing in mind the depreciation of the old plant, that some extension and remodelling of the existing station would lead to a more economical result than providing independent live steam heating boilers and taking power from outside at the price available. The changes made in the old plant, most of which has been running for a great many years, embrace raising the steam pressure from 80 to 120 lbs. per square inch, providing a certain amount of new boiler plant, rearranging the flues and constructing a new chimney shaft, compounding the existing engines, putting down a new generating set, and remodelling the switchboard and metering arrangements. The boiler plant now comprises four new Galloway 30 ft. by 8 ft. boilers (replacing smaller units of the same make), and two of the same size by Daniel Adamson & Co., formerly worked temporarily at the lower steam pressure. All these are provided with superheaters, and are fitted with Meldrum electrically-driven, automatic stokers, and are connected up through new flues to the new chimney shaft, which is arranged for either natural or forced draught. In the engine-room, which has been somewhat enlarged, are now four 100-kw. sets driven by Willans central valve engines, which have been recently compounded, two similar 60-kw. sets, and a new Bellis-Siemens 200-kw. set, with two-crank compound engine. All the generators are wound for 200 volts, and a simple two-wire distribution at this pressure is employed. A new generator switchboard has been provided in the engine-room, and a lighting feeder board is provided in an adjoining switch-room, to which leads are taken forming virtually part of the bus-bars. The power distribution board is in the engine-room itself.

The whole of the wiring of the new building was carried out by Messrs. H. J. Cash & Co., Caxton House, Westminster. From the generating station feeder board, mains are taken to all parts of the premises. Those to the new building consist of two, each of 0·75 sq. in. section, leading to two four-way main distribution boards at the north end of the block, with D.P. switches and fuses on slate bases for 400 amperes per way. The supply to the seven shops into which the premises may be divided is taken alternately from these two boards, and in the basement of each is its own sub-main board, from which wires are taken to the various floors. All wiring from the main boards is in screwed iron conduit, with each main and sub-main cable in a separate tube. The whole system of steel conduits was erected complete before flooring was laid and ceilings plastered. All wires were drawn after the buildings were completed in these details, and unusually large capacity is provided in all tubes, so that the wires may be withdrawn or added to at any time without disturbance of the buildings or of the decorations. Messrs. Cash make a great speciality of this method of installation. The shop

SECTIONAL ELEVATION OF D.P. DISTRIBUTION BOARD.

distribution boards are of a special pattern, supplied by P. W. Rands (Caxton House, Westminster). An illustration is given showing details of one of the double pole boards used for the arc lighting. This contract is one of the first on which the tandem arrangement of switches has been employed, but the same form of switch, known as the "Kartret" switch, resembling in some respects a miniature circuit-breaker, has been used in single pole units by the War Office at Sandhurst College and elsewhere. About 32 of these boards, from 19 way downwards and averaging about 15 ways, all fitted with 10-ampere switches, are in use. They are in substantial cast-iron cases fitted in most instances with special catches where they are too near the wall for a lock to be got at. The narrowness of the switch allows plenty of room in the box for wiring, and the arrangement is such that they can easily be wired up in place. A special form of enclosed fuse is used, in which no screws or rivets are employed to hold either the fuse wire or the clips to the porcelain tube. The fuse wire is held by the spring shutters at the ends, and the metal parts are of phosphor-bronze, all except the soft copper contact piece against which the fuse wire bears. There is $1\frac{1}{4}$ in. clearance between the end of the porcelain and the cast-iron case, allowing, as we have said, plenty of room for wiring.

The general scheme of lighting is the provision of arc lamps down the centres of the various shops, with a certain amount of local incandescent lighting, but, as mentioned below, some departments are lighted entirely by metal filament lamps. About 450 arc lamps are employed, and these are all of the well-known Brokie-Pell pattern supplied by

Hosted by Google

the Foster Engineering Co. (Wimbledon). The auxiliary incandescent lighting will be added gradually as required. In the jewellery, ladies' costume, and some other departments, as well as in the extensive refreshment rooms, the lighting is almost entirely by "Onewatt" lamps, supplied by Messrs. Siemens Brothers Dynamo Works, Ltd., of the 200-watt size, effectively arranged in Holophane reflectors and shades. The material for the special window lighting was also supplied by the Siemens firm, and consist entirely of Tantalum lamps in box reflectors, suspended behind the top of the window to throw light down on the goods displayed. No outside lamps of any kind are employed.

The generating station supplies more than 100 kw. for power purposes, not all, however, in connection with the new building, and among the purposes for which it is used may be mentioned the driving of machinery for printing, cabinet-making and general joinery, general purposes in the workshops of the building department, &c. In fact, all machinery on the premises is electrically driven. Electric lifts are also employed throughout. In the new premises there are twenty lifts altogether, supplied by R. Waygood & Co., Ltd. (Falmouth Road, S.E.), of which ten are for passenger service. These lifts are each capable of raising 20 cwt. at 250 ft. per minute, and are provided with control of the car switch type with self-centring detachable handle, somewhat similar to that in use on the tube railways. The cages are iron and glass in construction, and are made to the special designs of the architects. There are six lifts for goods service capable of taking loads from 10 to 20 cwt. at speeds varying from 125 to 250 ft. per minute, and three service lifts for a load of 1½ cwt. at a speed of 120 ft. per minute, and controlled by push-buttons on each floor. In addition to the above there is an inclined travelling goods hoist, driven electrically, for the purpose of taking up trolleys of parcels. The parcels sorting arrangements also include ingenious arrangements of glissoirs in connection with an electrically-driven revolving table. The main ventilation is by electrically-driven Blackman fans in the basement.

Among other special features is the special vacuum cleaning outfit supplied by the Vacuum Engineering Co., in which large electrically-driven turbine vacuum pumps are employed, and a very complete installation of pneumatic tubes has been installed by the Lampson Pneumatic Tube Co., also employing electrically-driven pumps. A further purpose to which electric power will probably be put is to drive the refrigerating machinery for a cold-store, but the details of this are not as yet decided upon.

The telephone arrangements involve a private branch exchange with connections to about 250 instruments, and a scheme for a wireless telegraph equipment is under consideration. In addition to the automatic gongs of the sprinkler installation, there is also fitted an installation of fire alarms by the Aero Automatic Fire Alarm Co. The great feature of this system is an automatic device for detecting any sudden rise of temperature or any slow rise that is too long continued. It consists of a small copper tube no larger than a number 14 wire, which is placed on the ceilings of the rooms and wherever the heat of a fire would affect it. The tube contains air at atmospheric pressure, which. when acted on by the heat, expands and generates pressure. This pressure acts on a sensitive instrument containing electrical relays at the central entrance of the extension, where all the tubes are collected, and rings fire gongs and transmits a telegraphic message to the Fire Brigade. In order that the outbreak may be located, the tubing is split up into forty different sections, each independent, and each dropping a different indicator. There are about eight miles of this sensitive tubing in the building.

In conclusion, we wish to acknowledge the help of Mr. W. Stewart (engineer to William Whiteley, Ltd.), and of several of the contractors for the equipment, in supplying us with information, particularly to Mr. H. J. Cash, of the firm who were responsible for the whole of the wiring.

THE TILLING-STEVENS PETROL-ELECTRIC OMNIBUS

WE have on several occasions referred to the progress of the petrol-electric system which Messrs. W. H. Stevens, Ltd., of Maidstone, have been developing, and in ELECTRICAL ENGINEERING, Vol. III., page 83, January 16th, 1908, we gave a complete illustrated description of the first omnibus which was equipped by them for Messrs. Thomas Tilling, Ltd., and has been running continuously in service since that year. The excellent results of this vehicle, especially as regards reliability and low cost of upkeep, have led to the decision of the company to adopt electric transmission gear exclusively for their omnibuses in the future, and an improved model was designed for the purpose on the same general lines as that described in ELECTRICAL ENGINEERING, Vol. VI., page 678, October 27th, 1910. Several of these are now in service, and preparations are already in hand for their manufacture in large quantities. On Monday last a demonstration was given of the steadiness of running, ease of control, and smoothness of starting of one of these vehicles (see Fig. 1) in the presence of a number of well-known men in electrical and automobile circles, who were afterwards entertained to lunch at the Holborn Restaurant by the directors of W. H. Stevens, Ltd.

The Tilling-Stevens petrol electric omnibus in the final form, which is the outcome of experience with the earlier vehicles referred to above, presents an example of an "all-electric" transmission, with no mechanical connection at any time between the engine and the road wheels, thus differing from several other systems which have been proposed or experimented with. The engine simply drives a semi-enclosed shunt-wound generator, while the rear axle is driven through a differential, worm and cardan shaft by a single series-wound electric motor. As is seen in Fig. 2, the motor is immediately behind the dynamo under the driver's floor-boards, but there is no mechanical connection between the two. Mounted between them is a fan carried on the dynamo shaft, which serves to ventilate both machines. The engine, specially designed for the work, has four cylinders, 105 mm. by 125 mm., and is coupled to the dynamo by a spring universal coupling. The dynamo is rated at 25 kw., at speeds from 350 to 1,400 r.p.m., and has been designed with a falling characteristic, so that any increase in the demand for current when the engine is fully loaded is accompanied by a reduction of voltage automatically, so that in combination with the series motor an automatic adjustment of the current and voltage takes place, according to the torque demanded by the conditions, thus giving the equivalent of a continuously variable

FIG. 1.—THE TILLING-STEVENS PETROL-ELECTRIC OMNIBUS.

gear. The control is of the simplest nature imaginable. When the car is ready to start the engine is running at a speed too slow to allow the generator to excite, but the circuit between the dynamo and motor is closed. To start, the "accelerator" or throttle pedal is depressed, the engine speeds up, the dynamo begins to excite, and the vehicle moves smoothly away as the field builds up; further speed regulation is effected almost entirely on the throttle pedal, but on stiff gradients a shunt resistance switch on the steering column is moved to weaken the dynamo field and permit of a higher engine speed. The shunt rheostat can also be so manipulated as to allow the engine to be considerably slowed down when

Hosted by Google

the car is running fast, but not requiring much power, as down slight inclines, with a substantial gain in economy of petrol consumption. The main circuit is never broken except for permanently stopping or reversing, and the pedal controlling the main circuit breaker is interlocked with the reversing lever, so that the latter can only be moved when the circuit is broken, thus preventing current being broken on the reversing controller contacts. This controller, together with the very simply constructed shunt regulator, is placed in a very accessible cast-iron box under the side of the frame. We are principally concerned here with the electrical equipment, but the mechanical design of the chassis, for which Mr. P. Frost-Smith, Chief Engineer to Messrs. T. Tilling, is chiefly responsible, shows as much care in design as does the electrical transmission.

Mr. Richard Tilling (Chairman, Thomas Tilling, Ltd.) was in the chair at the lunch which followed the inspection of the

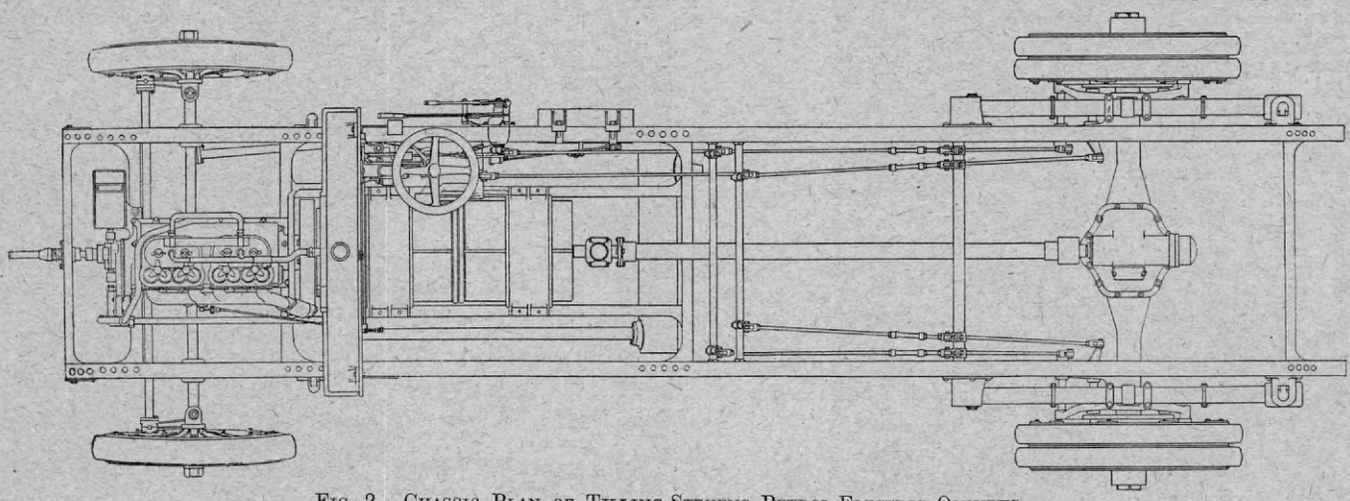

Fig. 2.—Chassis Plan of Tilling-Stevens Petrol-Electric Omnibus.

vehicle, and, in proposing the motor-omnibus industry, referred to some of their early troubles with geared vehicles, and to their friendly relations for the last fifty years with the London General Omnibus Co. They had now, in conjunction with Mr. Stevens, evolved a vehicle which was not only lighter, more silent, and more smooth running than its predecessors, but was considerably more economical, and they had made arrangements to build them in quantities at a works covering some 34 acres in the Midlands, to which Messrs. Stevens were removing from Maidstone. They were prepared to supply them to anyone, and to start with Messrs. Tilling had ordered 100 for their own use.

Mr. Duff (Joint Manager of the London General Omnibus Co.) replied, and emphasised particularly the advantage of having as few different types of vehicle as possible to look after.

Mr. W. A. Stevens then rose to propose the visitors, and outlined the general features of the omnibus which we have described above. He also paid high tribute to the work of Mr. Frost-Smith, without whose collaboration they could not have produced a vehicle to satisfy both traffic and police requirements.

Prof. W. C. Unwin (President of the Institution of Civil Engineers) and Mr. Louis Brennan replied to the toast.

Col. R. E. Crompton, in proposing the operating engineers, praised the work of Messrs. Tillings' engineering staff, and expressed his admiration for the shockless acceleration and the great overtaking power of the vehicle they had just seen, which would go far to relieve the congestion of street traffic.

Mr. P. Frost-Smith replied, and in the course of his speech remarked that in 1910 their expenses totalled 10·5d. per car mile, whereas the vehicles of the new type were now costing about 8d. per mile, and when running in quantity should lower the figure to 7½d. The great advantage was the reduction of maintenance expenses, a more important matter than the cost of fuel. Again, the depreciation would be much less for the electrical machines than for gearing. They had now been enabled to dispense entirely with their night repairing staff, and ran each 'bus for nine or ten days, after which it was overlooked in the day time, when much better work could be done.

Mr. P. Ellison (Chief Engineer, Eastbourne Corporation Omnibus Department) also replied.

Mr. W. M. Mordey, in proposing the Press, expressed his admiration for the smoothness of starting obtainable by electric transmission, which was better than they could ever get with the most perfect clutch, and prophesied that electrical methods would displace all forms of mechanical transmission for this class of work.

After this toast had been responded to, Dr. H. S. Hele Shaw proposed the Chairman, who fittingly replied.

ARC LAMPS FOR PHOTOGRAPHIC PURPOSES

SEVERAL new developments in photo-printing arc lamps have been made recently by the General Electric Co. (67 Queen Victoria Street). We understand that these lamps have now been sold in considerable numbers to process and photo engravers, cinematograph film-makers, printers, and photographers, whilst a recent further use for these has been found by lace-makers, who employ them to take blue prints of lace for travellers' use, the patterns, of course, being reproduced to the exact scale, besides which they are largely used for taking the photos of articles for catalogues, independent of daylight, giving much more artistic prints, when sepia ink is used, than can be produced by the blue print process.

Two types are supplied, viz., the enclosed type (see Fig. 1), emitting rays of high actinic value, and the open type (see Fig. 2), with spectrum especially suitable for colour work. For printing from negatives and tracings, the enclosed type is recommended, either medium or high power, according to the rapidity of exposure required. A 1,200-watt 200-volt lamp

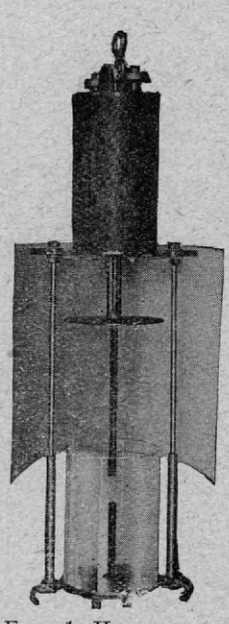

Fig. 1. High power enclosed lamp, showing globe dropped for trimming.

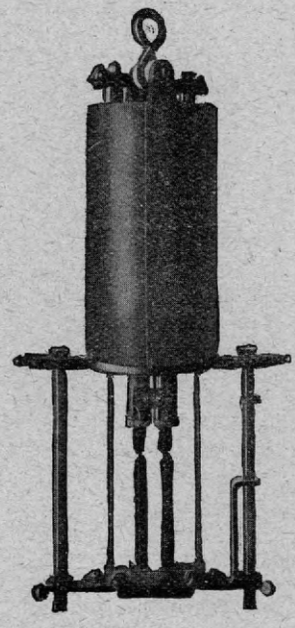

Fig. 2. Double carbon open type lamp.

will print four sheets of ordinary blue paper in flat frames, each 40 in. by 25 in., in ten minutes, at a cost (reckoning 3d. per unit) of a fraction over a halfpenny. Using a printing cylinder, 2,520 sq. in. can be printed in 3½ minutes, at a cost, on the above basis, of slightly under one farthing. For portraiture, enclosed lamps are advised. The best results are obtained by using two lamps—one a fixture and the other

Hosted by Google

used in conjunction with a suspension gear, movable so as to alter the direction of the light thrown upon the object. The company has recently designed a double arc open type lamp to meet the ever-increasing requirements of process work. This lamp, which is shown in Fig. 2, will give equally good results with all three colours, and by means of a special arrangement, the light from the crater is thrown directly on to the object, thereby increasing the efficiency. These lamps are designed for easy trimming, an arrangement for dropping the globes being provided, whereby this can be undertaken even when the lamps are hot, and the risk of broken globes enormously reduced. The bottom carbon-holder is so arranged that perfect alignment of the carbons can be instantly obtained. The lamps are manufactured throughout by the company at "Witton" Works, near Birmingham, all parts being standardised and allowing of easy replacement.

WATERPOWER PLANT AT THE BRITISH ALUMINIUM CO.'S WORKS AT KINLOCHLEVEN

TWO Papers, one entitled "The Loch Leven Water-Power Works," by Mr. A. H. Roberts, and the other, "The Hydroelectric Plant in the British Aluminium Company's Factory at Kinlochleven," by Mr. F. B. Sonnenschein, were read last week before the Institution of Civil Engineers. The first Paper was devoted to the hydraulic arrangements, and described the construction of the Blackwater dam, 3,112 ft. in length, and with a maximum height of 36 ft. This is provided with a valve-tower containing the six valves of the three draw-off pipes, the spindles being carried up to the valve-house above top water-level. The draw-off pipes lead to the upper penstock-chamber, whence the water is delivered over a measuring-weir into the conduit. Water is conveyed to the pipe-track by this conduit, which is 3½ miles in length; it is of square section, 8 ft. by 8 ft., and is laid to a general gradient of 1 in 1,000. The conduit discharges its water into the lower penstock-chamber of about 300,000 gallons capacity, where it is measured and delivered to the pipes as required. From the penstock-chamber water is conveyed to the power-house in six welded steel pipes of 39 in. diameter. The track is 1¼ miles in length, and the fall of 935 ft. yields a normal static pressure of 406 lb. per sq. in. Water is distributed from the six main pipes to the various turbines by a system of pipes comprising two omnibus pipes and six feeders, all of 39 in. diameter. The main valves which control the supply of water to the distributing pipes are of the sluice-valve type, hydraulically worked, and fitted with a mechanical device for controlling the speed of closing. At the top of the pipe-track, immediately below the penstock-chamber, automatic cut-off valves have been installed to stop the flow of water in the event of a burst occurring on the main pipe-lines. At the summit of a slight elevation in the main line, air-valves have been fixed to allow large quantities of air to pass in or out, as required, when filling or emptying pipes.

The plant in the power-house was dealt with in the second Paper. The aggregate power installed is 30,660 h.p. at the generator couplings, the generators being capable of a maximum output of 21,088 kw. Nine main units and two exciter units are erected, each unit consisting of a turbine and two generators. The main turbines are of the Pelton-wheel type, supplied by Messrs. Escher, Wyss & Co., with two water jets, and are designed to develop 3,200 B.H.P. each at any head between 870 ft. and 925 ft. when running at any speed between 300 and 330 revolutions per minute; the guaranteed efficiency at 2,900 B.H.P. is 80 per cent. Each drives two generators coupled in parallel; these are shunt machines without commutating poles, and have slot-wound drum armatures. The maximum output of each pair of generators is 2,200 kw. when running at 275 volts, and the guaranteed efficiency is 93 per cent. at 2,000 kw. self-exciting. They were supplied by Messrs. Dick, Kerr & Co. The two small exciter units are also of the Pelton-wheel type, each driving a pair of generators on one shaft. These consist of an exciter and lighting machine, capable of giving an output up to 550 kw., and a traction machine up to 94 kw. capacity. Each pair of main generators driven by one turbine are connected in parallel, with their leads coupled together through links to its own series of furnaces. A pair of bus-bars run down the power-house, which can be connected through links to any main unit, and to any series of furnaces. This allows of any set being taken off load without shutting down its series of furnaces, as they can be supplied with power through the bus-bars from any other pair of generators available.

The feeders and distributors for transmitting electrical power to the village and to the auxiliary plant consist of bare stranded aluminium cables erected on poles and varying in section from 169/0·085 cable (0·96 sq. in.) to 1/0·144 (No. 9 S.W.G.) wire. The poles are spaced to give spans not exceeding 40 yards, and at this length of span the cables have a sag of 16 in. at 60° F. The straight-through and tee-joints in the feeders and distributors are of the autogenous-weld or cast-type, but the house-service and public-lighting leads are connected to the distributors by mechanical clamps made of aluminium with aluminium-bronze bolts. The total length of feeders and distributors is nine miles.

The latter part of the Paper describes the tests which were taken after the plant was erected to ascertain whether the plant fulfilled the conditions of the specification as regards output, consumption, efficiency, and governing. It was found during the tests that the generators were liable to flash over if the voltage increased excessively, and that they were also liable to flash over if a circulating current flowed round the two armatures of the dynamos on the same shaft running in parallel, when load was thrown off. An electrical protective device was therefore designed and fitted to each pair of generators, which automatically breaks the field-circuit when either of these two conditions arises.

The consulting electrical engineers were Messrs. Kennedy & Jenkin.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

CREOSOTED WOOD.—A leaflet from R. Wade & Co. illustrates sections of poles, sleepers, &c., creosoted by the Rüping process, showing the great penetration obtained. A blotter accompanies the leaflet.

ACCUMULATORS.—Full details and prices of the large variety of batteries, cells, and accessories made by the Hart Accumulator Co., Ltd. (Stratford, London), are clearly set out in a neatly bound volume, which they have just issued. These include 25, 50, 60, and 100-volt types for lighting, as well as a smaller type for motor-car lighting and ignition work. A range of portable batteries from 2 to 12 volts is listed, and instructions for working and erecting the batteries are also given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC HEATING.—A booklet is being circulated by the City of London Electric Lighting Co., Ltd., pointing out the advantages of electric heating, and describing various patterns of radiators, water heaters, cooking appliances, irons and pans which the company are prepared to hire out.

LANTERNS.—A card from Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), gives some particulars of a new pattern lantern for outside and shop window lighting. These are supplied in all sizes suitable for lamps of 50 c.p. to 1,000 c.p. or for eight 50-c.p. lamps, and can be had in aluminium, and polished or oxidised copper.

KALKOS CONDUITS.—The Sun Electrical Co., Ltd. (118 and 120 Charing Cross Road, W.C.), have issued a catalogue relating to the Kalkos system of wiring without condensation, which has often been mentioned in this column. The demand for this material is so great that substantial reductions have been made in a number of the standard fittings. This catalogue will be sent to any of our readers on application to the firm.

Finsbury Technical College Old Students' Association.—At the annual general meeting, Mr. E. W. Moss was appointed to the new office of Honorary Assistant Treasurer, and all subscriptions should be forwarded to him at 20 Huddlestone Road, Tufnell Park, N. The annual dinner will be held at the Trocadero on December 9th, with Mr. R. J. Wallis-Jones in the chair. The annual dance will be held at Caxton Hall on February 3rd, 1912, and a smoking concert is to take place during March. A dining club has been formed among members of the Association, with the object of dining together once a month. Particulars can be obtained from Mr. H. W. Gregory, 1 Atherton Road, Forest Gate, E.

Manchester Municipal School of Technology.—The fourth volume of the journal of the school contains, among other papers on technical subjects, a reprint of a paper, by Mr. C. F. Smith, on single-phase motors, and Prof. Schwartz's paper on testing of rubber, read recently before the Institution of Electrical Engineers. A paper by Prof. W. W. H. Gee and Mr. F. Brotherton, on the resistance of the human body, is also reprinted, and a Faraday Society paper, by Prof. Gee and Mr. W. Harrison, on the electrical theory of dyeing, is also included. Other papers read before the Institution of Electrical Engineers reprinted in the volume are :—The high-tension spark discharge in air, by P. Kemp and W. A. Stephens, and the irregularities in the rotating field of the polyphase induction motor by Mr. C. F. Smith.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 16, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

26,124/10. **Coupling for Cables.** H. R. Doel and A. E. Clarke. A cylinder with a threaded exterior and a tapered interior receives one side of a tapered metal bush of circular bore for taking the cable, the other side being reversely tapered to take a nut with a tapered bore, and threaded on the exterior for screwing on to the cylinder. The bush is slit down its entire length, and a corresponding opposite groove is also made to weaken it, so that when the nut is screwed on it gives to the pressure, and grips the cable firmly. Three figures.

8,998/11. **Electric Furnace.** W. E. Lake (*Florence*). The crucible portion is made of a more highly resisting material than the body portion of the furnace, and the former is broader and higher than the latter. The advantage of this, is that when the current is forced through the furnace it first passes through the crucible wall and heats it to incandescence while the body is comparatively cool. The crucible is lined with a material which is only a conductor when it is highly heated, the idea being that it absorbs the current and tends to maintain the voltage constant. Low resistance terminals are provided, which make and break the circuit on tilting the furnace.

9,806/11. **Lamp Reflector.** E. and N. R. Booth. This takes the form of a curved piece of sheet metal, the edges of which are bent over to form grooves for taking a thin sheet of flexible material with a high reflecting power, such as blotting paper. This is held in position on the lampholder by a metal lug riveted or soldered to the metal sheet. One figure.

21,662/11. **Protective Systems.** British Thomson-Houston Co. and J. Whitcher. The object of this patent is to provide means of overcoming the effect of the capacity current due to the long pilot wires, &c., of a balanced feeder protective system. For this purpose a compensating winding is applied to each trip coil. This can be a separate winding, or the main winding of the coil may be tapped at a point which is connected to one end of each series transformer, so that the current flows through one part of the winding in the opposite direction to that in the other part. The trip coils can be connected either in series or in shunt with the transformers at the ends of the feeder. Three figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Electrodes] 17,723/11.

Distributing Systems, Cables, and Wires: Becker [Reducing energy lost in lines with electro-magnetic equalising] 65/11; Shuttleworth [Joint for cable troughs] 2,765/11; Cheese [Flexible conductors] 17,387/11.

Dynamos, Motors, and Transformers: Fawcus [Cooling dynamos] 25,036/10; Vandervell and Midgley [Variable-speed self-regulating dynamos] 25,588/10; Macdonald [Motors] 4,286/11; Haefely [Transformers] 20,523/11.

Electrochemistry: Elektrochemische Werke Ges. and Rothe [Disc-like flaming arcs for gas reactions] 13,335/11; Elektrochemische Werke Ges. [Electrolytic production of ammonium nitrate] 16,426/11

Incandescent Lamps: Phillips and Phillips [Means for supporting] 3,526/11

Switchgear and Fittings: Parkes [Ceiling roses, &c.] 25,478/10; Price [Rotary switch construction] 28,501/10; Smithson and Sharpe [Lamp suspension apparatus] 29,314/10; Clapham [Electric plug couplings] 16,935/11.

Telephony, Telegraphy, and Signalling: Wanisch [Automatic telephone systems] 25,243/10; Cassel [Signalling system] 25,318/10; De Freystadtler [Block-signalling system] 342/11.

Traction: Monard [Railway point and signal control] 10,740/11.

Miscellaneous: Maddick [Electric lighting of pictures] 25,371/10; Tate [Electric horns] 25,858/10; Thomas [Intermittently illuminating signs] 25,877/10; Justice (*Soc. Anon. Electricité et Electromecanique*) [Electrically-driven drilling apparatus] 27,701/10; Electric Construction Co. and Jay [Rotary fan construction] 5,924/11; Menns [Magnetic speed indicators] 9,575/11; Rushmore [Systems of electric lighting] 14,478/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Incandescent Lamps: Carangelo, 23,725/11.

Switchgear: Murray [Cut-out for meter testing] 18,763/11.

Telephony: McBerty [Semi-automatic exchange systems] 23,508/11.

Traction: Peffer [Trolley-pole attachments] 22,295/11.

Miscellaneous: Trautmann and Mayer [Charging accumulator plates] 23,439/11; Soc. Electro-Industrielle et Anciens Etablissements Mathieu Réunis [Sterilising apparatus, &c.] 23,828/11.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

27,598, of November 24th, 1897. **Fusible Cut-outs.** G. Byng. In order to minimise danger from arcing, the fuse wire is led through a chamber lined with a refractory material, such as plaster of Paris, which will not volatilise at the high temperature of the arc. In a modification the fuse wire is led through a suitably lined tube or handle.

28,225, of November 30th, 1897. **Tramway System.** W. M. Brown. A surface contact system in which the magnet carried by the vehicle has two windings, one of high resistance connected to both sides of the circuit, and the other of low resistance in series with the motors. A battery, which can be thrown in by a foot switch, is also provided, so that the magnet may be excited in the event of the line current being cut off temporarily. The battery can be charged while current is being delivered to the motors.

28,159, of November 30th, 1897. **Train Lighting System.** S. Watkins. In this system, the generator is carried on the car axle, and means are provided for automatically regulating the current under all conditions, and for maintaining the direction of the current constant when the rotation is reversed. The latter is done by gearing to the dynamo a shifting helix with two circumferential grooves, engaged by a spiral groove forming reflecting shoulders at the point of intersection. This actuates a sliding lever, having a fixed stud with a spring-actuated sleeve, which operates suitable mechanism for changing the polarity of the external circuit. A bearing sleeve to facilitate the mounting of the parts on the car axle is also described.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: T. L. Carbone [A.-C. type] 15,591/05.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Insulation] 15,770/05, and [Distribution] 17,561/06; Land-und Seekabelwerke Akt.-Ges. [Cables for mines] 9,176/07.

Dynamos and Motors: B. G. Lamme [A.-C. commutator series motor control] 5,507/07; F. M. Meyer [Coupling for driving shafts in either direction] 17,783/07; J. Arenas y Garcia [Armatures and field magnets of D.-C. homopolar machine] 25,350/07.

Electric Ignition: J. C. & G. Fuller and B. J. Moore, 17,601/06.

Incandescent Lamps: E. Bohm [Bulbs, &c.] 15,996/05; A. and G. J. Bonnella, 17,309/07.

Switchgear and Fittings: R. T. Preston and H. E. Theobald [Lamp holders] 17,346/07; G. Harding [Switches for electric bells] 17,584/07; H. J. Dowsing [Switch] 17,661/07; C. E. Hunter and W. H. Warren [Switch] 17,707/07; G. C. Fricker [Switches for advertising devices] 17,796/07.

Telephony, Telegraphy, and Signalling: P. M. Justice (*Rowland Telegraphic Co., U.S.A.*) [Electric telegraphs] 15,475/01; V. H. and H. E. A. C. Donnithorne [Locating sound signals] 17,264/07; J. & W. Mladek and K. Samal [Telegraph relays] 17,332/07; W. E. Lake (*H. B. Newhall*) [Wire supports] 17,683/07.

Traction: Siemens Bros. & Co. and L. M. G. Ferreira [Electric signal indicators] 16,894/04.

Miscellaneous: R. H. Wappler and C. F. Fayer [X-Ray interrupter] 17,308/07; A. S. Hickley [Electrolytic current rectifier] 17,457/07, and 17,458/07; W. Fennell and W. P. Perry [Thermo-electric couples] 17,490/07; P. E. Trainor [Electrically-propelled vehicle or boat] 17,526/07; McVittie [Safety-suspending apparatus for lifts] 17,660/07.

Hosted by Google

ELECTRIC TRACTION NOTES

The important announcement is made that the London and North Western Railway Co. propose, in connection with their Watford-Euston electric railway, to connect up with the North London Railway to Broad Street, and run a through service of electric trains upon these lines. This scheme is in order to accommodate the large number of London & North Western passengers now using Euston and who want to get further into the City. Another development in electric traction in London is the proposal of the London Electric Railways Co. to link up the whole of their tube railway system with the London & North Western Railway Company's system, and also to extend the Baker Street & Waterloo Railway to Queen's Park. In this way, by the use of a special type of carriage, it is anticipated that through connection will be given from Watford to Paddington, Marylebone, Baker Street, Oxford Circus, Piccadilly, Charing Cross, Waterloo, and other stations on the Baker Street and Waterloo lines. A lengthy official statement has been issued with regard to the scheme, but it gives no information as to the system of traction which has been adopted. On the Watford line, however, the continuous current third rail system is being adopted, and it is reasonable to conclude that this will be employed throughout if the extended scheme is sanctioned. An application is to be made to Parliament by the London Electric Railways Co. and the London & North Western Railway Co., authorising them to enter into agreement for the carrying out of the above scheme, which involves some forty miles of railway. Another important proposal is by the Central London Railway Co. for the construction of a line from Shepherd's Bush to Kew, Isleworth, and Hounslow, Hanwell and Ealing, joining up with the extension of the company's lines to that point which is now under consideration.

Among the other important electric traction schemes which will be promoted in the next session of Parliament may be mentioned proposals by the Stockport and Sheffield Corporations for powers to use trolley omnibuses, and another for the incorporation of the North Ormesby, South Bank, Normanby, and Grangetown Railless Traction Co.

The Board of Trade inquiry into the accident at Accrington upon the Rawtenstall tramway system referred to in our last issue, was held on Thursday. The driver's evidence was to the effect that the car had been running satisfactorily all day, and he could give no reason for the accident. The conductor and an inspector both stated that just before the car ran away, there was a smell of burning rubber. The Manager of the tramways stated that he found the shunt coil of No. 1 motor had gone, with the result that the motor could neither drive nor generate. It would be, however, difficult for a driver to realise what was the matter in so short a time, and with the rails in their greasy condition, the best brakes in the world would have failed to hold the car in check on such a gradient.

The Royal Commission appointed to inquire into the railway and tramway systems of Melbourne and its suburbs have issued a report. Among the more important recommendations are the conversion to electric traction of the Flinders Street-Richmond cable tramway, the Hawthorne and Kew horse tramways, and Camberwell and Caulfield railways. It is also recommended that the suburban railways be electrified, and that a State power station be established, capable of providing the necessary electric power, in addition to giving a supply of electrical energy for other public and private purposes. It is recommended that the overhead trolley system be adopted on the tramways. The full report may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, E.C.

According to the *Board of Trade Journal*, the Anglo-Argentine Tramway Co. have placed an order with a German firm for the construction of subway tramways in Buenos Aires. Three additional lines will be built later.

It is stated that a syndicate has been formed at Middlesbrough for running trolley omnibuses from Middlesbrough, through Grangetown, to Eston.

A company have approached the local authorities concerned, with regard to a trolley omnibus scheme between Leeds and Ilkley.

It is stated that the Cheshunt Council are considering the adoption of a trackless trolley system between Waltham Cross and Turnford. If this scheme is approved, it will, of course, be carried out by the Metropolitan Electric Tramways, Ltd.

The Newcastle Corporation recently placed an order for

ELECTRICAL INSTALLATIONS

Being a Compendium of information on Electric Light, Power Traction and Industrial Electrical Machinery.

By RANKIN KENNEDY, C.E.

The necessity for electrical engineers being well acquainted with all designs for installations that have given good results will be readily acknowledged by those whom the matter concerns.

While there are numerous text-books dealing with one branch or another of electrical engineering, they are all prepared for the student, and their contents deal rather with theory than with practice.

The aim of "ELECTRICAL INSTALLATIONS" is to assist the practical man who is concerned with electrical installations in any form, and this because it is recognised that there exists a very large class engaged in constructive and installation work, and a still larger class whose duty it is to take care of the machinery employed in working by electricity. Most of these men have picked up a working knowledge of their employment. What they need is to study the elements of the science of the subject. These elements are fully treated of in the first volume; and on the sound foundation thus laid, the author, who is a civil and electrical engineer by profession, and recognised as being in the front rank of electricians and engineers, proceeds to deal with every possible form of electrical installation, their principles and practical application.

This work describes and illustrates the best practice in all branches of the electric light and power installation business; the last volume treats of all the lighter branches of electrical manufactures—telephones, wireless telegraphy, and kindred subjects.

This second and revised edition of the work justly claims to have brought all subjects up to date with descriptions and information regarding recent machinery and apparatus. The matter has also been re-arranged so that all information relating to one subject follows consecutively.

The illustrations number 1,000, and there are eight fine plates in each volume. In addition, each plate contains a coloured cardboard sectional model of an electrical machine in four sections superposed.

TWO OPINIONS:

Mr. PONTECORVO, Engineer, The British Westinghouse Electric Co., Ltd., Manchester:—"The work is very clear in its explanations, and gives, by means of well illustrated experiments, a complete idea of the electrical phenomenon. The chapter with hints as to how to build experimental apparatus seems particularly useful. Printing and illustrations are clear and accurate."

Mr. A. H. SHAW, M.I.E.E., A.M.I.Mech.E., Manager Ilford Electricity Supply and Tramways, Ilford:—"I consider this work is all you claim for it. The matter is clear and up-to-date, and the diagrams and plates are particularly good. The article on supply meters should prove very useful. This is a work that everyone engaged in the practical applications of electricity should have access to."

A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,
97, Surrey Street, London, W.C.

Please send me, free of charge, and without any obligation on my part, Illustrated Booklet on ELECTRICAL INSTALLATIONS, and particulars of your plan whereby the volumes are delivered for a first payment of 1s. 6d.

600 tons of tram rails with an American firm, and some questions have been asked locally as to why the order was not placed in England. According to the Chairman of the Tramways Committee, these rails are for some very heavy gradients, and were made to an exceptional specification, which, we gather from the reported statements of the Chairman, English firms would not adhere to.

In consequence of the objections of the Borough Councils, the Highways Committee of the London County Council have abandoned for the present year the proposed tramway from Marble Arch to Cricklewood.

The arbitration concerning the purchase of the Hammersmith lines of the London United Tramways, Ltd., has been continued daily since our last issue. Mr. H. F. Parshall gave evidence for the company, in which he agreed with everything put forward by Mr. Sellon. Evidence was also given on behalf of the company by Mr. H. E. Blain, General Manager of the West Ham Corporation Tramways, and Mr. Leslie Vigers, the latter dealing with the valuation of the land and buildings. On Friday the case for the L.C.C. was opened by Mr. C. C. Hutchinson, who drew special attention to the fact that out of a total claim of £386,443 nearly £210,000 was in respect of the Chiswick Power House, which he said it was obvious the company was very anxious to get rid of. His construction of the clause of the Tramways Act of 1870, under which the purchase is taking place, is that anything that is not necessary could not be included in the property which was to be purchased. The Chiswick Power Station was used at present for a mileage several times greater than that of the Hammersmith lines, and could not, therefore, be said to belong wholly to the Hammersmith undertaking. The first witness for the County Council was Mr. J. H. Green, who valued the land upon which the Chiswick depôt and Power Station is situated at £1,800, as compared with £3,500 claimed by the company. Mr. J. K. Bruce, Deputy Chief Officer, L.C.C. Tramways, estimated the number of cars required for the Hammersmith service at thirty on the average, and, allowing for the maximum load, he put the required number at thirty-six. From a number of checks made on various days by counting the cars going into the Hammersmith area, he said that there were usually about thirty-three cars, the maximum number being forty on Whit Monday. Mr. W. E. Ireland, Superintendent of Rolling Stock, L.C.C. Tramways, said that while the company's cars were well painted, they were in a bad condition generally. It is possible that the arbitration will conclude next week.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

An exhibition of a working model of the automatic telephone system of the British Insulated and Helsby Cables, Ltd., was given at Donington House yesterday. We hope to deal with this more fully in our next issue.

An application to prolong the life of Patent No. 809/98, relating to automatic telephone systems was to have come before the Court of Chancery on Tuesday, but at the last moment it was decided not to proceed with it. The patent, which will expire on March 19th, 1912, describes the finger-plate calling device used on the Strowger automatic telephone system.

Some extremely interesting experiments on the magnetic properties of iron at high frequencies, made with an alternator generating at a frequency of 200,000 cycles per second, are described by E. F. W. Alexanderson, in the *Elektrotechnische Zeitschrift* of Oct. 26th last. This machine was designed especially for use in connection with wireless telephony, and the experiments are of more than theoretical interest. The iron armature has 800 slots, and generates at 90 volts. The rotor runs at 20,000 r.p.m. Experiments on a wound ring of iron strips of 0·076 mm. thickness showed that the true permeability of the iron remained practically constant, even up to the maximum frequency of 200,000 cycles per second. The magnetising current decreased with increased frequency, in spite of the very strong "skin effect" which caused a very rapid apparent saturation of the iron at the high frequencies. The apparent permeability at 200,000 cycles was only one-tenth of that at normal frequencies. At this frequency the highest flux density that could be produced was 1,200 lines per sq. cm. (with an effective magnetisation of 2·9 ampere-turns per cm.). The article concludes with a series of designs for high-frequency transformers with iron cores. A 5 kw. transformer at 200,000 cycles is stated to weigh less than one-twelth of a 5 kw. 60 cycle transformer, and to have an efficiency of 98·3 per cent., as compared with an efficiency of 90 per cent for the 60 cycle transformer.

The Engineering Standards Committee have just issued a report (No. 55) on a research into the mechanical properties of hard-drawn copper and bronze wires, which has been carried out at the National Physical Laboratory, with the assistance of the General Post Office and the National Telephone Co., with a view of obtaining some independent data in regard to the breaking stress of hard-drawn wire of small diameter, used for telegraph and telephone purposes. The experiments include investigation into the variation of mechanical properties of these wires due to difference of make, variation in diameter, length, and temperature, as also variation of strength due to the kinking of the wire, which latter defect apparently has a more considerable influence on the strength of the wire than has hitherto been appreciated. The figures for the moduli of elasticity clearly evidence the influence of kinks in the wire. A comparison between the modulus of elasticity as calculated on 50-ft. lengths and as calculated on a short, straight length brings this point out very distinctly. In conclusion, it is suggested that in view of the effect of kinks, an increase in the diameter of the coils above that in common use is desirable. We shall be pleased to forward copies of the report to any of our readers on receipt of the published price, 10s. 6d.

Reuter's correspondent at Cairo states that the wireless telegraph station at Port Said has now been completed, and is now available for private and commercial messages.

Subscriptions are invited for 60,000 ordinary £5 shares of the Constantipole Telephone Co.

A West Indian cable interruption epidemic has manifested itself during the past week, the cause of which is at present difficult to ascertain. The first failure occurred on 13th inst., the Jamaica-Colon cable of the West India and Panama Telegraph Company having given out, and the repairing steamer *Henry Holmes* is now engaged in restoring it.—The cable between Trinidad and British Guiana, belonging to the same company, was down on 16th inst., and was speedily repaired. —The French Company has been the most unfortunate, for not only was their main cable from New York to Hayti interrupted on the 16th inst., but also the connecting link between Guantanamo, Cuba, and Mole St. Nicolas, Hayti, this necessitating the transmission of all telegrams for Hayti, San Domingo, Venezuela, Curaçao, and Martinique *viâ* Key West and Guadeloupe at largely increased rates. But further trouble has also followed by the failure of the main cable from Martinique to Paramaribo, Dutch Guiana, and also the connecting link between the latter place and Cayenne, French Guiana, so that Dutch Guiana is entirely cut off from telegraphic service, and French Guiana can only be reached *viâ* the lines of the Western Telegraph Company.—The *Pouyer-Quertier* of the Compagnie Française des Cables Télégraphiques is likely to have a busy time for a while.—On the 18th inst. the cable between Saigon and Haiphong (China), belonging to the Eastern Extension Telegraph Company, broke down.—The Pontianak-Saigon cable has also followed suit by taking a rest on 20th inst. The telephone will be used between these two places.

The "Cole" Code.—We regret that in our review of the Cole Code on page xxxvi of last week's ELECTRICAL ENGINEERING Literary Supplement, the name of the publisher given was incorrect. The Code is published by The Advertiser, Limited, Rugby; and the wholesale agents are Sir Isaac Pitman and Sons, Ltd.

Drawn Filament Lamps.—The Deutsche Gasglühlicht Akt.Ges. (Auergesellschaft), the original manufacturers of the Osram lamp, have placed on the German market a complete series of lamps with drawn tungsten filaments, including a 10 (Hefner) c.p. lamp for 100–140 volts, and a 16 (Hefner) c.p. lamp for 160–260 volts. The former takes 1·2 to 1·3 watts per candle, the latter 1·25 watts per candle. The Allgemeine Elektricitäts-Gesellschaft also supply drawn filament lamps in all sizes except the 10 c.p., and both concerns have just reduced the prices about 25 per cent. Thus the 16 to 50 c.p. 100/130 volt lamps now cost 1.5 mark (1s. 6d.) instead of 2 marks, and the 25, 32, and 50 c.p. 200/250 volt lamps 2.5 marks (2s. 6d.) instead of 3.5 marks. According to the *Elektrotechnische Zeitschrift*, it is expected that Siemens & Halske will shortly also reduce their prices. This firm, according to the above journal, have stated that the American licencees of the tantalum and "Wotan" drawn tungsten lamps, have succeeded in developing a new and cheaper method of manufacturing drawn tungsten filaments, and that, by virtue of certain agreements, Siemens & Halske, the Allgemeine Elektricitäts-Ges., and the Auergesellschaft are all now entitled to manufacture under the patents covering this new process.

ELECTRIC HEATING AND COOKING

MR. S. L. R. PRICE, in his inaugural address as chairman of the Dublin Local Section of the Institution of Electrical Engineers, on Friday, November 17th, chose as his subject a general survey of electric heating and cooking. After referring to the conservatism that often bars the way to a realisation of the advantages opened up by new methods, and speaking of the value of showrooms run by the supply authority in educating the consumer, he passed on to the heating of rooms, distinguishing between the radiation and convection methods. He pointed out the disadvantage of the ordinary open fire method of heating, with its attendant draughts caused by cold intake air in the lower part of the room, and the lack of circulation of the air near the ceiling. For satisfactory heating, the aim should be for a maximum of air to be brought into contact with the heaters, with a minimum tendency to flue action, thus promoting gentle lateral currents of warm air. It was important not to concentrate the heating apparatus at one point in a room; four 250-watt radiators at different parts of a room had much more effect than one 1,000-watt radiator. The electric heater had a steadiness of heating unapproached by the coal fire, and a great advantage in not requiring attendance. Results of a comparative test were given, showing that the temperature of a certain room was raised from 45·2° F. to 52·8° F. in one hour and forty minutes by coal, with a fuel cost of 1·25d., while in a similar case the temperature was raised by electric heating from 52·6° F. to 57·6° F. in two hours, at a cost of 2d. for current.

Passing on to electric cooking, he said that the great stumbling-block was the provision of an adequate supply of hot water for domestic purposes. He outlined the work done in the Therol system of Messrs. Spagnoletti in this direction (see ELECTRICAL ENGINEERING, October 19th, Exhibition Supplement, p. 91), but finally recommended that water heating should be kept distinct from cooking, and effected by coke-fired boilers. The cooking problem itself was dealt with in the cheapest and most effective manner electrically. Instead of having a kitchen fire burning from about 6.30 a.m. to 9.30 p.m. to deal with three meals, at a cost of about 9d. a day for fuel, the various operations could be performed electrically, each unit being switched on and off as required, at a cost for current (at 1d. per unit) of 6d. per day, to which 2d. for the supply of hot water should be added to make the comparison complete.

Electric ovens as at present constructed were usually too flimsy to be of real use, and the lagging required to be improved. Relying on a polished surface to keep the heat might be more or less sound in theory, but was not so satisfactory in practice. Self-contained vessels were not such as would withstand the conditions to which they would be subjected for any length of time. The hot-plate must be the solution, but it must be capable of taking ordinary utensils without specially planed bottoms. Comparative curves were shown to show the relative speed of heating up of various patterns of apparatus, and several commercial forms of cooker were described. Finally, some comparisons with gas-heating were given showing that, under everyday conditions, the difference in cost between gas and electric cooking was very slight, and when to electric cooking had been added the advantages of convenience, cleanliness, and general adaptability from an economic standpoint, there could be no doubt as to its advantages over gas.

ELECTRICAL ENGINEERING LABORATORIES

A PAPER entitled "The Function of the Laboratory in the Training of an Engineer, with a short account of some New Laboratory Equipment," was read by Prof. E. W. Marchant at a joint meeting of the Manchester Local Section of the Institution of Electrical Engineers last week. Knowledge gained by experience, he said, was real knowledge, and was not soon forgotten or lost, and it was with the object of instilling some of this real knowledge about materials and machines that the laboratory had been created. The chief functions of the laboratory were: to teach the art of deduction from experiment and to give a practical knowledge of the operation of the machines with which the laboratory is intended to deal. It was not necessary that the machinery should be of great size; with small machines the student could be given a freer hand in the connection and arrangement of the apparatus. It was, however, sometimes possible for students to participate in tests on outside plant of large power. In the larger laboratories, such as those in Germany, too little was left to the student to do.

In some cases the student appears to be set a definite routine in his laboratory course, the organisation of the laboratory work appears to be almost military in its precision, and the inevitable result, as far as the English student is concerned, is to deaden his intelligence and make him a far less useful member of the engineering profession than he would have been had he been given greater freedom and allowed to act on his own initiative.

In many modern laboratories the teaching of the art of deduction from experiment seemed to have been lost sight of, and their function perverted into a training in the art of reading instruments correctly and drawing curves. The training which the laboratory gives was mainly in methods of analysis, and it was a matter for discussion as to how much of a student's time should be spent in work of this kind and how much in the constructive design which it will be his main business to achieve in his subsequent career. Although one of the most valuable purposes to which the laboratory could be put was for research, it was in most cases the carrying out of the work that was of the greatest value and not the result. Research work should not, in the author's opinion, be required from more than a small proportion of engineers in training.

The latter part of the Paper gave some descriptive notes on plant recently added to the equipment of the electrical engineering laboratories of the Liverpool University, dwelling particularly on a set designed for testing induction motors, consisting of two four-pole three-phase induction motors, one with a squirrel-cage rotor, and the other with slip-rings coupled up to two D.C. machines. A three-phase Westinghouse rotary converter had also been presented recently to the laboratory by Mr. Edward Whitley, and a specially designed 30-kw. high-speed motor generator was another new addition. Suitable switchgear has been provided for all these machines, and the laboratory has recently been equipped, through the generosity of Sir William Hartley, with a complete installation for wireless telegraphy.

MUNICIPAL WIRING POWERS

Among the clauses in the Sheffield Corporation's Bill, which is to be promoted next session, we notice one seeking powers to enable the Corporation to sell, let for hire, and fix any electric fitting for lighting, motive, or other purposes. This would rather indicate that the Sheffield Corporation, in spite of its defence of the action against it by the Electrical Contractors Association, is itself in doubt as to the legality of its position in at present maintaining the municipal wiring department. The action by the Electrical Contractors Association is expected to start very shortly, and in the event of the decision being against the Corporation, it may be anticipated that the Contractors Association will strongly oppose the Bill in Parliament.

Another Bill of interest in this connection is being promoted by the National Electric Construction Co., Ltd., in which it is sought to give Parliamentary authority to the agreements between the company and their predecessors the National Electric Wiring Co., Ltd., and some twenty-five local authorities throughout the country, by which the latter make an extra charge for current to cover the cost of the wiring. At Canterbury last year it was decided that a local authority, without specific Parliamentary authority, could not make such a charge.

Electrical Driving of Textile Factories.—An address on this subject was given recently before the Belfast Association of Engineers by Prof. Stanley. Last year, he said, not more than about 300 motors were in use for textile mill driving, whereas they were now being installed by hundreds, and one firm alone had delivered 2,000 since January, and had in hand inquiries for a further 5,000. In Germany there were over 50,000 loom motors at work. He pointed out the differences between group and individual drive, favouring the latter for most purposes. Three-phase induction motors were, in his opinion, the best for most spinning or weaving machinery, but for printing machinery he preferred D.C. and for spinning frames single-phase repulsion motors. Three-phase motors were now made dust-proof, and with ball bearings were most easy to control and gave a steadier drive than any other method. He emphasised the importance of selecting a size of motor suitable to the work. The general advantages of electrical driving in simplicity, flexibility, reliability, compactness, &c., were dwelt on, as well as the increase in production available, which in one Lancashire mill had been from 12 to 18 per cent. The improved quality of the work was also referred to. In conclusion, he dealt with power supply, and said that the time was ripe for starting a large power supply scheme in the north of Ireland. Several speakers joined in the discussion, in the course of which Mr. Pegg gave some particulars of a power scheme with peat fuel, where the generating costs were 0·6023d. per unit.

LOCAL NOTES

Abingdon: *Electric Supply.*—A committee has been appointed to inquire into the desirability of having an electric supply undertaking.

Cheltenham: *Electric Supply.*—The Cheltenham Rural District Council have given consent to the Cheltenham Corporation to extend their electric supply mains into a number of districts in their rural area.

Derby: *Electric Lighting Extensions.*—The Electric Lighting Committee's proposal to apply to the Board of Trade for sanction to supply electricity to Quarndon has been passed by the Council. The supply will be given by means of overhead wires, and the capital outlay is estimated at £1,300.

Farnham: *Wiring Small Property.*—The Farnham Gas and Electricity Co., Ltd., have received the consent of the Board of Trade and the Council to the system of having one service to supply a group of houses, the supply being carried from one to the other by means of a special cable fixed to the fronts of the houses.

Finchley: *Electric Light Works Assessment.*—The Urban District Council have given notice of appeal with regard to the assessment of the electric light works. The present assessment is £4,300 gross and £1,800 rateable. The appeal will be heard at the next meeting of the Assessment Committee.

Johnstone (N.B.): *Electric Supply.*—The Clyde Valley Electric Power Co., through their affiliated company, the Strathclyde Co., are taking up the question of electric supply in the district.

Leeds: *Electric Lighting Accounts.*—The accounts of the Electricity Department for the half-year to September 30th show that the accession of new consumers is now beginning to counteract the effect of metal filament lamps. The sales to private consumers during the half-year show an increase of £403. The sale of energy for power and heating purposes increased by 847,904 units, and in spite of a reduction on July 1st in the tariff, the income from this source increased by £2,377. The total revenue for the half-year is £2,699 more than that of the previous corresponding period, whilst the working expenses only increased by £65. The financial result of the half-year's working is £1,780 better than that for the previous corresponding period. The net result for the half-year is a deficit of £7,199, but this is purely a misleading figure, as the department depends to a large extent on the demand for light, and the year to which these figures apply represents the summer months.

London: *L.C.C.: Electric Supply.*—In a discussion upon the report by the Finance Committee of the London County Council concerning the future of electric supply in London (ELECTRICAL ENGINEERING, November 16th, page 631), Mr. H. H. Gordon suggested that in order to secure uniformity during the remaining period of the companies' lives, it would be a good policy to loan the companies the necessary money for their extensions, upon the same terms and under the same conditions as it was at present loaned to municipal authorities. He suggested, further, as an inducement to the companies to help in the formation of a comprehensive scheme, that distribution might be left in their hands for a certain period beyond the time when the County Council had statutory authority to purchase the undertakings. Mr. Hayes Fisher said he did not think there would be any unwillingness on the part of the companies to co-operate with the Council, and steps were being taken to set up a committee of members of both political views in the Council, with instructions to make a full inquiry and to obtain expert advice.

Bermondsey: Loan Refused.—The recommendation of the Finance Committee of the L.C.C., set out on page 632 of our last issue, refusing a loan to the Borough Council, for the reasons then given, has been adopted by the County Council.

Lowestoft: *Electrical Exhibition.*—As the result of two visits of the Borough Engineer and Chairman of the Electricity Committee to the Olympia Electrical Exhibition, the Committee have decided to arrange for an exhibition in Lowestoft early next year, for the display of applications of electricity to cooking, heating, and power purposes.

Shipley: *Street Lighting.*—Terms have been arranged between the Highways Committee and the Electricity Committee for street lighting.

Skegness: *Supply of Electricity.*—A resolution by the Chairman of the Council that a special day be set apart for the consideration of the question of electricity supply in the district has been passed.

Sweden: *Electricity Supply.*—The *Board of Trade Journal* states that plans have been submitted to the Stockholm Gas and Electric Lighting Department for a large electric power station at Dalelfven. The cost of the entire undertaking is put at £746,000. It appears that certain legal questions are preventing the work from being commenced immediately.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Atherton.—The Council have decided to erect a sub-station for the purpose of supplying electricity in the Four Lane Ends district.

Chili.—Plans for the erection of a generating station in the town of Puerto Monte have been approved. The work must commence within six months and be completed by September, 1912. The concessionaire is Don Santiago Schweizer.

Darlington.—The Corporation invite tenders by December 4th for a 500-kw. D.C. dynamo and reciprocating engine. Particulars from Borough Electrical Engineer.

Hastings.—A Local Government Board inquiry was held at the Town Hall last week concerning an application for a loan to extend the Council's electric lighting mains to West Hill.

London: *Battersea.*—Mains extensions at an estimated cost of about £136 are to be carried out.

Hackney.—Mains extensions at an estimated value of about £130 are to be carried out.

Hammersmith.—The Borough Council propose a further expenditure of £10,000 upon the electricity undertaking. The sum has already been sanctioned by the Council in a previous loan of £23,775.

The Electricity Department require 2,500 yards of 0·025 square inch and 500 yards of 0·08 square inch service cables.

Mansfield.—An application is to be made to the Local Government Board for sanction to a loan of £3,500 in connection with supply to the Mansfield and Woodhouse district.

Menai Bridge.—The Council have approved of a scheme of electric lighting by Mr. W. E. Parry.

Norwich.—Tenders are invited by November 27th for two water tube boilers. Particulars from City Electrical Engineer.

Romford.—The Rural District Council have given the Electrical & Engineering Supplies Co., Ltd., permission to lay mains for the supply of electricity in the Harold Wood district.

Siam.—Tenders are invited for the erection of a 3,000-kw. generating station at Bangkok. Tenders will be received at the Ministry of Local Government at Bangkok by March 15th, 1912. Correspondence and inquiries should be addressed to Mr. F. B. Shaw, Engineer-in-Charge, Municipal Electric Power Station, Bangkok. Copy of the specifications, &c., may be seen at 73 Basinghall Street, E.C.

Warrington.—The Council invite tenders by November 28th for low-tension cable. Particulars from Borough Electrical Engineer.

Wrexham.—Tenders are invited by December 5th for a main switchboard. (See an advertisement on another page.)

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Aberdare.—Cinematograph Theatre. Architects, Messrs. Johnson & Richards, Merthyr Tydfil.

Bournemouth.—New Law Courts. Borough Engineer.

Dumfries.—Theatre in High Street.

Leek.—New baths.

Northampton.—Electric lighting and power installation in temporary building at technical school.

Southend.—New concert hall at Westcliff.

Warrington.—Tenders are invited by December 1st for an electric bell installation at the Evelyn Street school.

Hosted by Google

TENDERS RECEIVED AND ACCEPTED

Atherton.—The Council have accepted the tenders of Callender's Cable & Construction Co., Ltd., for 880 yards of high-tension concentric paper-insulated, lead-covered cable, and that of Messrs. Hanchett, Barrett & Co. for two transformers.

Belfast.—The tender of Messrs. Willans & Robinson, Ltd., has been accepted for a second turbo-alternator and condensing plant. Orders have also been placed for the overhead work for the Ligoniel and Belmont tramway extensions as follows:—Poles, Messrs. John Spencer & Co., Ltd.; cast-iron work, Messrs. G. Webber & Sons (Belfast); wrought-iron work, Messrs. W. Boydell & Sons, Ltd.

London: *Hammersmith.*—The following tenders were received for an illuminated sign at the Council's electricity works:—Imperial Lighting Co., £13 15s.; Darling & Roch, £16; Brilliant Sign Co., Ltd., £18 10s.; Sun Electrical Co., £26 10s. The tender of the Brilliant Sign Co. has been accepted.

The Council have agreed to purchase from the British Electric Transformer Co. the two 250-kw. and two 75-kw. transformers used at Olympia during the recent electrical exhibition, at a total cost of £330; as part of the sale the Council is returning to the company the eight old transformers now rendered useless in consequence of the change over from arc to incandescent lighting in the main streets.

L.C.C.—The following tenders have been received for the supply of static transformers and switchgear for the new Vauxhall sub-station:—Static transformers: British Westinghouse Co., £2,772 10s.; British Electric Transformer Co., £2,803 5s.; General Electric Co., £2,875; British Thomson-Houston Co., £3,065; Dick, Kerr & Co., £3,129 10s.; W. E. Burnand & Co., £3,388 10s. High and low-tension switchgear: Switchgear & Cowans, £5,029 18s.; Johnson & Phillips, £6,193 15s.; A. Reyrolle & Co., £6,399 10s.; The General Electric Co. £6,498; Spagnoletti, £6,821; Electric and Ordnance Accessories Co., £6,950 12s.; Electric Construction Co., £7,408 2s.; Siemens Bros. Dynamo Works, £7,449 15s.; Ferranti, £8,079 10s. The tender of the British Westinghouse Co. has been accepted in the first instance, and that of Switchgear & Cowans, Ltd., in the second.

Battersea.—The Council have accepted the offer of Messrs. Whipp & Bourne for four circuit-breakers at £33 17s.

Hackney.—The tender of the Synchronome Co. for a master clock and thirteen electric movement dials for the Town Hall at £68, has been accepted.

Manchester.—The Electricity Committee has recommended for acceptance a tender for a Howden-Siemens 5,000-kw. exhaust steam turbine generating set, with Mirrlees-Watson condensing plant. The exhaust steam turbine will be used in conjuction with the Yates & Thom engines at the Stuart Street generating station.

Oldham.—The tender of the Brush Electrical Engineering Co., for a 1,200-kw. turbo-alternator, has been accepted.

South America.—Marconi's Wireless Telegraph Co., Ltd., have received a contract for the erection of a number of wireless telegraph stations along the South American coast. The total contract price is £64,066.

Amongst the orders for surface condensing plants which the Mirrlees Watson Co., Ltd., have recently received for steam-condensing plant are:—Bolckow Vaughan's Steel Works, Southbank; De Beers Consolidated Mines, Ltd., Kimberley; Carron Iron Works; Elliott's Metal Co., Birmingham; Bradford Colliery; Wigan Coal & Iron Co. Jet condensing plants are being supplied to Nobel's Explosives Co.; Empress Mills, Nagpur; London Electric Supply Corporation.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £59 10s. to £59 15s. (last week, £58 15s. to £59).

Siemens Bros. & Co., Ltd.—As the greater part of the office staff at Caxton House was removed last Monday to new offices at the Woolwich works, all future communications relating to the following branches of the business should be addressed to the company at Woolwich, viz.:—Insulated wires and cables, telegraph and telephone apparatus, line materials, measuring and testing apparatus, batteries, railway signalling, publications, accounts. The postal address is Siemens Brothers & Co., Ltd., Woolwich, Kent. Telegrams: "Siemens, Woolwich." Telephone: City 6400.

Plant for Sale.—The Bury Corporation has for disposal two 250-kw. Belliss-Siemens generating sets (see an advertisement on another page).

Plant for Sale.—The business of the Beck Flame Lamp, Ltd., is for sale. (See an advertisement on another page.)

Coal Testing.—Messrs. D. E. Greenwood and J. K. Wells have opened a coal-testing laboratory at 25 York Place, Baker Street, W., where they will be pleased to receive inquiries from central station engineers and others respecting the calorific value and other properties of the fuel they use.

Bankruptcies.—W. R. Gard, Orchard Electrical Works, Orchard Street, Canterbury, now residing at 65 Kingsley Avenue, West Ealing, has been adjudicated a bankrupt.

APPOINTMENTS AND PERSONAL NOTES

Mr. Fred. E. Hinton, who for the last three and a half years has held the post of Superintendent of the Electric & Ordnance Accessories Co., Ltd., at Cheston Road, Aston Manor, Birmingham, is leaving to take up a position at the London office of Vickers, Ltd. A presentation was made to Mr. Hinton at a Smoking Concert on Monday of last week.

Mr. W. Mackenzie, late Mechanical Superintendent of the West Ham Corporation Generating Station, who is leaving to take up the appointment of Station Superintendent of the Stratford Station of the Charing Cross, West End, and City Electricity Supply Co., was presented with a silver cigarette case, match box, and sovereign purse by the staff of the West Ham Electricity Department at a dinner on Saturday, November 11th.

Mr. W. Hughes, late manager of the Plant Department of the British Westinghouse Co., and formerly their South Wales representative, has terminated his connection with the company, and, in conjunction with his associates, will henceforth devote his whole time to consulting practice, specialising in electrical mining equipment, at 5 Dowgate Hill, Cannon Street, E.C.

Mr. William C. Jeary, formerly Manager of the Vacuum Cleaner Department to the General Electric Co., Ltd., has been appointed General Manager of Magic Appliances, Limited (Magic Suction Cleaner), 6 Farringdon Avenue, E.C. (Telephone, Holborn 6525.)

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Johnson-Billington Electricity Meters, Ltd.—Mr. A. M. Billington has ceased to be a director of this company.

Mexican Light and Power Co.—Applications have been invited for the purchase of £1,000,000 5 per cent. second mortgage 50 year bonds at 87.

Companies Struck Off Register.—The names of the Amalgamated Dry Batteries, Ltd., and the South-Western Electrical Co., Ltd., have been struck off the Register of Joint Stock Companies.

Rio de Janeiro Tramways, Light & Power Co.—It is proposed to increase the share capital of this company by $10,000,000, of which $5,000,000 are to be offered for subscription at once.

NEW COMPANIES

WINSCOMBE ELECTRIC LIGHT & POWER CO., Longfield, Winscombe, Somerset. Capital, £2,000.

GENERAL ENGINEERING CO., Hipperholme. Capital £1,000. Electrical and general engineers.

THE LEOMINSTER ELECTRIC SUPPLY CO., registered by S. Williams & Co., of 38 Parliament Street, S.W. Capital £4,000.

The Illuminating Engineering Society.—At the opening meeting of the session on Friday last, Mr. L. Gaster gave a short summary of the progress in the Society's work made during the vacation. He mentioned that with the co-operation of the Library Association, the Association of Medical Officers in Schools, the Association of Teachers in Technical Institutions, and the London Teachers' Association, committees had been formed to investigate school and library lighting. The Joint Committee on Street Lighting Specifications had continued its meetings, and the Society had been represented at the Congress of the Royal Sanitary Institute at Belfast and at the International Hygienic Congress at Dresden. The hon. secretary also attended the meeting of the International Electrotechnical Commission at Turin, with which a certain amount of co-operation is favoured, and the International Electrical Congress at Turin, where approval was expressed of the Society's efforts to form an International Commission for the Study of Illumination. Announcements were also made as to courses of lectures on illumination which had been arranged at the Regent Street and Battersea Polytechnics and the Northampton Institute.

SUMMARY

We report the meetings held in Birmingham, Newcastle, and Glasgow, to discuss the proposed new Articles of Association of the Institution of Electrical Engineers. The Glasgow Section is the only one which has passed a vote in favour of an increase in the subscriptions. Mr. Ferranti has announced another decision of the Council on the question of a name for the "late-Licentiate" class. We publish an interesting analysis of the number of members in London, the provinces and abroad, the revenue derived from their subscriptions and their representation on the Council. (Page 653.)

We give the provisions of the Bill which is being promoted by the Incorporated Municipal Electrical Association to confer wiring and other powers upon municipalities. (Page 654.)

In the House of Commons on Tuesday, Clause 59 of the Coal Mines Bill was amended to read that the use of electricity is to be discontinued in any mine where the proportion of inflammable gas exceeds $1\frac{1}{4}$ per cent. In the Bill as it left the Standing Committee, the proportion was $\frac{1}{2}$ per cent. (Page 654.)

A paper on automatic reversible boosters by Mr. R. Rankin was discussed at last Thursday's meeting of the Institution of Electrical Engineers. The author described all the more usual types of battery boosters, pointing out some of the advantages and disadvantages of each; on the whole he preferred those controlled by external regulators to those of the diverter type. The sluggishness of the latter was referred to in the discussion, which also dealt with the alleged instability of certain systems. (Page 655.)

Mr. F. A. Newington, in his inaugural address to the Scottish Local Section of the Institution of Electrical Engineers, dealt with a number of aspects of electric supply matters, and urged the importance of modifying the Conspiracy and Protection of Property Act (1875) to include electric supply undertakings. (Page 656.)

A cable box explosion occurred in the Strand (London) on Thursday last, due to a short circuit on a bitumen-insulated cable. (Page 657.)

Mr. H. Harding Churton's inaugural address to the Yorkshire Local Section of the Institution of Electrical Engineers, was devoted to a consideration of the relations between capital and labour. (Page 657.)

Mr. W. T. Taylor's paper on "High Voltage Transformers" has been discussed by the Birmingham Local Section of the Institution of Electrical Engineers. The paper was not so severely criticised as it had been in London, but some points of detail were taken up. (Page 657.)

A convenient form of ceiling rose, with removable terminal blocks, and a cord grip on the base, was one of the patents published last week. For cable troughs, a joint which keeps perfect alignment, and can be used without jointing material, was also protected. The British Thomson-Houston Co. have introduced a process for steadying the arcs of arc lamps in which light-giving and steadying materials are used. An improved insulating sleeve for oil transformers, which increases the cooling effect, and gives good oil circulation was also patented, as well as one in connection with submersible motors, with a new form of bearing, and means for protecting the coils from the rush of water. A patent for an insulating material has been granted to A. R. Müller in spite of opposition. (Page 658.)

Hosted by Google

At Clerkenwell Police Court on Wednesday, Mr. Bros appointed Mr. C. A. Baker, of the London County Council, as Electrical Inspector under the St. Pancras Electric Lighting Provisional Order, for twelve months. (Page 659.)

In our "Electric Traction Notes" we mention a decision of the L. & S.W. Railway with regard to electric traction; the proposed conversion to electric traction of the East London Railway; and the reference back to the arbitrator of his award in the Cavehill and Whitewell tramways arbitration. (Page 659.)

Under "Telephony and Telegraphy (including Wireless)" we give an account of the demonstration last week of the Strowger automatic telephone system. A special company has been formed to take over the system. We also refer to the large wireless telegraph station which the Marconi Co. has erected at Coltano in Italy. (Page 659.)

The Brighton Corporation have refused to support the Municipal Wiring Bill of the I.M.E.A. financially; but the Dundee Electricity Committee recommend that financial support be given to this Bill.—The Islington Council propose to spend £250 on a hiring-out scheme for shop-front lighting.—Additional street arc lighting is being carried out at Blackpool.—There has been a good deal of opposition to the electric supply scheme in Aldeburgh.—The St. Annes-on-Sea electricity accounts show a surplus of £971. (Page 661.)

The Sydney Council propose to borrow £250,000 for electric supply extensions, and the following electric supply loans are also contemplated:—Worcester, £1,400; Dartford, £8,500; Greenock, £3,700; Redditch, £5,850; Swinton, £3,323. Extensions are also contemplated at Bolton. A switchboard is required at Wrexham, the Worsley Council are contemplating an electric supply scheme, and the Singapore Municipal Authorities are taking up a loan for electric supply extensions. (Page 661.)

Subscriptions are being invited this week to the Automatic Telephone Manufacturing Co., and the Hadley Engineering Co. The latter is in connection with the Tilling-Stevens petrol-electric omnibus system. (Page 662.)

ARRANGEMENTS FOR THE WEEK

FRIDAY, DECEMBER 1st.

Northampton Institute Engineering Society.

5 p.m. At the Institute. Debate on "The Prospects of the Technical and Practical Man."

TUESDAY, DECEMBER 5th.

Institution of Electrical Engineers: Manchester Students' Section.

7.30 p.m. At the Municipal School of Technology. "Practical Points in the Design and Construction of Drum Type Controllers," by A. N. Howarth.

Institution of Civil Engineers.

8 p.m. Paper to be further discussed. "Electric Lighting of Railway Trains: the Brake Vehicle Method," by R. T. Smith.

THURSDAY, DECEMBER 7th.

Institution of Electrical Engineers.

8 p.m. "Notes on National and International Standards for Electrical Machinery," by Dr. R. Pohl.

FRIDAY, DECEMBER 8th.

Electrical Engineers' Dance.

9 p.m. At Midland Hotel, Manchester.

INHUMANITY!

OLD LADY (watching Jointer at his "dangerous work")—Why does it hurt you to touch those two wires and not that one?

JOINTER—'Cause they *earth* that one, mum.

OLD LADY—Then it's a great shame that they don't earth the others as well!

PUBLISHERS' NOTICE:—Books containing 48 Reprints of the Cartoons from Oct., 1910, to Sept., 1911, may be obtained, Price* 8d. *net (post free 9½d.).

THE INSTITUTION OF ELECTRICAL ENGINEERS

LAST week we published special reports of the meetings held in London, Manchester, Leeds, and Dublin to consider the new Articles of Association proposed by the Council, and this week we give accounts of similar meetings at Birmingham, Newcastle, and Glasgow. Members in every centre except Glasgow have raised their voices against the proposal to increase subscriptions, but a meeting of the Glasgow Local Section has distinguished itself by giving a unanimous vote in favour of the increase. The feeling that there is no necessity to increase the subscriptions of existing members is, however, so widespread elsewhere that there is little doubt that the proposal, if persisted in, would not receive a sufficient number of votes to pass it. In the unlikely event, however, of subscriptions being increased, we predict that, notwithstanding the vote at Glasgow, there would be proportionately more resignations of Scotch members than English ones. The Englishman growls at the price of a thing being raised, but as often as not he pays in the end. The Scotsman says little, but if he thinks a thing is too dear he simply does without it.

The only other development in the situation is that the Council is gradually deciding on a name for the new "late-Licentiate" class by a process of elimination. "Licentiate" has been abandoned, and the announcement has now been made that no name which includes the word "Member" will be considered suitable. This disposes of the title "Junior Associate Member," suggested and abandoned in the Council chamber, and re-suggested by one of our contemporaries, who has apparently not noticed that a Junior Associate Member I.E.E. would obviously have to put up with the unofficial abbreviation "Jamie." Another contemporary has chosen the name "Junior Member," which is also put out of court. Practically the only two useful suggestions left of the many names proposed are "Graduate," and our own suggestion, "Subscriber"; and "Graduate" is obviously unsuited for a class composed of young men who have not graduated and older men who never will. The only objection to "Subscriber" is that a man will not be tempted to join the Institution in order to write this title after his name; in the opinion of the Associate Member, at any rate, that is its greatest recommendation.

BIRMINGHAM

A special meeting was held on Wednesday last week. Mr. M. Railing (Chairman of the Section), presided, and Mr. R. Hammond, Mr. Hirst, and Mr. Kingsbury were present to hear the views expressed. Associates were present at the meeting as well as Corporate Members.

Mr. M. Solomon first explained the attitude of the Committee of the Local Section, after which the new articles were discussed block by block, and a vote of the members was taken on each of the principal points.

The opinion of the meeting was almost unanimously in favour of retaining the old sub-clause 12 (d), which allowed the Council full power to elect as members any persons who were "prominently associated with the objects of the Institution," but were not technically qualified. Opposition to the new "Licentiate" class was almost unanimous. On the subscription question, a considerable proportion of members supported the view of the Birmingham Committee that it would be unfair to ask country members to pay an increased subscription in order to pay for the up-keep of what was virtually a club-house, from which they would receive no personal benefit, and that the subscriptions of existing members should continue on the old basis, while new members residing within 20 miles of London should pay on the new schedule. There was, however, a feeling on the part of a good many members that if the increase of subscription resulted in raising the status and extending the utility of the Institution, it would be justified even in the case of country members. It was pointed out by more than one speaker that the German and American societies did much more for their members than the English Institution. The German society, for instance, had issued a set of rules for the testing of plant and material which were used all over the world. The suggestion that a postal vote of the whole body of members should be taken on each of the principal innovations proposed was adopted unanimously.

Amongst the members taking part in the discussion were Messrs. R. A. Chattock, W. Fennell, C. C. Garrard, W. C. Goodchild, S. H. Holden, Dr. G. Kapp, E. J. Kipps, F. J. Moffett, R. O. Orsettich, N. B. Rosher, and S. P. Smith.

At the end of the meeting Messrs. Kingsbury, Hirst, and Hammond dealt shortly with the points raised in the discussion. Mr. Hammond stated, as treasurer, that the Institution was in a perfectly sound state financially.

NEWCASTLE

A special meeting was held on Friday. Mr. J. E. Kingsbury and Mr. Rowell (the Secretary) were present on behalf of the Council. Mr. Kingsbury, in reply to a number of questions which had been submitted to the Council by the Committee of the Newcastle local section, said that there was no urgent anxiety regarding the finances of the Institution, but that at the present rates the yearly surplus would be a decreasing one. The expenditure on the London members, he said, was slightly less than that applicable to the local sections, after making allowance for the expenses at headquarters, which were of benefit to the whole Institution. The amount of the examination fees had been left open, as this might have to be altered from time to time. He hoped that the question of closing down a local section would never require to be discussed, but it was obvious that some provision had to be made for dealing with a section which had become ineffective, owing to lack of support.

Mr. H. L. Riseley pointed out that the Institution as a whole had to bear the cost of such items as the deficit on the London dinner, the cost of the conversazione, and the upkeep of the library, whereas the local section had to pay for their dinners out of their own pockets, and any deficit had to be made up by the members. He suggested that the Journal should follow more on the lines of the *Proceedings* of the American Institute of Electrical Engineers, and that it should be published in parts, so as to reach members promptly.

Mr. Sloan thought that the increased subscriptions would result in a serious decrease of membership, and he suggested that the local section should have clearly explained to them what they were likely to gain by these increases, and on the other hand, what they would lose in the event of the increases not going through.

Mr. Carter advocated a system of confidential reports from employers, as a guide to a man's fitness for admission or transfer, as opposed to mere written examination.

Mr. Blackman (Sunderland Corporation) gave some figures to show that the Institution made a clear profit of £126 per annum out of the Newcastle section at the present rates, and he could not see any reason for increasing this to £250 by raising the subscriptions.

Mr. C. Vernier asked for a more prompt distribution of the Papers, and suggested that the delays in the past had been the result of the rule that all Papers had to be submitted to a committee in London.

Mr. G. Stoney prophesied that although an increase in the subscription might result in a temporary decrease in the membership, the effect would not be felt at the end of three or four years.

Several other members also spoke.

Mr. Kingsbury, in reply, pleaded for a broader view of the Council's proposal by the provincial members. The new powers sought by the Council were necessary for the efficient running of the Institution, and it was certain that they were not likely to be abused. Additional expense would be incurred by issuing the *Proceedings* in parts, as had been suggested, as a double printing would be required. The Institution, he said, was run on exceedingly economical lines, and the expenses could not be reduced without at the same time impairing the efficiency.

A resolution asking for further consideration of the new rules to be deferred for a year was put forward by Mr. Riseley, but was lost by the casting vote of the Chairman.

GLASGOW

A special general meeting of the Scottish Local Section was held at Glasgow on Friday. Mr. Sam Mavor presided, and was supported by Mr. Ferranti, President of the Institution, and Messrs. E. G. Tidd and W. W. Lackie, past-chairmen of the Section. The discussion lasted 2½ hours.

Mr. Ferranti said that, although the Council had attempted to do what was best for the Institution and its members, they were by no means infallible, and in the present instance a mistake had been made. The revision of the Articles of Association had been a matter of consideration for a considerable time, and the committee entrusted with this work had latterly began to lose interest in it, so that it was felt that the proposals should be formulated as soon as possible. He pointed out that there had grown up multifarious interests, some of them purely technical, some of them commercial, and many a combination of the two, which were not being properly looked after and superintended as he thought ought to be done by the Institution. The admission of the various classes of people represented by these interests meant broadening the basis of membership. He next insisted that subscriptions should be regarded as a payment made to a central body who were organised to look after their interests, and see that they were conserved.

At the suggestion of Mr. James Caldwell, it was then agreed that the discussion should be regulated to deal with specific points one at a time, and the proposed broadening of the basis of membership was first considered.

Hosted by Google

Mr. McWhirter favoured the proposal. Mr. T. Crichton Fulton (Associate) said that they might end by weakening their Institution if they admitted too many non-technical men. He asked if any voting power would be given to provincial members in connection with the adoption or otherwise of the amended constitution, and Mr. Harold Watson thought that proxy voting might be possible. Mr. Ferranti agreed that this was worth looking into. Mr. Scott Maxwell said that broadening the basis on the lines indicated would tend to lower the status of the commercial electrical engineer, who was the man they should seek to encourage. Mr. W. W. Lackie supported the Council's proposal. Mr. E. G. Tidd said that the technical business man was eligible for Associate Membership. Mr. W. L. Spence said in his experience as an engineer he had never found that broadening the basis of a structure detrimentally affected the possibilities of the height to which it might attain. Professor F. G. Baily agreed to the desirability of getting both the purely commercial man and the technical commercial man into the Institution. Mr. J. A. Robertson asked for some guarantee that the new class would be properly distinguished, so as to keep a distinct class for qualified technical men whose qualifications gave them a certain position in the technical world.

Mr. Ferranti said only Corporate Members would still be Members and Associate Members. The new class would not have the word member as part of their title.

Mr. Onslow, in supporting the proposals, thought the new class should be included in the Associate class. Mr. Simon suggested that due discrimination should be exercised in the admission of non-technical men. Finally, Mr. Lee Murray complained that many men remained in the Associate class who should be Associate Members. He thought corporate membership should be confined to engineers. Great good would be done to the Institution, and its scope of usefulness would be increased by moving in the direction proposed by the Council.

On a show of hands being taken, the principle of broadening the basis of membership was declared unanimously agreed to.

The subject of subscriptions was then discussed.

Mr. McWhirter stated that local provincial members did not enjoy the privileges of London members. Mr. Mavor, although at first opposed to the increased subscription, now thought the increase was absolutely necessary. Mr. W. L. Spence objected to the extent of the proposed increase. Mr. J. S. Nicholson was against a graduated subscription for town and country members. Mr. Burbidge thought an increased subscription would have the effect of decreasing the funds. He suggested a small increase now and a further increase later. Mr. Scott Maxwell, Mr. J. A. Robertson, and Professor Baily favoured a uniform subscription. Mr. Simon compared the subscriptions with those levied by the Institution of Engineers and Shipbuilders, which were lower, whilst better value was received by local members. Mr. Lackie said the financial year should synchronise with the beginning of the winter session, so that new members might not have to pay two subscriptions within fourteen months.

Mr. Ferranti referred to the Civils having no local sections, whilst the Engineers' and Shipbuilders' Institution had not erected their buildings out of members' subscriptions. He calculated to lose 10 per cent. of the members by the increased subscription, and no allowance had been made for any revenue from the proposed new grade of member.

On a vote being taken,

It was unanimously agreed that the present subscriptions should be increased, whilst the majority present at the meeting were in favour of a uniform subscription.

ANALYSIS OF THE RECEIPTS FROM SUBSCRIPTIONS

Mr. Thomas Roles, City Electrical Engineer and Manager, Bradford, has sent us an interesting analysis, comparing the numbers of the London and country members and those living abroad together with an estimate of the aggregate subscriptions in each of the three cases, and a comparison of their representation on the Council. He includes in the metropolitan district all places within 50 miles of London, *e.g.*, Bedford, Brighton, Cambridge, Colchester, and Reading. We have corrected an inaccuracy in his estimate of the subscriptions which the members residing in the colonies and abroad should be paying, but in other respects the figures are given as he has sent them to us.

	London.	Country.	Colonies and Abroad.	Total.
Members	568	391	369	1,328
Associate Members	977	1,209	603	2,789
Associates	371	318	200	889
Students	486	636	148	1,270
Total	2,402	2,554	1,320	6,276
Proportion of Members to Associate Members	58%	32%	61%	47%
Total revenue from proposed Subscriptions	£6,689	£6,652	£3,503	£16,844
Estimated Revenue from Present Subscriptions ...	£5,131	£5,106	£2,273	£12,510
Increased Revenue from present membership	£1,558	£1,546	£1,230	£4,334

	Number.	Percentage.
London members	2,402	38·3
Members in Country, Colonies, and Abroad	3,874	61·7
Representation on Council (excluding Past Presidents).		
London Members	19	63·3
Country Members (including Chairmen of Local Centres)	11	36·7

Mr. Roles also traverses Mr. Hammond's statement that more than one-third of the subscriptions from Local Sections is expended by way of money grants to them and printing for them, and points out that last year the grants, including travelling expenses, amounted only to £729 15s. 11d. He remarks that the cost of including the Local Section Papers in the Journal ought not to be debited to the Local Sections only, and that, as a matter of fact, the whole cost of printing and issuing the Journal amounted in 1910 only to 4s. 7d. per member.

Mr. A. H. Dykes writes us with regard to the proposed Association of Consulting Engineers (originally intended to be confined to Members of the Institution of Civil Engineers). It is now proposed "to include all Engineers of standing who are full members of the Institution representing the particular branch of the Profession in which they practise."

A delegation of the Manchester Students' Committee, which had drawn up a number of proposed amendments to the Council's draft Articles of Association, was received by Mr. Robert Hammond and Mr. Rowell at the Queen's Hotel, Manchester, on Wednesday last week.

THE I.M.E.A. BILL

Full Wiring Powers Sought.

IN the House of Commons on Tuesday, Sir William Howell Davies, the Member for Bristol (South), who is on the Government side of the House, introduced a Bill to amend the Acts relating to electric lighting. This has been prepared by the Incorporated Municipal Electrical Association, and considerable support has been promised by local authorities.

Clause 1 gives Local Authorities power to wire houses and to sell, or to let for hire, wiring, fittings, lamps, motors, &c., but they may not do this under cost price.

Clause 2 authorises them to have showrooms, to promote exhibitions, and to advertise.

Clause 3 permits them to sell by-products.

Clause 4 relieves them of the obligation to provide a standby supply to premises "having a separate supply of energy, Electric or otherwise," unless a reasonable agreement as to price is arrived at.

Clause 5 legalises payment of the expenses of delegates to meetings, conferences, &c.

Clause 6 enables net profits (not exceeding half the nett. annual revenue) to be applied "to any of the purposes of their undertaking, including the formation of a fund for Working Capital," instead of to relief of rates.

Clause 7 authorises the raising of loans for periods of ten years for working capital, payments to the sinking fund to commence only two years after the date of the loan.

Clause 8 extends Section 4 of the Conspiracy and Protection of Property Act, 1875, (relating to breach of contract by persons employed in supply of gas and water) to electricity supply, so as to make "wilful and malicious" strikes of electricity works employees illegal.

Clause 9 permits Local Authorities to work in combination in exercising the powers conferred under Clauses 1 and 2.

Clause 10 will give the Bill, if passed, the title "Electric Lighting Act, 1911."

Further reference to the Bill will be found under the headings Brighton and Dundee on page 661.

THE COAL MINES BILL

ON Thursday and Friday last week, the House of Commons considered the Coal Mines Bill, as amended by the Standing Committee. In "Electrical Engineering in Mines" for September 7th, 1911, we dealt with the Bill as it left the Committee, particularly in regard to Sub-section 2 of Clause 59 (Clause 60 in the original Bill), which, as amended by the Committee, provided that if the amount of inflammable gas in the air currents exceeds ½ per cent., the use of electricity shall at once be discontinued. On Friday Mr. Newman moved the omission of the sub-section, but after considerable discussion an amendment by Sir A. Markham that 1¼ per cent. be substituted for ½ per cent. was adopted. As naked lights are permitted in places in which the amount of gas does not exceed this percentage, electricity is evidently to be considered as dangerous as exposed lights. We shall deal more fully with this matter next week.

Hosted by Google

AUTOMATIC REVERSIBLE BATTERY BOOSTERS

A PAPER by Mr. R. Rankin on automatic reversible battery boosters was discussed at last Thursday's meeting of the Institution of Electrical Engineers in London and at the Manchester Local Section last Tuesday. With a view to comparing the various types in use, the author classified these boosters as follows:—Those in which the booster can be self-contained and operated by its own field windings independently of any outside controller; those in which a so-called exciter is an absolute necessity, not merely for exciting purposes, being an essential in the theory of the system, and those in which an external automatic regulator is used on the booster field, either indirectly or through an exciter, the latter not being an essential in the theory of the scheme. He proceeded, after a few introductory remarks on the economy incidental to the load equalisation and good voltage regulation produced by booster controlled batteries, to describe a number of arrangements in use.

The simplest in the first class is the plain differential booster with one field winding excited by the bus-bar voltage, giving a booster voltage in the charge direction, and another in opposition to it, carrying a portion of the load current. This system provides no compensation for variations in the battery voltage or resistance. This difficulty is got over in the Pirani booster by placing the principal shunt across the battery. This, however, has a tendency to make the action unstable, but this is sometimes avoided by including iron-aluminium cells in the shunt coil circuit. The Highfield semi-automatic booster is similar to the plain Pirani booster, but both, if used without exciters, require an excessive amount of copper in the field circuits. The Crompton booster seeks to compensate for the variation in the state of the battery by the addition of a shunt coil across the booster terminals, but retains some unsatisfactory feature of the Pirani arrangement. A similar third coil forms a part of the Lancashire booster, and this, being excited by the difference between the bus-bar and battery voltage, tends to produce a voltage equal to that at its own terminals, and leaves the other coils free to exercise their functions independent of the state of the battery, and enables the current diverter to be placed in the generator circuit instead of the load circuit.

In the second class we have first the Highfield booster, in which the state of the battery is taken care of by a small exciter connected in opposition to the battery through the booster shunt coil, so that the latter is excited by the difference between the exciter and battery voltages. Owing to the presence of the exciter, the battery and booster can be run alone on the load, and a compounding effect may be obtained by a suitable setting of the diverter. The E.C.C., or Strang booster, is similar in principle, except that the exciter voltage is controlled by the bus-bar voltage instead of being constant. All diverter controlled boosters are, however, unsatisfactory with over-compounded generators, as it is difficult to adjust the compounding of the booster and generator to be exactly the same, and various other difficulties are also met with in the adjustment of the diverters.

In the Entz booster, which is of the third class, a pair of variable carbon resistances, controlled by a solenoid in the generator circuit, takes care of the field of the booster or its exciter, the field coil being in the centre arm of a bridge arm, so that the current can flow in either direction, according to the relation of the two variable resistances. The regulator is easily set to balance at any generator current, and the working is quite independent of the generator compounding. The regulator can be set to give at first a change of exciting current greater than the steady value required, resulting in much quicker building up of the field changes. The well-known Tirill regulator of the British Thomson-Houston Co. can be employed in almost exactly the same way, but owing to its "overshooting" action, it is necessary to employ additional floating contacts as an auxiliary checking control. Another similar device is the Taylor-Scotson regulator (*see* ELECTRICAL ENGINEERING, February 16th, page 83), but instead of a resistance in series, with a field winding being open and short-circuited alternately, as by the Tirill regulator, the operation is performed directly on a field winding itself. The Tilney booster employs a potentiometer-type booster, field regulating, and reversing switch, controlled by a small motor, of which the armature is connected through a resistance across the line voltage, while its field is wound differentially, one coil being excited from the bus-bars, and the other carrying a portion of the generator current. The action is not so quick as in the foregoing, and no provision is made for over-regulation. The Thury voltage regulator is employed in the Thury booster in a similar way, and is open to some of the same objections. Other systems on a similar principle to that of the Entz booster are those of Lincoln and Bijur. In the former system, which is designed particularly for alternating current work, the torque of a small A.-C. motor, which is responsive to variations in the main generator current, is balanced by a spring, and controls ordinary switches. In Bijur's system the pull of a solenoid is balanced by a spring, and mercury contacts are used. The Brown-Boveri voltage regulator (*see* ELECTRICAL ENGINEERING, July 13th, page 400) is employed in that firm's booster system. The two resistances, each provided with a number of contacts, are connected in Wheatstone bridge fashion, the booster field taking the place of the galvanometer. Over-regulation is prevented by the construction of the apparatus. As in other differential systems, compounding of the main generator affects the working.

The author then passed on to consider some methods of using boosters, pointing out some of the difficulties in the adjustment of three-wire booster sets. He referred also to the use of booster-controlled batteries for load equalisation in connection with colliery winding plants, describing a method proposed by Crompton & Co., and a way in which an Entz or similarly regulated booster can be adapted to this work.

For regulating alternating current systems in which a battery is linked to the system by a rotary converter, the Entz regulator can be worked by an alternating-current solenoid wound so as to be responsive to variations in the energy component of the alternating current. If, however, the split pole type of converter be used, auxiliary booster plant can be dispensed with entirely. This system was fully described in a Paper by Mr. J. L. Woodbridge, read in America (*see* ELECTRICAL ENGINEERING, Vol. IV., page 731), where an automatic exciter method of controlling equalising plants was also described. Some notes were then given on the plant at Gary Steel Works, where this system is in use, and the booster plant at the Hucknall Torkard Colliery, Nottingham (*see* ELECTRICAL ENGINEERING IN MINES, July 7th, 1910, page lxxxi.).

A few tables of figures of results of working of booster installations are given, and finally the author summarised his conclusions, drawing attention to the improvement in the life of batteries when worked under the conditions of automatic booster control. There was little difference in working results between the second class of booster and the Lancashire type of the first class, but the first and second classes were all more sluggish in their action than the third, in which a diverter is not used, but external regulation was relied on; and of these, on the whole, he preferred the Entz type.

DISCUSSION.

Mr. J. S. HIGHFIELD (Chief Engineer, Metropolitan Supply Co.), who opened the discussion, wished that makers would devise some method of charging for maintenance that was not on the principle of the present Insurance Bill, viz., that the healthy people did not pay for the sick ones. The difficulty of designing automatic boosters was that the battery curve of charge and discharge was not a straight line, and that it turned up very quickly when the battery came to its final state of complete charge. It was therefore necessary to employ various constant pressure devices and external regulators, &c. In designing a booster for ordinary work, however, it was advisable not to take account of the extreme end of the charge curve. In working on loads with violent variations it was best to work the battery at a light state of charge and complete the charge only at the end of the day. He did not think it was necessary to design a booster to keep constant load on the generator when the battery was fully charged. The Thury regulator was satisfactory so long as the variations in the load were slow, but when they became rapid then it was not adequate, and other forms of regulators worked very much in the same way. He agreed with the author that the non-inductive diverter was not altogether satisfactory, as the current increased in it at a greater rate than in the field circuit. In his opinion the diverter should be made inductive, as by that means the growing current in the external circuit is deflected round the fields of the booster. He had used these successfully in connection with a series-wound generator. With rapidly varying loads it was essential to put a heavy fly-wheel on the booster. Laminated fields made the booster respond more rapidly to the variations. He was not altogether in agreement with the author that it was

Hosted by Google

a fairly common practice to use compound generators for traction and power loads. If the original design of the station contemplated the use of a battery and booster, the generators should be shunt wound.

Mr. A. M. Taylor (Birmingham Corporation Electricity Department), said that at Birmingham they found that the variation in the traction load in view of the large number of tramcars, was so small that it was unnecessary to have their generators compound wound. On the question of whether a standby battery should be tied up to the bus bars for good or bad, or whether it should be off automatically at the critical moment, he mentioned that there was a circuit-breaker at Manchester, where there was a 15,000 ampere battery, which cuts the battery off from the bus bars, not so much to save the battery as to save the boosters. In Birmingham they proposed to do the opposite, viz., to tie the battery up to the bus bars. If a sudden and unexpected load of, say, 17,000 or 20,000 amperes came, they wanted the battery to stand up to the bus bars absolutely, and they were proposing to introduce an automatic short switch to clap the battery on to the bus bars and cut out the booster. On the question of cost, there was strong competition between boosters and automatic end cell regulating switches. He did not believe that there was much scope for automatic boosters on A.C. systems. In Birmingham they started with heavy loads on their A.C. supply up to 1,000 kw. for each individual installation, without any Tirrill regulator, and he did not think that the economy from the use of this regulator could have paid for a battery. He thought that it was only with winding installations where it was absolutely indispensable to have a battery.

Mr. H. Burge (Crompton & Co., Ltd.), said that the instability of the Pirani booster mentioned by the author could be cured by providing the machine with interpoles, and by setting the brushes forward so that the armature reaction was split up, so as to demagnetise the field and reduce the booster bolts by a fixed amount for every 100 amperes in the armature. He disagreed with Mr. Highfield that a shunt generator should be adopted with a battery and booster for traction work; over-compounding was nearly always necessary. He also criticised the author's description of the working of the Crompton winding scheme.

Mr. B. M. Jenkin described a case where considerable overloads were caused on a traction system owing to the sluggishness of the diverter type of booster, but the difficulty had been got over by allowing the generator to take the momentary overload. It seemed to him that the diverter type was more expensive than a booster with Tirrill regulator. With regard to compounding traction generators, when there was a battery booster that was supposed to keep the load on the generator constant, if the battery booster did its work properly there was no fluctuation in current on the main generator by which it could be made to over-compound. One arrangement which worked satisfactorily was to put the generator field series winding in the main return circuit. Then the fluctuation in the main return circuit over-compounded the booster, but the current through the generator armature remained constant.

Mr. G. C. Allingham (Tudor Accumulator Co.) pointed out that the distinction made in the paper between boosters with and without exciter was one of arrangement and not of principle. The Pirani booster, which was simply a differential booster with a separately excited coil connected across the battery, was not really unstable. It was true that when the battery discharged, the battery volts dropped, and the separately excited field dropped slightly, but there was not a cumulative effect, as the rise of voltage in the booster due to the drop of voltage in the shunt coil was insufficient to compensate even for the drop in the machine itself. What did make the machine unstable was when a third coil was put across the armature, as in the Crompton arrangement as described by the author, but he believed Crompton's had given up this. If the third exciting coil was made very strong, compared with the other coils, the machine would be very unstable, and there would be a very strong building up effect, but if the third coil was made weak then it had no effect at all. The Highfield booster could be unstable in exactly the same way as the three-coil booster. The Lancashire booster, being controlled by the generator current, was quite stable.

Mr. E. K. Scott said the simple differential type of booster had done good service, and had been working in London for ten years, and suggested the use of homopolar machines for booster work, as they were exceptionally suitable for heavy overloads.

Mr. Rankin, in reply, said an inductive diverter would not be so simple as Mr. Highfield thought. If compounding were necessary they must carry the feeder current or return current round the generator magnets, and let the armature current remain steady, as Mr. Jenkin had said. If a brush-shifting arrangement could make the Pirani booster stable, he was surprised that such people as Siemens-Schuckert use aluminium-iron cells. In his opinion it was cheaper to have a battery and booster than follow the plan suggested by Mr. Jenkin. If they designed their machines for 200 per cent. overload, they would not need a battery at all. He had shown in the Paper exactly what Mr. Allingham had pointed out, and the net result was the same.

ELECTRICITY SUPPLY PROBLEMS

MR. F. A. NEWINGTON (City Electrical Engineer, Edinburgh) delivered his inaugural address as chairman of the Scottish Local Section of the Institution of Electrical Engineers on Tuesday, November 14th, and gave a survey of several subjects connected with public electric supply. Speaking first of generating plant, he said that, although for limited areas the continuous-current system had advantages, all development on a large scale would be carried out in the immediate future, at any rate, with alternating-current plant, as the largest practicable unit for high-speed continuous-current generators appeared to be 1,500 kw. He then gave a few descriptive notes on the exhaust steam turbine plant at Edinburgh, by which for the same quantity of steam used, the output had been increased by 77 per cent.

He then dealt with the metal filament lamp situation, saying that from the supply point of view the corner had now been turned, as the better efficiency had led to considerable increase in consumers. Without taking into account other advantages, he reckoned that the metal filament lamp was now able to compete with the gas mantle with electricity at 2⅜d. per unit, and gas at 3s. per 1,000 cu. ft. He thought the efforts of lamp-makers would be better spent in improving and cheapening lamps of about 30 c.p. than in bringing out more small sizes.

The majority of towns were not large manufacturing centres, and he thought that it would probably be more advantageous to the supply authorities to reduce the rates for lighting rather than to supply for power at very low rates. At Edinburgh all consumers who used motors for more than 3½ hours per day were entitled to reduced rates ranging from 1⅛d. to 0·8d. per unit. In such large manufacturing towns as Glasgow and Manchester, the conditions were different. Reference was made to various systems of charging. Electric heating and cooking were prevented from making as much progress as they should by the high cost of the apparatus and by the price charged for current. Electric cooking could only be expected to come into use on a large scale when the apparatus was hired out. The wiring contractors objected to the supply authorities having powers to do this, but did not appear to have sufficient capital to hire out cookers themselves. Mr. Newington then made reference to the impending depletion of our coal supplies, and emphasised the desirability for economy and restriction of export.

Passing on to the manufacturing industry, he said that most of the manufacturers of electrical plant appeared to be busy, but that the work was not remunerative. This he attributed to the extremely low prices quoted, and the real cause of this did not seem to be either the acceptance of the lowest tender by municipalities or foreign competition, but that the capacity of the existing works for turning out plant was far greater than the demand, and the only remedy seemed a large increase in the trade abroad.

In conclusion, he spoke a few words on the labour question, attributing some of the unrest to the present system of elementary education, which was unfitting men for the work they had to do without fitting them for anything higher. A serious phase of strikes was the possibility of stoppage of the electric supply. In 1875 the "Conspiracy and Protection of Property Act" made it a penal offence for any person employed in gas or water undertakings to break the contract of service, should such breach of contract interfere with the supply of gas or water. The date of this Act explained why electricity supply was not included, but it was the duty of the Institution to get this Act amended to meet the requirements of the present time with the least possible delay.

Public Time Service.—"Electric Clocks" was the title of a Paper read before the students of the Scottish Local Section of the Institution of Electrical Engineers on Friday, November 17th, by Prof. Magnus Maclean. The author mentioned that electric clocks were first produced about the middle of last century, since when hundreds of patents had been obtained, the most of which employed faulty mechanical gear, operated electrically, and consequently resulted in failure. Detailed descriptions were given of the three chief systems in successful use, consisting of: independent clocks wound up electrically; a number of independent clocks synchronised electrically by a master clock every hour; a number of clock dials controlled and impelled by a master clock at regular intervals. Prof. Maclean suggested a further method whereby a single master clock would synchronise every hour a certain number of independent clocks at different parts of the city, each of which would control and impel 200 or more dials in blocks of buildings in the neighbourhood.

CABLE BOX EXPLOSION IN THE STRAND (LONDON)

ON Thursday last shortly after 1.30 p.m., some commotion was caused on the south side of the Strand, where a cable conduit explosion had lifted the cover of a street box and disturbed a portion of the footway, there being at the same time an alarm of fire in the adjoining premises. The mains in question are those of the Charing Cross, West End and City Electricity Supply Co., and consist of Callender's bitumen insulated cable laid in Callender-Webber ducts. The box is a plain brick chamber containing a pair of Peard enclosed fuses, it is not filled with compound or other substance and there are no branch or service connections from it. In fact the premises in question are not lighted by the Charing Cross Company.

It appears that a short-circuit developed a few yards away from the box and smoke was seen rising from the pavement, bring both the Company's staff and the Fire Brigade to the scene. Unfortunately, as the firemen were ripping up the pavement matters became worse, and the explosion of the inflammable gases caused the cable box-lid to be blown off and the pavement to be forced up, and about seven passers-by were slightly injured. The burning gases also appear to have spread into the cellars under the pavement through disused coal shoots, causing the alarm of fire inside the premises.

The exact cause of the original short-circuit will probably never be known; it may have been due to previous mechanical damage, percolation of damp after the heavy rains, or both. The records of the leakage indicator in the station show no previous lowering of the insulation, and it is curious to note that the fuses in the box itself did not blow. The Charing Cross Company's staff acted with great promptitude, and within five minutes of the alarm had disconnected the cable. There was no interruption of supply, as the arrangement of the net permitted of the supply being maintained through a different feeder.

CAPITAL AND LABOUR

MR. T. HARDING CHURTON chose the relations between capital and labour as the subject of his inaugural address to the Yorkshire Local Section of the Institution of Electrical Engineers, delivered at Leeds on Wednesday of last week. He pointed out that capital and labour were both necessary antecedents to the production of any commodity, and proceeded to show that it was the relation of supply to demand which controlled the market value of capital, labour, and the products of both. He then discussed the results tending to follow the artificial raising of the value of either capital or labour by combinations, finally arguing that "supply" is dependent upon the facility with which the commodity may be imported—and upon the degree of this facility depends the extent to which the value of either capital or labour may be locally forced up by combination of capitalists or of labour respectively. If the supply of either capital or labour falls below the amount which the other can profitably utilise, the supply of the product must be diminished. And, conversely, if both the factors of production are proportionately increased, the product will also be increased.

Plania Carbons.—As announced in our issue of October 26th, The Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), have now the sole agency for Plania carbons in the United Kingdom, and Mr. W. G. Mayer, previously with H. G. Mayer & Co., the former agents, has joined the Electrical Co. to take over the management of this department. The senior partner of H. G. Mayer & Co. (Mr. H. Mayer), has, however, joined the Globe Electric Co., Ltd. (11 Farringdon Avenue, E.C.), to manage their carbon department, and assigned H. G. Mayer & Co.'s contracts to the latter company. We publish this explanation to avoid confusion, but we understand from both firms that all orders for Plania carbons, whether given to The Electrical Co., or the Globe Co., pass through the Electrical Co.'s hands.

HIGH-VOLTAGE TRANSFORMERS

Institution of Electrical Engineers, Birmingham Local Section

AT the meeting of the Birmingham Local Section on November 15th, Mr. W. T. Taylor's Paper on "High Voltage Power" was discussed. An abstract of the Paper was given in ELECTRICAL ENGINEERING, November 16th, page 621. In the absence of the author, the Paper was to have been read by Mr. J. F. C. Snell, but he was unable to be present, and Mr. A. M. Taylor kindly filled his place.

Dr. G. KAPP (Birmingham University), in opening the discussion, commented on the statement made by the author that the shell type was mechanically stronger than the core type. In his opinion the reverse was the case. Transformers for supply of current to furnaces which made enormous sudden demands owing to short-circuits, were usually of the core type. He did not understand how three-phase current could be supplied when one of the three line conductors was broken down, and desired an explanation of this, together with the meaning of the term "open-delta."

Dr. D. K. MORRIS (Morris & Lister) pointed out that the author had not been quite fair to the core type of transformer, as when enumerating the comparative advantages and disadvantages of the two types, he had omitted some of the advantages of the core type, which he had mentioned in another part of the paper.

Dr. G. C. GARRARD (The General Electric Co.) said the advantage of the "T" three-unit system was that if one transformer broke down, the other two can be arranged to supply on open-delta. With respect to Dr. Kapp's query regarding the possibility of three-phase supply with one line conductor interrupted, this could be done if the earth was used. The method suggested of holding the core plates together by tape was unsatisfactory, and could only be used in very small sizes: steel bolts should be used in large transformers. The question of unequal heating depended more on the design than on the type, core or shell; the latter type was usually considered the best from this point of view. In the core type the yoke was usually made of the same section as the core, but for economy of material it was better to have the core of smaller section than the yoke. The best shape for the cross section of the core was an ellipse. To prevent breakdown in the end turns of the winding, it was preferable to reinforce the insulation of these turns rather than use an external choke coil. It was a good practice for successful parallel operation of transformers to adopt the same scheme of connections throughout the system. The delta-delta system was inferior from the point of view of regulation with out of balance loads, to the delta-star system.

Mr. FORREST (Birmingham Corporation) said the author did not make any definite recommendation with regard to the best type of transformer as regards the cooling system. With a self-cooled oil transformer there was trouble owing to the deposit of sludge which filled up the ducts and prevented proper circulation of the oil. The forced oil-cooled system tended to keep the ducts clear and allowed the oil to be cooled outside the building. The use of water-cooling worms on the top of a high-voltage transformer appeared to be risky. The table given by the author for the floor-space did not indicate whether in the case of the air-blast type the space occupied by the blower was included.

Mr. R. ORSETTICH (General Electric Co.) stated that transformers were liable to trouble from three causes, viz.:—At the terminals, from moving of the coils, and from failure of the insulation of the end coils. With transformers intended for voltages of the order described by the author, the condenser type of terminal was the best. To prevent movement of the coils owing to sudden current rushes, it was now the best practice to clamp the coils carefully. The insulation of the end coils should be such as to be capable of standing at least double the working voltage between turns. The author had not mentioned the question of the ageing of iron or the use of stalloy. The method of avoiding punctures of the insulation between turns was not given: it was, of course, as already pointed out, provided against by the extra insulation of the end turns. The development of the "T" three-unit system of connection was due to a patent quarrel in the United States. With regard to the specification, this should not lay down the details of construction, but specify simply the performance.

Mr. A. M. TAYLOR (Birmingham Corporation) said that the table for floor-space occupied by various types of transformer was useless for practical purposes, as it was not stated whether the transformers were single-phase or three-phase. In Birmingham floor-space was a very important consideration. His experience with 5,000-volt transformers was that there had been no trouble due to movement of the coils, although there had been short-circuits.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 23, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

25,478/10. **Ceiling Rose.** E. J. PARKES. To facilitate the erection of this type of fitting, the terminal blocks are formed of plugs and sockets arranged to slide into recesses in a rib on each side of a second insulating rib, which are at right angles to one another, and form the porcelain base. One end of the square terminal blocks has a longitudinal hole to receive a split pin, which has a transverse hole to form a socket in which the flexible is clamped by a screw. At the other end there is a similar transverse hole for the circuit wire, also clamped by a screw. The ends of the ribs are notched on the surface, and at the side, for the conductor to pass over and around, so that the rib supports the weight of the fitting. The passages at the back of the base for the line wires are preferably coned. Two figures.

2,765/11. **Joint for Cable Troughing.** R. SHUTTLEWORTH. This invention relates to a lock-fast joint for earthenware, &c., troughing. The spigot end of each section is provided with a snug, next to which there is a corresponding inwardly projecting snug. At the bottom of the socket end a raised section with a curved approach is arranged, on which the spigot end rests when the snugs have engaged each other. The curved part of the socket end can be filled in with jointing material if desired. This method prevents the troughs working loose or getting out of position and damaging the cables. Two figures.

4,286/11. **Submersible Motors.** W. R. MACDONALD. To prevent the ends of the windings from getting damaged due to the rush of water through the air gap, baffle plates are fixed to the sides of the casing to deflect the water away from the coils. An improved bearing is also covered by this patent. Cylindrical flanges extending inwards carry the bearings, which are perforated. On the outside of the bearing, above the perforation, a cup is fixed to give the water ready access to the shaft. The cup, however, is only necessary when the casing is not filled with water, so that the bearing can be fed with the water which is splashed about. One figure.

17,387/11. **Flexible Conductors.** E. V. CHEESE. A device for keeping flexible conductors, connected to apparatus, from twisting and becoming entangled, and causing, in the case of telephones, interference with the sounds, consists of a casing made in two parts. One of these has a longitudinal groove with undercut sides, and a semicircular bottom to take the flexible. The other, forming the cover, is of corresponding construction, and slides on to the lower part. Two figures.

17,723/11. **Arc Lamp Electrodes.** BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*). In the practice of mixing a steadying material with the lighting material for steadying the arc, it is found that the arc takes up the former before vaporising the latter, with the result that the proportion between the amounts of these vapours in the arc does not remain constant, thus producing a wide variation between either or both the intensity or colour of the light, from the materials. According to this invention, which is particularly applicable to A.-C. working, the light-giving material is introduced into the arc from one electrode during the first half period of the current, whilst the steadying material is introduced during the second half period from the other electrode, thereby fattening and giving conductivity to the arc. In one form titanium carbide is enclosed in a thin iron shell, while the other electrode is made of carbon impregnated with potassium viborate and then dried.

20,523/11. **Transformers.** E. HAEFELY. For effective cooling of oil transformers the insulating sleeve between the windings is of polygonal shape, so arranged that the inner winding is in contact with the sides of the sleeve, leaving the angular spaces open for the circulation of the oil and the cooling of the sleeve, whilst the outer winding bears on the corners of the sleeve, so that a space is left between it and the sides of the sleeve. Three figures.

Opposition to Grant of Patents

11,908/10. **Insulating Material.** A. R. MÜLLER and R. M. D. SYNDICATE, LTD. This patent has been granted in spite of opposition. It relates to an improved insulating material, comprising a mixture of two parts of asbestos to one of tar, compressed to the required shape, and heated to a temperature of 400° to 500° C.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: GES. FÜR MASCHINEN- UND METALLINDUSTRIE, 22,841/10.

Distributing Systems, Cables, and Wires: COSTAR, BATES, and BRITISH INSULATED & HELSBY CABLES, LTD. [Enamelling wire] 26,142/10; LAKE (*United States Light & Heating Co.*) [Automatic electric regulators for lighting circuits] 5,499/11.

Dynamos and Motors: BRESLAUER [Current generators] 26,187/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Speed control devices] 26,439/10; MACDONALD [Motors] 4,287/11.

Electric Ignition: FORSTER, 27,256/10; ROBERT BOSCH [Interrupter] 18,083/11.

Electrometallurgy: SIMPSON and OVIATT [Furnaces for producing iron or steel] 18,679/10.

Incandescent Lamps: GROTE, 26,667/10; BARROLLIER [Machine for joining filament supports to lamp bulbs] 7,868/11.

Storage Batteries: ELEKTRIZITÄTS AKT.-GES HYDRAWERK [Primary batteries] 6,664/11.

Switchgear: MCCAFFERY and KLYNE [Electrically-operated time switches] 25,906/10; DICKSON [Switches] 26,248/10; SCHRODER [Time switches for lighting] 7,416/11.

Telephony, Telegraphy and Signalling: TELEPHON APPARAT FABRIK. E. ZWIETUSCH & CO. GES. [Circuit device for operating selectors] 26,079/10; AITKIN, and BRITISH INSULATED and HELSBY CABLES, LTD. [Switchboards] 1,110/11; BOULT (*Oksnevad*) [System of railway signalling] 2,890/11; STEINBERGER [Telephone mouthpieces] 14,590/11.

Traction: CLARK [Batteries for train lighting] 26,542/10; CRAVEN [Electric radiators for railway carriages, &c.] 29,291/10; BLACKSTONE [Trolley heads] 30,240/10; SOC. LES FILS DE A. DEROME [Bogies for overhead trolleys] 8,201/11.

Miscellaneous: MUIRHEAD and WILKINS [Electrical connection devices] 26,077/10; REINIGER, GEBBERT, and SCHALL AKT.-GES. [Mercury-contact breakers] 26,341/10; KNOWLES [Purification of electrolytic gases] 27,264/10; BRÜCK [Magnetic separation of materials] 11,898/11; SOC. ANON "LE DÉTECTIVE" [Fire alarms] 12,450/11; MARKS (*Spinnerei and Weberei Steinen Akt.-Ges.*) [Current distributors for power looms with electric stopping and signalling devices] 15,798/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: CARL ZEISS [Reflector searchlights] 23,060/11.

Distribution: HEWLETT [Circuit controlling devices] 23,734/11.

Electrochemistry: CARL [Electrolysis of aqueous solutions of metallic salts] 24,238/11.

Switchgear: HEILBRUN [Switch] 24,003/11.

Traction: SIEMENS & HALSKE AKT.-GES. [Electric-signals] 21,873/11.

Miscellaneous: GES. FÜR ELEKTRO-TECHNISCHE [Electric welding seams of tubes] 23,943/11; COLEMAN [Electro-magnetic relay] 24,154/11.

The following amended Specification can now be obtained.

CLATWORTHY and HOLMES [Electrical driving of printing presses] 9,802/98; HUNTE [Dry cell] 14,615/08; SHARMAN [Musical signalling by radio telegraphy] 12,790/09.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. C. JOHNSON and M. P. THOMSEN, 16,301/05.

Distributing Systems: BRITISH THOMSON-HOUSTON Co. (*General Electric Co., U.S.A.*) [Electric circuit control] 18,022/07.

Dynamos and Motors: UNION ELEKTRICITÄTS-GES. [Single-phase commutator motor control] 17,220/04.

Electric Ignition: ELECTRIC IGNITION Co. and F. H. HALL [Contact maker] 17,812/06; A. HORCH [Switches] 18,083/06.

Electrochemistry: J. WETTER (*Elektricitäts Akt.-Ges. vorm Schuckert & Co.*) [Obtaining chlorine, hydrogen, &c., by electrolysis] 17,981/06; A. CLASSEN [Producing metallic deposits on articles] 17,969/07.

Incandescent Lamps: A. G. BLOXAM (*Siemens & Halske Akt.-Ges.*) [Metallic filaments] 17,973/07; N. KESSLER and G. JELICH, 18,013A/07; R. JAHODA, S. and I. VON LOTI and R. LATZKO [Metallic filaments] 18,053/07.

Fittings: W. J. BODELL [Lamp holders] 18,033/07.

Telephony and Telegraphy: SIEMENS BROS. & Co. (*Siemens & Halske Akt.-Ges.*) [Order telegraphs] 17,827/06.

Traction: H. B. SAWYER [Trolley pulley] 17,832/07; N. FALLEK [Tramcar bells] 17,947/07.

Miscellaneous: A. W. STEVEN [Centrifugal fans] 18,046/06; H. W. CHINNERY [Advertising apparatus] 18,151/07.

DISPUTE re MUNICIPAL WIRING RULES AT ST. PANCRAS

AT the Clerkenwell Police Court on Wednesday last week, Mr. Bros finally disposed of the application for the appointment of an electrical inspector, made by Mr. A. E. Evans, of 38 Fitzroy Street, Fitzroy Square, and Messrs. McDonald, Syer & Co., Ltd., of 295 Gray's Inn Road. W.C. The previous proceedings were reported in our issues of October 12th, p. 559, and November 9th, p. 609.

Mr. Barrington Ward, on behalf of the St. Pancras Borough Council, said that since Mr. Tweedy Smith had taken the case in hand it had assumed a very different aspect. He now felt that he could not resist the appointment of an inspector, and he had intimated to the other side the willingness of the Borough Council to agree to the appointment of Mr. C. A. Baker, Principal Electrical Assistant, and senior inspector under the Electric Lighting Acts, in the Engineers' Department of the L.C.C. At the same time he asked the magistrate to appoint the inspector merely in respect of the two applications, and not generally or for any specific period.

Mr. TWEEDY SMITH first objected to the inspector being appointed for these two cases only, because he had a whole bundle of complaints in the area. He wanted a permanent inspector appointed under Section 28 of the St. Pancras Electric Lighting Order, and Regulation 31 of the Board of Trade Regulations, in order that St. Pancras should be dealt with in exactly the same way as all the other London boroughs. Otherwise he would be continually coming to the magistrate for the appointment of an inspector for each individual case.

Mr. BROS said he was inclined to appoint the inspector under the terms of the St. Pancras Order for 12 months to act generally.

Mr. TWEEDY SMITH pointed out that this would only enable the inspector to test works and lines, and not consumers' installations.

After a good deal of discussion it was decided that the inspector should be appointed as from January 1st, 1912, for 12 months, and if the parties cannot agree upon the form of the order making the appointment, or any other matters, the magistrate will decide.

ELECTRIC TRACTION NOTES

The arbitration to determine the price of the London United Tramways Co.'s Hammersmith lines is still proceeding. Mr. W. E. Ireland, Superintendent of Rolling Stock to the London County Council, has valued the cars at £338, compared with the company's estimate of £514 each. He also contends that the repair shop machinery only had, originally, a life of ten years, so that the value in 1909, after 8½ years' use, was very small. Mr. J. Shepherd, Electrical Engineer to the London County Council Tramways, expressed the opinion that the two 500-kw. D.-C. sets at the Chiswick Power House will be quite sufficient to run the Hammersmith lines, as the demand on a Bank Holiday would be from 460 to 560 kw. only. In cross-examination, Mr. Shepherd admitted that the Greenwich power station of the L.C.C. has an installed capacity of 31 kw. per car in use, whereas the average power used per car was only about half this, the excess being necessary to deal with peak loads and for spare and repairs. Mr. John Welling, Permanent Way Engineer to the L.C.C., said that, in his opinion, the rails on four out of the five sections on the Hammersmith lines were practically "dead," and he reduced the valuation of the permanent way and overhead equipment to considerably less than that of Mr. Sellon. Evidence was also given to the effect that the car shed at Chiswick, which the Company says the L.C.C. should take over, is three times too large for the number of cars required for the Hammersmith lines.

The Manchester Corporation is to be asked to appoint a sub-committee to consider the best means for relieving the congestion of traffic in the central portion of the city. Suggestions have been made that the construction of subway tramways was in contemplation, but we understand that the Tramways Committee have no intentions in this direction at present.

A proposal to instal trolley omnibuses in Bloemfontein is under consideration by the Council.

The Tynemouth Corporation have a proposal before them by the Tynemouth and District Electric Traction Co. for the running of trolley omnibuses upon certain routes where tramway extensions are thought necessary. As a condition for the construction of these lines, the company have asked for the consolidation of the dates of purchase of the existing tramways and light railways, so that they should be the same as that for the proposed trolley omnibus system, viz., twenty-one years from the granting of the trolley omnibus powers. There is, however, a difference of opinion between the company and the Corporation as to the cost of street widenings.

The Irish Court of Appeal has dealt with an appeal in connection with the purchase by the Belfast Corporation of the Cavehill and Whitewell Tramway Company's undertaking. Mr. Lynden Macassey, the arbitrator, fixed the price at £56,155, upon the basis of a going concern, and also taking into account other elements of value, which, he considered, had a bearing upon the sale. The Corporation argued that this was a misconstruction of the reference to the arbitrator and of an agreement between the parties, and the King's Bench Division ordered the award to be sent back to the arbitrator for further consideration. This latter decision was appealed against. After considerable argument, the order of the King's Bench Court referring the award back to the arbitrator was confirmed, with certain alterations, making it quite clear upon what basis the arbitrator is to proceed.

The report of the British Columbia Railway Co. for the past financial year shows very remarkable progress, the total receipts having risen by some 44 per cent. The gross revenue was £958,500, and a dividend of 8 per cent. for the year is declared upon the ordinary shares.

According to the *Pall Mall Gazette*, the London and South-Western Railway have definitely decided not to take any steps to convert their suburban lines to electric traction. This decision has been reached, it is said, after very careful consideration. In any event, no work of this description will be undertaken until Waterloo Station has been reconstructed, which it is expected will be finished in about three years.

At an extraordinary general meeting of the British Electric Traction Co. on Wednesday the modified scheme of capital reorganisation was passed. The poll taken resulted in 3,210 voting in favour of the scheme and 507 against. In addition the directors held proxies to the extent of 38,000 in favour.

Another electric traction scheme of some importance, which will come before Parliament next year, is one by the lessees of the East London Railway Co. for converting that line to electrical working.

The promoters of the proposed scheme for running trolley omnibuses between Guiseley and Otley, recently referred to in our columns, have decided to postpone their application to Parliament until next year.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

As was briefly mentioned in our last issue, an exhibition of a model automatic telephone exchange was given by the British Insulated and Helsby Cables, Ltd., in London, on Wednesday last week. The various parts of the model shown were similar to those to be employed in the Epsom exchange, which the company is now erecting for the Post Office. The system employed and the details of the apparatus were fully explained in a Paper read before the Institution of Electrical Engineers by Mr. W. Aitken on May 18th, and the object of the present demonstration was to make the apparatus familiar to the lay Press and the general public.

In our issue of May 25th, in which we referred to Mr. Aitken's Paper and reported the discussion upon it, we described and illustrated the subscriber's instrument, and also the connector employed in C.B. automatic exchanges. Such a connector is not, however, required for every line. Each subscriber's line is connected at the exchange to a simpler apparatus termed a line switch, which automatically extends the line to a free "selector" as soon as he removes his receiver from the switchboard. Each "connector" has 100 lines connected to it, and there would be 100 connectors in a 1,000-line exchange, so that each group of 100 lines would be available at 10 connectors. The connectors, which correspond more or less to the "multiple" on a manual board, are joined up to the "selectors" which, in connection with the line switches, may be taken to correspond to the operator's keyboard. Say, for instance, the number required by a subscriber is 865. The series of impulses sent by the subscriber's finger-plate switch, corresponding to the hundreds, will cause the selector to step up to the eighth level of contacts, and it will then rotate until the first free line to a "connector" is found. The connector will in its turn receive the first of the six impulses, causing it to step up to the sixth level of its contacts, and will then

Hosted by Google

rotate until the fifth group of springs corresponding to the units of the number required is reached.

For details of construction, the actual connections, and the manner in which in the case of engaged lines connection cannot be made, and the "busy" signal is transmitted to the subscriber, we must refer our readers to Mr. Aitken's Paper published in full in the Institution *Journal*.

At the demonstration Mr. James Taylor, Vice-Chairman of the company, introduced Mr. Dane Sinclair, General Manager of the British Insulated & Helsby Cables, Ltd., and formerly Engineer-in-Chief of the National Telephone Co., who delivered a short lecture on the advantages of the system. Mr. Keith, the inventor, was also present, and explained the technical details to the visitors.

The Automatic Telephone Manufacturing Co., with a capital of £1,000,000 in £1 shares (500,000 preferred), has been registered. The company is to acquire from the Automatic Telephone Co., of Chicago, certain patents relating to the Strowger automatic telephone system, and will also acquire from the British Insulated & Helsby Cables, Ltd., certain lands, works and plant at Edge Lane, Liverpool, where the manufacture of automatic telephone apparatus upon the Strowger system will be carried on. The subscribers are J. Taylor, D. Sinclair, A. Brooker, J. S. Harmood Banner, F. E. V. Russell Roberts, V. D. Heyne, and J. Bruce. The directors are J. Taylor, D. Sinclair, J. S. Harmood Banner, E. A. Mellinger, of Chicago, J. B. Russell, of New York, and M. Muspratt. Reference to the prospectus will be found on page 662.

It was stated at the annual meeting of the German Society of Naval Architects last week that on the top of the existing 100-metre iron wireless telegraph tower at Nauen, the Telefunkengesellschaft have erected another tower of the same height. The range of the original tower was 5,000 kilometres, but much better results are now expected. According to the *Times* correspondent, the Telefunkengesellschaft have received orders this year for 390 wireless stations.

The *Daily Telegraph* correspondent at Stockholm states that several well-known business men have petitioned the Government for a concession to build a wireless station on the Marconi system near Stockholm with a radius of 1,200 miles. The idea is to undertake from this station regular telegraph communication between Sweden and several European countries, as well as with Canada, United States, South America, Africa, Asia, and Australasia. Communication with Great Britain would be direct, and with most other countries the communication would be *viâ* Great Britain. It is intended to form a company with a capital of £100,000, and if the concession is granted the station would be working within twelve months.

The most powerful wireless telegraph station yet installed was opened at Coltano, Italy, about a week ago. The available power is 1,000 kw., and some idea of its range can be had from the fact that the 500-kw. station at Clifden, Ireland, recently succeeded in communicating with Buenos Ayres, a distance of 7,000 miles. We mentioned in ELECTRICAL ENGINEERING, October 26th, p. 587, that the Spanish Government intend to carry on internal wireless telegraphy, for which purpose stations are to be erected at Cadiz and Barcelona, and also in Teneriffe and Las Palmas for external telegrams. When these stations are in working order, they will open a service with the Coltano station, which will put them in touch with England and other countries.

West Indian cables have once more practically been placed in working order, for the Jamaica-Colon, Mole St. Nicholas-Guantanamo, New York-Haiti, and Martinique-Paramaribo sections have been repaired, leaving only the Paramaribo-Cayenne cable to be attended to.—Censorship has been proclaimed by the San Domingo Government.—The *Henry Holmes* left Jamaica for St. Lucia.—Communication with Lubango is restored, while the lines between Teheran and Chahroud failed, and were repaired on 25th inst.—Telegrams for Astrabad and Khorasan region must be sent *viâ* Russia.—The cable between Saigon and Pontianak gave out on 24th inst. between the latter place and the island of Poulocondore.—The land lines of the Indo-European Telegraph Company between Rowne and Odessa ceased working on 27th inst., and on the same day we learn that radio-telegrams from ships at sea to Italian coast stations can only be sent at sender's risk, and they must be in plain language.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of 9d. per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203–6, Temple Chambers, London, E.C

APPOINTMENT VACANT.

ASSISTANT INSTALLATION INSPECTOR REQUIRED.—Must be experienced in the testing of power and lighting installations. Salary 30s. per week. Applications in writing, giving full details of training and experience, and enclosing copies of not more than three recent testimonials, to THE ENGINEER AND MANAGER, Electricity Works, 27 Osborn Street, E., not later than Thursday, December 7th, 1911. The person appointed will be required to reside within the Borough of Stepney.

FOR SALE.

C. JENNINGS & CO. can supply woodwork of any description at short notice, Stairs, Balusters, Newels, Handrails, Sash bars, Mouldings, Joinery. Support BRITISH Industry, and refuse Foreign doors. We compete. Electric casings and underground troughing also supplied. JENNINGS & Co., 955 Pennywell Road, Bristol.

GAS RETORT CARBON for Sale. Pitch, Insulating Material, Creosote. We supply the Trade.—V. DASNIERES, 10 St. Mary Axe, London, E.C.

PATENTS.

The Proprietors of Letters Patent No. 27,236 of 1908, relating to electric generators, desires to dispose of the patent or to grant licences to interested parties on reasonable terms, with a view to the adequate working of the patent in this country. Enquiries to be addressed to :—

CRUIKSHANK & FAIRWEATHER, LIMITED,
International Patent Agency,
65-66 Chancery Lane, London, W.C.

John E. Raworth,
Queen Anne's Chambers, 30, Broadway, Westminster, London, S.W.
Chartered Patent Agent.

REMOVAL. MR. J. G. LORRAIN, M.I.E.E., M.I.Mech.E., Chartered Patent Agent, has removed his office from Norfolk House, Norfolk Street, Strand, W.C., to
Staple Inn Buildings, High Holborn, London, W.C.

LOCAL NOTES

Aldeburgh: *Electric Supply.*—Mr. A. P. Trotter, Electrical Adviser to the Board of Trade, held a public meeting last week to inquire into certain objections raised by residents and owners of property close to the site of the proposed power station of the Aldeburgh Electric Supply Co. The power station is to be erected near the Great Eastern Railway Co., and Diesel engines are to be employed. Most of the objections are mainly due to a feeling that there will be vibration and nuisance from the working of the power station, and a representative of the company explained what is intended in order to meet these objections. Mr. Trotter will report to the Board of Trade in due course.

Blackpool: *Street Lighting.*—It has been decided to put up an additional ten Metroflam arc lamps on the promenade.

Brighton: *Electrical Exhibition.*—The Electrical Exhibition organised by the Electricity Department closed on Saturday. During its three weeks' run it was attended by upwards of 40,000 people, practically one-third of the population of Brighton. During that time thirty-two practical demonstrations were given in electric cooking, two of them being on an exceptionally large scale. Very considerable interest has been roused amongst consumers in the possibilities which electrical apparatus now offers in connection with the cooking operations of an ordinary house with electricity at 1d. per unit. Copies of some photographs which we have seen show that the arrangement and display of the exhibits at this local exhibition fell little, if at all, short of its recent prototype in London.

Municipal Wiring.—The proposal of the Incorporated Municipal Electrical Association to promote a Bill in Parliament conferring wiring powers upon all municipalities, was discussed at some length at the Council meeting last week. The Electric Lighting Committee recommend the Council to co-operate in this promotion, but after a long discussion this suggestion was not agreed to. The opponents of the proposal made good use of the opinions of Mr. J. Christie, the Borough Electrical Engineer, on this matter, and it may be remembered in his Presidential Address to the Incorporated Municipal Electrical Association, in June, he clearly pointed out that he was not in favour of municipalities undertaking the wiring of consumers' premises. Particulars of the Bill will be found on page 654.

Dundalk: *Electric Lighting Works.*—Good progress is being made with the erection of the electricity works. The main walls of the engine-room are now finished, and a start has been made upon the foundations for the generating sets. A scheme of street lighting is being inquired into. Messrs. Miller, Wilson & Pegg are the consulting engineers.

Dundee: *Municipal Wiring.*—The Electricity Committee have discussed the Bill conferring municipal wiring powers to all local authorities which the Incorporated Municipal Electrical Association have brought forward. The Convener of the Electricity Committee stated that the Dundee contractors were not pushing electricity as they should. During the last four years the work done by them represented barely £13,000, and £36,000 worth of work had gone outside the city. Mr. H. Richardson, the City Electrical Engineer, reporting upon the provisions of the Bill, said that many corporations already possessed the powers that it was now sought to make general, and they were absolutely necessary for the advancement of municipal electrical undertakings. The Committee are in favour of supporting the Bill to the extent of subscribing their share of the promotion expenses.

London: *Islington: Shop Lighting.*—The Electricity Committee propose to set aside £250 in connection with a hiring-out scheme for shop-front lighting.

North Berwick: *Electric Lighting.*—The Council have agreed to an extension by six months of the time within which Messrs. Crompton & Co. had agreed to give a supply of electricity in the district.

St. Anne's-on-Sea: *Electric Lighting Accounts.*—The accounts of the electric lighting department for the year to March 31st, show a net surplus of £971 after meeting capital charges. The sum of £600 has been transferred to relief of rates, and the balance placed to reserve fund. The latter now stands at £4,899, which is equivalent to 9·4 per cent. of the capital expenditure. The increase in the number of units sold over the previous year was 11,298, which is equivalent to 1·4 per cent.

Uruguay: *Electric Supply.*—According to a *Times* correspondent at Montevideo, the Government have presented a Bill for the nationalisation of electric supply throughout the Republic. Existing concessions, it is said, are to be redeemed on a financial basis by the issue of 5 per cent. bonds.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Australia.—The Sydney City Council have decided to make arrangements for borrowing to the extent of £250,000 in connection with the electricity undertaking.

Beauly (N.B.).—Mr. Williams, an electrical engineer of Inverness, has placed a scheme of electric lighting before the Council. The estimated capital expenditure is £850.

Bolton.—We understand that extensions of the electricity undertaking will be put in hand very shortly.

Dartford.—It is proposed to apply for sanction to a loan of £8,500 for additional machinery at the electricity works.

Greenock.—The Borough Electrical Engineer estimates that an expenditure of £3,700 will be necessary in order to give supply to the works of Messrs. Dunlop, Bremner & Co.

London: *Hammersmith.*—The Finance Committee of the L.C.C. recommend sanction to a loan of £750 for the conversion of public gas lamps to electric lamps.

St. Pancras.—The Finance Committee of the L.C.C. recommend sanction to a loan of £9,964 for mains, generating plant, house services and meters.

Redditch.—A Local Government Board inquiry was held last week concerning a loan of £5,850 for extensions to the electricity undertaking. New generating plant to the extent of 250 kw. is to be installed.

Singapore.—The Municipal Commissioners are floating a loan of £116,700 for the purposes of an electrical installation, among other things.

Swinton.—A Local Government Board inquiry was held last week regarding a loan of £3,323 for the purposes of the electricity undertaking.

OSRAM·LAMPS

Worcester.—New mains are to be laid at an estimated cost of £1,400 in connection with electric pumping at the waterworks.

Worsley.—The Council are in communication with the Lancashire Electric Power Co. with regard to electric supply.

Wrexham.—Tenders are invited by December 5th for a main switchboard. Particulars from the Electrical Engineer, and tenders to the Town Clerk.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Barnsley.—Mechanics' Institute, Hanson Street. Architects, Messrs. Crawshaw & Wilkinson, 13 Regent Street.

Brighouse.—New municipal baths.

Cambridge.—Schools in Melbourne Place. Borough Engineer.

Derby.—Enlargement of Pear Tree Council School. Architects, Naylor & Sale, Smith's Bank Chambers, Market Place.

Grassington.—Tenders are invited for the electric lighting of the Wesleyan Chapel. Rev. A. Pritchard, Rock House.

Greenock.—Large building in Bogle Street as a trades hotel.

Lancaster.—Girls' Grammar School on High Street estate. Architect, H. Littler, 16 Ribblesdale Place, Preston.

Leicester.—Public Hall for the Corporation. Borough Surveyor.

London.—New branch post and sorting office at E. Ham. J. Rutherford, 22 Carlisle Place, S.W.

Newquay.—Pavilion. Borough Surveyor.

Swansea.—Business premises in Castle Street. Architect, S. Williams, Wharton Street, Cardiff.

Tottenham.—The Architect to the Education Committee has been instructed to report with regard to the wiring of new schools for electric lighting.

Hosted by Google

TENDERS RECEIVED AND ACCEPTED

Blackpool.—The tender of the United Electric Car Co. for six toast-rack cars has been accepted.

Dundee.—The Tramways Sub-committee have accepted a tender by the Railless Electric Traction Co. for two trolley omnibuses at £700 each.

Jerusalem.—It is stated that the contract for an electric tramway and lighting system has been placed with a French firm.

APPOINTMENTS AND PERSONAL NOTES

Mr. E. V. Johnson, late technical representative for Messrs. Willans & Robinson in South Wales, has joined the firm of Messrs. W. V. Waite & Co., Ltd., Cardiff.

A representative gathering of Mr. Hamilton Dixon's electrical friends met at the Florence Restaurant, on Friday, November 24th, on the occasion of a farewell dinner to Mr. Dixon prior to his departure for Manchester, where he is about to take up an important position. Mr. Dixon, who is well known as a genial character in the electrical industry, has for some years been connected with his brother-in-law, Mr. Haydn Harrison, in his business at 11 Victoria Street. All those who have come in contact with him will wish him success in his new venture.

The Stepney Electricity Department require an assistant installation inspector at a salary of 30s. per week. (See an advertisement on another page.)

Mr. John D. MacKenzie, 217, West George Street, Glasgow, has been appointed sole Scottish agent for Sykes & Sugden, Ltd., Huddersfield, who manufacture service fuses, joint boxes, feeder pillars, &c.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £61 to £61 10s. (last week, £59 10s. to £59 15s.).

The J.-L. Manufacturing Co., Ltd.—To avoid any misconception which might be occasioned by the recent notice of the voluntary liquidation of this company, we are asked to call attention to the fact that this is occasioned by the amalgamation of the company with Submersible Motors, Ltd., as announced in ELECTRICAL ENGINEERING, October 19th, page 574.

Board of Trade Commercial Intelligence Department.—A Commercial Information Bureau is now attached to the Board of Trade Commissioner's Office, Norwich Union Buildings, Cape Town. Commercial information dealing with trade in the United Kingdom and South Africa will be given free of charge to those interested in British trade.

Canadian Agency Wanted.—The *Board of Trade Journal* states that a Winnipeg correspondent, who is a large dealer in metal filament lamps, desires to receive quotations and samples from British manufacturers.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

MOTORS.—A sheet from the Electrical Company, Ltd. (122-4 Charing Cross Road, W.C.) gives a list of D.-C. motors in stock for voltages of 100-120, 200-250, and 400-500, as well as new machines of 6 and 10 h.p. for 220 volts, and speeds of 840 and 1,060 respectively.

CARBONS.—In another leaflet from the same firm, various qualities of Plania carbons, and the uses to which they can be put, are outlined. The flame type, which can be had with or without a metal core, is dimensioned in millimetres and inches, and the price per length of 100 pieces is given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

STEAM TRAP.—Details of a steam trap of the "spirit expansion" type are to hand from Geipel & Co. (Vulcan Works, 72A St. Thomas' Street, London, S.E.). It is small and compact, has a rotating valve, and a large valve opening. It is made for steam pressures up to 100 lbs., and a number are already in use. A special form is made for railway carriage heating.

BOOKS.—A catalogue of technical books from W. & G. Foyle (135 Charing Cross Road, W.C.), contains all the latest editions. Second-hand copies, however, can be obtained of all the books at about half published price.

MOTORS.—A neatly arranged catalogue from Scholey & Co., Ltd. (151 Queen Victoria Street, London, E.C.), gives a general description, with very clear diagrams, and full particulars of a series of A.-C. motors. The usual types of single, two, and three phase machines, with slip ring or squirrel cage rotors are shown, and efficiencies and power factors are also given, while the approximate weights and shipping particulars and the dimensions at the end make it a very useful guide.

FANS AND TATTERSALL AIR HEATERS.—Leaflets from C. Whittaker & Co., Ltd. (Union Foundry, Haslingden, Lancs.), describe a radiator type of air heater or cooler, which consists of a number of flat thin corrugated tubes, bent zig-zag fashion to give a large surface to the heating fluid and the air, which flow respectively through and between the tubes in thin streams. It can be connected to a fan either of the centrifugal or propeller type, both of which are referred to on separate sheets. The combination is equally adapted for cooling liquids, to cool gas engines, condensing water, &c. The Tattersall surface condenser, in which air, with evaporated cooling, is used instead of water, is also described.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Automatic Telephone Manufacturing Co.—Applications are being invited for an issue of 200,000 6 per cent. cumulative preference shares and 360,000 ordinary shares of £1 each. The dividend on the preference shares is guaranteed by the British Insulated & Helsby Cables, Ltd.

Hadley Engineering Co.—This Company, which has been formed to take over, among other things, the manufacture of the Tilling-Stevens petrol electric omnibuses, is issuing capital to the extent of 120,000 preference shares and 12,000 ordinary shares of £1 each. We referred to the new 'buses in our last issue.

South America Light & Power Co.—An issue is being made of £150,000 5 per cent. first debentures at 96. The company holds a perpetual contract for the supply of electricity for all purposes in Bahia Blanca, in addition to a number of other concessions.

Aron Electricity Meter.—The transfer books will be closed from December 7th to 14th inclusive.

Adelaide Electric Supply Co.—The net profit for the year to August 31st was £40,983. After meeting debenture interest and the dividend of 6 per cent. on the preference shares, a final dividend of 6½ per cent., making 10 per cent. for the year, is declared on the ordinary shares, together with a bonus of 2s. per share. The sum of £5,000 is transferred to general reserve, £5,000 to dividend equalisation fund, and £4,385 carried forward.

NEW COMPANIES

LOND & CRAWFORD, registered by Jordan & Sons, 116 Chancery Lane, W.C. Capital £1,000. Electrical engineers and contractors.

UNIVERSAL CHEAP CABLES, 40 King Street, Cheapside, E.C. Capital, £100,000. To acquire the patents of the Johnson Secret Wireless Telegraph and Telephone Testing Syndicate and to carry on the business of wireless and other telegraphists and telephonists.

Witton-Kramer Lifting Magnets.—We have received from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), an excellent view of the part of their stand at the Olympia Electrical Exhibition, on which they demonstrated the working of the Witton-Kramer crane magnet. An account of these demonstrations, with an illustration of the apparatus, appeared in the special Exhibition Supplement to ELECTRICAL ENGINEERING, October 12th, p. 59.

Osram Lamps.—The General Electric Co. (67 Queen Victoria Street), have sent us a striking illustration reproduced from an untouched photograph, showing the result of a recent collision between a motor-omnibus and a lamp standard in Great Portland Street. Although the lantern was bent over to a considerable angle, the Osram lamps therein remained intact, and lighted up when the current was next switched on.

NOTICE is hereby given that the TRANSFER BOOKS and REGISTER of members of ARON ELECTRICITY METER, LTD., will be closed from Thursday, the 7th December, to Thursday, the 14th December, 1911, both days inclusive.

By Order,

M. ARON, F.C.I.S.,
Secretary.

SUMMARY

An article dealing with the Coal Mines Bill, which passed its third reading on Tuesday in the House of Commons, occupies the first position in our monthly supplement on Electrical Engineering in Mines, and besides critical comment contains a report of the debate on the clause limiting the use of electricity to places in mines where the proportion of inflammable gas does not exceed 1¼ per cent. An abstract is also given of a report on electricity in mines in 1910, and further articles deal with a new safety lamp and a system of automatically controlled mining locomotives.

A few notes are given on the career of Prof. E. Arnold, of Karlsruhe, who died last month. (Page 665.)

A Paper by Mr. Roger T. Smith, read recently before the Institution of Civil Engineers, describes the brake vehicle method of train lighting employed on the Great Western Railway. (Page 665.)

A correspondent discusses the method of appointing the council of the Institution of Electrical Engineers, objecting to the principle of self-nomination, and bringing forward the example of another body, in which this system was rejected. (Page 666.)

Mr. R. Rankin's Paper on "Automatic Reversible Battery Boosters" has been further discussed by the Manchester Local Section of the Institution of Electrical Engineers. (Page 667.)

In the Appeal Court on Monday, the appeal of the British Westinghouse Co. against the arbitrator's award regarding the Lots Road turbines was dismissed with costs. The Westinghouse Co. will have to bear the whole cost of installing the Parsons turbines, plus the difference between the actual and guaranteed steam consumption of the Westinghouse turbines. (Page 667.)

At the last meeting of the City Corporation a combined scheme of electric and gas lighting for the whole of the streets in the City was approved. The contract is for ten years, and is divided between the City of London Electric Lighting Co. and the Gas Light and Coke Co. The total illumination will be increased by 601,765 c.p., with a decrease in cost of £6,832 per annum. (Page 667.)

A generator driven by a paraffin engine is to be used for the lighting of the Royal train in India. (Page 668.)

Some evidences of the strength of wire drawn tungsten filaments are given on page 668.

A time element attachment for circuit-breakers is discussed in an illustrated article. (Page 669.)

A cheap method of supporting metal filaments has been devised, in which mica discs are used instead of platinum or iridium wires. Another patent published last week was for a mercury contact-breaker, which utilises the heating effect of the spark on an extinguishing fluid to rapidly break the circuit. A process for enamelling wires by a series of thin uniform coatings is also protected, as well as a connection device for attaching terminals to cases containing apparatus. Two patents expire during the coming week relating to

Hosted by Google

wireless telegraphy, including one of Sir Oliver Lodge's in which the apparatus is connected up on the Wheatstone bridge principle, and the coherer is contained in a metal casing to avoid outside influences; the other, by G. Marconi, also encloses the coherer in a metal box with openings closed by screens, which are actuated by a pivoted lever for putting it in circuit. (Page 670.)

UNDER "Telephony and Telegraphy" we mention the reason why the Post Office cannot see their way to erect an experimental automatic exchange in Ireland. Mr. Charles Bright's lecture to the London Chamber of Commerce on the Atlantic cable position is also referred to. (Page 670.)

IN "Electric Traction Notes" we report the concluding stage of the arbitration concerning the Hammersmith lines of the London United Tramways; and give Col. Yorke's opinion as to the recent accident on the Birmingham and Midland tramways. (Page 671.)

A NUMBER of corporations are promising support to the I.M.E.A. Wiring Bill.—The Frome Electricity Works are to be transferred to Messrs. Edmundson's Electricity Corporation.—In consequence of the recent change of policy in the Newport (Mon.) Electricity Department, the Chairman of the Electricity Committee has declined to continue in the office. (Page 672.)

SOME illustrations show the improvement in lighting that has been effected in some of the tube railway stations. (Page 671.)

THE West Hartlepool scheme of utilising blast furnace gases for generating electricity has been sanctioned. Loans are to be taken up at Darlington (£3,220); Erith (£11,761); Sheffield (£61,099); and Blackpool (£4,200). A 3,000 kw. turbine is required at Stalybridge; cables at Middleton; a high-tension switchboard at Croydon, and a 750 h.p. motor at Brighton. (Page 673.)

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 7TH.

Institution of Electrical Engineers.

8 p.m. "Notes on National and International Standards for Electrical Machinery," by Dr. R. Pohl.

FRIDAY, DECEMBER 8TH.

Royal Astronomical Society.

5 p.m. At Burlington House. "The New 'Synchronome' Astronomical Regulator," by F. Hope Jones

Northampton Institute.

6.30 to 11 p.m. Prize distribution.

Royal Automobile Club.

9 p.m. "London to Brighton in 45 Minutes by Electric Train," by Philip Dawson.

Electrical Engineers' Dance

9 p.m. At Midland Hotel, Manchester.

SATURDAY, DECEMBER 9TH.

Northampton Institute.

6.30 to 11 p.m. Annual Conversazione.

Birmingham and District Electric Club.

7 p.m. Annual meeting at Colonnade Hotel, New Street.

MONDAY, DECEMBER 11TH.

Institution of Post Office Electrical Engineers.

6 p.m. At Institution of Electrical Engineers. "Distribution by Means of Parallel Cables," by E. A. Pink.

Institution of Electrical Engineers: Newcastle Local Section.

7.30 p.m. At Armstrong College of Science.

TUESDAY, DECEMBER 12TH.

Institution of Electrical Engineers: Glasgow Section.

7 p.m. Annual dinner at "The Grosvenor," Gordon Street.

Institution of Electrical Engineers: Manchester Section.

7.30 p.m. At the University. "Heat Conductivity in Electrical Machinery," by Miles Walker and H. D. Symons.

WEDNESDAY, DECEMBER 13TH.

Dynamicables.

7.30 p.m. Dinner at Trocadero.

Institution of Electrical Engineers: Birmingham Section.

7.30 p.m. At Municipal Technical School. (1) "Automatic Starting of Asynchronous Motors," by N. Pensabene-Perez; (2) "Some Notes on the Circle Diagram," by T. F. Wall.

Royal Society of Arts.

8 p.m. "Continuous Service in Passenger Transportation," by W. Yorath Lewis.

Association of Engineers-in-Charge.

8 p.m. At St. Bride's Institute, London. "Methods of Dealing with Losses in Steam Plant due to Condensation," by G. Wilkinson and J. Rendell Wilkinson.

ONE REASON WHY THE PRICE OF COAL WILL GO UP.

MINER:—Get out! I don't understand you and I don't want you, and besides you are a labour-saving device.

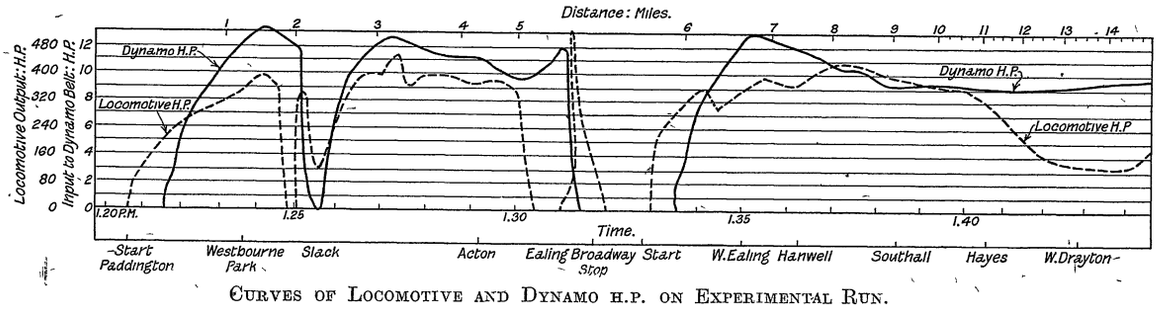
OBITUARY

E. Arnold.



PROF. ENGELBERT ARNOLD, who died on November 14th last, was as well known through his writings on dynamo design and kindred subjects as he was as head of the electrical department of the Technical University at Karlsruhe, the high-standing of which was in a great measure due to his personal work. Of his books, his two-volume "Die Gleichstrommaschine" is perhaps the best known, and by many he was regarded as the authority *par excellence* on continuous current design, and more particularly on the theory of commutation. He wrote, however, also extensively on alternating current matters, partly in collaboration with Mr. J. L. de la Cour. There are not a few English electrical engineers who received their training in his laboratory at Karlsruhe, and in many ways the influence of his teaching was far-reaching. Prior to his work in the development of the Karlsruhe College, Dr. Arnold was for a while chief electrical designer to the Oerlikon Co., which firm he joined after six years' experience at a manufacturing works at Riga, founded by himself and H. Dettmann. His connection with Riga, however, commenced in 1880 on his taking an appointment at the Riga Polytechnic, in addition to the duties of which he was able to practise engineering generally. Although the greater part of his career was thus passed in Germany and Russia, he was by birth a Swiss, having been born near Lucerne in 1856, and it was at the famous Zurich Polytechnicum that he received his early technical training.

THE BRAKE VEHICLE METHOD OF TRAIN LIGHTING

MR. ROGER T. SMITH (Chief Electrical Engineer, Great Western Railway) read a Paper entitled "Electric Lighting of Railway Trains: the Brake-Vehicle Method," on November 28th, before the Institution of Civil Engineers. He referred briefly to methods that had been used from 1881 onwards for electric train lighting, including block-train methods with a single equipment, and the self-lit coach method with a dynamo on every vehicle, and proceeded to consider the different parts of the problem in detail. Considering first the provisions of adequate illumination in the carriages, he recommended an illumination, measured on a horizontal plane at eye-level, of 2 foot-candles in 3rd class, and 2½ foot-candles in 1st class compartments. Glare or dazzle would be minimised if not entirely prevented by keeping lamps out of the line of sight, by providing a white background behind the glowing filament, or by reducing the intrinsic brilliancy of the filament, by enclosing the lamp in a diffusing globe or Holophane globe, the latter at the same time improving distribution. The tungsten lamp had now replaced the carbon lamp, its most economical efficiency with present train-lighting lamps being 1·3 watt per candle. On the average, tungsten lamps, with a useful life of 850 hours, now had to be changed only once a year in the electrically-lit coaches on the Great Western Railway, where lamp-voltage was regulated within ±2½ per cent. In the latest corridor coaches on the G.W.R. each first-class compartment has five 10 c.p. lamps in pine-shaped diffusing globes. Four of these are placed in the roof in positions convenient for reading, and the other, in the centre, is provided with a dimming switch, so that it can be turned down at night. In the third-class carriages three 10-c.p. lamps are placed in clear glass globes, with white reflectors, and a switch places these in series for dimming them at night. The lamp pressure adopted is 22 volts, so that 12 cell batteries can be employed.

Some notes follow on the accumulator, which is an essential part of any system, considering only the lead cell. The two extremes among methods of charging lead cells are charging at constant voltage and charging at constant current, but a method of charging which combines the advantages of both extremes, while avoiding their disadvantages, is recommended, the charge being completely under the control of an automatic regulator set to give the proper compromise. The arrangement consists in starting with a heavy charge and gradually reducing it until, after proper gasing has taken place so as to mix the electrolyte, the charge is stopped when the cells are full, or the battery is left floating on the load while lights are on. Automatic regulation is necessary to secure a long and healthy life for the lead cell, and to reduce maintenance it is essential; when properly arranged, 10 per cent. per annum of the initial cost of the whole cell will provide for both maintenance and renewals of the plates and boxes. At the present time, the active material in the lead cell seems limited to a life of about five to seven years, only attaining the latter age when carefully nursed. The variable-speed dynamo is only dealt with briefly from the electrical point of view, but several details as regards belt driving and suspension are gone into. Electro-magnetic cut-in and cut-out switches are preferred by the author, and can be combined with the functions of a reverse-current circuit-breaker. The functions of the automatic regulator are as follows:—It must control the lamp-voltage within ±2½ per cent., independently of lamp-load and entirely independently of battery-voltage. When lamps are off, it must control the generator-field so as to provide the full output of the dynamo for charging an empty battery; and when lamps are on, the balance of the full output must be available for charging. As charging proceeds the regulator must control the inherent regulation of the dynamo so that its voltage only rises sufficiently to give a diminishing charging current. With a fully charged battery and lamps off, the regulator should reduce the charging current to zero, and with a fully charged battery and lamps on, the dynamo output must be adjusted to equal the lamp load, leaving the battery in a floating condition with current neither entering nor leaving it.

It was mainly to reduce the number of equipments and battery cells per train, and thus to minimise both initial cost and expenses of maintenance, that the brake-vehicle system has been adopted in preference to equipping every coach as a self-lit vehicle. The conditions of traffic, however, always require a certain number of self-lit vehicles.

Curves of Locomotive and Dynamo H.P. on Experimental Run.

An experimental six-coach train lit on this method has been run nearly continuously for two years in all sorts of traffic, varying from fast main-line services to slow, stopping, local services. Two brake-vehicles, equipped with 45-ampere dynamos, regulators, and 180-ampere batteries, light themselves and three dependents. A self-lit detachable coach completes the train. The Leitner system provided the only available apparatus able to meet the special conditions. All the equipments are in parallel, coupled through cables along the whole train providing for this. For the lighting circuits the through wiring and method of coupling is arranged on the loop-positive system, one regulator controlling the lamp-voltage on each side of the loop.

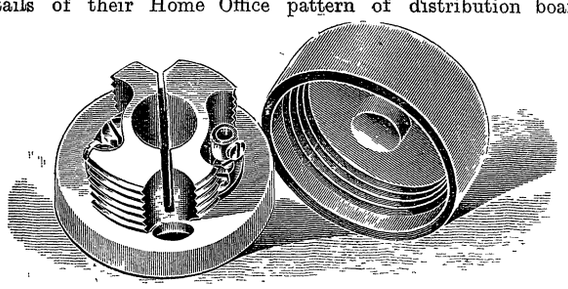
In the Leitner system the variable-speed generator ensures approximately constant voltage at all speeds and outputs above cutting-in speed by connecting the shunt field through the armature to a pair of auxiliary brushes which bear on electrically opposite sides of the commutator. Main and auxiliary brushes are given a forward lead. The field-current may therefore be

Hosted by Google

said to pass through the armature twice, in directions electrically at right angles to each other. When the dynamo revolves slowly the pressure across the auxiliary brushes is added to that across the main brushes, so that the field-current is large and the machine builds up quickly. As, with increased speed, armature-reaction distorts the magnetic flux in the direction of rotation, the effect of the auxiliary brushes first diminishes to zero and then reverses and the field-current is reduced. By this means the voltage of the machine can be kept practically constant for all speeds from, say, 500 to 2,000 revolutions per minute, though the inherent regulation of the machine will allow its voltage to rise independently of speed when charging a battery.

The cut-in switch is actuated by an armature rotating in two field windings, one of thick and the other of thin wire, both in series between the dynamo and the battery. The armature winding is connected across the battery. The fine series winding is short-circuited by the coarse winding when the switch is closed. The device also acts as a reverse-current circuit-breaker. The automatic regulator is controlled by an accurate voltmeter switch of the beam-balance type, the pull of a solenoid acting against an adjustable control spring. Any increase in voltage above the normal makes a contact on one side of the beam-balance, while any decrease makes a contact on the other side. The contacts work relays, and the relays supply current to move, through a small motor and gearing, a slider on four rows of variable-resistance contacts. One variable resistance is in series with the lamps, each of two others in series with one half of the dynamo-field, and a fourth is in series with the voltmeter-coil itself. One slider moving over all four rows of contacts adds or subtracts resistance simultaneously in each circuit, each section of the slider being insulated from its neighbour or neighbours on adjacent contacts.

The results of experimental runs with this equipment are detailed at some length in the Paper, and a curve relating to one of these is reproduced here. The system has been since applied to several other trains on the Great Western Railway, and on these a bus-bar system of through wiring is being adopted.



The total annual cost of lighting a six-coach train on the looped-positive brake-vehicle method as deduced from the runs of the experimental equipment is as follows. The cost of the initial equipment would be £761, inclusive of all carriage-work charges; adding working costs, extra cost of locomotive power—determined experimentally—and capital charges, the total annual cost becomes :—

	£
Working-costs	45
Power to drive dynamos, 1½ per cent. on £875 ...	13
Haulage of extra weight, 1·7 per cent. on £875	15
Interest on £761 at 4 per cent.	30
Reproduction of capital in 20 years at 3 per cent.	23
Total annual cost of lighting a six-coach train	£126

In conclusion the author points out the great safety of the system from the point of view of fire risk.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

LIGHTING SUPPLIES.—A catalogue from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), contains details of their Home Office pattern of distribution boards,

CIRCULAR DETACHABLE FUSE.

shielded fuses, branch switches, including the "Slick" flat switch, wall plugs and adaptors, cut-outs, "Coates'" lamp-holder shields, and china lampholders. The wall plugs are also supplied in midget, standard, and union gauges, and are all interchangeable. Among the cut-outs, we understand that the plaster-lined type and the new circular detachable fuse illustrated above have been reduced in price. Sign flashers are also included, and these can be had in the motor-driven or "thermic" types.

ELECTRIC LAMPS AND LIGHTING ACCESSORIES.—The British Westinghouse Electric and Manufacturing Co., Ltd. (Trafford Park, Manchester) has issued a series of lists neatly arranged in a leather binder. It is divided into sections, covering the "Arcturus" flame arc, and the Auriga metal filament lamps, general accessories, fittings, and glassware, cables, wires, and conduits, aerial fans, and cooking and heating apparatus.

CORRESPONDENCE

THE INSTITUTION OF ELECTRICAL ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Most of this discussion appears to be directed to details, and neglects the real cause of the present unfortunate state of the I.E.E.—the non-election of the Council.

If one asks "who gave the Council the power to rule us?" everyone knows the true answer: "it rules because it was nominated by the previous one," and the previous one because nominated by the one before, and so back into the dark ages, till one comes to the original meeting of the founders in 1871, to whom we are all grateful. The present body rules us to-day solely because it is the great[38]-grandson of the 1871 Council. I strongly support the hereditary principle in government, but this is heredity gone mad! Who would ever suggest the House of Lords as the sole ruler of the nation without King or Commons?

I know the argument on the other side—the Civils do it. I would meet it thus. I am a strong Conservative, and never want to change an old custom that gives good results. In the case of the Civils, the system is bad, and tends to bad results; but in their case they have fine old traditions behind them which neutralise those tendencies: the result is good—let well alone. In our case there is the same bad system: no counteracting influences; all the bad effects such a system tends to produce; the result is bad: change that system.

But any alternative should be a well-tried one; and there is a remedy which has stood the test of time. I belong to another Institution, a far stronger one than the I.E.E.; one that does everything for its members, and the industry in which they are interested, that the I.E.E. does for theirs, and a great deal more; *e.g.*, every Bill that comes before Parliament that affects that industry is scrutinised minutely, and every objectionable point is fought hard. If a decision is given in any court making a new principle to the detriment of that industry, it sees that case is taken to appeal, and generally pays most or all the cost. Now, some years back that body was suffering from the same disease as ourselves—a self-nominating Council, and with the same results. That Council was doing things of which the members strongly disapproved, though that Council never went to such extreme lengths as ours has done.

The members rose, swept the Council away, and put in a new one. This is too strong medicine for any but a very strong and healthy body, which we are not; moreover, on personal grounds I would deprecate it.

But they did more. They prevented any recurrence of the disease. They passed a new article: "No candidate shall be nominated by more than two members. No candidate can be nominated by the Council." This is a direct blow at the root of the evil, and we ought to do likewise. An over-crowded ballot sheet was prophesied, and to obviate it some said twenty supporters should be required. I have the certified figures for the last five years. Number of vacancies each year, 25 (a Council of 50, half retire annually); number of candidates, 35, 33, 33, 31, 32. The percentage of votes received by the *lowest* rejected candidate of those received by the *highest* elected one were for the last five years 41 per cent., 33 per cent., 32 per cent., 37 per cent., 24 per cent. The fact is, men are not such fools as to stand when they have no chance, it is merely to hold themselves up to ridicule. The effect on the composition of the Council is somewhat unexpected. It remains the same every year to just the same extent as before. The retiring members who stand again are almost always re-elected; the figures for the five years are, not re-elected, 2, 1, 0, 0, 1. It may be urged "if the result is the same, why change?" The result is not the same. In the self-nominating Council, when any measure is proposed, the self-interest of every member of it makes him say to himself, "Is the majority of the Council in favour of this? if so, and I oppose it, I make myself unpopular, and risk not being renominated." What the whole Institution wants does not affect his self-interest at all.

In the elected Council he asks: "Is the majority of the Institution in favour of this? If not, and the Council passes it, I lose my seat at the next election."

Moreover, if he does not know, he takes pains to find out; and in that other institution he can find out. There is none of the "secrecy of the Council Chamber" which has such a blighting effect on ours. With the exception of matters which it would be obviously inexpedient to publish at the moment—and they are few—a full report of every Council and every Committee meeting is published; everything is open and above-board, and every member knows what is being done, and can take an interest in it.

If we make this change, all other matters can be left. They will be dealt with by our own elected representatives, not by an alien body. Those representatives might well be—I hope they will be—the present members of Council, and they will carry out the wishes of the Institution, to whom they are responsible.

ONE WHO HAS BELONGED FOR TWENTY-EIGHT YEARS.

ELECTRICAL ENGINEERING

IN

MINES

Correspondence on any of the subjects dealt with in this Supplement is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203–206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

THE COAL MINES BILL

AS was briefly reported in our last issue, the House of Commons has decided that the use of electricity in mines shall be restricted to mines or parts of mines in which the proportion of inflammable gas in the air currents does not exceed 1¼ per cent. This is to apply both in the case of existing installations and new ones. The Bill was read a third time in the House of Commons at a late hour on Tuesday night. It has still to be passed by the House of Lords, but it is unlikely that any amendment as to the application of electricity will be made there.

All those with expert knowledge who listened to the debate and the previous discussion by the Standing Committee last summer will have been impressed with the mistake made by the Government in departing from their original intention and in permitting regulations as to detail to be made by Act of Parliament, instead of leaving such matters to be dealt with by Home Office regulations in the ordinary way.

Before coming to the debate on the Clause relating to the use of electricity, reference must be made to the Clauses in which the use of unprotected lights are referred to. The first of these to be discussed (Clause 32) restricted the use of naked lights to those seams in which the air-current in the return air-way does not normally contain more than half per cent. of inflammable gas. The desirability of this Clause was strongly insisted upon, and it was passed. When, however, Clause 42, relating to travelling roads and haulage, was discussed, the Government admitted that they had taken samples of air from the main air-way of six or seven mines in all parts of the country, and in nearly all there was over half per cent. of gas. It would seem, therefore, that the mines in which naked lights are employed—chiefly in Scotland, where there are 71·8 per cent. of naked lights (the small "Scotch" lamp worn in the miner's cap), as against 8·4 per cent. in England—will gradually discontinue this practice. It is, therefore, particularly regrettable that throughout the subsequent debate the "dangers" of electric power should have been discussed as equivalent to the danger from naked lights. There has been considerable confusion between Clause 32 and Clause 66, relating to the withdrawal of workmen when the presence of gas is observed. Mr. Patchell, in his remarks on the Bill at the dinner of the Birmingham Section of the Institution of Electrical Engineers, and the recent circular of the British Electrical and Allied Manufacturers' Association, both conveyed the impression that naked lights were permitted if the proportion of gas was less than 1¼ per cent., but this is not the case. The almost unmeasurable and practically universal ½ per cent. "normally" is to be the limit for naked lights, but if 1¼ per cent. is detected in naked light seams it is to be the signal for the immediate withdrawal of the men. We regret that Sir A. Markham, who is almost fanatically opposed to the use of electricity in any but the safest mines, and who, nevertheless, being a mine-owner himself, must certainly be in a position to appreciate thoroughly the difference between Clauses 32 and 66, rather promoted this confusion, for in proposing the 1¼ per cent. law for electrical installations, he insisted on the contention that electricity was as dangerous as naked lights, and should be used only under similar conditions.

To Clause 32, restricting the use of naked lights to seams in which the percentage of gas does not exceed ½ per cent., a useful addition was made on the proposal of Mr. Masterman on behalf of the Government. The addition is as follows:—

Provided that, subject always to the provisions of this Act and any regulations made thereunder as to the use of electricity in mines, electric lamps, if enclosed in airtight fittings and having the lamp globes hermetically sealed, may be used on main haulage roads and elsewhere within such limits as may be fixed by the regulations of the mine.

It is seen that this will encourage the further use of electric lighting in main roads and pumping stations in which the proportion of gas may exceed ½ per cent., but is less than 1¼ per cent., and considerable extension of electric lighting in the Scottish mines may therefore be anticipated. The words "or elsewhere" were inserted at the suggestion of Mr. S. Roberts so as to include pumping stations. Mr. Atherley-Jones, in the discussion on this amendment, referred to the coal-dust experiments of Prof. Thornton and the "extreme danger in terminals from short-circuit," and asked for an assurance from Mr. Masterman that the necessary safety regulation would be insisted on by the inspectors, and Mr. Masterman replied that the Home Office "will lean to the side of extreme caution in the matter."

We give below a report of the discussion on Clause 59 (Clause 60 in the original Bill) relating to the use of electricity. The clause as finally amended reads as follows:—

(1) Electricity shall not be used in any part of a mine where, on account of the risk of explosion of gas or coal dust, the use of electricity would be dangerous to life, and if the owner of a mine, on being required by an inspector of the division not to use, or to desist from using electricity in the mine or any part thereof on such ground as aforesaid, refuses to do so, the question as to the application of this Section to the mine or part thereof shall be settled in manner provided by this Act for settling disputes.

(2) If in any place of a mine, or part of a ventilating district of a mine, the amount of inflammable gas in the air currents exceeds 1¼ per cent., the use of electricity shall at once be discontinued in such place or part of such ventilating district where the inflammable gas exists till the air current is clear of the same, or shall not exceed one-half per cent.

(3) When any question under this Section is to be settled by arbitration, the owner shall, pending the settlement of the question, comply with the requirement of the inspector subject to an appeal to the Chief Inspector.

(4) The use of electricity in any mine shall be subject to general regulations under this Act.

Mr. NEWMAN (Unionist) moved that Sub-section (2) should be deleted. He referred to the recent report of the Depart-

mental Committee on the Use of Electricity in Mines, in which it had been pointed out that, although the employment of electricity should be prohibited where inflammable gas occurred daily or frequently, prohibition was not required when from all the evidence available gas was likely to be of rare occurrence. The danger would only arise in the latter case in the unlikely event of a simultaneous coincidence of the presence of gas or a dense cloud of coal dust, a sufficient failure of apparatus to produce intense sparking, and failure of the officials or workmen to observe the rules. These rules made this sub-section redundant. They included a provision that each motor, when working, should have a safety lamp by it, and that pressure should be cut off from the motor immediately the lamp indicated the presence of fire-damp.

Mr. J. E. GORDON (Unionist) seconded the amendment.

This amendment was subsequently withdrawn, and an amendment proposed by Mr. Lyell (Radical) and Sir A. Markham was accepted, altering the Clause to read as it stands above. When it came down from the Standing Committee, electricity was (at the suggestion of Sir A. Markham himself) prohibited if the percentage of gas exceeded ½ per cent., but he now proposed that this should be increased to 1¼ per cent.

Sir A. MARKHAM (Radical) in opposing Mr. Newman's proposal, said that there was no such thing on the market as a gas-tight motor. In any mine with which he was associated, if a motor were taken in where gas existed in any quantities, the manager would very soon cease to occupy his position. He explained that when a motor cooled down after a run it breathed in the air through the journals and along the shaft, and said that one could not prevent open sparking as one could on the surface. The Clause would give security against something which the men throughout the country regarded as the most dangerous thing introduced into mines for many years. Every inspector, he said, regarded the advent of electricity into mines with the greatest amount of alarm, and he had not met a single mine owner who wanted to work a motor where a mixture of gas and air was present. The electrical industry, he said, did not know what they were talking about. No sane manager would introduce what might at any time cause open sparking, but there were certain madmen who wished to use motors in mines where gas was present. The representatives of the miners asked that the use of electricity should be abolished altogether, and he hoped the House would allow it only under conditions where a naked light was used in mines at the present time.

Sir F. BANBURY (Unionist) said that, having listened to the arguments, he thought there was a great deal to be said against the withdrawal of the Clause.

Mr. T. E. HARVEY (Labour) said that although there were over a million workmen they did not differ on this question. The greatest dread of the miners was of electricity being introduced into the mine at all. He was convinced that the West Stanley explosion had been the result of electricity. At one colliery he knew of a case in which electric coal-cutters were giving off sparks and flames.

Mr. MASTERMAN (on behalf of the Government), said: "I am sure the mover and seconder of this amendment did not intend to convey the impression that on such a Bill as this we should pay any attention whatever to the demands of the electrical industry. Our sole concern is with the safety of the mine, and, if we are quite convinced that some such provision as this is necessary in the interests of the safety of the mines, the electrical industry will have to adapt itself to that limitation." Interviews with divisional inspectors and others had convinced him that, with the best provision in the world, there was danger of electricity producing what would be similar to a naked light. They were providing new and drastic regulations which, he was glad to say, would be accepted by the coal-owners without arbitration. In those regulations they did very largely apply the standard which they were now putting into a general Sub-section. Such rules provided that the pressure should be cut off from any motor when the safety lamp showed any indication of fire-damp. Where they could not use naked lights the mines should be cut off from the electrical machinery, which should not be worked until the district affected was free of gas.

Viscount CASTLEREAGH (Unionist) pointed out that the Home Office Regulations provided for under Subsection (4) would deal with the matter far better than by Act of Parliament.

Viscount WOLMER (Unionist) said that it was quite possible for the machinery to get out of gear between the visits of inspectors.

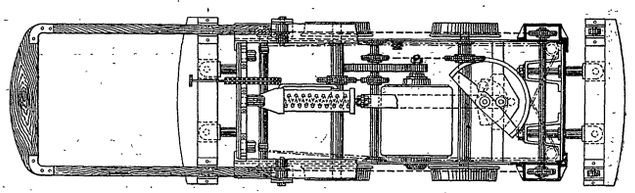
Mr. FENWICK (Radical), speaking as a practical miner, thought that users of electricity should be placed in the same position as users of naked lights, but considered that the Subsection might well have been omitted from the Bill, and the matter dealt with by the Special Rules.

Colonel HICKMAN (Unionist) said that there were sufficient safeguards without this subsection, *e.g.*, Subsection (1), and the provision for arbitration in the case of difference between the mine-owner and the inspector.

Sir A. MARKHAM interposed the remark that in all cases in which the Home Office had gone to arbitration it had been beaten.

Colonel HICKMAN, continuing, pointed out that fresh inventions were being evolved to improve the applications of electricity, and it would be easier to apply these improvements if this sort of thing were arranged by Regulations than by a strict clause in an Act, which could only be altered by another Act of Parliament.

Sir HILDRED CARLILE (Unionist) complained that Mr. Masterman's statement had confused the issue so far as men like himself, with no technical knowledge, were concerned. It had been shown that naked lights were unsafe in almost every mine, and yet Mr. Masterman laid it down that electricity should not be used except where a naked light was safe. From what he knew of electrical engineers, he thought they would fasten on the difficulty and clear it up.



Mr. ENOCH EDWARDS (Labour), urged that it was well to keep on the safe side in a subject which they did not understand. The men felt that there was a danger and dreaded it.

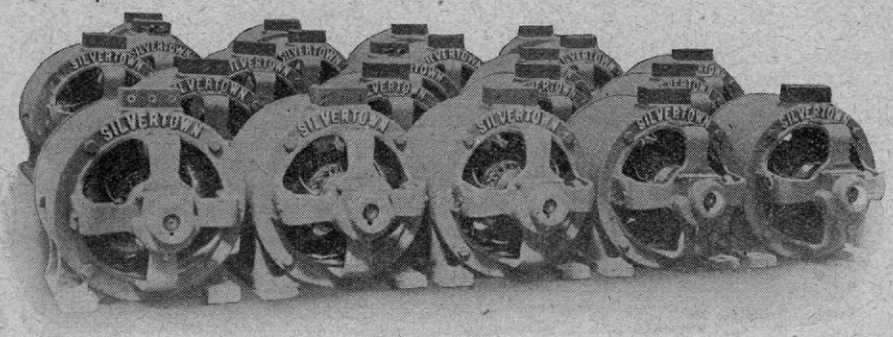
Sir C. CORY (Radical) agreed that electricity was dangerous. He generally preferred rules to be laid down by Parliament, but the use of electricity was in such a transitional stage that he thought it would be better to leave it to regulations to be made from time to time.

Mr. NEWMAN then formally withdrew his amendment, and the amendment proposed by Mr. Lyell and Sir A. Markham was agreed to.

A MINING LOCOMOTIVE WITHOUT A DRIVER

A SOMEWHAT curious system of underground transport used in a mine at Von de Heydt, in the Saar district (Germany) is described in *Elektrische Kraftbetriebe und Bahnen*. Electric accumulator locomotives are employed, with an automatic controlling arrangement, instead of a driver. The locomotives are small in size, and are under 2½ tons in weight, and draw from 10 to 16 tubs. As shown in the figure, the locomotive has a long projecting bow-shaped buffer, which, when it meets an obstacle, is pushed in and thereby puts the controller through the off position into the braking position, stopping the train before the buffer has reached its

PLAN OF AUTOMATIC MINING LOCOMOTIVE.



innermost position. As soon as the obstruction is removed the buffer is pushed out again by its springs, and the locomotive starts again. The speed does not exceed about 2¼ miles per hour. Special arrangements are provided for opening ventilation doors automatically before the locomotive reaches them, and an automatic gate is employed at junctions, which is locked by the pressure of a train fouling the junction, and released as soon as it has passed, permitting the branch train to proceed and follow the train from the main line.

Association of Mining Electrical Engineers.—A meeting of the West of Scotland Branch was held on Friday evening, November 17th, in the Technical College, Glasgow. Mr. A. Anderson presided. The Chairman and Professor Burns explained the system and method of examination for the Association certificate. An animated discussion ensued regarding the status and qualifications of a competent person as referred to in the Home Office Rules. Two Papers, "Electricity in Connection with Explosives," by E. Kilburn Scott, and "Lessons to be Learned from the Electrical Mining Accidents in Scotland," by C. A. Carlow, were considered, and discussion on them was adjourned to the next meeting. It was resolved to take a ballot of members to ascertain whether future meeting should be held on Saturday afternoons instead of Friday evenings.

Electricity in Mines in France.—In view of the amendments to the Coal Mines Bill, the following extract from the French mining regulations, reproduced in the *Iron and Coal Trades Review*, will be of interest. The use of electricity is prohibited in mines in which sudden outbursts of firedamp are liable to occur, except for portable electric lamps and for electric shot-firing. In other fiery mines, the only places in which electrical installations are permitted are the intake air shafts, in or near the bottoms of these shafts, and in or near galleries into which the ventilating current penetrates directly from the intake shaft without having passed through any working place. With the authorisation of the Government mining authorities of the locality, sheathed cables may be laid in the return airways of slightly gassy mines.

ELECTRICITY IN MINES DURING 1910

PART II. of the General Report on Mines and Quarries for 1910, by the Chief Inspector of Mines, includes a report by Mr. R. Nelson (H.M. Electrical Inspector of Mines). In this report it is mentioned that electricity was newly introduced into forty mines during the year. Attention is also drawn to the installation of a new shaft signalling apparatus with electrically illuminated visual signals in a large colliery in the north of England.

Accidents.—During 1910 there were twenty-one fatal accidents as a result of the use of electricity in coal mines, causing twenty-one deaths. No fatal accidents attending the use of electricity in metalliferous mines were reported. Of the above twenty-one accidents twenty were due to electric shock, the remaining one being due to suffocation as a result of an underground fire. There were no fatal ignitions of firedamp caused by electricity throughout the year. During 1909 there were in all fifteen fatal accidents causing twenty-three deaths: there were, therefore, on the whole, two deaths fewer in 1910 than in 1909.

Some details are given of two slight underground fires, which originated in motor rooms, and the use of timber and other inflammable material is deprecated. Of the twenty electric shock accidents already referred to, four took place on the surface and sixteen below ground. Of the four surface accidents, all occurred on three-phase systems, three of medium pressure, and the other of high pressure. Two took place at coking plants, and in each case the victim made contact with live trolley wires, normally inaccessible, while oiling the machinery without switching off the pressure first. A third was due to contact with a live part of high-pressure switchgear, the deceased having presumably attempted to make some adjustment, without, however, having first switched off the pressure. The remaining surface accident was caused by the breaking of an insulator on an overhead line, which allowed a live medium pressure wire to make contact with a steel stay wire. Of the sixteen underground accidents, eleven occurred on three-phase systems, two of low pressure, seven of medium pressure, and two of high pressure, and the remaining five on medium pressure continuous current. The causes of these fatalities are summarised as follows:—Absence of, or inefficient earth connection, six; defective insulation of cable system, six; contact with uninsulated live parts, three; misadventure, one. The last mentioned is supposed to have been caused by the curiosity of the victim in probing the inside of a starting switch with a piece of copper wire. Of the fatal cable accidents, one was from an armoured cable, and the remainder from unarmoured cables. In this connection it is interesting to note that the total fatalities from unarmoured cables from 1905 to 1910 were twenty, while only two occurred from armoured cable and two from concentric cables.

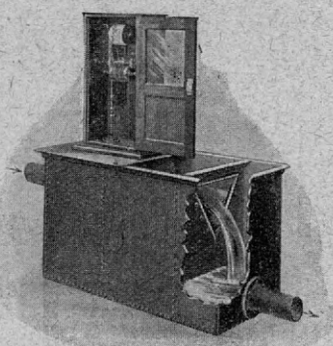
Three non-fatal underground fires caused by electricity were reported in 1910, one due to passing tubs knocking over a timber support to a junction box, and another by a cable breakdown setting fire to timber in a pump-room. There were also forty-eight non-fatal shock accidents generally trifling in their results. In one case the victim was restored by Silvester's method of artificial respiration.

Mr. Nelson concludes as follows:—

The admission that much of the electrical plant in use below ground is not by any means all it might be is quite commonly made by those well qualified to offer an opinion, and I agree with that view; but that those accidents which occur are thereby explained does not, as is frequently assumed to be the case, immediately follow. Though it is probable that something remains to be done in replacing plant which is actively or potentially dangerous from the point of view of the risk of electric shock, it is certain that there is much more to be done in improving the standard of upkeep of electrical plant below ground. A great proportion of accidents might have been avoided by systematic and thorough inspection and maintenance of the various plants. So high a proportion of preventable accidents is not creditable to colliery electricians. H.M. Electrical Inspector of Factories has to report nine fatal electric shock accidents in factories throughout the United Kingdom during the year 1910, as against 48 electric shock accidents in and about mines. It is hardly possible to suggest that those responsible for the upkeep of electrical plants below ground are less conscientious than those occupying similar positions on the surface, but from personal observation I do doubt whether all colliery electricians are thoroughly alive to some of the dangers which commonly occur in underground working, and the figures just quoted are, I think, some confirmation of that view. I would mention specifically the casual and obviously inefficient way in which earth connections are so often made; the tendency to dispense with systematic inspection and testing of apparatus, or in other words, the tendency to assume that everything is right until something is shown by an accident or breakdown to be wrong; and, finally, the very common failure to protect unarmoured cables during shot-firing operations. Each of these causes is directly or indirectly responsible every year for some accidents, and yet a colliery electrician would be likely to repudiate any personal responsibility for an accident so contributed to or so caused. Nevertheless such responsibility has existed and does exist in greater or less measure in many cases, and the occasion for it is damaging to the electrical industry, as undue weight thereby attaches to the arguments of those who would prohibit the use of electricity below ground, in spite of its advantage from an economic standpoint, and in spite of its advantage to the workmen in saving what would otherwise be arduous labour. However small when expressed as a percentage of the total number of fatal accidents in mines those due to the use of electricity may be, there still remains room for improvement.

Electric Miners' Lamps.—In dealing with the question of safety lamps, the Chief Inspector says: There seems every probability that had electric hand lamps been in use at the Whitehaven and Hulton Collieries the disasters which took place there during the year would not have occurred, as, in the case of both these disasters, there is little or no doubt that the igniting cause of the explosion was a gauze safety lamp.

The total number of miners' electric hand lamps in use during the year 1910 was 2,055, or 0·28 per cent. of the total, as compared with 2,155, or 0·32 per cent. of the total in use during the preceding year. A great majority of the lamps are used in Durham—namely, 1,797—and their use is practically restricted to one colliery.



Attention is drawn to the prize that is being offered for the best design of electric miner's lamp (see ELECTRICAL ENGINEERING IN MINES, June 1st, page xli.).

Electric Coal Cutters.—Figures are also given in the report of the number of coal cutters of various kinds in use. It appears that a total of 873 electrically-driven machines are employed, as compared with 777 in the previous year. Of these 504 are disc machines, 261 are of the bar type, 207 have chain cutters, and only one percussion machine is in use. The Scotland district and the York and North Midland district take the lead as regards the number of machines employed, more than 54 per cent. of the total number of machines in use being employed in these two districts.

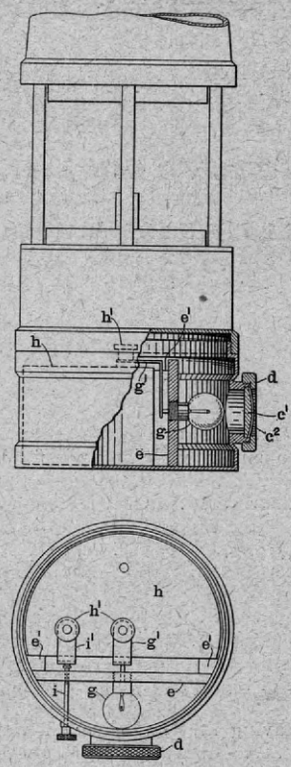
Engineering Abstracts

Journal of the International Institute of Technical Bibliography, is a complete, illustrated, international review of the world's engineering progress. It contains indexes and abstracts of all important books, papers, and articles, published everywhere in the world.

Published in seven monthly sections, viz.:—
Mechanical Engineering; Electrical Engineering; Civil Engineering; Mining and Metallurgy; Applied Chemistry; Military and Naval Engineering: Supplement.



The Electrical Engineering Section

contains, apart from references to all books and articles, short abstracts of all patents published in England, America, Germany, France, Austria, etc., as well.

Price per section, 24/- p.a., and for the total edition containing all seven sections, £4.

For full Particulars and Specimen Copies apply to
The SECRETARY, International Institute of Technical Bibliography,

MINERS' SAFETY LAMP

MINERS' SAFETY LAMP.

THE patents published last month of interest to mining engineers, included a specification, No. 4,722 of 1911, by T. Jones and T. R. Davies, relating to a safety lamp. This is provided with an emergency electric lamp, g, which, with its accumulator, is arranged in a small brass or aluminium casing, adapted to be screwed on or preferably locked to the bottom of the oil container, which can be done by a ratchet and pawl device operated by a key or by magnetism. The opening in the side of the casing is provided with a ring seating, to take a lens c^1, which is protected by wire gauze, c^2, and both are secured by a ring cap d. The figure shows the lamp g carried by a socket in the bridge piece e, which also acts as a reflector. Distance pieces e^1, placed between this and the accumulator, serve to keep the latter in position, and also provides a space for the contact pieces i^1 and g^1, which are attached to the terminals h^1. One of these is connected to the centre contact of the lamp, and the circuit is completed through the adjustable contact switch i, which may be in the form of a screw pin.

Articles of Interest to Mining Electrical Engineers published in "Electrical Engineering" during November.

November 2nd.—Monthly supplement on "ELECTRICAL ENGINEERING IN MINES," opening with notes on the electric power plant of a group of shale mines and oil works in Scotland, and containing a long article describing the electrical equipment of the Rhymney Valley collieries of the Powell Duffryn Steam Coal Co., which include generating plant driven by coke oven gas and exhaust steam, as well as two of the largest electric winding plants in the world at a colliery which is entirely without boilers. Reports are given of the annual meeting of the Association of Mining Electrical Engineers, and several branch meetings. Other articles include some notes on Electricity in Mines in Scotland, and a discussion on the avoidance of electrical accidents in mines.

November 9th.—Notes on a large South American power plant and some plant extensions in a London generating station.

November 16th.—Literary supplement containing reviews of books and a selected list of works in all branches of electrical engineering. Papers and discussions on high-voltage transformers and turbo-generators. References to the Coal Mines Bill at the Birmingham dinner of the Institution of Electrical Engineers.

November 23rd.—Action taken by the B.E.A.M.A. with regard to the Coal Mines Bill.

Electric Lamps for Mines.—At a dinner of the Scottish Branch of the National Association of Colliery Managers in Edinburgh recently, Mr. W. Walker, in replying to the toast of H.M. Inspectors of Mines, said that the new Mines Bill would, if it became law, put more responsibility on both the manager and the inspector. He also referred to the large number of preventable accidents caused by ignition of gas from naked lights, and said that there was a better light than either the naked light or the safety lamp, and that was the electric light. There was a great future for portable electric lights in mines, and he would like to see the colliery managers devoting their energy to devising a lamp to meet all conditions.

AUTOMATIC REVERSIBLE BATTERY BOOSTERS

MR. R. RANKIN'S Paper on automatic reversible battery boosters, read before the Institution of Electrical Engineers on November 23rd, was discussed at Manchester on Tuesday, November 28th (see ELECTRICAL ENGINEERING, November 30th, page 655).

Mr. E. C. MCKINNON (Chloride Electrical Storage Co.), who opened the discussion, drew attention to the wide use of boosters in this country, the United States, the Colonies, Japan, and China, although on the Continent end cells and regulating switches were much more usual. It was a pity that there were so many systems in competition, and it would really be advantageous if some of the less efficacious types were removed from the market.

Mr. A. G. COOPER (Borough Electrical Engineer, Colne) said that at Colne the battery had been scrapped long ago, but he was pleased to hear that they were now so much improved.

Mr. P. P. WHEELWRIGHT (Borough Electrical Engineers, Blackburn) spoke of two years' satisfactory experience of an Entz booster which was very rapid in action.

Mr. C. L. E. STEWART (Borough Electrical Engineer, Rawtenstall) had had a Lancashire booster running for 2¾ years, and had found it quite quick enough in action for a traction load. The voltage regulation was also good enough to connect lighting consumers to the traction circuit.

Mr. H. T. WILKINSON (Wardle Engineering Co.) deprecated the Continental regulating switches, and wished to know why there were not greater developments in this country in the regulation of alternating systems by batteries and boosters.

Mr. H. C. CREWS (Crews and Handford) recorded his satisfactory experience with a Lancashire booster in an installation containing several large lifts.

Mr. C. C. ATCHISON (Borough Electrical Engineer, Rochdale) was not sure that extreme rapidity of response was always essential, and thought that different types of boosters might be best for different circumstances. He looked forward to great developments in connection with alternating current supply.

Mr. J. Frith also made a few remarks on diverter boosters, and the author replied briefly.

THE LOTS ROAD TURBINES

JUDGMENT was delivered on Monday in the dispute between the British Westinghouse Electric & Manufacturing Co., Ltd., and the Underground Electric Railways Co. of London, Ltd., regarding the substitution of Parsons turbines for Westinghouse turbines at the Lots Road generating station. We gave details of the case in our issue for November 9th, p. 610. Briefly, the facts are that certain Westinghouse steam turbines failed to come up to the contract figures for steam consumption, and Parsons turbines were substituted. This was done by agreement between the parties, but a dispute arose as to the amount the Westinghouse Co. should pay as damages for the failure of their turbines to come up to contract. The arbitrator, the Hon. Alfred Lyttelton, K.C., acting upon directions from the High Court, to which he appealed for advice, assessed damages on the basis of the difference between the actual and guaranteed steam consumption of the Westinghouse turbines during the five years they were at work, *plus* the whole cost of the Parsons turbines. An important legal point in the case was as to whether an arbitrator's award, when based upon directions from the High Court, as in this instance, is appealable. The Westinghouse Co. appealed to have the arbitrator's award set aside or remitted to him on the ground that these directions were wrong in law.

LORD JUSTICE VAUGHAN WILLIAMS, in giving his judgment, held that under Section 19 of the Arbitration Act of 1889 there is no appeal from a decision of the King's Bench Division when embodied in an arbitrator's award. Such a decision did not amount to a judgment or an order, and he quoted a judgment by Lord Esher to the effect that the Arbitration Act would be a "snare and a delusion" if an appeal under such circumstances were allowed. There never had been, he said, a case in which an appeal had been entertained against an arbitrator's award, because, as was contended by the Westinghouse Co. in this case, the advice given to the arbitrator by the High Court was wrong in law. The fact that the arbitrator had made the advice of the High Court part of his award made no difference. At the same time, he held that the advice given by the High Court in this case was perfectly right, and that the appeal should be dismissed with costs.

LORD JUSTICE KENNEDY agreed with Lord Justice Vaughan Williams on the main question as to the method of assessing the damages, but held that where the advice given by the High Court to an arbitrator was a mistake in law, that was good ground for the Appeal Court to set aside or remit the award to the arbitrator.

LORD JUSTICE BUCKLEY also took this latter view, but held that the appeal should be allowed for the following reason:—In his opinion the arbitrator had admitted in his award that not only was it a reasonable and prudent thing for the Underground Railway Co. to substitute Parsons for Westinghouse machines in consequence of the breach of contract, but that even if the Westinghouse machines had given the contract figures for steam consumption it would still have been a reasonable and prudent thing for the Underground Co. to instal Parsons machines, owing to their greater efficiency. He therefore thought the Westinghouse Co. were entitled to an order remitting the award to the arbitrator, as in his opinion the advice of the High Court was wrong in law, and that the arbitrator had been misdirected as to the basis upon which to assess damages. By a majority, however, the appeal was dismissed with costs.

STREET LIGHTING IN THE CITY OF LONDON

AFTER a long period of investigation and experiment, the City Corporation at its last meeting decided upon a scheme of street lighting for the next ten years. This scheme is the direct outcome of a visit by a deputation of the City Corporation to the Continent in 1908 (ELECTRICAL ENGINEERING, Vol. V., page 645). During the past four or five years there has been keen competition between the City of London Electric Lighting Co. and the Gas Light & Coke Co. for the street lighting of the City, and experimental demonstrations of modern methods of street lighting have been carried on by both companies. After one or two more or less minor experiments, a large scheme was put into use last year with a view, mainly, to testing the practical usefulness of lamps suspended across streets, central standards, and side brackets. As a result of the inquiries of the deputation mentioned above, there was a strong prejudice in favour of using centrally hung lamps, wherever possible, and the experiments with electric lighting in this connection were fully described in ELECTRICAL ENGINEERING, December 22nd, 1910, Vol. VI., page 803. Similar experiments with gas lighting were being carried out simultaneously.

With the results of these later experiments before them, the City Corporation were able to draw up a scheme for the complete lighting of their area, and tenders were invited for the work from the electric and gas lighting companies. In view of what took place in Holborn, where the electricity and gas companies decided to prepare a joint tender rather than continue a disastrous competition, it is not without some significance that in the case of the City lighting neither company was prepared to quote for the whole, but preferred to continue lighting the portions already dealt with by each. The official reason given for this attitude is that it is due to the large capital expenditure which would be involved. Therefore, a joint scheme of electric and gas lighting has been accepted which will give a total increase of 601,765 c.p. for a decreased cost of £6,832. The City of London Electric Lighting Co. will receive £7,322 per annum for a much increased illumination, as against £10,744 at present, and the Gas Light & Coke Co. £6,709, against £10,099, making a total of £14,041 per annum against the present figure of £20,873. The increased candle-power is almost double the present aggregate. Although the Charing Cross, West End, and City Electricity Supply Co. fitted some experimental centrally hung arc lamps in Cannon Street, they did not tender for the larger scheme.

So far as the main thoroughfares are concerned, we believe it is the intention to adopt lamps of 2,000 c.p. suspended from span wires, similar to those now used in Cheapside, it having been found that these throw no shadows, and give a very efficient illumination.

Students' Section of the Institution of Electrical Engineers.—Some changes have been made in the Committee of the Students' Section, which is now composed of Messrs. E. F. Hetherington (*Chairman*), P. G. Ryder (*Vice-Chairman*), H. C. Burrowes, E. L. Emtage, J. F. Forrest, R. N. James, C. G. Shaw, H. W. Gregory, E. W. Moss, D. Betts, J. C. Rennie, and G. W. P. Page. Mr. J. B. Sparks, 27 Mowbray Road, N.W., is Honorary Secretary, and Mr. J. Mould is Honorary Assistant Secretary. Programmes of Papers have been arranged for the London, Manchester, and Glasgow Students' Sections, but so far no visits to works have been announced.

Hosted by Google

A TRAIN LIGHTING SET FOR INDIA

We are able to illustrate here, through the courtesy of the British Thomson-Houston Co. (Rugby) a train-lighting plant driven by a paraffin engine, which they have supplied to Messrs. Turner, Hoare & Co., of Bombay, for use in the royal train to be used by his Majesty King George V.

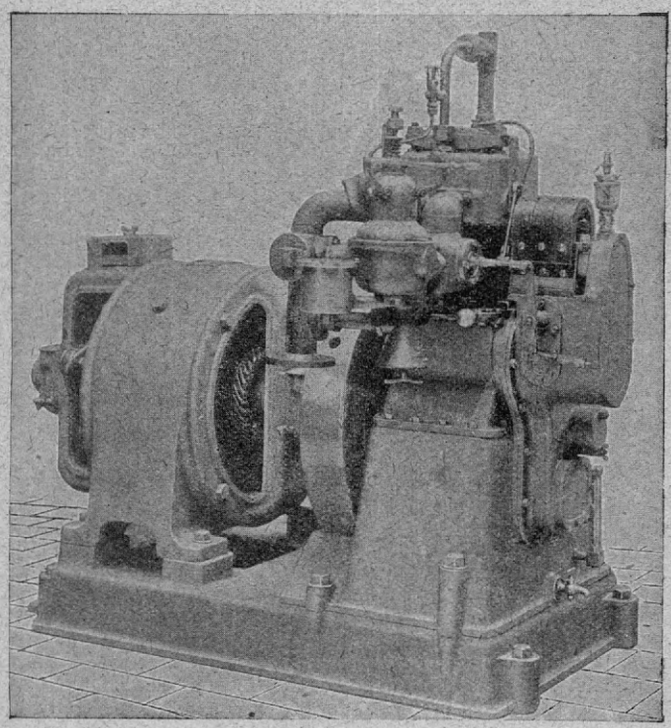

Fig. 1.—Paraffin Engine and Dynamo.

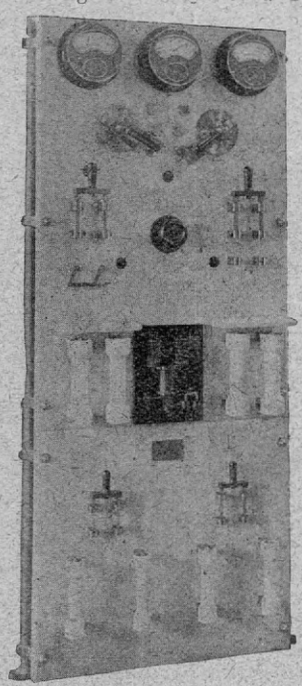
in travelling in India to and from the Durbar. This set will be installed in one of the cars composing the royal train, from which all other cars will be lighted. We understand that a special train has been built for his Majesty's sole use during all of his journeys in India. The generating plant which is shown in Fig. 1 consists of a 4·8-kw. 25-32-volt



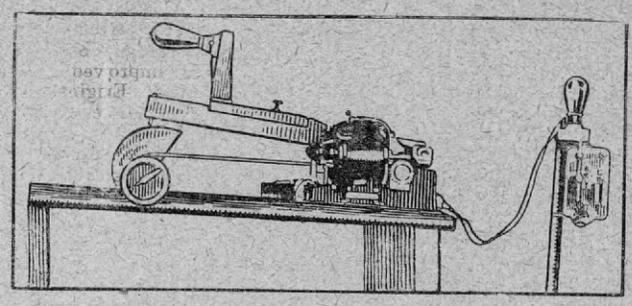


Fig. 2.—Switchboard.

B.T.-H. generator, direct coupled, and mounted on a combination base to a paraffin engine. The marble panel for controlling this set is shown in Fig. 2, and consists of a combination generator and accumulator panel, which was equipped with the necessary instruments, rheostat, cut-outs, switches, and charging and discharging switch.

WIRE DRAWN LAMP FILAMENTS

Some tests in America with the special apparatus illustrated here have shown clearly the strength of the Mazda drawn tungsten filament. In this apparatus the arm upon which the lamp is mounted is brought to a constant position by each revolution of a small cam, and is allowed to drop freely from this position upon a second cam constructed according to the principle of the spiral. The drop increased from 1/100 of an inch at the start to four inches maximum, having a constant increment of 1/100 in. per revolution. The fall at which the filament breaks is indicated directly upon a dial in hundredths of an inch by a pointer attached to the large cam.

In a comparative test of 25-watt lamps with the old squirted filament and the new drawn-wire filament, the old style of lamp

Lamp-testing Machine.

broke at 0·06 in., while the new one was dropped 3·75 in. before it broke. Similarly, a 60-watt lamp with the old filament could only reach 1·15 in., while a 4-in. drop failed to break the drawn filament of the same size. In another test reported from America, some 100-volt lamps were placed on a rack which was hinged at one end and permitted to drop periodically upon a solid surface from heights varying from 6 to 24 inches, and withstood 3,697 such shocks without breaking.

The British Thomson-Houston Co. also send us some extracts of letters they have received showing the durability of the drawn filament. One of these describes the successful use of Mazda lamps at the top of a colliery pit-head having a continual vibratory lateral movement of about 2 in. Another from South Africa states that the breakages in a batch of 1,200 lamps shipped in cardboard boxes in crates did not exceed 1 per cent., while a contractor writes that of a batch of lamps which arrived in a box badly damaged in transport, only one arrived broken.

Tests have also been conducted during the past year by the United States Navy on drawn wire Mazda lamps to determine their serviceability for use on warships. The formal test, which was started in November, 1910, was continued until July 1st, 1911. Since that time, however, the officers on the ships have kept the lamps under observation, and many are still burning which were installed in November and December, 1910. The following table gives a summary of the results for the period from November and December, 1910, up to July 1st, 1911:—

Size of lamp in use.	Total Mazda Lamps installed.	Average life of Mazda Lamps to July 1st, 1911.	Lamps broken during target practice.
25 Watt.	375	755 hours	12 lamps or 4%
40 ,,	842	1155 ,,	28 ,, ,, 3%
60 ,,	36	1677 ,,	1 ,, ,, 0·3%
400 ,,	8	1386 ,,	—
500 ,,	9	2563 ,,	—

The Electrical Engineers' Ball.—The Electrical Engineers' Ball for 1912 will be held at the Hotel Cecil on Friday, February 16th. A strong Committee has been formed, consisting of the following gentlemen:—H. Alabaster, Leonard Andrews, Frank Bailey, O. H. Baldwin, R. Belfield, W. W. Blunt, J. H. Bowden, T. Browett, C. S. Vesey Brown, E. S. Byng, Jas. Callender, A. C. Cramb, F. R. Davenport, Harold Dickinson, Sydney Dobson, R. S. Erskine, S. Z. de Ferranti, E. J. Fox, E. Garcke, T. E. Gatehouse, Sir J. Gavey, Jas. Gray, R. Kaye Gray, A. E. Hadley, R. Hammond, Charles Hill, J. S. Highfield, H. Hirst, Col. H. Capel Holden, J. E. Kingsbury, E. M. Lacey, W. E. Lane, H. M. Leaf, F. A. C. Leigh, W. L. Magden, W. Lee Matthews, W. M. Mordey, P. V. McMahon, Lee Murray, F. H. Nalder, E. A. Nash, Major O'Meara, Hugh A. Pearson, T. Petersen, M. J. Railing, J. E. Raworth, Martin F. Roberts, W. Rutherford, G. F. TIME ELEMENT CIRCUIT-BREAKERS

THERE is a mistaken idea that time-element circuit-breakers of the dash-pot pattern are not reliable at different temperatures, and that the range of adjustment is adversely affected by local conditions. This may be the case with some makes of circuit-breakers, but from curves and data placed at our disposal by Messrs. G. Ellison (Victoria Works, Warstone Lane, Birmingham), it is evident that the device which this firm employs gives practical immunity from these defects. The curves, some of which we reproduce, are from tests made at the National Physical Laboratory.

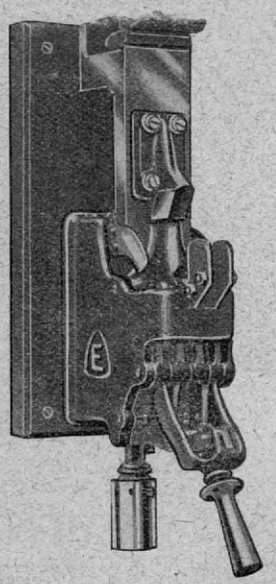

FIG. 1.—CIRCUIT-BREAKER WITH ADJUSTABLE TIME LAG.

Fig. 1 is a general view of the circuit-breaker, and Fig. 2 shows the construction of the adjustable dash-pot. The piston of the latter and the lower end of the cylinder in which it moves are tapered, so that the retardation can be decreased or increased by lowering or raising the cylinder, and thus varying the clearance and the rate of flow of the oil. The screw thread, S, of fairly small pitch, enables the height of the cylinder to be accurately adjusted, and it is locked in position by the set screw, A, which will engage in any one of a series of numbered tapped holes shown in the elevation. This gives a very wide range of extremely fine adjustment. Another feature of this circuit-breaker is that the retardation of the plunger only takes place during about $\frac{1}{8}$ in. of the stroke, so that it is free during the remainder of the stroke to travel up quickly and to deliver the necessary sharp blow to the retaining hook of the circuit-breaker.

Fig. 3 shows the results of a test made with different oils at two different temperatures, to ascertain the effect of changes of temperature on the time-element adjustment.

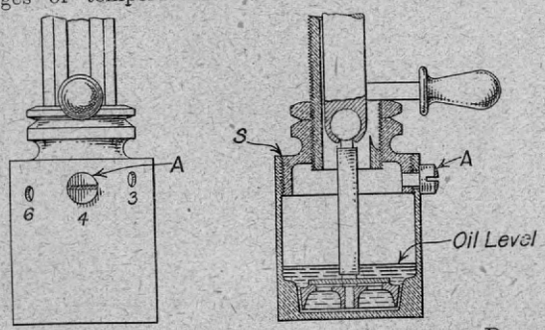

FIG. 2.—ELEVATION AND SECTION OF ADJUSTABLE DASHPOT.

The third curve in which thin cycle oil is employed—the oil recommended by Mr. Ellison in ordinary circumstances—shows that with 10° C. difference of temperature it is unnecessary to change the adjustment. Thicker oils and glycerine would only be used when long retardations are required, and, although with these the effect of the change of temperature is more marked, it is evident that the wide range and accuracy of adjustment quite compensates for this. These curves are for a 10-ampere circuit-breaker, tested with 13 amperes.

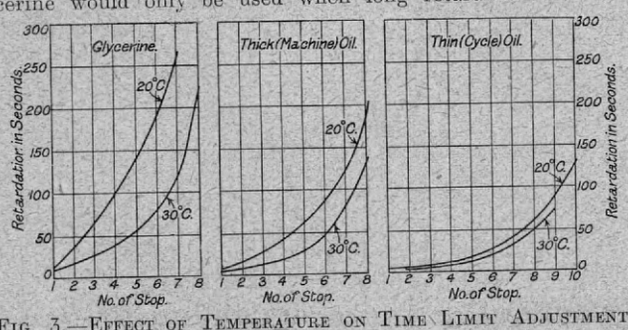

FIG. 3.—EFFECT OF TEMPERATURE ON TIME LIMIT ADJUSTMENT.

Fig. 4 is the record of a series of tests on the effect of considerable vibration. It is seen that in situations where the circuit-breaker is subjected to serious vibration the retardation is diminished about 50%, but the shape of the curve shows that the adjustment can easily be altered to suit the different conditions. A further test was made to ascertain the effect of slow oscillation, such as would be met with on board ship. The circuit-breaker was suspended on hooks, and tested at the different settings, while oscillating slowly over an arc of 17°, the only difference in the adjustment being that the amount of oil in the cylinder was increased to ensure that the piston was covered with oil at all times. It was found that there was no observable difference between the results and those in which the circuit-breaker was securely fixed without vibration.

Fig. 5, showing a series of tests on a 10-ampere circuit-breaker with overload, demonstrates that the circuit-breaker possesses a true inverse time-element; that is to say, that, as the overload increases, the time that elapses before the circuit is broken decreases. The curve with the thin oil indicates the conditions usually required in practice, but the retardation at higher loads can be increased by using a still thicker oil than heavy machine or by employing glycerine.

A modified form of dash-pot is also applied in some cases in connection with the firm's star-delta starting switch,

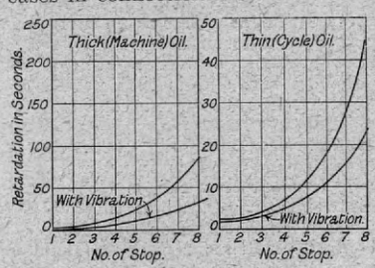

FIG. 4.—EFFECT OF VIBRATION.

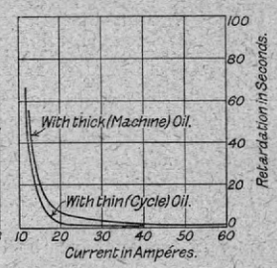

FIG. 5.—SHOWING INVERSE TIME ELEMENT EFFECT ON HEAVY OVERLOADS.

to prevent switching over too soon from the starting to the running position. After switching on to the starting position the handle of the switch is locked by a cam until the dash-pot has had time to set. The switches are also so designed that they cannot be put on to the running position first, so that the addition of the dash-pot device renders them absolutely fool-proof.

In addition to the foregoing, we are informed that this patent time-limit device can be fitted to almost any make of circuit-breaker. Although up to the present the device has not been widely advertised, we understand that it has been extensively used with good results.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

In the House of Commons on Wednesday last week Mr. Lardner asked the Postmaster-General whether an experimental automatic telephone exchange will be set up in Ireland in view of the fact that there are many small exchanges there for which the automatic system will be suitable both in efficiency and economy. He further asked as to the estimated cost of the experiments now being carried on with automatic telephones. The Postmaster-General stated that three experimental automatic exchanges were about to be established at Epsom, Caterham, and the General Post Office, London, where they can all be watched conveniently by the technical officers in the engineer-in-chief's department. This would not apply to an exchange in Ireland. No precise estimate of the cost of working the experimental exchanges was at present available; indeed, it is one of the objects of the experiments to ascertain that cost.

At the London Chamber of Commerce on Nov. 29th Mr. Charles Bright, F.R.S.E., gave an address on "The Atlantic Cable Position and its Moral." He referred to the amalgamation of the Western Union Telegraph Co. of America with the American Telephone & Telegraph Co., and pointed out the effect this has on British commerce. He urged the necessity of being able to carry on private communications with our Colonies, which was impossible under the present conditions. Again, in the event of misunderstandings with America, we could not rely on the companies' lines remaining neutral, which meant that we might be cut off at any time. A reso-

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Nov. 30, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

26,077/10. **Terminal Connections.** A. MUIRHEAD and C. F. C. WILKINS. A device for fixing terminals to cases containing electrical apparatus, consists in moulding an insulating body into a metal collar provided with a flange, which is soldered to the metallic lid of the casing. In one form, for additional security, the collar extends up the sides of the body, and is sometimes provided with a jamb nut which screws into the lid. The conductor passes through a central passage in the body, and is soldered to the usual metal socket, which is firmly secured. Six figures.

26,142/10. **Enamelling Wire.** A. COSTAR, D. BATES, and THE BRITISH INSULATED & HELSBY CABLES, LTD. The wire is passed in succession from the coating tank through a series of tubes arranged in a heating retort, the temperature of which is regulated by an air-admitting device. The lower ends of the tubes are immersed in the liquid, and just above, in the tubes, rubbers are fitted, which produce a firm, smooth pressure on the material, and obtain a uniform thickness free from air bubbles. They also remove all superfluous material and return it to the tank. The wire passes out at the top over a pulley, which carries water for cooling the coating, and is then passed down over other pulleys to the tank for the next coating. Four figures.

26,341/10. **Mercury Contact Breakers.** REINIGER, GEBBERT, and SCHALL AKT.-GES. The feature of this invention is that the contact is broken inside a chamber which is closed at the top, the bottom dipping into mercury on which alcohol floats. This generates gas when the circuit is broken, and forces the mercury away from the contact pin, thus rapidly extinguishing the spark. A solenoid actuates the contact pin. Four figures.

26,667/10. **Filament Supports.** E. R. GROTE. Thin mica discs attached to the central rod are perforated at regular intervals along the edges to take the filaments, and are slit radially between each pair of filaments to render them elastic. The upper disc is provided with conductors for joining each adjacent pair of filaments together. Instead of slitting the discs, they may be mounted with springs above and below the point of support, or mica rings held in spring wire supports may be used instead of the discs. Four figures.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

29,069 of December 8th, 1897. **Syntonic Telegraphy.** O. J. LODGE and A. MUIRHEAD. A system of signalling by Hertzian waves has receiving areas bridged by the coherer, inductance, and condenser, which are arranged in two parallel circuits in one arm of a Wheatstone bridge system, while the receiver and battery are across the diameters. By means of a rotating cylindrical switch, actuated by a switch lever, the coherer is automatically connected first to the receiving areas, to the receiver-signal circuits, or to a decohering apparatus which can be either mechanical or electrical. The areas are provided with a spark-gap and a latch, which is opened for transmitting and closed for receiving. The signalling is preferably done through a relay circuit, either by key or automatic transmission. The coherer apparatus is protected from outside disturbances by being enclosed in a metal casing.

29,306 of December 10th, 1897. **Wireless Telegraphy.** WIRELESS TELEGRAPH & SIGNAL CO. and G. MARCONI. This relates to certain improvements, in which the coherer is enclosed in a thick metal box provided with two openings. These are closed by shutters actuated by a lever, which carries two sets of contacts connected to earth and the conductor respectively. When transmitting the openings are closed, and the spark balls are in circuit, but for receiving the coherer is connected up by reversing the lever, which is pivoted.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: JOHNSON & PHILLIPS, LTD., and BROCKIE [Globes] 402/11; CONRADTY and CONRADTY [Electrodes] 14,729/11.

Distributing Systems: HOPE [Circuit fuse boxes] 29,631/10.

Dynamos, Motors, and Transformers: BROOKS and ALSTON [Machines for winding armatures] 26,225/10; FREEMAN [Dynamos] 26,393/10; ADAMS MANUFACTURING CO. (*Cutler Hammer Manufacturing Co.*) [Speed controlling device] 26,420/10; BRITISH THOMSON-HOUSTON CO. (*Allgemeine Electricitäts Ges.*) [Motor control] 5,289/11; SIEMENS SCHUCKERTWERKE GES. [Driving rotary field induction motors] 17,768/11; HAEFELY [Transformers] 20,524/11.

Electric Ignition: PODSZUS, 3,821/11; MEA FABRIK MAGNEI-ELEKTRISCHER APPARATE GES., 4,085/11.

Electrochemistry: VON BROCKDORFF [Electrolysis of liquids] 27,562/10.

Incandescent Lamps: BRITISH THOMSON-HOUSTON CO (*General Electric Co., U.S.A.*) [Incandescing bodies for lamps, &c.] 13,021/11.

Switchgear and Fittings: JONES, JOPP and SUNNUCKS [Globe or shade support] 26,410/10; DICKSON [Switches] 26,627/10; LEITNER [Electric regulators] 27,037/10; DICKSON [Thermally-actuated switch] 27,277/10; WALKER [Rheostats] 3,510/11; SANTO [Cut-out] 19,120/11.

Telephony, Telegraphy, and Signalling: DAVISON, and CHANCE BROS. & Co. [Submarine audible signalling apparatus] 26,657/10; DUNTON [Signalling devices for telephone systems] 12,898/11; STEINBERGER [Telephone mouthpieces] 14,591/11; WESTERN ELECTRIC CO. (*Western Electric Co., U.S.A.*) [Telephone receivers] 17,875/11.

Miscellaneous: BRITISH INSULATED and HELSBY CABLES, LTD., and BUCHER [Electric welding machines] 26,478/10; CANNING [Electric apparatus for gas lighting] 27,986/10; SWIFT and BAXTER [Electric clock] 29,747/10; TANNER [Automatic electric advertising] 30,176/10; WATSON, and MORRIS & LISTER, LTD. [Electrostatic machines] 1,036/11; R. WAYGOOD & Co., and WALKER [Lifts and hoists] 1,168/11, and [Brake mechanism of lifts, cranes, &c.] 4,167/11; BONNET [Bell pushes] 3,514/11; TRIQUET [Sterilising liquids by ultra violet rays] 9,047/11; J. HALDEN & Co., and WATTS [Electric photographic printing machines] 10,702/11; KNOWLES [Purification of electrolytic gases] 21,600/11; HELBRONNER, and VON RECKLINGHAUSEN [Sterilising liquids by ultra violet rays, 21,829/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Electric Ignition: DIEHL, 24,970/11.

Fittings: SIEMENS SCHUCKERTWERKE GES. [Buffer machines for electrical conduits] 24,744/11.

Telephony and Signalling: SIEMENS & HALSKE AKT.-GES. [Semi and automatic exchanges] 19,456/11; AKTIEBOLAGET L. M. ERICSSON & Co. [Common battery system] 23,823/11 and 23,824/11; DE BRAAM [Automatic railway signalling] 24,128/11 and 24,237/11; WEISSMANN [Device for giving signals, &c., at a distance] 25,165/11.

Miscellaneous: COMPAGNIE POUR LA FABRICATION DES COMPTEURS ET MATERIEL D'USINES À GAZ [Current-limiting apparatus] 13,315/11.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: S. SZUBERT [Thermal feed] 18,243/07; W. J. DAVY [Globe with ash-tray] 18,513/07.

Dynamos and Motors: J. F. JOHNSON (*Felten and Guilleaume Lahmeyerwerke Akt.-Ges.*) [Armatures, &c.] 18,156/06; M. COUADE [Electromotors] 3,927/07; R. B. RANSFORD (*Compagnie Parisienne des Voitures Électriques Procédès Krieger*) [Regulation and control] 18,245/07.

Electric Ignition: A. DE DION and G. BOUTON, 24,572/04; L. K. LEAHY, 16,916/06.

Electrochemistry: J. H. MONGE and C. ARZANO [Electroplating] 18,210/07.

Incandescent Lamps: R. and E. BOHM [Bulbs] 17,678/02.

Storage Batteries: E. M. SCHNEIDER [Secondary batteries] 18,565/06; W. FENNELL and W. P. PERRY [Secondary batteries] 18,348/07.

Switchgear and Fittings: S. S. BERRY [Flexible conductor protection] 18,304/06; L. M. WATERHOUSE [Lamp holder] 18,445/06; G. DAVIS [Lamp holders] 18,227/07; J. O. GIRDLESTONE and J. W. JONES [Automatic make-and-break switch] 18,319/07; J. B. M. P. H. R. D'IVRY [Switch operated by current impulses] 18,332/07; C. W. DAWSON [Shades, reflectors, and holders for lamps] 18,346/07; J. EWART [Tumbler switch] 18,406/07.

Telephony, Telegraphy and Signalling: BULLERS, LTD. and E. J. CHAMBERS. [Telegraph poles] 17,630/03; S. EISENSTEIN [Wireless telegraphy and telephony transmission] 16,435/05; G. E. GRIMM [Guard for telephone mouthpieces] 13,201/06; G. A. BAILEY [Tramway signalling] 18,187/07; C. H. ELLISON and C. M. JACOBS [Telegraph and telephone calls] 18,308/07.

Traction: J. S. RAWORTH [Electrically-propelled vehicles] 17,975/04; J. F. and J. WOOTTON [Electric signal contacts] 18,452/07; G. NEALE [Railway signals] 18,527/07.

Miscellaneous: E. A. HAILWOOD [Miners' safety lamps] 18,195/06; O. SCHÖPPE [Electric fire alarms] 18,242/07; B. P. HAIGH [Marine steering gear, electric control] 18,444/07; M. W. ROBERTSON [Carbon-brush connections] 18,462/07; L. D. J. A. DUNOYER [Magnetic measurements] 18,571/07; J. COLE [Electric signs] 18,573/07.

Hosted by Google

lution was passed urging the Government for national as well as Imperial reasons not to transfer to any foreign corporation the licences formerly granted to British Atlantic companies. If this is impossible, then the Governments of our Dominions, especially Canada, should be co-operated with for the establishment of an independent and strictly all-British Trans-atlantic cable, and land line connecting with the Imperial Pacific Cable, this being in duplicate (on different routes), and worked on a low-rate basis, and further urges that this course be pursued in any case, even if favourable terms are secured under the present system.

A Conference of representatives of Metropolitan Borough Councils met at the Guildhall on Monday morning to appoint a deputation to wait upon the Postmaster-General to ask him to restrict the use of overhead telephone wires in London. In reply to this deputation later in the day, the Postmaster-General pointed out what a small proportion of the Post Office wires in the Metropolitan area is at present overhead, viz., only 330 miles out of 1,090 miles. Further, all the poles are situated on private property, and only 50 miles of overhead wire are along public roads. He once more pointed out that the whole question was one of cost. The cost per mile of the laying an underground wire was, he said, from five to ten times as much as that of an overhead line, and whilst he recognised the importance of putting wires underground where this policy could be economically justified, we still had to bear in mind the loss of £1,000,000 upon the telegraph system. He was anxious to avoid any friction between the Borough Councils and the Post Office, and suggested that a committee should be appointed by the former to confer with the Chief Engineer to the Post Office. One of the points which they might consider was whether the Boroughs would contribute towards the cost of placing the wires underground.

The lines of the Indo-European Telegraph Company, reported down in our last week's issue, are now working again. —The lines between Teheran and Chahroud were down on 29th ult. between Meshed and Astrabad, as were also the lines of the same company between Odessa and Kertch.—The French Government is about to open cables between Konakry, Monrovia, and Grand Bassam on the West Coast of Africa, which are apparently leading to competition between the Eastern African companies and the Government, for the latter have stated that the rates from Kotonon are the same as from Konakry for all traffic exchanged between Swakopmund and places south, and Canary Islands, Senegal, and Europe.—The Portuguese Government has also now taken control of the acceptance of telegrams from the public at Quelimane, Mozambique, and Lorenco Marques. This means that the Eastern and South African Telegraph Company is debarred from dealing with the public. Apparently the Portuguese Government possessed the right they have taken advantage of, under the old concessions.

ELECTRIC TRACTION NOTES

The Board of Trade report by Colonel Yorke on the fatal accident on the Birmingham and Midland tramways system on October 3rd has been published. It will be remembered that a car belonging to the Birmingham Corporation, after stopping to set down, ran back down Cape Hill, Smethwick, colliding with a Birmingham and Midland Tramways Co.'s car, carrying it down the hill, and causing it to collide with a third car belonging to the Corporation. Colonel Yorke is of opinion that there was no "failure" of brakes, but that the run back of the first car was caused by the driver carelessly allowing his hand-brake to become released before giving the car power, and failing to re-apply the hand-brake. He then probably got confused, and failed to reverse the reversing handle before applying the magnetic track-brake, the car at that time being on the move backwards, so that the magnetic brake was inoperative. If this was the case the car would be entirely unbraked, and the speed would rapidly increase. The driver says he subsequently reversed the motors, causing the canopy switch to fly out. This, the inspector points out, would merely cause the wheels to skid, and would have little effect on a car moving at high speed.

Further evidence has been heard with regard to the purchase of the Hammersmith lines of the London & United Tramways Co. by the London County Council. Mr. A. Dickinson, for the L.C.C., has put the value of the permanent way at £23,887 against £42,278; ducts, cables, manholes, &c., £14,604 against £21,843: workshop equipment, £3,456 against £4,256: and generating plant, £52,024 against £107,704. He also stated that 40 cars will be sufficient, and taking 10 kw. as the power used per car, 400 kw. of generating plant would suffice. Allowing for peak loads and spare plant, he considered that the two 500 kw. D.C. sets at Chiswick will be all that would be required. Mr. J. F. C. Snell also gave evidence for the L.C.C., and gave figures of valuation of the various portions of the equipment closely approximating to those given by Mr. Dickinson. From an examination of the log readings, he had come to the conclusion that 40 cars on the Hammersmith lines would require about 570 kw. as a maximum, which could well be supplied by one 500-kw. machine. The capacity of the Chiswick power house was in his opinion far in excess of what was required for the Hammersmith lines, and was, therefore, quite unsuitable for the undertaking. Mr. A. Baker, General Manager of the Birmingham Corporation tramways, expressed the opinion that 36 cars would be sufficient for the Hammersmith lines. The evidence was concluded on Tuesday, and Mr. Hutchinson will deliver his final speech for the L.C.C. to-morrow, whilst Mr. Balfour Browne will make his speech for the Company on Monday.

UNDERGROUND STATION LIGHTING

THE illustrations given here which we have received from Messrs. Siemens Brothers' Dynamo Works, Tyssen Street, Dalston, show the improvement in methods of station lighting

Fig. 1.—Bank Station Lighted by Arc Lamps.

on the Central London Railway. Fig. 1 shows the earlier system employed, where small arc lamps were used, and is from a photograph at the Bank station. In Fig. 2, which represents the latest method, metal filament lamps in holophane reflectors are used, the lamps being of the well-known Siemens "Onewatt" type of 100 c.p. each. The use of these small

Fig. 2.—Oxford Circus Station Lighted by One-watt Lamps in Holophane Reflectors.

units with suitable reflectors has resulted in a very uniform distribution, and the illumination averages about 4½ candle feet at a height of four feet above the platform. We are also informed that the metal filament lamp installation consumes less than a quarter of the current that was used with the earlier arrangement of arc lamps.

Hosted by Google

AUTOMATIC TELEPHONE EQUIPMENT

An immediate connection at any time of the day or night.

An instantaneous intimation either that the connection has been effected or that the telephone is engaged.

Certainty of connection with the right number.

Freedom from interruption in the middle of a conversation.

No operators to overhear conversations.

Great reduction in operating expenses, as manual labour is no longer required to deal with each message.

The manual system to secure operating efficiency and economy requires concentration, and therefore the installation of costly and unwieldy multiple switch-boards. In the Automatic System the sub-division of the Exchange presents no difficulties and thereby substantial savings can be effected in cables, etc.

Substantial savings in repairs and replacements.

A diminution in the cost of providing Exchange Switch Rooms and Sub-Offices as the space occupied by the Automatic Apparatus is much less than that required for the Manual System.

Installations can be provided for any number of lines.

LOCAL NOTES

Bolton: *I.M.E.A. Bill.*—The Electricity Committee are in favour of contributing *pro rata* towards the expenses of promoting the municipal wiring Bill of the Incorporated Municipal Electrical Association.

Frome: *Transfer of Electricity Works.*—When the electricity works were first installed by Messrs. Edmundson's Electricity Corporation, Ltd., it was intended that they should be managed for twenty-five years by the contractors, who were to repay, by half-yearly instalments, the principal and interest, and at the end of that period to hand over the works to the Council free. This arrangement, however, has not been found to work satisfactorily, and a new agreement has now been approved transferring the works completely to Messrs. Edmundson's.

Horsham: *I.M.E.A. Bill.*—The Electric Lighting Committee at the last meeting recommended the Council to support the I.M.E.A. Bill, the terms of which we gave in our last issue, relating to municipal wiring, &c. Councillor Roberts moved an amendment to the effect that the Council should not support the Bill whilst it contained Clauses 1 and 2, relating to municipal wiring, and this opposition had a certain amount of support. Eventually, however, upon the Chairman of the Electricity Committee undertaking to limit the Council's liability for costs to £2, the recommendation to support the Bill was carried by a two to one majority.

London: *Holborn: Street Lighting.*—The Finance Committee of the L.C.C. recommends sanction to a loan of £8,000 for the purposes of the joint scheme of electric and gas lighting which brought the Holborn Council prominently before the public a short time ago.

Newport (Mon.): *Policy of Electricity Committee.*—It will be remembered that the Electricity and Tramways Committee recently decided to rearrange the managerial duties of the two undertakings, in order that Mr. H. Collings Bishop, the Electrical Engineer, should devote himself entirely to the technical side. Alderman Phillips, Chairman of the Committee, however, disagrees with this policy, and has refused an invitation to continue the Chairmanship of the Committee under the new Council.

Oldham: *Assessment of Electricity Works.*—The Electricity Committee object to the assessment of the electricity works at the high figure of £3,581. The Borough valuer states that this figure has been arrived at in the usual way by assessing the undertaking on the income less certain deductions, but the Electricity Committee have instructed the Chairman to confer with the Electrical Engineer and Town Clerk with a view to calling in an outside valuer.

Swansea: *Action by Gas Company.*—It is understood that the Swansea Gas Light Co. have issued a writ against the Swansea Rural District Council, asking for an injunction restraining the Council from using electricity for lighting purposes within certain districts. The contention of the Gas Company is that the Council are debarred from using electricity by an agreement with the Gas Company. A point will possibly arise as to whether the company have exercised reasonable expedition in meeting the needs of the district, says a local contemporary.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Accrington.—The Council have under consideration the installation of a gas-engine plant for further extensions of the electricity works. We understand that an endeavour is being made to secure the service of Mr. Percy Allen of the Castner-Kellner Alkali Co., as consulting engineer in connection with the project.

Brighton.—Tenders are invited by Dec. 11th for a 750-h.p. three-phase induction motor to be coupled to a 440-kw. generator, which latter will be provided by the Corporation. Particulars from Borough Electrical Engineer.

Croydon.—Tenders are invited for high-tension switchboards (see an advertisement on another page).

Darlington.—A Local Government Board inquiry has been held with regard to a loan of £3,220 for the installation of an additional 500-kw. generating set.

Eccles.—The Electrical Engineer has submitted an estimate of the cost of fitting automatic and mechanical stokers to the boilers at the electricity works.

Erith.—In addition to a loan of £7,671 for extensions at the electricity works which the Council has decided to apply for, an additional sum of £4,000 is to be added as the cost of the necessary mains to supply current to the contractors at the Crossness Sewage Works of the L.C.C.

Great Harwood.—The Council propose to erect a generating station at an estimated cost of £8,085, a loan for which is to be applied for.

Heston and Isleworth.—An application is to be made to the Local Government Board for sanction to borrow £2,000 for house services and £5,000 for additional generating machinery.

India.—According to the *Times of India*, considerable extensions of the Cauvery electric power scheme have been sanctioned. The estimated expenditure is put at about £1,687,000. Additional generating plant to the extent of 5,000 h.p. is to be installed.

London: *Fulham.*—The Finance Committee of the L.C.C. recommend sanction to a loan of £9,280 for extensions to the electricity undertaking.

Hackney.—The Finance Committee of the L.C.C. recommend sanction to a loan of £4,364 for extensions to the electricity undertaking.

Middleton.—Tenders are invited by Dec. 22nd for a supply of feeder and distributor cable. Particulars from Borough Electrical Engineer.

Sheffield.—A Local Government Board inquiry will be held to-day concerning a loan of £61,099 for extensions at the Neepsend electricity works.

Stalybridge, Hyde, &c.—The Joint Tramways and Electricity Board contemplate installing a second 3,000-kw. turbine.

West Hartlepool.—The scheme of the West Hartlepool Corporation, involving an expenditure of £38,000 for utilising blast furnace gases in connection with generating electricity, has received the sanction of the Local Government Board. The Council will erect their plant at the Seaton Carew Iron Works Company's premises, and use their existing power station as a reserve.

MISCELLANEOUS

Aberdare.—The Council have decided to ask Mr. Stephen Sellon to advise them with regard to tramways.

Blackpool.—A loan of £4,200 is to be applied for in connection with the purchase of six new tramcars.

South Shields.—Tenders are invited by Dec. 13th for the supply and erection of an up-to-date X-ray installation at the workhouse hospital for the Guardians. Particulars from the Clerk, Union Offices, Barrington Street.

TENDERS RECEIVED AND ACCEPTED

Dunfermline.—The contract for the electrical installation at the new women's institute has been given to Messrs. Melville, Robb & Scott, of Dunfermline, at £428.

Liverpool.—The Liverpool Tramways Committee recommend the acceptance of the following tenders:—British Westinghouse Co., two 2,000-kw. D.-C. turbo-generators; British Thomson-Houston Co., two 3,500-kw. turbo-alternators; Worthington Pump Co., four cooling towers and pipes. The total amount of these tenders is about £100,000. The recommendation of the Committee, which was discussed at the Council meeting on Friday, met with some criticism, and the meeting was adjourned until Saturday, when the tenders mentioned above were accepted. Mr. Bromley-Holmes, the Council's consulting engineer, had the alternative of erecting

Hosted by Google

a new station or installing additional plant at Lister-Drive, and he decided upon the latter course.

London: *L.C.C.*—The Stores Committee recommend the acceptance of tenders by Messrs. Plutte Scheele & Co., and Messrs. Ship Carbons, Ltd., for the supply of electric carbons during 1912.

The Highways Committee recommend the acceptance of the tender of the Bambridge Patent Flexible Shaft Co. for three portable electric grinding machines at £73 6s. each. The following tenders have been received for five electric motors for the above :—Electric Construction Co., £377 11s.; British Westinghouse Co., £456 17s.; General Electric Co., £551; Lancashire Dynamo & Motor Co., Ltd., £571; Dick, Kerr & Co., £625 11s. A tender was also submitted by the British Thomson-Houston Co., which was not to specification. The tender of the Electric Construction Co. is recommended for acceptance. For the switchgear the following were received :—Evered & Co., £86 8s., less 2½ per cent.; Spagnoletti, £94; Johnson & Phillips, £95; Edison & Swan United Electric Light Co., £97 19s., less 2½ per cent.; Electric Construction Co., £109 7s.; General Electric Co., £114 4s., less 2½ per cent.; British Westinghouse Co., £149 15s., less 2½ per cent. The tender of Messrs. Evered & Co. is recommended for acceptance.

In view of the great interest now taken in Diesel engines for central station work, the following list of orders recently obtained by the Diesel Engine Co., Ltd., of 179, Queen Victoria Street, London, will prove interesting :—Bath Electricity Works, one 680-b.h.p. engine; Oxford Electricity Supply Co., one 650-b.h.p. engine; Isle of Thanet Electric Tramways & Lighting Co., one 600-b.h.p. engine; North Metropolitan Electric Power Supply Co. (repeat order), one 400-b.h.p. engine; Sheerness & District Electric Supply Co. (repeat order), one 400-b.h.p. engine; Messrs. C. H. Walker & Co., Ltd., four 1,000-b.h.p. engines; the Great Northern Railway Co. (repeat order), one 420-b.h.p. engine; Punta Arenas Electricity Supply Co., one 250-b.h.p. engine; General Electric Co., Ltd., one 200-b.h.p. and two 400-b.h.p. engines; Dacca Electricity Supply Co., three 350-b.h.p. engines; Messrs. Agar Cross & Co., for Argentine, four 650-b.h.p. engines; for the Canadian Government (repeat order), two 400-b.h.p. engines; Aldershot Electricity Works, one 200-b.h.p. engine; Bridgwater Electric Power & Traction Co., one 150-b.h.p. engine; Bangor Electricity Works, one 140-b.h.p. engine; Bude Electricity Supply Co., one 130-b.h.p. engine. The majority of the above orders are for the latest type of Diesel engine, which the Diesel Engine Co., Ltd., have specially designed to meet the requirements of Central Stations.

PATENT
LOUD SPEAKING TELEPHONES
COMPLETE INSTALLATIONS FOR

Adopted by the British Admiralty, Foreign Governments, the Leading Shipping Companies, and as used in many Electrical Generating Stations.
ALFRED GRAHAM & CO.,
ELECTRICAL ENGINEERS AND CONTRACTORS,
ST. ANDREW'S WORKS, CROFTON PARK, LONDON.

APPOINTMENTS AND PERSONAL NOTES

The following short list of candidates for the position of Borough Electrical Engineer to the South Shields Corporation has been prepared :—J. H. Bolam, Borough Electrical Engineer, Weymouth; S. R. Windle, Chief Assistant Electrical Engineer, Sunderland; R. M. Torpy, Chief Assistant Electrical Engineer, Wimbledon; A. G. Cooper, Borough Electrical Engineer, Colne; E. S. Rayner, Borough Electrical Engineer and Tramways Manager, Doncaster; H. S. Ellis, Deputy City Electrical Engineer, Bradford. The salary is £400 per annum.

Mr. S. J. Hollinrake, of Hebden Bridge, has been appointed Electrical Engineer to the Bispham Council.

Mr. J. Christie, Engineer and Manager of the Brighton electricity undertaking, has prepared a scheme for dealing with the vacancy caused by the resignation of Mr. C. C. Fowler, which the Electricity Committee have adopted. Under this scheme, Mr. G. T. Joyce will be designated "Assistant Manager," and have power to act in Mr. Christie's absence in all matters connected with the commercial side of the undertaking, and Mr. G. Claughton will be rated as "Assistant Engineer," with powers to act in Mr. Christie's absence in all matters connected with the engineering side. The salary of these two officials is to be increased by £50 per annum at once, with two further annual increases of £25, making the maximum £350 and £400 per annum respectively.

A log-book keeper is required by the Stepney Electricity Department (see an advertisement on another page).

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £61 to £61 10s. (last week the same).

Hart Accumulators.—The Hart Accumulator Co., Ltd., Marshgate Lane, Stratford, E., have been appointed by Royal Warrant purveyors of accumulators to his Majesty King George.

Change of Address.—We are asked to announce that in future the address of the Stoke-on-Trent Electricity Department will be St. Peter's Chambers, Glebe Street, where the central offices of the Electricity Supply Department are now situated. In these offices all business connected with the electricity works in Burslem, Hanley, Longton, and Stoke will be transacted.

Liquidations.—A petition by Messrs. Ransomes & Rapier, Ltd., for the winding up of the Kearney High Speed Railway Co., Ltd., will be heard in the High Courts on December 12th.

A meeting of the Solium Electrical Co., Ltd., will be held at 23 King Street, Nottingham, on Friday, January 12th, at 11 a.m., to hear the liquidator's account of the winding up.

Bankruptcies.—A. P. Parker, Electrical Engineer, 8 Mary Street and 57 Yorkshire Street, Burnley, has been adjudicated bankrupt.

Lectures on Illumination.—Mr. W. C. Clinton, B.Sc., Assistant Professor of Electrical Engineering at the University College, London, commences a course of eight lectures on Illumination and Photometry, on Wednesday, January 10th, at 6.30 p.m. The fee for the course is two guineas. Application for tickets should be made to the Secretary, Mr. W. W. Seton, University College, Gower Street, London.

Royal Institution.—Among the lecture arrangements announced to take place at the Royal Institution before Easter, we note that Professor Sir J. J. Thomson, Professor of Natural Philosophy, R.I., will give six lectures on "Molecular Physics."

The Physical Society.—The seventh annual exhibition of the Physical Society, at which some thirty firms will be exhibiting, will be held at the Imperial College of Science, South Kensington, on Tuesday, December 19th, in the afternoon (from 3 to 6), and in the evening (from 7 to 10). A discourse on "The Electric Discharge and the Luminosity which survives it," will be given by Prof. the Hon. R. J. Strutt, F.R.S., at 4.30, and again at 8 p.m. Admission will be by ticket only, so that members of the Faraday, Iptical, Röntgen, and Physical Societies, and the Institution of Electrical Engineers wishing to attend should apply to the Society to which they belong.

SUMMARY

At the last meeting of the Institution of Electrical Engineers, Mr. Ferranti announced that no further suggestions regarding the new articles of association would be made till early next year. (Page 677.)

We announce the death of Dr. M. Kallmann, of Berlin. (Page 677.)

An article describes the new wholesale stores and switchboard manufacturing works of Drake & Gorham, Ltd. (Page 678.)

Demonstrations of electric cooking are being given at the showrooms of the County of London Electric Supply Co. (Page 678.)

A paper by Dr. R. Pohl on standards for electrical machinery has been discussed by the Institution of Electrical Engineers at Leeds and in London. The author considered that a suitable degree of standardisation of performance, ratings, tests, and sizes of machines would be of great assistance to the industry, but criticised strongly the rules proposed by the Engineering Standards Committee, setting forth in detail modifications which he thought desirable. We give a report of the discussion in London, but owing to pressure on our space we are obliged to hold over our report of the Leeds discussion till next week. (Page 679.)

A number of new electrical supplies and accessories are described on pages 680 and 681.

A note on improved methods of illumination and a description of a new process of electroplating on china and glass are given on page 681.

The British Thomson-Houston Co. has patented a pure graphite conductor with a high density, obtained from a mixture of graphite with a pitch binder, suitable for furnaces, &c., and especially for incandescent lamps. Other patents published last week include a lamp-shade support, by means of spring clips attached to the casing, as well as an improved method of arranging spiral grooves on arc lamp electrodes for taking the active material; and a weather-proof electric contact push. Two patents relating to traction motors expire during the coming week; one deals with a design of bearing and its lubrication, while the other covers a general construction, in which inwardly projecting bearings are provided to economise space. (Page 682.)

Under "Electric Traction Notes" we report the Paper read by Mr. Philip Dawson on Friday upon the proposed conversion of the line to Brighton to single-phase electric traction. Mr. Dawson explained why the original tenders for the single-phase in the south of London were given to a German firm, and some interesting figures were also given showing the manner in which the Brighton Corporation have regained their traffic since electric traction was introduced. The annual report of the London Traffic Branch of the Board of Trade refers to a proposed tube railway from East to West of London, dealing solely with Post Office traffic. The Leeds Corporation have adopted the report expressing confidence in Mr. Hamilton, the manager of the tramway system. The arbitration with regard to the purchase of the London United Tramway system in London has been concluded, and the award will be delivered later. (Page 683.)

In our "Telephony and Telegraphy (including Wireless)" we give some detailed particulars of the arrangements which have been made for the changing over of the National Telephone Company's subscribers to the Post Office system. We also mention a Bill for making a payment on account of the purchase money to the National Telephone Co.; an appeal for telephonic com-

Hosted by Google

munication with the Isle of Man; a report that the Telefunken and Marconi systems of wireless telegraphy have been abandoned in Australia, and the work that has been done with automatic telephones. (Page 684.)

THE Accrington Corporation has decided to instal gas plant at the electricity works at a cost of £27,000.—After many months' discussion, the street electric lighting scheme at Carnarvon has been rejected.—A scheme for the hiring of lamps and fittings for shop lighting has been prepared at Hammersmith.—An offer to purchase the Worthing Electricity Works has been refused.—The Topsham Electricity Works were practically destroyed by fire on Sunday. (Page 685.)

LOCAL GOVERNMENT BOARD inquiries have been or will be held at Bexhill (£3,200); Bootle (£41,255); Burton-on-Trent (£17,000); Greenock (£25,000); Turton (£4,500); and Tunbridge Wells (£6,000). A high-tension feeder is required at Blackpool; a new power house is to be erected at Bolton; cables, lighting battery, switchgear, &c., are required at Carlisle; switchboards, cables, and boiler extensions at Croydon; generating set at Hornsey; and mains at Hackney, Nelson, and Wrexham. (Page 685.)

THE India Rubber, Gutta Percha & Telegraph Works, Ltd., made a loss of £55,457 last year. (Page 688.)

The I.M.E.A. Bill.—In our last few issues we have noted the action of certain Local Authorities with regard to the I.M.E.A. Wiring Bill. We are now informed by the Hon. Secretary of the Association that, so far, 29 per cent. of the Local Authorities have replied to the Association defining their action in the matter. Many of these have fixed a definite maximum to their guarantee of financial assistance, whilst others have simply promised to support on a *pro rata* basis. The definite guarantees amount to over £700, whilst the total, if the sums which have been recommended but not yet confirmed are added, amounts to about £1,000. There, therefore, seems every probability of the Association getting a guarantee for the full amount of the cost of promoting the Bill.

ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 14TH.

Institution of Electrical Engineers.

8 p.m. "Residence Tariffs," by A. H. Seabrook.

Institution of Electrical Engineers: Dublin Section.

8 p.m. At New Royal College of Science. "Small Electricity Undertakings," by P. L. Spalding.

FRIDAY, DECEMBER 15TH.

Manchester Association of Engineers.

7.30 p.m. Conversazione with Local Section I.E.E. at Whitworth Institute.

Electro-Harmonic Society.

8 p.m. Smoking concert at Holborn Restaurant.

SATURDAY, DECEMBER 16TH.

Association of Mining Electrical Engineers.

5 p.m. Yorkshire Branch. At Royal Hotel, Sheffield. (1) "Pit Shaft Signalling," by E. E. Beadsmoore; (2) "Earthing, Earth Plates, and Leakage Detectors," by C. Jones.

Association of Mining Electrical Engineers.

6 p.m. At Pontypridd Town Hall. "The Threatened Shortage of Coal: What Engineers are doing to meet it, and what Electricity has done and is doing," by S. F. Walker.

TUESDAY, DECEMBER 19TH.

Institution of Electrical Engineers: Manchester Students.

7.30 p.m. At Municipal School of Technology. Debate on "D.C. versus A.C. for Industrial Purposes."

Institution of Electrical Engineers: Glasgow Section.

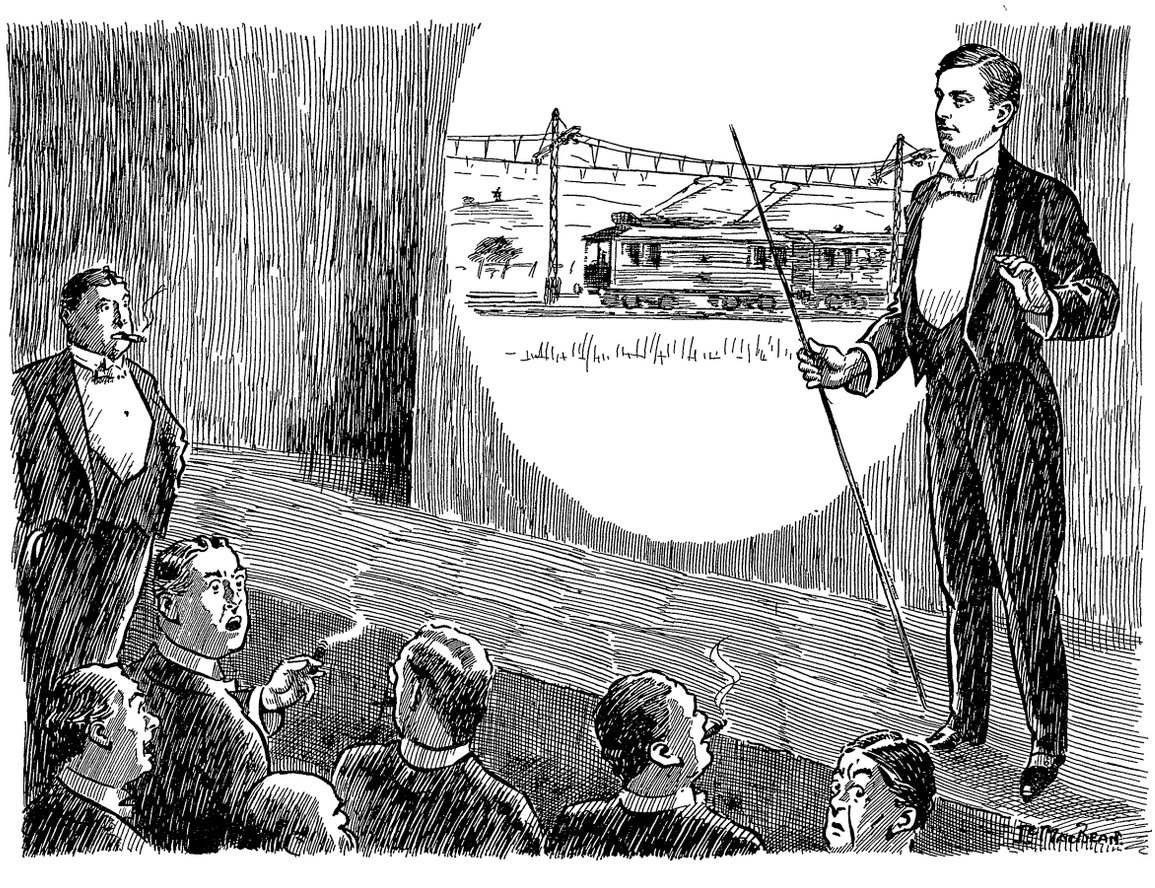
8 p.m. At Heriot Watt College, Edinburgh. "The Heriot Watt College Laboratories," by Prof. F. G. Baily.

Illuminating Engineering Society.

8 p.m. At Royal Society of Arts. "Some Aspects of Railway Station and Goods Yard Illumination," by Haydn T. Harrison.

Physical Society of London.

Annual exhibition. Afternoon and evening.

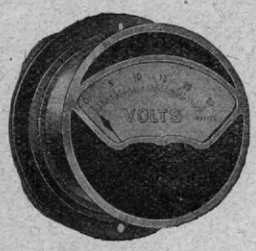


WEDNESDAY, DECEMBER 20TH.

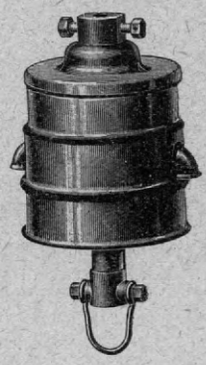
Institution of Electrical Engineers: Students' Section.

7.45 p.m. "Some Experiments with Wireless Telegraphy Transmitters," by P. R. Cowsey and G. G. Dawson.

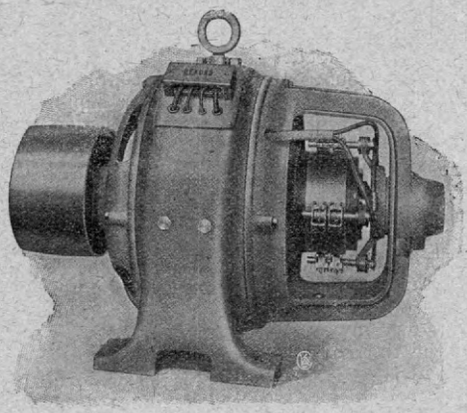
Institution of Electrical Engineers: Newcastle Section.



Annual dinner.



THE NEW PHASE OF THE BRIGHTON RAILWAY.



Mr. Philip Dawson, in his lecture at the Royal Automobile Club, expressed the hope that he would be able before long to drive his friends from London to Brighton by single-phase traction in forty-five minutes.—Envy of the law-abiding members of the Club.

THE INSTITUTION OF ELECTRICAL ENGINEERS

AT the meeting of the Institution in London on Thursday, Mr. S. Z. de Ferranti announced, with reference to the revised Articles of Association, that since the last informal meeting the Council had taken further steps to ascertain the views of the members. They had received a number of suggestions, which are being carefully considered to see how far it is possible to reconcile the different views and to embody them in the revised Articles. The time required to give these suggestions adequate consideration rendered it impossible to make any further suggestion until early next year.

We would suggest that the Council would have been better advised to have adopted at once our recommendations as to subscriptions (see ELECTRICAL ENGINEERING, November 23rd, page 637), and to have announced that no subscriptions of existing members at January 1st, 1913, would be raised, so as to encourage a large number of new members and transfers to full membership and associate-membership during the year. As we have already pointed out, the raising of subscriptions generally at once will undoubtedly bring about wholesale resignations, so that while, on the one hand endeavouring to extend the membership by their "broadening" proposals, the Council would be working in precisely the opposite direction by promoting a reduction of the present membership.

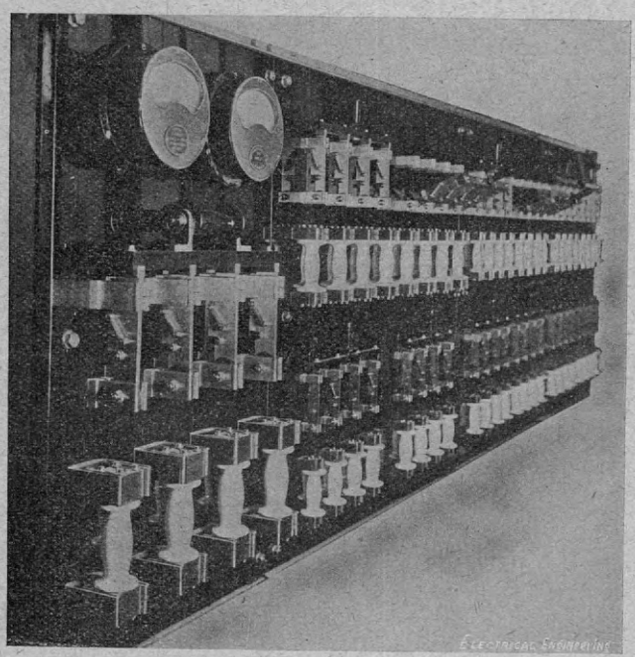
Midland Electrical Engineers' Ball.—The first Midland Electrical Engineers' Ball is to be held at the Grand Hotel, Birmingham, on Friday, January 19th, 1912, under the patronage of the Lord Mayor and Lady Mayoress of Birmingham. An influential committee has been formed, of which Mr. R. A. Chattock is chairman. Mr. H. Foulds, 14 Dale End, Birmingham, is hon. treasurer, and applications for tickets at one guinea each, which include supper, &c., can be made to him. The hon. secretary is Mr. H. B. Matthews.

OBITUARY

We regret to record the death, after a long illness, on November 29th, of Dr. M. Kallmann, Electrical Adviser to the Municipality of Berlin and Professor at Charlottenburg Technical College. Dr. Kallman was a prolific writer of papers dealing with electric supply distribution, cable testing &c., and was a frequent contributor to the German technical press. Latterly he took up the subject of motor regulation, &c., by iron wire resistances or "variators." Before his appointment as muncipal engineer he had charge of the testing department of the Berlin central stations.

Honour to Mr. Ferranti.—The opening of the new Physical Laboratory of the Victoria University, Manchester, has been made the occasion for conferring an honorary D.Sc. degree on Mr. S. Z. de Ferranti, and also upon Madame Curie.

Manchester Local Section of the Institution of Electrical Engineers.—A Paper, by Mr. Miles Walker and Mr. H. D. Symonds, on Heat Paths in Electrical Machinery, was read and discussed at Manchester on Tuesday. At the Council's request, we are refraining from publishing the Paper and discussion until the Paper has been read in London, which is to be done in January. We would suggest that it would have been advantageous rather than the reverse if the Press had been allowed to publish reports of both Paper and discussion, as the members would then have had good time to study its contents before the London discussion, and would also have been enabled to avoid going over the same ground as in the Manchester discussion. We can only hope that the Institution will now itself prepare a full printed report of the Manchester discussion well before the London meeting to circulate with the Paper to intending speakers. If the Press are always to be forbidden to report Local Section discussions preceding those in London on a Paper, this course might be made a regular procedure.



Faraday House Students' Society.—Dr. Alexander Russell has been appointed president of this society, E. B. Ritson, vice-president, F. T. Chapman, B.Sc., treasurer, and B. P. K. Walsh, secretary. The next meeting will be held on January 17th, 1912, at 4.45 p.m., when Mr. E. B. Ritson will give an account of his personal experiences when an engineer with the High-Tension, Hydro-Electric Power Company at Necaxa, Mexico.

Hosted by Google

THE NEW WHOLESALE OFFICES AND STORES OF DRAKE AND GORHAM, LTD.

OWING to the rapid increase in their wholesale business, Drake & Gorham, Ltd., have found it necessary to open special offices and stores to deal with this branch of their work. A building adjoining their old works in Felix Street, S.E., has been taken and equipped in such a manner as to enable the firm to deal promptly with all orders. By the courtesy of Mr. R. W. Smith, who is manager of the wholesale business, we are enabled to give a few details of our recent visit to the new premises. The offices are spacious and include, besides general offices, the offices of the manager and sub-manager, with special rooms for a staff of typists, keeping of records, &c. A private telephone exchange has been provided for with a good service of lines, so that customers need experience no delay. The extensive basement and ground floor, as well as the whole of another part of the building, has been fitted out as a stores for the wholsale business, and judging by the amount of stock of all classes of material which we saw, we should say that the firm should have no difficulty in dealing promptly with any order.

In the works adjoining some of the well-known manufactures of this firm were being dealt with at the time of our visit. Prominent amongst these are switchboards. We

DRAKE & GORHAM SWITCHBOARD.

reproduce here an illustration of an important switchboard recently supplied by this firm to the order of "The Greenwich Inlaid Linoleum Co." for use at their works. This board is designed to control 600 h.p. two-phase four-wire at 440 volts. The switches are standard D. & G. quick-break knife type, and the fuses are the firm's standard square-ended type. The main switch is made to carry 600 amperes, four of the distributing switches are of 200-ampere size each, and the remaining eight of 100 amperes each. The switchboard conforms to all the requirements of modern practice, the four 'bus-bars at the back being mounted on porcelain insulators, which are supported at the top of the board on cast-iron brackets.

Amongst the switchboards going through the works at the time of our visit was one for the town lighting of Bantry. This is a D.-C. board on three large white marble panels designed to control two generators, a battery, and twelve feeders. The firm have also recently concluded important switchboard contracts for Carlow, Belturbet, &c. That for Carlow consisted of twenty-four panels, and was designed to control both D.C. and A.C. We also saw a great number of smaller boards for battery control and other purposes, as well as boards enclosed in sheet-iron cases for mining work, &c. Other articles we saw in process of manufacture were the D. & G. fool-proof pattern battery regulator, Cardew earthing devices, cast-iron fuse-boxes, and a host of other articles too numerous for specific mention.

Another part of the building is set off for the manufacture of the firm's complete automatic set for petrol lighting of country houses. These sets are entirely automatic, and once started can be kept going day and night without attention. We understand that there is a big demand for these sets.

With regard to cast-iron boxes, a very large stock of all sizes and designs is kept, so that any ordinary order can be dealt with at once.

In the fittings department a great business is done in the conversion of old fittings. We saw a large number of silver, copper, wrought-iron, and other fittings in the process of being adapted for the more modern illuminant. New fittings are, of course, also dealt with in this department, as well as smaller supplies such as switches, fuses, &c. Adjoining the fittings department is the dipping department, where all the various effects and colours on metals are obtained by means of chemical processing, and leading out of this room is the lacquering department. The equipment of the works, offices, and stores is very complete, and judging by the general bustle and hurry on the day of our visit, Messrs. Drake & Gorham are well justified in extending their premises.

DEMONSTRATIONS OF ELECTRIC COOKING

THE County of London Electric Supply Co. are at present giving a demonstration of the household uses of electricity at their district showrooms, Upper Richmond Road, Putney. The particular features are vacuum cleaning and cooking. The district adjacent to the showroom consists of good residential property, where there is a particular opening for the use of the electric supply for cooking and vacuum cleaning. A fully

COUNTY OF LONDON ELECTRIC SUPPLY CO.'S SHOWROOM.

qualified lady lecturer is in charge of the cooking demonstrations, which are given at 11.30, 3, and 6 o'clock daily, in the electric kitchen, which is attached permanently to the showroom, of which a view is given here. The lectures are proving very popular, due in part to the attractive window, which has been fitted up as a kitchen, and which has created wide interest. The neighbourhood has also been well circularised with personal invitations to the demonstrations, and posters have been put up on the hoardings in the district.

Linking up of the London Stations.—The Joint Conference of London Electric Supply Authorities held a further Conference at the Cannon Street Hotel last Thursday, which was well attended. Mr. W. F. Fladgate occupied the chair. Among those present were Aldermen and Councillors representing the following Boroughs: Battersea, Fulham, Hammersmith, Hampstead, Islington, Poplar, St. Marylebone, Shoreditch, Stepney; and there were also present directors of the following companies: The Charing Cross Electricity Supply Co., the Chelsea Electricity Supply Co., the City of London Electric Lighting Co., the County of London Electric Supply Co., the Metropolitan Electric Supply Co., and the South Metropolitan Electric Light Co. The Chairman addressed the meeting, and after reviewing the work of the past year, gave a forecast of their future programme, especially with regard to the important question of linking up the supply undertakings of London under the powers conferred by the London Electric Supply Act, 1908. The Executive Committee's report was unanimously adopted.

Hosted by Google

STANDARDS FOR ELECTRICAL MACHINERY

A PAPER by Dr. R. Pohl, entitled "Notes on National and International Standards for Electrical Machinery," was discussed at last Thursday's meeting of the Institution of Electrical Engineers in London, and also on the previous Wednesday by the Yorkshire Local Section at Leeds. The Paper dealt in some detail with the standards for electrical machinery proposed by the Engineering Standard Committee tentatively in 1907, and made various suggestions for their modification. After some remarks showing the great assistance that properly drawn-up standards are both to manufacturers and customers, he dealt first with the question of rating. Ratings based on "continuous" and "intermittent" working were recognised by the Committee, but a third "short-period" rating figured in the German and Belgian standards. For continuous working the author preferred the following definition to the six-hour run:—"The output of machines for continuous working shall be the output at which, with suitable attention, they can work continuously from week-end to week-end. Their suitability for this shall be proved by their passing the prescribed tests." For intermittent working he submitted the following definition:—"The output of motors for intermittent working shall be the output at which, with suitable attention, they can work from week-end to week-end intermittently with the specified load factor. Their suitability for this shall be proved by their passing the prescribed tests." He further suggested that only three standard load factors be adopted—namely, ½ for lifts and severe crane and hoist work; ¼ for ordinary shop cranes; ⅛ for traversing and other light duty.

Among other points which he touched on were classification of types, to which "flame proof" should be added, and wearing depth allowed on commutators, which can be much less than those specified in the standards. Regarding sparklessness, he suggested the following clause:—"There shall be practically no sparking at the brushes of commutators or slip-rings at any load up to and including full load, and no injurious sparking at the specified overloads, and the position of the brushes, except where otherwise stated, shall remain fixed for all loads."

The overload capacity called for in British practice was very much higher than that in the French, Belgian, and German standards. The author suggested that 25 per cent. for one hour, 100 per cent. momentarily, be adopted for machines for continuous rating, and 25 per cent. for five minutes, 50 per cent, momentarily, for intermittently working machines. Generators should be capable of maintaining their full voltage up to 25 per cent. overload (15 per cent. in the German specification) when running at their full-load speed, the power factor in the case of alternating current generators being equal to the normal power factor.

With regard to voltage regulation, the author saw no reason for departing from the present rule that the regulation of alternators shall not exceed 6 per cent. on a non-inductive load and 20 per cent. on an inductive load having a power factor of 0·8, except in cases where a much larger pressure rise is permissible in view of the employment of quick-acting automatic regulators. Generators compounded for constant pressure at all loads should maintain this pressure within 2 per cent., and the voltage of overcompounded generators, for a rise in pressure from no load to full load not exceeding 10 per cent. of the no-load pressure, should not depart at any load more than 3 per cent. from the ideal linear load characteristic.

There was considerable variation in the loads at which efficiency and power factors were to be guaranteed, but the author thought that full and half load was sufficient, and the method of measurement of the individual losses should be the standard test. For insulation a flash test was of more value than a measurement of insulation resistance, and he suggested that all windings for working pressures above 200 volts be flashed to earth with alternating current of twice the working pressure, but not less than 1,500 volts; windings for less than 200 volts with 1,000-volt alternating current. The pressure should be raised gradually for this flash test, and the full voltage be applied for one minute.

The question of temperature rise was dealt with at some length, and finally it was recommended that the permissible temperature rise, as ascertained by the specified tests, must be such as to ensure that in the interior of field coils the actual temperature of 125° C., and in distributed windings 110° C., is not exceeded. The air temperature should be taken as 35° C. The highest rise must, in consequence, not exceed 125−35=90° C. and 110−35=75° C. respectively. For distributed windings, such as direct-current armatures, alternating-current stator and rotor coils, which must be measured by thermometer on the surface, an allowance must be made for the temperature drop in the outer insulation and in the interior of the coil. The sum of these is not likely to exceed 20° C. In addition we are to allow 5° C. to meet the discrepancy due to reducing the durations of the test, or a total of 25° C., leaving a rise of 50° C. In the case of field coils for direct-current machines and alternators if measured by internal thermometer, the margin to be allowed consists of 10° C. possible error due to the thermometer not being placed at the point of highest temperature, and 5° on account of the reduced length of run, leaving a rise of 75° C. Where special materials designed to resist high temperatures are employed, a much higher temperature rise is rightly permitted by the present standards. Single-layer windings of heavy copper strip, wound on edge, would also be quite safe if one allowed a temperature rise of 75° C. as measured by thermometer on the surface. There need further be no limit to the temperature of squirrel-cage rotors, unless ordinary soldered joints are employed, for which the approximate limit of safety is a temperature of 150° C.

With regard to the duration of the test run, he suggested the following rule: The duration of the full-load test shall be such that the temperature rise shall not increase by more than 2 per cent. during the last half hour of the run. In order to ascertain this, a thermometer fixed to a suitable stationary part of the machine shall be employed.

With regard to the standardisation of pressures, frequencies, outputs, and speeds, he suggested the omission of 110 and 115 volts as standard pressures, except for exciters, and the replacing of 525 and 500 volts for generators and motors respectively of the Engineering Standards Committee by 580 and 550 volts. The only standard frequency should be 50 cycles. He analysed the tables of outputs and speeds proposed by the Engineering Standards Committee, and suggested more uniform steps between the sizes on the basis of a 25 per cent. step in output wherever possible.

DISCUSSION IN LONDON.

Mr. T. Harding Churton saw serious difficulties in the way of general standardisation in view of the large number of frequencies and voltages. There was, nevertheless, scope for rules which would be universally recognised for the rating and testing of machines. He agreed that the existing rules of the Standards Committee were not sound, and mentioned some experiments he had made with a view to seeing what the one-hour test came to as an equivalent in intermittent work. A ventilated motor if run for one hour continuously had the same temperature rise as if run with an intermittency of three to four. If it were running for half an hour it was equivalent to an intermittency of one in four, which was nearer the actual requirements of practice. With the motor totally enclosed, a half-hour was equivalent to one in six intermittency. This rather showed a necessity for making separate rules for different classes of electrical machinery.

Mr. W. E. Robson agreed that the Standards Committee regulations were a dead letter, but there were several difficulties to be overcome before standards could be adopted. One of the main ideas in standardisation was to improve the standard of performance, but before anything definite in this direction was done it would be necessary for manufacturers to agree amongst themselves as to observing these standards, and also for it to be made an offence against the law for foreign manufacturers to sell machines here which did not conform to our ideas of performance. During the last few years orders for electrical machinery had been plentiful, but prices were such that manufacturers were not in the position he would like them to be as regards profits. At the same time there was not a sufficient volume of work in this country to enable what he called real manufacture to be carried on. There were so many firms making certain classes of machinery that it was quite impossible for them to carry on manufacture on a large scale. One way out of this might be for the larger firms to come to an agreement to pool their orders for particular sizes of motors. This would be one great move towards real "manufacture," and would enable better technical men to be employed at better salaries, as the profits would be increased and money could be spent upon development work. With regard to the ratings given in the Paper, he agreed that machines going for six hours at full load were practically always good for continuous operation, but he did not see any reason why the six hours should be left out. He thought it was unnecessary to have a smaller time rating than one hour. With regard to classification, electric motors, in his opinion, would eventually be pro-

Hosted by Google

hibited in places in mines where there was the slightest danger of explosion, and for this reason he thought flame-proof motors could very well be left out from any standard classification, because eventually they might not be wanted. The present regulations with regard to wear on commutators were unnecessarily hard. He usually allowed a wearing depth of three-eighths of an inch for commutators up to six inches diameter; half an inch from six to ten inches diameter; five-eighths of an inch from ten to eighteen inches diameter; three-quarters of an inch from eighteen to twenty-four inches diameter; and one inch above twenty-four inches.

Mr. ROBERT HAMMOND thought it due to the Standards Committee to say a few words in defence of what they had done. Their object had been to cheapen the cost whilst having efficiency thoroughly in view. He heartily appreciated the Paper, for only by such criticism was the Standards Committee able to keep in touch with those who knew. The Committee would shortly make a fresh start, and the Paper would be very valuable to them, but it must not be thought that the Committee had arrived at its previous conclusions in a haphazard manner. The Committee had endeavoured to select sizes of machines for which most of the manufacturers already had patterns in their shops, and to lay down conditions of tests which would hold the consulting engineer in check, a test based on Dr. Pohl's ratings, would require the consulting engineer to take a three weeks' holiday with all his staff at hand whilst tests were being carried out. He would have liked Dr. Pohl to have acknowledged one thing in the standard specification, and that was that for the first time the Committee had swept away the absurd idea of overload. It was absurd to say that a machine should have a certain temperature rise, and then specify that it should stand 25 per cent. more.

Professor SILVANUS P. THOMPSON disagreed with Dr. Pohl's suggestion to eliminate machines working at 100 or 115 volts in view of the utility of that pressure for lighting circuits. It was unnecessary to have a long run in order to find out the output and temperature of a machine under conditions of regular operation. Temperature rise followed a perfectly regular law, and he had adopted the plan of making a few observations at the beginning of the test to find out the temperature rise per minute, and when the rise had got to a point at which it was only half as fast as it was at first, he then stopped. They were then half-way up to the final temperature.

Mr. H. JONES said that it was in the bigger and special schemes that foreign competition was most noticeable. For motors from 5 to 100 h.p. the Germans had not a look in at present English prices. Standardisation carried too far stultified design. He thought it was a dangerous thing to say that there should be "practically no sparking." That depended entirely upon the gullibility of the buyer and the plausibility of the seller, and it had involved many firms in more serious losses than they would admit. Again, "momentary overload" should be more exactly defined. With a high permissible temperature rise, they would be a steeper curve from cold to hot.

Mr. W. E. BURNAND endorsed the author's conclusions, and hoped that he would continue his efforts to introduce standards.

Dr. POHL, in reply, said that his main object was to aim at shortening the duration of tests rather than lengthening them. In many cases six hours was too long for small machines, and too short for large machines. He did not agree with Mr. Hammond that the committee had swept away overload. The fact that it was not mentioned in the specification did not sweep it away. An overload of 25 per cent. for two hours and 50 per cent. for one hour was the general practice. His complaint was that manufacturing costs in this country were too high, and an effort must be made to bring the manufacture down. He did not believe in hiding their weakness by political methods, and he did not like to do away with the sting of competition. It would be very much better for the buying public if the Institution of Electrical Engineers and the Standards Committee would take the matter in hand and give the English firms the advantages which the greater American and German firms possessed from their vast productions. The Standards Committee should be a standing committee, to which any development should be referred so as to bring the standards up to the requirements of the times.

ELECTRIC LIGHTING SUPPLIES

WE referred briefly last week to the comprehensive new catalogue of electric lighting supplies which has been issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), and we are now able to illustrate some of the newer or more important items therein. With regard to the fuses which we mentioned last week, we regret that the wrong block was inserted as illustrating the new pattern of circular detachable fuse. This neat piece of apparatus is shown here in Fig. 1. These have removable covers which carry the fuse terminals; operators have not, therefore, to insert new fuses when standing on steps, ladders, or in other insecure or dangerous positions. They can, by a simple half-turn, remove the cover with its fuse chamber and terminals affixed, and conveniently and rapidly insert a new fuse at the bench or table. When replacing the cover they are efficiently pro-

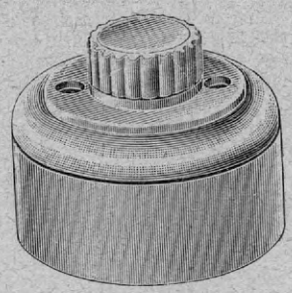


FIG. 1.—DETACHABLE TYPE PLASTER-LINED FUSE.

tected against injury due to the fuse again blowing, by the patent combined cover and hand shield.

The fuse illustrated last week was the older non-detachable

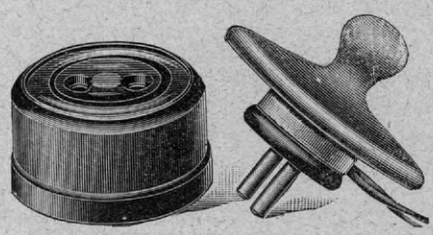

FIG. 2.—HOME OFFICE PATTERN PLUG.

type, and it is these which it should have been stated were reduced in price.

We also illustrate in Fig. 2 one of the special Home Office pattern of wall plug, which is being sold in large numbers. As with all the patterns of plug, these are made in three gauges,

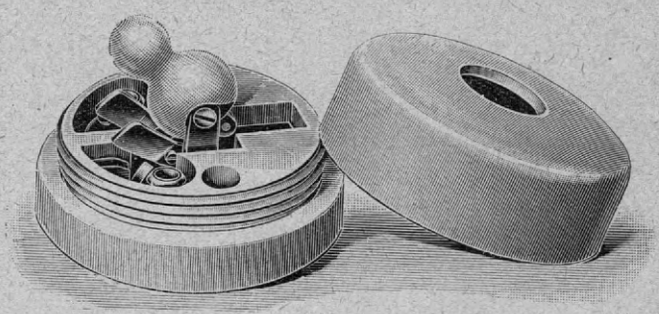

FIG. 3.—PORCELAIN-HANDLED "SLICK" SWITCH.

named midget, standard, and union respectively; all are interchangeable with others of the same gauge.

Another speciality is the "Slick" type of flat switch, a porcelain-cased and porcelain-handled form of which, also designed specially to meet Home Office requirements, is

FIG. 4.—"COATES" INSULATED LAMP-HOLDER.

shown in Fig. 3. The insulating "Coates" shields for lamp-holders, illustrated in Fig. 4, is also well known. It is entirely fireproof, and can be attached to existing lamp-holders without unwiring them. Another interesting lamp-holder, which is quite new, is the "Goliath" Edison screw socket, in china and metal case, for high candle-power Osram lamps.

Hosted by Google

CATALOGUES AND PAMPHLETS, &c., RECEIVED

LACQUERS AND VARNISHES.—We have received from the Fred. Crane Chemical Co. (22 and 23 Newhall Hill, Birmingham) a price list dealing with a number of special preparations for the use of metal workers, electrical manufacturers, &c. These include frosting and coloured lacquers for incandescent lamps, aluminium paints, celluloid enamels, bronzes, &c. Particular attention should be called to the company's "Zapon" cold brushing and dipping enamels for brass, copper, or silver, giving a celluloid skin, "Brassoline" cold lacquer, and the dull black "Enameloid." A separate list deals with spraying machines for spray bronzing, lacquering, varnishing, &c.

DECORATIVE OUTFITS.—The Electrical and Engineering Supplies Co., Ltd. (36 & 37 Upper Thames Street, London, E.C.), has issued a pamphlet relating to outfits for decorating Christmas trees and shop windows. All live parts are totally enclosed, and each holder has two soft brass clips for fixing in any desired position. They can be had for voltages from 100 to 250.

BOILER-FEED PUMPS.—A pamphlet (in German) from the Allgemeine Elektricitäts-Gesellschaft describes a compact form of centrifugal boiler-feed pump driven by a miniature steam turbine.

INSULATION TESTER.—A simple form of self-contained insulation testing instrument working with dry cells is described in a leaflet from the same firm.

ELECTRIC SIGNS.—We understand that Simplex Conduits, Limited (116 Charing Cross Road, London, W.C.), are making a special offer in connection with their signs. They are prepared to design a suitable advertisement for any class of goods at a nominal charge of five shillings. The price of these signs has also been reduced.

INSULATING VARNISH.—We have received from Messrs. Major & Co., Ltd., of Sculcoates, Hull, a copy of a new booklet entitled "The Manufacture of Insulating Varnish." This is an attractive little publication, describing, with the aid of excellent illustrations, the firm's methods, and should appeal to electrical engineers and all users of varnish. The view of the firm's electrical laboratory, where insulating varnish is tested up to 42,000 volts, is of particular interest. Besides finishing varnishes for motor coils, &c., the firm makes black japan varnishes, acid-proof enamel, tinting varnishes for lamp bulbs, core plate varnishes, mica building varnishes, and fireproof fusebox paint.

ELECTRIC SIGNS.—We have received from the Electrical & Engineering Supplies Co., Ltd. (36 and 37 Upper Thames Street, London, E.C.), a new list of electric signs illustrating a few of the various patterns made by them.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

LANTERN SLIDES.—Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster, S.W.), have prepared a revised list of the series of lantern slides of technical subjects which they keep in stock and are willing to lend to lecturers and others free of charge. The series includes some 180 different slides, and illustrates some of the most up-to-date electrical plant. Those dealing with electric railway work and electric drive of rolling mills are particularly compete.

SMALL ALTERNATORS.—The Crypto Electrical Co., 155–159 Bermondsey Street, S.E., have put on the market a new pattern of self-contained motor-driven alternator, with an output of 100 to 2,000 watts, for such uses as ozone generation, insulation testing, and Röntgen-ray apparatus, voltages from 50 to 250, and frequencies from 40 to 125 can be arranged for, and the apparatus can be driven by a belt, using the continuous current side as an exciter if required.

DIESEL ENGINES.—A copy of a new pamphlet from the Diesel Engine Co., Ltd. (179 Queen Victoria Street, London, E.C.), gives some important figures obtained under working conditions which show the low cost of running and maintaining these engines. A long list of central stations, both home and abroad, equipped with Diesel plant, show that it is well suited to this work. We understand that at the present time some 600,000 b.h.p. are in use. Some of the larger plants installed are beautifully illustrated on art paper in a separate pamphlet. Our readers should obtain copies of these pamphlets.

AUTOMATIC SIGN SWITCHES.—A leaflet giving particulars of motor-driven switches of this type, with prices of several patterns, has been issued by the Electrical Engineering & Supplies Co., Ltd. (36 and 37 Upper Thames Street, London, E.C.). A feature of these switches is that all parts are standardised and are interchangeable, spare parts being kept in stock for quick delivery. They are made for dealing with current up to 25 amperes per way. Prices for several patterns are given.

RADIATORS.—The Dowsing Radiant Heat Co., Ltd. (105 Great Portland Street, London, W.), are bringing out some new designs of Bastian quartz heaters, which give a pure red heat. The heating elements can be easily replaced, and a good circulation of heated air is also maintained.

STEEL REFLECTORS

THE Benjamin Electric, Ltd., have prepared, and are about to issue, a new catalogue of the "Holophane-Benjamin" line of steel reflectors for industrial lighting. These reflectors, which are of stamped steel enamelled outside and coated with a special diffusing and reflecting surface inside, are specially suitable for the lighting of mills, factories, workshops, dockyards, railway stations, &c. Five different patterns are made, four of which are for pendant use in four different sizes, with lamps from 17 to 300 watt, while the fifth type, which is parabolic in three styles, is designed for local lighting with small lamps, say from 17 to 35 watt. A reflector of the focussing type is illustrated here. These reflectors are for use with the ordinary shade carrier lampholder, and no gallery is required, or they can be supplied equipped with the "Benco" weatherproof lampholder (see ELECTRICAL ENGINEERING, September 14th, page 509), making a most satisfactory and efficient line for outdoor work. They are entirely British made, and are covered by patents and registrations and pending applications.

"HOLOPHANE-BENJAMIN" FOCUSSING STEEL REFLECTOR.

ILLUMINATION

WITH a view to checking the use of incandescent lamps in unsuitable ways, a matter of greater importance since the introduction of metal filament lamps with their high intensity, the British Thomson-Houston Co. have organised an Illuminating Engineering Department as a permanent branch of their organisation, to study the subject of scientific illumination, and to disseminate correct principles among the public, thus enabling full advantage to be taken of the fine effects which their Mazda lamps render possible. They point out the great waste of light common with unsuitable reflectors, and consider that both the Continent and the United States are in advance of this country. With these objects they have issued a publication entitled "Ready Rules for Lighting Works," in which their recommendations are clearly put. As is well known, the company have produced a complete series of reflector fittings with Mazda lamps, arranged in suitable fittings to be in the correct optical position in relation to the scientifically constructed reflectors, be they of glass or metal, and they designate each complete combination of lamp, reflector, and gallery as a "Mazdalier." The reflectors are divided into three main groups, those giving a "focussing" or concentrated stream of light, those with an "extensive" or widespread distribution, and an intermediate or "intensive" form suited to a large range of purpose when spaced correctly apart according to the rules given. The trade name of "Mazdalux" is given to the metal form of reflector employed in these combinations.

ELECTRO-PLATING ON CHINA AND GLASS, Etc.

THROUGH the courtesy of the Harvey Electrochemical Co., we were able to inspect an interesting exhibit of china and glass ware electroplated by the Marino patent process, which was on view at their office in Norfolk House, Laurence Pountney Hill, E.C. As is well known, in work of this kind the article must be prepared with a metallic coating before it can be electroplated. Two half-plated samples were shown, so that the old and new processes could be closely examined. In the former, the surface of the article only is treated, with plumbago as the conducting medium, which, once started, is likely to cause the plating to peel off easily. In the latter, however, a flux is used which permeates the pores, so that when the metal is deposited it forms an integral part of the article, which no efforts will disturb without bringing off the china as well. The process is very simple, cheap, and quick. The unglazed article, after being prepared, is placed in the bath of metal, through which a current passes, and in about half an hour it is richly coated, and can then be polished, burnished, oxidised, or lacquered. Plated rims can also be formed on glass, &c., by first roughening the lip to be plated, and then immersing in the bath. Samples of salad bowls, flower vases, scent bottles, demonstrated this. The firm carry on other forms of electroplating, including the preparation of tin-plated aluminium cooking utensils. They have also a cold electro-galvanising process.

Meters Approved.—The Board of Trade have approved of the E.A.C. ampere-hour meter and the B.T.-H. A.C. single-phase meter.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Dec. 7, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.
Names in italics indicate communicators of inventions from abroad.

26,410/10. **Lamp Shade Supports.** T. M. Jones, A. G. Jopp, and G. Sunnucks. For fixing lamp shades, three flat spring steel slips are fitted at one end to the inside of the casing or gallery by screws, the other end being formed with an upward bend projecting inwards, which laps over and around the edge of the globe, gripping it firmly. One clip, in combination with a projection on the casing, can be used with the same effect. Three figures.

3,514/11. **Electric Bell Push.** L. Bonnet. Two contact strips are mounted on an insulating block enclosed in a metal box, which has a tubular socket in the side to take the live wires. The push-button passes through the centre of a plate, which seals the front of the box. This is rendered waterproof by means of a shoulder attached to the button, and which is kept pressed against a rubber washer by the usual spring used in bell-pushes. Four figures.

13,021/11. **Graphite Conductors.** British Thomson-Houston Co. (*General Electric Co., U.S.A.*). This covers a process for producing pure graphite conductors, especially for use in incandescent lamp filaments, having a density approximating to 2·26. These are squirted or otherwise shaped from a mixture of finely divided pure graphite with a binder, which is subsequently carbonised or graphitised. A suitable binder consists of coal-tar pitch soluble in benzol, which becomes sufficiently liquid to flow at about 180° C.

14,729/11. **Arc Lamp Electrodes.** P. and E. Conradty. To secure regular and slow burning in electrodes of this type, the active material is arranged in spiral grooves formed on the outside of the electrode, so that the arc follows the spirals and is carried gradually round. Five figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.
Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: Blondel [Automatic, for light projections] 5,502/11; Worsley [Clutch mechanism for the attachment of] 15,862/11; Chemische Fabrik Buckau [Manufacture of magnetite electrodes] 16,902/11.

Distributing Systems, Cables, and Wires: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Circuit controlling devices] 178/11; Morgan [Wire terminals] 15,091/11; Graham [Circuit fuses] 16,228/11.

Dynamos and Motors: Electrical Construction Co., and Pensabene [Means for carrying brushes] 27,205/10; Bottone [Current generators] 28,611/10; Siemens Bros. Dynamo Works, Ltd., and Lydall [Speed control] 8,591/11; Siemens Bros. Dynamo Works [Means for obtaining constant speed in D.-C. motors] 10,342/11; Oliver Imray [Static frequency converter] 11,526/11.

Storage Batteries: Bayer and Hubbard, 16,859/11.

Switchgear and Fuses: Garside [Switches and controllers] 5,856/11; British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Electrically-operated switch control] 6,663/11; Kallmann [Safety fuses] 15,646/11.

Telephony and Telegraphy: Graham and Rickets [Impedance coil for telephony] 10,045/11; Steinberger [Telephone mouthpieces] 13,641/11; Bann [Telephone receiver holders] 13,948/11; Siemens Bros & Co. (*Siemens & Halske Akt.-Ges.*) [Mountings for wall telephone sets] 18,462/11.

Traction: Munro and Railless Electric Traction Co. [Crossings for conductors] 29,706/10 and [Current collectors for electric-vehicles] 2,889/11; Sieper [Motor-vehicle controllers] 1,776/11; Siemens Bros. & Co. (*Siemens & Halske Akt.-Ges.*) [Circuit for railway points and signals] 18,293/11 and [Railway signals] 18,776/11.

Miscellaneous: Billon Daguerre [Producing hyper-ultra violet rays] 24,025/10; Johnson (*Badische Anilin & Soda Fabrik*) [Electrical purification of gases] 60/11; Morris & Lister, Ltd., and Morris & Watson [Electrical influence machines] 2,591/11; Lake (*C. B. Cottrell & Sons Co.*) [Manufacture of electrotype plates] 13,515/11 and 13,542/11; Hertzberg, Low, and Wohl [Electrocuting trap] 16,065/11; Allgemeine Elektricitäts-Ges. [Device for locking H.-T. chamber of motor vehicles] 17,304/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps: Harlé et Cie [Lighting and regulating] 25,138/11; Heimann and Schäffer [Regulating device for three-phase lamp] 25,586/11.

Cables and Wires: Stephenson [Apparatus for localising faults] 25,683/11.

Heating: Monnot [Devices] 22,992/11.

Telephony: Betulander [Automatic systems] 25,216/11.

Miscellaneous: Quastenberg [Magnets] 24,146/11; Abraham and Carpentier [A.-C. galvanometer circuits] 25,044/11; Jahr [Woven fabric electrode for utilising heating effect of a current] 25,477/11.

Amendment

17,010/10. **Braking Induction Motors.** E. Rosenberg and J. S. Peck. As a result of the extended investigation under section 8, the above-mentioned specification has been amended by way of disclaimer. It was abstracted in Electrical Engineering, August 10th, 1911, p. 450.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

29,587 and 29,590 of December 14th, 1897. **Traction Motors.** British Thomson-Houston Co. (*E. D. Priest, U.S.A.*). The first of these two patents deals particularly with the bearings and means of lubricating them. The field-magnet frame, which is made in two parts and bolted together, is supported at one end on the car axle and at the other on the truck by means of a spring-supported bar. The bearings are mounted in detachable boxes on the lower half of the frame, with lugs projecting inwardly to form guides for the brasses. These have adjusting screws adapted to be locked at the outer ends by cotter pins. The bearing box is divided into two compartments, which are packed with oil-saturated cotton waste. The oil is confined to the bearing by means of a flange round the oil thrower, whilst just behind there is a second thrower enclosed in a chamber connected with the outside of the motor.

The second relates to a general construction. The field magnets in this case are made in one piece and provided with removable frame heads. To economise space, these are designed with inwardly projecting portions to support the brasses for the bearings, and at the same time to overhang the armature winding and commutator. Other points worth mentioning are the curved flanges, which are arranged on the inner side of the frame to deal with the oil, which is cast off, and the pole piece laminations, which have their edges partly concentric and partly eccentric with the armature, whilst the commutator segments are held between a bevelled extension, and an adjustable clamping ring.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: Siemens Bros. Dynamo Works and E. A. Holmes [Searchlight type] 18,681/07; J. Y. Johnson (*Jupiter Elektrophotographische Ges.*) 19,014/07.

Distributing Systems, Cables, and Wires: A. E. H. and A. S. Dussek [Bituminous conduits] 18,849/07.

Dynamos and Motors: British Thomson-Houston Co. (*General Electric Co., U.S.A.*) [Motor control] 18,201/04; British Thomson-Houston Co. and W. F. Dawson [Rotor short-circuiting devices] 18,881/07; Rhodes Motors, Ltd., and S. H. Fielden [Controlling motors] 18,956/07.

Electric Ignition: J. Kwapil and O. Bihn, 18,868/07.

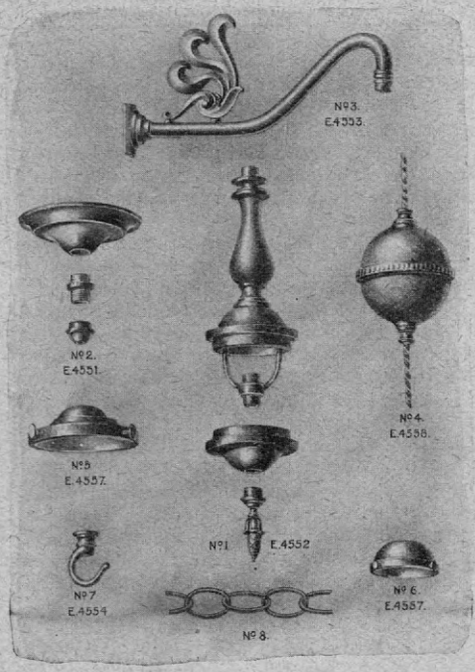
Electrometallurgy and Electrochemistry: J. Y. Johnson (*Badische Anilin & Soda Fabrik*) [Production of manganese sulphate by electrolysis] 17,981/03; H. Pauling [Obtaining nitric acid by electrolysis] 18,603/06; F. Wynne [Heating metals in molten state] 18,835/06.

Heating: D. B. Rawson and E. E. Sager [Water-heater] 19,101/07.

Incandescent Lamps: K. Füsser [Supporting] 19,073/07.

Switchgear: B. S. Hornby [Cut-outs, switches] 18,378/04; W. H. Laird [Time-switch mechanism] 18,790/07; Siemens Bros. Dynamo Works [Drum-type motor-controller] 18,833/07; R. W. Gudgeon [Commutator switch for semaphor signals] 18,843/07.

Telephony, Telegraphy, and Signalling: J. C. W. Humfrey [Signalling by perforated strips] 18,804/07; British Insulated & Helsby Cables, Ltd., and H. H. Harrison [Two-tone telegraph sounder] 18,921/07; R. R. Osman [Wireless telegraphy] 19,077/07.



Traction: C. E. Leader [Railway signals] 18,764/07.

Miscellaneous: J. Mackenzie [Impulse transmitter for indicating movements at a distance] 18,762/07; F. E. Ryall [Thermal-electric contact device for alarms] 18,937/07; A. Jacobs [Electric thermometers] 19,102/07.

"UNIT" FITTINGS

A NEW price sheet from Simplex Conduits, Ltd., deals with the latest developments of their unit system of making up electric light fittings. This system of adjustable parts has been devised and introduced in answer to a demand which is met with amongst contractors in outlying districts, but more particularly abroad, where the contractor cannot readily draw upon the manufacturer's stock. It is a practical impossibility for firms, particularly electrical houses in the Colonies, to carry a representative stock of electric light

Component Parts of Unit Fittings.

fittings, unless at a considerable outlay, and when one particular pattern of fitting is out of stock it often entails a wait of some months before the stock can be replenished. The Simplex "Unit" system consists of half-a-dozen parts which may be assembled in numerous ways, resulting in a handsome fitting, varying in design from a table lamp to a nine-light electrolier. The various component parts are illustrated here, and the attractive nature of the various combinations that can be made up will be readily imagined.

ELECTRIC TRACTION NOTES

A Paper on the single-phase system of main line railway traction, with the attractive title, "London to Brighton in 45 minutes," was read by Mr. Philip Dawson on Friday last at the Royal Automobile Club. After distinguishing between the main features of the continuous current third rail and single-phase systems, pointing out particularly that the latter is the only system capable of indefinite extension while at the same time quite as suitable for suburban working, the author described, with the aid of numerous lantern slides, the principal examples of main line electric traction in America and on the Continent, calling attention specially to the success of the Hamburg single-phase lines, and the decision of the Prussian Government to employ a single-phase system exclusively. The progress of railway electrification in England was briefly sketched, and some particulars were then given of the single-phase working on the South London and Crystal Palace lines of the L.B. & S.C.Ry. On the former, the first year's working resulted in a 97 per cent. increase of passengers, and the figure for the second year was 130 per cent. It was notable that they had experienced no stoppage of supply. Dealing generally with the advantages of electric traction, Mr. Dawson pointed out that whereas 1,500 h.p. was about the limit for steam locomotives, electric locomotives of 4,000 h.p. were already in regular use. Electric locomotives, on account of their regularity of torque, could exert a tractive effort 25 per cent. greater than could a steam locomotive for the same weight on the driving axles. Railways would probably in the future be able to purchase alternating current in this country at 0·4d. to 0·45d. per unit, and with the single-phase system there were no costs of conversion. With cheap electricity and a frequent train service, which enables the interest on the capital expended on the conductor system to be divided over a very large train mileage, electric traction, he said, becomes cheaper than steam, in addition to the numerous other advantages which it possesses.

The annual cost of maintenance of an electric locomotive was less than half that of a steam locomotive, and five electric locomotives would do the work of eight steam locomotives. Only one man was required to drive them, and considerable time and space was spared.

These points, he continued, are fully realised by the Brighton Railway Company, and a scheme for electrifying the whole of their services to Brighton is being investigated. The whole of the services between London Bridge and Brighton could easily be electrified, all steam, as regards this portion of the line, being entirely done away with. The Eastbourne and Hastings trains would be hauled electrically as far as Lewes, where a steam locomotive would take them to their destination. Many, if not all, the Portsmouth trains would be run electrically as far as Worthing, whence a steam locomotive would haul them to Portsmouth. Such a transformation would enable a 10 to 15 minute service to be given to Brighton, and a 20 to 30 minute service to all the intermediate stations; and the consequent traffic increase should be at least correspondingly large. It is proposed that the non-stop trains should do London to Brighton in about 45 minutes, and the stopping trains in about 60 minutes. The calculations in connection with this proposal are already far advanced, but it will be several months yet before any scheme will be ready to present to the Brighton Board for their consideration.

In the discussion that followed, Mr. O. H. Baldwin expressed regret that the equipments were of German manufacture, but Mr. Dawson explained in his reply that tenders were invited from the most important British, American, and Continental firms, but that the guarantees and prices of the particular German firm whose tender was accepted were so immeasurably better than any of the others that they could not help themselves. Lord Bessborough (Chairman of the L.B. & S.C. Railway), who was in the chair, said that Mr. Dawson's report as to the conversion of the line to Brighton would probably be presented to the Board about March next, when it would be most seriously considered, and if the advantages claimed were such as to justify it, the scheme would be put into operation. Both he and Mr. Forbes (general manager) were emphatic as to the success of the lines already converted, and the latter stated that in the year 1903-4, when the trams started running, the Brighton Company's traffic in this district suddenly dropped from eight millions to three millions. In the first year of electrification they got back to eight millions, and this year they would be up to ten millions. The results on the Victoria-Crystal Palace branch were equally satisfactory. The line was opened in May, and there had been an increase of 70 per cent. in the number of passengers. Among other speakers were Mr. E. Manville, who emphasised the advantages of single-phase working, and Mr. G. Partridge (Chief Engineer to the London Electric Supply Corporation), who said that one of the chief reasons that the supply has been so satisfactory was the simplicity of the system.

The fourth annual report of the London Traffic Branch of the Board of Trade gives at length, as usual, figures of traffic carried by railways, tramways, and omnibuses in Greater London. There is little of direct electrical interest in the report beyond a description of a proposed underground electric railway for the exclusive use of the General Post Office, in order to facilitate postal business about London. This, it is suggested, should run from east to west a distance of 6½ miles. The diameter of the tube would be 7 ft. 6 in., containing two 2-ft. tracks. The tube would be in the London clay. With a view to reducing the traffic congestion in the streets a number of suggestions are made for the provision of new arterial roads. Another point of some importance in the report is an expression of opinion that trolley omnibuses in the London area are as unsuitable as ordinary motor omnibuses. An officer of the Board of Trade who has been watching the trolley omnibuses at Leeds and Bradford states

OSRAM-LAMPS

Hosted by Google

that the vehicles there are driven with excessive caution, such as the Commissioner of Police has never been able to obtain among drivers in London.

The arbitration proceedings in connection with the purchase of the Hammersmith lines of the London United Tramways Co. by the L.C.C.., concluded on Monday. Mr. C. C. Hutchinson, K.C., for the latter, argued that the Council had only to pay for the lines constructed ready for work, and not special payments to local authorities or the Kew Observatory, nor for Parliamentary expenses. They had also only to purchase plant that was needful for the undertaking, and not that "used" for the undertaking. The power station was "unsuitable," and should not be included in the award at all. If certain of the special payments were included in the award, he asked the Arbitrator to state a special case. Mr. Balfour Browne, K.C., replied for the Company.

The re-hearing of the arbitration to determine the price to be paid by the Belfast Corporation for the Cavehill and Whitewell tramways takes place in London to-morrow. As we pointed out in our last issue, the arbitrator's award has been remitted to him for further consideration on the ground that he has misinterpreted the terms of the reference under which he was appointed.

The *Board of Trade Journal*, quoting from a report by H.M. Trade Commissioner for New Zealand, states that the Government have informed a deputation that the electrification of the whole of the State railways is contemplated. A small branch line will probably be selected upon which to carry out experiments.

The accounts of the Bradford Tramways Department for the half-year to September 30th, show a record half-year's profit, amounting to £35,867. This exceeds the profit for the corresponding period of last year by £11,876. The Electricity Committee now supplies current to the Tramways Department at one-eighth of a penny per unit less than previously, and this has had the effect of reducing the cost of energy by £2,609.

A scheme for introducing a circular service of trolley omnibuses in North Shields and the surrounding district is under consideration.

In consequence of complaints with regard to the tramway officials assisting other municipal bodies, &c., a special committee of the Leeds Corporation was recently appointed to investigate and report. For several years past certain members of the Council have objected to Mr. J. B. Hamilton, the Tramway Manager, carrying on a private consulting practice, but the Tramways Committee have been fully cognisant of this, and it is, therefore, not surprising that the report in question is a complete exoneration of Mr. Hamilton's actions. The report contains recommendations as to the duties and privileges of Corporation officials. There was considerable discussion at the last meeting of the Leeds City Council upon the report. The Labour party on the Council have apparently taken up a very strong attitude against Mr. J. B. Hamilton, the Tramway Manager, but eventually the Committee's report was adopted, the Conservative and Liberal members of the Council voting together against the Labour group.

The Chiswick Council have before it a proposal to establish a system of trolley omnibuses in the district. The necessary powers were secured last session.

There was a net profit of £11,782 upon the Isle of Thanet Electric Trams & Lighting Co. for the year to September 30th. The directors propose to place £1,500 to reserve, £6,000 to maintenance of permanent way, £2,000 towards third-party insurance reserve, carrying forward the balance.

A sub-committee of the Todmorden Corporation has been appointed to visit the Leeds and Bradford trolley omnibus installations.

Speaking at the annual general meeting of the British Columbia Electric Railway Co., Ltd., last week, Mr. R. M. Horne-Payne stated that whilst the Corporation of Vancouver had the right in 1919 to purchase most of the railway property within the city limits on certain conditions, he personally held the opinion that the city would not wish to buy at that period or for many years to come.

In the scheme of the Brighton Corporation for the provision of trolley omnibuses, an expenditure of £137,400 is provided for.

Mr. Goodrich has given notice in the London County Council that it be referred to the Highways Committee to consider the question of an experimental installation of trolley omnibuses from West India Docks to South Hackney, and also to report as soon as possible on the adaptability or otherwise of the system in other parts of London where the existing traffic is not sufficient to justify the laying down of tramways. Mr. Johnson has given notice of an amendment to this to the effect that the Council should decline to subject the Borough of Stepney to any further experiments in view of the disastrous results of the last one there.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A good deal of progress has been made with the arrangements for the transfer of the subscribers hitherto connected to the twenty-three exchanges of the National Telephone Co. which will not form a permanent part of the telephone system after the company's undertaking has been transferred to the Post Office. A certain number of these exchanges have been changed over already, and transfers are being made in various parts of the country every Saturday, that day of the week being chosen in order to have the Sunday for clearing any faults that may arise. In the London district, the Ealing and Esher exchanges have already been changed over, and several transfers have also taken place in South Wales. Practically all the Post Office exchange equipments are ready for the additional subscribers to be transferred to them, and the transfers are being made gradually in the order of their comparative urgency. With regard to London, the new "Avenue" exchange in Creechurch Lane is now complete, and the whole of the subscribers to the old Avenue exchange will be transferred *en bloc* on a date yet to be settled, but possibly during the first week of the new year. The whole of the Westminster subscribers will be transferred to the Victoria exchange on December 30th. This transfer is arranged to synchronise with the coming into force of the new directory, on account of the changes in the telephone numbers. At the Avenue exchange there will, of course, be no change in the numbers. The third of the London exchanges which will be discontinued is "Bank," but it will be some months before this will be transferred as, owing to the lease having still some time to run, the matter is not so urgent as in the case of those exchanges the leases of which expire at the end of the year. The Bank subscribers will eventually be connected to the "Central" exchange.

Automatic telephone exchange working is to be given a thorough trial in Australia. There is already a trial installation within a building in Sydney, and the Australian Postmaster-General has recently accepted a tender from the Automatic Telephone Co. of Chicago for an installation on the Strowger system at Geelong. This installation will have an initial capacity of 600 lines, but will be capable of considerable extension. In the case of several telephone exchanges in other parts of the Commonwealth, alternative tenders are being invited for C.B., semi-automatic, and automatic equipments. In view of the fact that every adult operator must receive £110 per annum, it would appear that there is room for considerable economy by the adoption of a satisfactory automatic system.

The Postmaster-General has introduced a Bill authorising the Government to make a payment of £3,000,000 to the National Telephone Co., on account of the telephone purchase money, before the total sum payable is finally ascertained.

In reply to a communication from the Islington Borough Council with reference to the rating of telephone wires after the Post Office has acquired the National Telephone Company's system next year, the Postmaster-General states that the Government are willing to authorise some contribution in lieu of rates on the transfer of the telephone plant, and that the precise basis of contribution is still under consideration.

Representatives of all the Manx municipal bodies met at Ramsey last week, and passed a resolution requesting the Lieutenant-Governor to petition the Government for telephonic communication with England.

The Executive Committee of the Farmers' Union have resolved to ask the Postmaster-General to reconsider the scheme of rural party telephones, and to arrange for farmers to be connected with the main telephone line separately at a much cheaper rate than at present.

It is stated that the dispute between the National Telephone Company and the Hythe Town Council has been settled, both parties paying their own costs.

Mr. Charles Bright, F.R.S.E., in an interesting article in the *Empire Review*, urges once more the importance of consolidating the telegraphic communications of the Empire. He

Hosted by Google

deplores the control of most of the Atlantic cables passing into American hands. He outlines a scheme for the completing and duplicating of the existing network by additional British-owned cables, amounting to some 8,000 miles, and contrasts the German cable policy as compared with our own, and discusses the proportions in which the Colonial Governments should contribute to the scheme. Mr. Bright does not look forward to any great supplanting of cables by wireless telegraphy, unless great unlooked-for developments take place in the latter, and does not consider an Imperial wireless scheme as in any way a suitable substitute for the completion of the Imperial cable chain. Nor does he think much of the value of wireless communication in time of war, on account of the ease of interference, but he urged strongly the strategic value of a complete Imperial cable chain.

On the 6th inst. the cable between Bolama and Bissao was restored, while the route of the Indo-European Telegraph Company was down between Alep and Bagdad.—On the same day the cable between Cape Saintjacques and Doson was put into working order, and on the following day the Indo-European Company repaired its line.—The Norwegian Government, on the 7th, advised the opening of wireless telegraphy between Ingo in Norway and the Spitzbergen Islands, but this service is to be considered as an extension of the telegraph system.—The line between Bagdad and Bassorah was down on December 8th, and was repaired on the 10th.—In connection with the King's visit to India, two more special offices have been opened at Durbar Camps.—The route *viâ* Kiachta is working normally again.—The cable between the Faroe Islands and Iceland has suffered an interruption, and on the 11th inst. the French cable company repaired the section between Paramaribo and Cayenne.—Owing to the pressure of work on the Malta-Tripoli cable, the Eastern Telegraph Company states that messages can only be accepted at sender's risk.

According to a Reuter telegram from Melbourne, Marconi's Wireless Telegraph Co. has notified the Australian Commonwealth Government of its intention to take proceedings to test the right of other companies to use certain systems there, including the Telefunken system, which is used in the Commonwealth telegraph stations.

According to the *Daily Chronicle* Melbourne correspondent, the Australian Postmaster-General has announced that the Government have abandoned the Telefunken and Marconi systems of wireless telegraphy in favour of the Balsillie system.

LOCAL NOTES

Accrington: *Gas Plant.*—In further reference to our notice last week with regard to the installation of gas plant at the electricity works, the estimated cost is put at £27,000. It is intended to instal a 2,000-b.h.p. gas engine with a by-product recovery plant. It is estimated that on a 60 per cent. load feeder there will be a saving in favour of gas of £1,100 per annum, and that there will be a further sum of £1,250 per annum in revenue from by-products. Tenders for the plant have been received, but their acceptance is conditional upon the Local Government Board granting the loan.

Barcelona: *Electricity Supply.*—According to the *Financial Times*, the well-known Canadian group who control the Rio de Janeiro Tramway, Light & Power Co., Ltd., have acquired two large water power rights in Barcelona, and propose to erect two 120,000-h.p. power stations. A new company with a capital of £4,000,000 is to be promoted.

Bath: *Municipal Wiring.*—The Electricity Committee's recommendation that the Council should support the I.M.E.A. Bill on condition that the Council's share of the promotion expenses does not exceed £100, has been passed.

Carnarvon: *Street Lighting.*—At the last meeting of the Council the scheme for the electric lighting of the streets, which has been under discussion for many months, was rejected by a majority of twelve to ten.

Linlithgow: *Electric Supply.*—Some private promoters have placed an electric lighting scheme before the Council, which is to be considered at a special meeting.

Liverpool: *Price of Electricity.*—The Lighting and Tramways Committee have instructed the Electrical Engineer to draw up a report on the possibility of reducing the charges for electricity supply.

London: *Hammersmith: Supply of Fittings.*—Early this year the Council approved a scheme for the supply on hire of wiring and fittings for external lighting. This scheme only included the hiring of lanterns with clusters of incandescent lamps, but the Electricity Committee have now prepared an enlarged scheme, which includes the hiring of arc lamps. It is proposed that the Council shall supply the lamps direct and that the work of fixing and maintenance shall be carried out by its own workmen and not by contractors.

L.C.C.: Electric Lighting.—Tenders are to be invited from six selected firms for the electric lighting of the new engine house at the Abbey Mills Pumping Station.

Nelson: *Municipal Wiring.*—Consideration of the request from the I.M.E.A. for financial support to their Bill relating to Municipal Wiring, &c., has been deferred.

Swansea: *Electricity Accounts.*—The accounts of the electricity undertaking for the year to March 31st, which have just been issued, show a net profit of £2,802 against £2,722 for 1909-10. The total revenue increased from £26,300 to £29,800.

Teignmouth: *Electric Supply.*—Dr. Purvis, of Exeter, recently placed an electric lighting scheme before the Council, but the terms were considered too high. At the same time there is a strong feeling in the district that electricity should be available, and a resolution is to be brought forward at the next meeting urging the Council to apply for a provisional order.

Sheffield: *Street Lighting.*—The Electric Light Sub-Committee have placed before the Watch Committee proposals for street lighting by metal filament lamps in all streets in the city where electric mains are laid.

Topsham: *Fire at Electricity Works.*—A fire which practically destroyed the works of a Topsham electric lighting company occurred on Sunday night. According to accounts in the local papers, the only part of the works which has been at all saved is the battery room. The damage is estimated at £2,000.

Worthing: *Proposed Purchase of Electricity Works.*—Mr. F. C. Gates has written to the Electricity Committee offering, on behalf of himself and a number of friends, to take over the electricity undertaking from the Council. The Electricity Committee report that in their opinion the undertaking is in a satisfactory condition, and that the offer should not be entertained. This proposal was adopted at the last meeting of the Council.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Argentine.—It is stated that plans for the conversion to electric traction of the Central Argentine Railway line to the Tigre will shortly be presented to the Government. If negotiations with the electric supply company do not bring about a result, the Railway Company will erect its own power house.

Bexhill.—A Local Government Board inquiry was held last week concerning a loan of £3,200 for electric supply purposes.

Blackpool.—The Electrical Engineer has been authorised to lay a new high-tension feeder, and a new tramway feeder.

Bolton.—The Electrical Engineer has prepared a scheme for a new power house.

Bootle.—A loan of £41,255 is proposed for additional generating plant.

Burton-on-Trent.—The Electrical Engineer has presented a scheme of extensions at the electricity works at an estimated expenditure of £17,000. The scheme practically involves a duplication of the present plant.

Canada.—According to the *Board of Trade Journal*, an Ontario Municipality will shortly invite tenders for large quantities of electrical plant. An address may be obtained at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

Carlisle.—An application is to be made for a loan of £5,100 for cables and £1,744 for lighting battery, booster balancing set and switchgear.

Croydon.—Extensions and renewals at the electricity works are to be carried out as follows:—Switchboards £4,000, cables £300, boiler extensions £250.

Hosted by Google

Greenock.—There seems every possibility of arrangements being made between the Council and the Port Glasgow Council for supplying electricity. The estimated capital expenditure upon the scheme is £25,000.

Hornsey.—Tenders are invited for a steam dynamo set with either reciprocating engine or turbine. Full particulars from Borough Electrical Engineer.

Ireland.—A scheme for the electric lighting of Killeshandra by the Cavan Rural District Council has been approved by the Irish Local Government Board.

Llanbedr.—The Council have decided to adopt the electric lighting scheme, using water from the River Astro for driving the generating plant.

London: *Hackney.*—Mains extensions at an estimated cost of £2,000 are recommended.

Lytham.—Mr. P. J. S. Tiddeman, on behalf of the Lytham Electric Lighting Co., is endeavouring to promote an electric supply scheme there. An initial outlay of £10,000 is necessary, and up to the present £4,000 has been raised. The scheme is being placed before the Local Traders' Association.

Nelson.—A loan of £3,000 for mains and services is to be applied for.

New Zealand.—A proposal to borrow £12,000 for electric lighting extensions has been placed before the New Plymouth Council.

The Frankton Council have decided to establish an electricity works.

South Africa.—The Wynberg Council propose to undertake an electric supply installation.

Tunbridge Wells.—In consequence of the development of the electricity undertaking, the Electrical Engineer asks for a loan of £6,000.

Turton (Lancs.).—An inquiry was held last week concerning a loan of £4,500 for electric supply purposes. There was no opposition.

Wrexham.—An application is to made for a loan of £1,200 for mains and £600 for services.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Barking.—New post office. H.M. Office of Works, London.

Barrow-in-Furness.—Tenders are invited for an electrical installation at the central fire station, Abbey Road. Particulars from Borough Electrical Engineer.

Bexhill.—New drill hall for Territorial Association.

Birmingham.—New art gallery. Architects, Messrs. Crouch, Butler & Savage, Newhall Street.

Bridlington.—Extensions at the grammar school. Architect, J. Bilson, 23 Parliament Street, Hull.

Cambridge.—Schools in Melbourne Place. Borough Engineer.

Cheltenham.—New municipal offices.

Croydon.—Fifteen houses, Norton Gardens, W. F. Riley, London, S.W. Fourteen houses, Brockenhurst Road, R. Palmer, Sherwood Road. Ten houses, Cedar Road, C. Banks, Oakfield Road.

Fulham.—Cinematograph hall in High Street.

Hendon.—Elementary school for 1,000 scholars. Middlesex Education Committee.

Lancashire.—Elementary school near Rochdale. Girls' grammar school on High Street estate, Lancaster. Architect, Mr. H. Littler, 16, Ribblesdale Place.

Manchester.—Extensions in technical institute, Old Trafford. Architects, J. Bowden & Co., 14 Ridgefield, Manchester.

Northallerton.—School in Victoria Street. Architects, J. M. Bottomley & Wellburn, 28 Albert Road, Middlesbrough.

Rathmines.—New technical institute costing £10,000.

Wood Green.—Music-hall.

MISCELLANEOUS

Bedford.—The Electricity and Street Lighting Committee have prepared a scheme of street electric lighting.

Canada.—The *Board of Trade Journal*, quoting from a Toronto paper, states that surveys are being made for an electric railway from Port Hope through Peterboro' to Orillia. It is proposed to connect the lines at Port Hope with an electric railway from Montreal and Toronto. The Canadian Northern Railway Co. is said to be interested.

New Zealand.—The Nelson City Engineer, says the *Board of Trade Journal*, has been instructed to report upon a tramway scheme.

The Palmerston Borough Council has decided to obtain a report from Mr. F. Black, an electrical engineer of Wellington, with regard to tramways.

Rathmines.—The Council have applied for a loan of £1,000 for the purpose of an electric fire-escape and tender.

Russia.—The *Board of Trade Journal* states that the Russian Minister for Home Affairs proposes to allocate a sum of £950,000 for new telegraph lines.

Switzerland.—The Railway Budget for 1912 includes a sum for the equipment of eighty-four coaches with dynamos for electric lighting.

TENDERS RECEIVED AND ACCEPTED

Bournemouth.—An offer by the British Westinghouse Co. to fit brakes to thirty small cars at £22 5s. per brake has been accepted.

Brighton.—The Electric Lighting Committee have had before it tenders from a British firm for electric lamps at 6s. per lamp for street lighting, and from a German firm at 5s. 3d. They have decided to accept the former.

Bury.—The tender of the British Westinghouse Co. for two 750-kw. rotary transformers has been accepted.

London: *L.C.C.*—The tender of Messrs. L. Andrew & Co., of Manchester, has been accepted for a twelve-months' supply of insulated materials. Tenders by Messrs. Hooper's Telegraph Works and the Yorkshire Cable Co., for a twelve-months' supply of electric cables and wires, and for the supply of electric lamps for a similar period by the A.E.G. Electric Co., Brimsdown Lamp Works, The Brush Electrical Engineering Co., Ltd., and the General Electric Co., have also been accepted.

Hammersmith.—The following tenders have been received for cables:—Standard Cable Manufacturing Co., £277; General Electric Co., £292; Connolly Bros., £315; Union Cable Co., £316 5s.; Western Electric Co., £322; Electrical Engineering & Agency Co., £328; Aubert, Grenier & Co., £328; Siemens Bros. Co., £346 15s.; Callender's Cable & Construction Co., £348; British Insulated & Helsby Cables, £348 7s.; Johnson & Phillips, £348; W. T. Henley's Telegraph Works Co., £352 10s.; R. Todd, £354; Pirelli, £360; W. T. Glover & Co., £363 10s.; Craigpark Electric Cable Co., £370; Drake & Gorham, £392 14s. The tender of the Standard Cable Manufacturing Co. is recommended for acceptance.

Tottenham.—A tender by the North Metropolitan Supply Co. for the electric lighting of the Down Lane school has been accepted.

The Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—Members: T. J. H. Blackley, G. Dunn, R. S. Whipple. Associate Members: W. Arundell, R. C. Atkinson, B. J. Beasley, P. W. Beatty, P. E. Bolton, G. E. Carr, H. W. Devey, W. E. Downey, R. H. Friend, W. E. Highfield, H. D. Johnston, E. P. Jones, J. E. Jones, A. Kean, C. B. Kinnes, S. Y. Maling, I. W. Massie, T. Mills, R. D. Moss, H. W. Outram, A. J. Percival, W. Pleasance, E. B. Preston, J. S. Primrose, E. M. Redfern, G. Salter, J. H. Schnauber, H. Smith, J. Sykes, H. A. Tulloch, D. G. Vincent, D. B. Webbe, W. Wilson, J. Wright. Associates: E. J. Dutch, H. C. Houghton, W. W. Howie. Students: G. Arblaster, J. O. Archer, E. G. Batt, F. A. Broadhurst, J. P. Castle, H. N. Davis, S. W. Dunn, A. English, M. N. Ghose, H. Gibbs, A. Grad, W. H. Harris, A. V. Labayen, A. Sacré, C. E. Smith, E. M. Teare, B. P. Walsh.

"Zed" Fuses and "The Miracle."—Messrs. Siemens Brothers Dynamo Works, Ltd. (Caxton House, Westminster), inform us that they have received the order to supply the whole of the fuse distribution boxes and ironclad switch and fuse gear required in connection with the forthcoming production at Olympia of the wordless spectacle entitled "The Miracle." The "Zed" distribution boards will have to comply with the theatre regulations of the L.C.C., and the supply of these boards in record time (the order has to be completed in ten days) was only made possible by the firm's extensive experience of theatre installations, enabling them to standardise boards of suitable design. The whole of the ironclad switches will be of their standard "SW" type manufactured at Stafford Works. These boxes, we understand, are selling so well that the firm has been obliged to adopt special arrangements to keep pace with the demand.

APPOINTMENTS AND PERSONAL NOTES

The recommendation that Mr. G. Claughton should be appointed Assistant Engineer, and Mr. G. T. Joyce Assistant Manager, at the Brighton electricity undertaking, referred to in our last issue, has been passed by the Council.

The list of candidates for the appointment of Borough Engineer at South Shields has been reduced to Mr. A. G. Cooper, of Colne, Mr. H. S. Ellis, of Bradford, and Mr. E. S. Rayner, of Doncaster.

The City of Birmingham Electric Supply Department has a few vacancies for dynamo attendants at the Summer Lane electricity works. Commencing wages, 25s. 9d. per week of 56 hours (see an advertisement on another page).

The salary of Mr. H. Baker, cashier in the Tramways Department of the Bournemouth Corporation, has been increased from £175 to £190 per annum with a maximum of £200 next year.

An assistant is required in the mains department of the Derby Corporation electricity undertaking. (See advertisement on another page.)

Mr. A. H. Burbidge, Electrical Engineer and Tramway Manager to the Kilmarnock Corporation, has been appointed Engineer and Manager of the Burmah Electric Lighting and Power Co.'s undertaking in Mandalay.

The Newport Corporation have received forty-nine applications for the post of Commercial Manager to the Electricity and Tramways undertakings. The salaries asked range from £200 to £1,000 per annum. A short list is to be prepared.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £62 5s. to £62 15s. (last week, £61 to £61 10s.).

Patents for Sale.—The proprietors of a telephone patent are desirous of licensing it to British manufacturers. (See an advertisement on another page.)

The proprietor of British patent 17,062 of 1903, for improvements relating to ignition devices for internal combustion engines, desires to dispose of same or enter into working arrangements (see advertisement on another page).

Tantalum Lamps.—All the tantalum lamps supplied from Siemens Brothers Dynamo Works, Ltd., Works and Stores, at Tyssen Street, Dalston, will henceforth be marked on the bulb with the word "Tantalum," and in a short time all deliveries of "Tantalum" lamps from the firm's branches will bear the same mark.

Liquidations.—The British Tramways & General Construction Co. is to be wound up voluntarily. O. H. Smith, Mount Clare, Roehampton, S.W., and B. C. Molloy, 5 Paper Buildings, E.C., are liquidators. A meeting of creditors will be held at 83 Cannon Street, E.C., to-morrow (Friday) at 12 noon.

A meeting of the British Aluminium Co. will be held on January 15th, 1912, at Basildon House, Moorgate Street, at 10.30 a.m. to hear the account of the winding-up. This, of course, relates to the old company in voluntary liquidation.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

India Rubber, Gutta Percha & Telegraph Works Co.—The accounts for the year to Sept. 30th show a net loss of £55,457. The directors have transferred £50,000 from reserve to the balance brought forward last year of £22,614, and after meeting the preference dividend a balance of £4,657 is carried forward. No distribution is made to the ordinary shareholders. The report states that the general business of the company has been fully maintained, but it has unfortunately been absolutely impossible during the last eighteen months to vary the selling prices in step with the enormous fluctuations in the costs of raw material. The company's electrical work shows a slight improvement.

The Melbourne Electric Supply Co.—There is a net profit of £16,528 available from the year to August 31st. A dividend of 2½ per cent. is recommended on the consolidated ordinary stock, and a balance of £5,207 is carried forward.

NEW COMPANIES

DIMMING SWITCHES.—Registered by Jordan & Sons, 116 Chancery Lane, W.C. Capital, £2,000. To acquire from the Midland Electric Manufacturing Co., Ltd., a licence to use an invention for improvements in current-graduating devices or resistances.

ROMOLITE, Capel House, New Broad Street. Capital, £1,000. Electrical Engineers and Manufacturers.

KENT-MITCHELL. Registered by Jordan & Sons, 116 Chancery Lane, W.C. Capital, £600. To acquire patents for the Multiplex Advertising Machine, Lazilite electric fittings, and the Kent-Mitchell Gear.

LEECLA WATCHES.

Guaranteed five years.

Non-magnetic, strong, durable and moderate in price. 3/6 each.

The best for Central Station and all Electrical Engineers. By post, 1½d. extra.

SUMMARY

A Christmas story appears on page 691.

A letter in our correspondence column makes a suggestion regarding the control of the finances of the Institution of Electrical Engineers. A well-known firm writes to correct a wrong impression that might be gathered from a paper read recently on commutator construction. A letter from the Secretary of the Electrical Trades Benevolent Institution refers to the position of that deserving body. (Page 691.)

At the annual dinner of the Scottish Local Section of the Institution of Electrical Engineers, the economies of the Glasgow telephone system were referred to, and Mr. Ferranti expressed agreement with some of the criticisms of the proposed new Article of Association made by the Scottish Section. (Page 692.)

A draft set of rules for the proposed Association of Consulting Engineers has been drawn up. (Page 692.)

Mr. A. H. Seabrook read a Paper on "Residence Tariffs" at last Thursday's meeting of the Institution of Electrical Engineers. He discussed the pros and cons of the various methods of charging, describing in particular the so-called telephone system in use at Marylebone, where an amount depending on the number of active lamps is paid in advance, and a further charge of 1d. per unit made for electricity consumed for all purposes. Some difference of opinion as to the merits of this system was shown in the discussion. (Page 693.)

In the discussion at Leeds on Dr. Pohl's Paper on Standards for Electrical Machinery, the E.S.C. standards were severely criticised. The remarks throughout were of a thoroughly practical nature, and showed an appreciation of the various points of detail dealt with in the Paper as well as its general conclusions. (Page 695.)

Short articles describing some new fittings, &c., appear on pages 695 and 696.

In consequence of the estimates for the conversion of the street lamps in Hampstead from gas to electricity having been exceeded by £10,000, the chief electrical engineer to the Council has been asked to resign and the services of the chief assistant electrical engineer have been dispensed with. (Page 696.)

In our "Electric Traction Notes" we give the arbitrator's award as to the price to be paid for tramway energy at Gravesend, and refer to the Board of Trade inquiry into the tramway accident at Stalybridge in October; the refusal of the City Corporation to agree to the construction of tramways over the proposed new Southwark Bridge; and the "A.-L." system of "continuous" transportation. (Page 697.)

Under "Telephony and Telegraphy (including Wireless)," we report a paper read before the Institution of Post Office Electrical Engineers, in which the "parallel distribution" method of laying telephone cables in-

Hosted by Google

stead of laying a large multiple cable to a distributing centre is advocated. We also mention the fact that the Government do not intend to undertake the expenditure involved in laying a State-owned Transatlantic cable, and the appointment of a joint solicitor to the G.P.O. (Page 697.)

A PATENT for a new type of brush gear, in which no current passes through the holder, was published last week. Another referred to a trolley-'bus system of traction, and described a crossing for wires of opposite polarity. Contacts for switches and controllers, and terminals for insulated conductors, were also dealt with, as well as a method of maintaining a constant speed on D.-C. motors. A patent has been granted, in spite of opposition, in connection with long electric arcs for producing a reaction between gases. A patent for a system of electric welding expires during the coming week, after a full life of fourteen years. (Page 698.)

A COMPANY has been fined for making unauthorised connection with the Hampstead electricity mains.—The L.C.C. and the Marylebone Borough Council have settled their dispute concerning pressure testing stations.—Farnham Council have refused a general consent to the system of supplying a number of houses from one service, but will consider individual cases. (Page 701.)

A 150-KW. Diesel-driven alternator is to be installed at Bray; a high-speed generating set, balancer, &c., are required at Dartford; mains at Epsom, Battersea, Poplar, Motherwell, and Tunbridge Wells; additional generating plant at Nuneaton and Swansea, and a new power station is contemplated at Torquay. (Page 701.)

THE COMPLIMENTS OF THE SEASON

OUR Editor and Assistant Editor have been very pleased to receive from Siemens Brothers & Co., Ltd., and Siemens Brothers Dynamo Works, Ltd., copies of the 1912 issue of their well-known morocco leather-covered pocket diary, which has proved of great utility on former occasions.

The Editor has received an elegant and extremely useful gift from Simplex Conduits, Ltd. It consists of a neat leather case of exactly the size and shape to fit into a waistcoat pocket, and contains a steel rule graduated in inches and centimetres, a knife, stylographic pen, and a pencil. It is beautifully made and finished, and is the neatest thing of its kind we have seen.

Mawdsley's, Ltd. (Zone Works, Dursley, Gloucestershire), are sending to their friends an artistic wall calendar with a reproduction in colour of a picture by Frank Haviland.

We have received a handsome and convenient blotter from Bruce, Peebles & Co., Ltd., with combined calendar and book of squared paper.

The Phœnix Electric Heating Co. accompany their season's greetings by a calendar on which is reproduced in colour a charming landscape by Yeend King.

The pocket diary issued by Simplex Conduits, Ltd., besides serving this purpose in a most convenient and practical shape, contains, without an undue increase in bulk, an abridged catalogue of "Simplex" specialities and a collection of the tables and "constants" most required for house-wiring work. It is an ideal pocket-book for the wiring contractor.

The Brimsdown Lamp Works, Ltd., have sent us a useful Christmas present in the shape of a pack of playing cards, on the backs of which a facsimile of their excellent "John Bull" poster is printed. The pack includes a "joker," so that it is presumably intended for the game of poker. We wish the company a flush sequence of really good orders during the coming year.

The wall calendar being issued by the D.P. Battery Co. is embellished with a series of views of the picturesque neighbourhood of the Company's works in Derbyshire.

ODD-MAN "ELECTRICIAN" NEWLY IN CHARGE OF COUNTRY HOUSE PLANT:—It's a shame the way the last man kept the place, Sir. Why, the water in these glass cisterns was *filthy* and these gridiron things were choked up with dirt, so I've cleaned 'em and given 'em all a coat of paint!

EMPLOYER (evidently pleased):—Ah! perhaps we'll have a better light, now!

***PUBLISHERS' NOTICE:—Books containing 48 Reprints of the Cartoons from Oct., 1910, to Sept., 1911, may be obtained, Price* 8d. *net (post free* 9½d.).**

A CHRISTMAS STORY

IT was not yet midnight. I had been at the last Dynamicable dinner before Christmas, but had left early, and was sitting musing in front of the fire in my study. One of the performers in the after-dinner entertainment had been a conjurer, who had done many things that seemed impossible. I was wondering whether one could not enlist his services in the electrical industry to bring about an increase in the prices of motors and generators. It was doubtful, however, whether the Institution of Electrical Engineers would accept him as a Corporate Member, and he might refuse to help if he were made a mere Associate. Then suddenly I heard a voice in front of me saying, "You pay your increased subscription; we do the rest." The speaker stood between me and the fireplace, but the door of the room had not opened.

"You can't be Santa Claus," I said sleepily, "because your beard is r——, I mean, golden; and you can't be the Honorary Treasurer, because he wouldn't come down the chimney."

"I am Santa Claus," said the man with the golden beard; "my beard is getting white very quickly; you see, I must talk at all the meetings. Fifty-six hairs turned colour at Leeds alone, and it will be quite white before Christmas. Come along back to the Trocadero Restaurant; the Dynamicables are waiting for me."

Before I could recover from my surprise, I was back among the Dynamicables in the seat I had vacated half an hour previously, and I found that Santa Claus had already begun his speech.

"I wish to impress upon you," he was saying, "the dignity that is conferred on the Dynamicables—on every member of the Dynamicables—by the amplitude and magnificence of this noble hall in which we dine. Dignity is what we want, and it is dignity we must have. We ask you further to pay larger subscriptions to enhance that dignity. It is true that we do not require an increased revenue to maintain the magnificence or the dignity of this hall or the structure of the Trocadero; no, our finances are ample to meet all requirements in this respect. We want the increase for other matters—many other projects—they are so many that I will not weary you by naming them. It is sufficient for me to assure you that they are all dignified. You may trust them all to your Council: they know what they want, and they know what you ought to want.

"It is proposed to increase the subscriptions of members by fifty per cent.—think what this means in raising the status of the association! The Honorary Members and the present Life Members pay no subscriptions, but they must also have their dignity raised, and we intend to increase their subscriptions by one hundred per cent. We have members abroad, but the dignity of this hall throws its rays to the uttermost ends of the earth. The subscriptions of these members must be raised in proportion to the distance, for you are aware that the radiation of dignity cannot be done without money.

"Then there are others. The dignity conferred by the increased subscription will attract greater numbers of members. Unlike another Institution, the Dynamicables is limited to a membership of 101, and the already large waiting list will be greatly increased. The members on the waiting list are honoured by being proposed, seconded, and supported by members of an association upon whom this hall casts its dignity, and they too must pay subscriptions—large and dignified subscriptions. This class requires a designation, and we propose to call them "Expectants," but we are ready to consider any suggestion of an even more dignified title.

"Another desirable innovation is the holding of these meetings at an earlier and more dignified hour, and it is suggested that the Dynamicables shall dine at 4.30 instead of 7.30. The dignity . . ."

At this point the conversation of members who did not wish to listen to Santa Claus' speech had increased so much in volume that, in spite of his trenchant voice, his words were no longer audible.

A gentleman with a beard was protesting that the proper thing to do was to have fish dinners at Greenwich, and his neighbour was advocating a Dynamicable tennis court near Ponders End. A man with a jovial face suggested a winter meeting in Switzerland, and a polite gentleman with grey hair wanted the menus to take the form of pictorial posters. A clean-shaven man with a satirical smile clamoured for a picnic in the rooms devoted to commercial testing at Bushey, and refused to take the Chairman's advice that the proper thing to do was to have a hearing before the Comptroller of Patents. Finally, Santa Claus, fearing an adverse vote on his proposals, summoned the Trocadero orchestra, who drowned everybody's voice by playing "The Mistletoe Bough" in a depressing key —and then I awoke in my armchair in front of the fire, and sent my dog to howl at the Christmas waits.

Crystal Palace School of Practical Engineering.—The usual annual inspection and announcement of the list of certificates awarded by the examiners was held last Tuesday, Sir Douglas Fox in the chair.

CORRESPONDENCE

THE INSTITUTION OF ELECTRICAL ENGINEERS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Now that the affairs of the Institution of Electrical Engineers are in the melting pot, the following proposition may possibly commend itself to members of the Institution with business training and instincts, namely, that the office of Treasurer be abolished, and the financial affairs of the Institution be controlled by the Finance Committee solely. It is an open secret that the Chairman of the Finance Committee is Mr. R. Kaye Gray, in whose business capacity every member, without exception, has the utmost confidence.

Yours, &c.,

A MEMBER OF TWENTY-SEVEN YEARS' STANDING.

December 15, 1911.

COMMUTATOR CONSTRUCTION OF TURBO-DYNAMOS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In a paper on turbo-generator construction recently read by Mr. R. J. Roberts at Manchester, a brief reference was made to that form of turbo-dynamo commutator which consists in carrying the commutator from the outside by means of flexible steel discs attached to the end shrinking rings. Some doubt seems to exist as to the origin of this construction (the author's statement in this respect being incorrect), and hence the following particulars may be of interest.

This feature of design was got out by our Swiss house in the autumn of 1907, and duly patented in various countries, the German patent being dated November 9th, 1907, and the English patent July 11th, 1908. Since 1908 this type of commutator has been standard with us (several machines at work in England are provided with it), and has completely fulfilled expectations. The advantages of this somewhat daring construction are, firstly, that the commutator can be effectively ventilated by cool air forced through it from end to end, and secondly that circumferential distortion is practically eliminated, as the steel membranes allow the commutator to expand longitudinally almost as it likes. The nett result is, that the commutation of the machines (with carbon brushes) is quite as good as that of the best high-speed engine-driven dynamos. So far, we have found no disadvantages whatever from the above construction, but, of course, the greatest care has to be taken with the material and design of the flexible membranes.

There is an old British patent relating to a commutator construction in which the commutator is carried from the outside by means of solid supports, but as far as we know our Swiss company was the first to bring out and standardise a line of high-speed commutators embodying the principle of flexible connection to the driving shaft and the free internal air way indicated above.

We are, dear Sir,

Yours faithfully,

BROWN, BOVERI & Co., LTD.

Caxton House, Westminster,
December 18th, 1911.

THE ELECTRICAL TRADES BENEVOLENT INSTITUTION.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—Now that winter is upon us, and calls are sure to be made on the Electrical Trades Benevolent Institution, I must beg the members of the electrical industry to kindly give it their support.

The amount which has been invested since January 1st is £962 18s., and it is most important that this should be brought up to £1,200 before the end of the year. I therefore trust that I shall be forgiven for again begging.

Pensions must be paid only out of the interest on invested funds, and consequently it is essential that we should build up these more rapidly than has been the case.

Many questions are asked me from time to time regarding the position of the institution in view of the National Insurance Bill. Permit me to say that the majority of those who have benefited or are entitled to benefit by the funds of this institu-

Hosted by Google

tion are outside the scope of the Insurance Bill. Beyond this, the benefits given by the institution differ in character and extent to those given by the Insurance Bill.

Yours faithfully,

F. B. O. HAWES,
Secretary, Electrical Trades Benevolent Institution.

18 Park Mansions, S.W. *Dec. 18th,* 1911.

ANNUAL DINNER OF THE SCOTTISH LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE annual dinner of the Scottish Local Section of the Institution of Electrical Engineers was held on the 12th inst. in the Grosvenor Restaurant, Glasgow. Major James Lowson presided over a company of 240 guests in the absence of Mr. Frank A. Newington, Chairman of the Section.

After the toast of the Imperial Forces had been proposed by the Very Rev. Ll. Deane, and replied to by Sir G. T. Beatson, Sir J. H. A. Macdonald proposed the toast of the Corporation of the City of Glasgow. They had, he said, made great headway in the use of electricity for lighting and power, although he did not know whether it had succeeded in the telephone undertaking, but at least the attempt was a great credit to them. Lord Provost Stevenson, in his reply, said that the Corporation had 12,000 subscribers on their telephone system, each of whom saved £5 on his subscription during the five years that the Corporation owned the service, which meant a total saving of £300,000 to these subscribers. He was assured by the Postmaster-General that these rates would not be raised to any subscribers for eighteen months, so that a further £90,000 would be saved before the expiry of that time. The Electricity Department had progressed and developed enormously since the severance of its connection with the Gas Department, although he considered a mistake had been made by erecting the original generating station at Port Dundas, but hoped that in the near future electrical energy would be developed at the collieries outside the city boundaries.

Professor Barr proposed the Institution of Electrical Engineers. As a subscriber to both the telephone systems in Glasgow, he could not calculate that he had saved as a result of his Corporation and Post Office connection.

Mr. Ferranti, in his reply, said that there had been a great discussion and a great conflict of opinions within the Institution as to how they should frame their new rules. He had come to them a fortnight ago with fear and trembling, but he left with the highest possible opinion of their views and the sound business way in which they looked upon the whole matter. In the new rules he was sure that voting by proxy would be carried through. At present it was illegal to do this, with the result that members at a considerable distance from London had practically no voice in the management of the Institution. That, he hoped, would be altered. The result of all this difference of opinion and discussion was going to be a great revival of interest in the Institution on the part of the whole membership, and he had no doubt that their Institution was now to develop into a far more useful instrument for the benefit of the profession than it had been heretofore. There were, however, differences of opinion which had still to be reconciled, and he hoped that what would happen in the long-run would be for the greatest good of the majority. The Scottish Local Section had expressed itself definitely in favour of a uniform increased subscription and in favour of the broadening of the basis of membership as suggested in the new articles. Their largest Local Section —Manchester—held different views on these two points, but he hoped that with the interests of the whole Institution kept in view these differences would be reconciled.

Mr. W. A. Chamen proposed "The Scottish Local Section," which, he said, had risen in membership from 231 in 1906 to 355 in 1911, and Mr. Lowson replied. They were looking forward, he said, to a summer meeting of the Institution in Glasgow, when they expected some 200 guests from the South.

Underground Station Lighting.—Siemens Brothers Dynamo Works, Ltd., write us referring to our article on page 671 of ELECTRICAL ENGINEERING, December 7th, that an error arose as regards the figure which they gave for the illumination at Oxford Circus. This should have been 1½-ft. candles instead of 4½ at a height of 4 ft. above the platform. This is the value of an illumination which is practically uniform from end to end of the platform, and we can say from personal observation that a remarkably pleasant effect is produced.

THE ASSOCIATION OF CONSULTING ENGINEERS

A GOOD deal has been heard from time to time about the proposed formation of an association to protect the interests of consulting engineers as distinct from experts engaged in the commercial side of engineering work, but of the actual position arrived at comparatively little has been published. We have now before us a draft code of rules, which we have received from Mr. A. H. Dykes, who is acting as honorary secretary to the movement, which crystallises into more definite form its aims and objects. One class of members only is proposed, to pay one guinea subscription per annum, and the qualifications are that the candidate shall be in practice as a consulting engineer and shall be a full member of the Institution representing his particular branch of the profession, so that it is now quite clear that the original limitation to corporate members of the Institution of Civil Engineers has been abandoned. He is further required not to be a member or agent of any contracting firm with whom he may have occasion to deal on behalf of his clients, and not to be connected either with any company doing engineering insurance work or any firm who advertise or canvass for consulting work. The rules for professional conduct adopted by the Institutions of Civil and Electrical Engineers are, with certain slight modifications, included in the draft rules of the new Association. The election of members is to be primarily by the committee, but names of candidates are to be circulated to give the membership opportunity to offer objections. The committee are to be elected by a postal ballot, and any member may send in nominations.

These rules have been drawn up by a committee composed of the following gentlemen:—R. Hammond, B. Latham, S. R. Lowcock, E. L. Mansergh, T. L. Miller, W. M. Mordey, W. H. Patchell, W. H. Preece, H. Rofe, J. F. C. Snell, E. H. Stevenson, J. Swinburne, G. Midgley Taylor, and the Hon. Secretary, Mr. A. H. Dykes (11 Victoria Street, S.W.), to whom inquiries as to the Association may be addressed.

The Smoke Abatement Exhibition.—Considerable progress is being made with the arrangements for the International Smoke Abatement Exhibition to be held at the Royal Agricultural Hall, London, from March 25th to April 4th, 1912. The Exhibition, of which the Duke of Argyll is President, is being organised by the Coal Smoke Abatement Society, and a number of distinguished bodies have extended their support. Electrical interests are well represented in this way, as the patrons include the Institution of Electrical Engineers, which has nominated one of its Vice-Presidents, Mr. W. H. Patchell, to the Exhibition Council; the British Electrical and Allied Manufacturers' Association, with its Secretary, Mr. D. N. Dunlop, on the Council, and the Conference of Chief Officials of London Electric Supply Companies, represented by its Chairman, Mr. Frank Bailey (joint Managing Director of the City of London Electric Lighting Co., Ltd.), and Hon. Secretary, Mr. F. J. Walker (General Manager of the St. James' and Pall Mall Electric Light Co., Ltd.). Sir William Preece and Sir Oliver Lodge are Vice-Presidents of the Exhibition, and prominent members of the Advisory Council include Mr. W. Baynes (Chief Electrical Engineer, St. Pancras Borough Council), Mr. S. T. Dobson (Chief Engineer, St. James' and Pall Mall Electric Light Co., Ltd.), Mr. R. S. Erskine (Kensington and Knightsbridge Electric Light Co., Ltd.), Mr. Claude W. Hill, Professor A. Jamieson, Mr. E. L. Joseph (Ozonair, Ltd.), and Mr. J. B. Simpson (Chairman, Waste Heat and Gas Electrical Generating Stations, Ltd.). Sub-Committees have been appointed, and meet frequently to deal with the organisation of a comprehensive exhibit to demonstrate the uses of electricity for lighting, heating, and other domestic purposes, as well as for commercial and motive power purposes. A large block with a minimum area of 1,280 feet, near the centre of the Hall, has been reserved, and there will also be other shows by individual concerns. A number of the firms constituting the Manufacturers' Association are taking up the matter. Conferences and lectures will be held, and will be attended by delegates from municipalities and from the various societies. Mr. Bailey has undertaken to give an illustrated lecture with special reference to electricity. A considerable proportion of available space has been already applied for. The Organising Manager is Mr. F. W. Bridges, of 119, Finsbury Pavement, E.C.

The Society of Engineers.—Among the premiums announced at the annual meeting on December 11th was one of £3 3s. to Mr. E. Kilburn Scott for his Paper on nitrogen products made with the aid of electric power.

Hosted by Google

RESIDENCE TARIFFS

SYSTEMS of charging residential consumers with electricity were discussed in a Paper read by Mr. A. H. Seabrook at the Institution of Electrical Engineers, London, on Thursday last.

No tariff was theoretically sound, said the author, which did not differentiate between standing and running costs, and did not charge the consumer separately with regard to them. Another important point was that of expediency, which must be taken into account from a business as well as a competitive point of view. A suitable tariff should ensure a proper return from each consumer, based upon the standing and running charges, the variables of which should be taken into account for each consumer; it should be simple and comprehensive; it should require only one meter with one system of wiring; it should offer special terms for the use of electricity for all purposes other than lighting, and encourage the long-hour use of energy for lighting; it should be cheap in application and should eliminate as far as possible complaints from customers; and, lastly, it should have great flexibility as regards the number of lamps installed, so that the consumer only pays for the light he requires.

The Paper then proceeded to review various systems at present in use. These may be classified as the flat rate per unit, the flat rate per kw. of maximum demand, with no charge per unit, and the various methods of applying the Hopkinson differential rate, which more or less combine the first two. The first is the most common system used; it charges so much per unit, regardless of the maximum demand, which ignores the costs of standing charges. It also makes no difference between the careful and the extravagant consumer, and above all it does not encourage the use of energy for heating or cooking, nor is it favourable to long-hour lighting, such as in basements and other dark places. The second system has very wide possibilities among small residence consumers where meters are impracticable on account of the cost. It charges weekly or monthly so much per lamp or per kw. or part of a kw. installed, the price per week per lamp including lamp renewals and a small charge towards the wiring, which is an instalment towards the whole cost. The system is used by the Fixed Price Light Co. in South London, and has been applied on a small scale in St. Marylebone for artisans' dwellings, consisting of one-, two-, and three-room tenements. The price per tenement is calculated, in the case of kitchens and sitting-rooms, in such a way that if the consumer uses his lamps day and night, the price per unit obtained would be a little under 1d., and lower in the case of bedrooms. The price per lamp per week includes lamp renewals, and also a sum calculated to write off within a reasonable period the capital expended in wiring. The charge for a single-room tenement is 7d. per week (one 25-c.p. osram) made up of current 4d., lamp renewals 2d., and installation repayment 1d. For a two-room tenement the kitchen is charged 7d. and the bedroom 5d. per week. This system is suitable for small long-hour users, but a limiter, which is sometimes used, spoils it, since what is saved by not having a meter is lost on the limiter.

The Hopkinson system, which has a primary and secondary rate for standing and running charges, is generally admitted to be the only correct basis of charge, but its adoption is hindered owing to the difficulty of bringing it before consumers in a simple and easily understood manner. The following are a few of the methods of putting this system into practice: The Wright system, which is well known, is difficult to understand, and almost prevents the consumer using electricity for purposes other than lighting; it is expensive in capital cost, application, and in settling complaints, and usually tends to restrict the use of electricity.

The Norwich rateable value system is a differential one, the primary rate is a fixed percentage on the rateable value of the house, and there is a secondary rate of a penny per unit. This is easily understood, cheap to apply, and encourages cooking and heating and the liberal use of energy for lighting, but it assumes that similarly rated houses will have similar installations, and that, therefore, the same amount of energy will be required by all consumers. This, however, would be a drawback in London, where the rateable value varies greatly with position.

A system not used in this country is that known as the Detroit system. This has a primary charge based on the number of rooms, a high price per unit being charged for a fixed number of units per room, all in excess being at a low secondary rate. The author quotes the *Electrical World* (New York), which compares this method with the connected load basis of primary charge. There it is stated that the latter favours the careful and not the liberal consumer, and that it is open to the consumer to increase his installation after it has been inspected. To the first of these objections the author points out that in assessing the primary charge on a "connected load" basis only "active" lamps are counted, all "convenience" lamps being ignored, which would, therefore, encourage the addition of these lights; the latter objection could be covered by prosecution. The Contract Demand system, proposed by Messrs. Handcock and Dykes, is based on the connected load principle, a limiter being installed which causes the light to flicker when the maximum demand, stated by the consumer, is exceeded. It is a very simple system, and ideal for lighting, but it is out of the question for all other uses of electricity.

The Metropolitan system, as used by the Metropolitan and Brompton Supply Companies in London, is based on the connected load, and consists of three charges, a primary kilowatt charge, a first energy charge of 2d. per unit up to the amount of the annual primary charge, and a second energy charge at 1d. per unit for all additional units. This low charge renders the use of energy possible for all purposes, and without the necessity of meters or separate circuits. It is argued that the 2d. units can be used for kettles, irons, &c., and the 1d. units for radiators, cookers, &c., but against this is the fact that the consumer cannot afford to pay even 2d. for this purpose, and he has no means of knowing when he is off this rate, so that he can make free use of the service at the lowest rate. This system depends on the method of assessing the maximum demand for lighting.

Finally, the author puts forward the so-called "telephone" system based by him on an idea suggested by Mr. Arthur Wright. This is a differential system, which bases its primary charge on 70 per cent. of the lighting load at £14 per kw. per annum, not including convenience or decorative lamps, nor watts for domestic purposes, these being charged at 1d. per unit. It is, however, stipulated that electricity is to be exclusively used for lighting, that it is to be paid annually in advance, but can be paid only a quarter at a time in advance at an increased charge of 10 per cent. It must be noted that the primary charge will always be the same as long as the watts assessed remain constant. In this way the consumer pays his share of running and standing charges; it also encourages long-hour lighting, and allows "other apparatus" to be connected without the expense of meters or separate circuits; it does not discourage the free installation of extra lights, as decorative lamps, &c., are not counted in the primary charge. The system is also simple and easy to understand, and practically eliminates complaints, as these can only refer to the number of penny units. It is maintained that 70 per cent. of the lighting watts is excessive, but the author points out that it should be remembered that no occasional lights, such as are used in cellars and other dark places, nor decorative lamps are counted, so that the larger the house the more nearly will this figure be right. In conclusion, it is stated that with a complete electric service, including heating and cooking, it will be found that the lighting portion is from one-third to one-half the total revenue of each residence, so that the lighting load factor will not be the chief factor, and cooking, taken in the aggregate, as well as fans, water heating, polishing, &c., will be largely non-peak. With regard to the cooking, it is found that at St. Marylebone the midday load is usually greater than the evening.

Mr. Seabrook announced that since the writing of the Paper, the Marylebone Electricity Department had further reduced the charge for current for heating, &c., which was now ¾d. per unit for the six summer months and 1d. per unit for the six winter months. He also circulated some tables of figures which he had worked out, showing how the annual charge worked out as an average per active room shows variation from 8s. 6d. to £3.

Discussion.

Mr. E. T. Ruthven-Murray (Engineer-in-Chief, North Metropolitan Electric Power Supply Co.) said that it was important that a tariff should be such as to encourage the "other uses" of electricity. A great deal had been made of the differentiation between standing and running costs, but no tariff should be considered sound only because it differentiated between these two kinds of costs. He was afraid that, in framing the "telephone system," expediency had weighed more

Hosted by Google

than the other factors. The whole of the standing charges were allocated to the lighting account instead of being divided up with the other uses. In view of the fact that a house now taking, say, 750 watts might at any time put in 4 or 5 kw. of cooking plant, he thought that system was dangerous. Regarding the five essential features that the author had laid down for an ideal tariff, he scarcely thought that the telephone system really complied with any of them. No system could be considered satisfactory that assumed the honesty of the consumer, neglected load factor, and entailed invasion of the consumers' premises for inspection. The author condemned the flat rate as assuming constancy of load factor, but surely the telephone system did the very same thing. The speaker objected to the number of forms which the system entailed the filling up of, and suggested that, like the famous "Form IV.," these would eventually find their way into the waste paper basket. He did not see how the name telephone could be of any assistance.

Mr. G. WILKINSON (Borough Electrical Engineer, Harrogate) remarked that it was only the name of the telephone system of charging that was new. The system was practically the same as that used by himself at Harrogate, except that Mr. Seabrook obtained fat prices, while he obtained thin ones. While at Marylebone, £14 per kw. on a 90 per cent. load-factor basis was obtained; in his own system be obtained only £9 per kw. of maximum demand. Mr. Seabrook ought to be very glad to get his extra 1d. per unit after such large capital charges. The author, in comparing the cost of current limiters and meters, had evidently omitted the fact that the former had no shunt loss. He noted that Mr. Seabrook put demand indicators into the houses, and asked what was done when their readings were not such as were expected. The "other uses" could only be catered for as long as the mains and services would stand it without incurring enormous additional capital charges, and he would like to know what was to be done when this point was reached.

Mr. ARTHUR WRIGHT paid high tribute to Mr. Seabrook's business ability, and said that it was difficult to criticise a system which had turned a very dead concern into a very live one. He thought that difficulties must arise in differentiating between active and decorative lamps, and considered that a serious disadvantage of the system was that it omitted provision for commercial discounts. The best system for small houses was on the lamp contract basis, preferably with a limiter, without extra charge for units used, as in such cases the cost of current supplied was not more than 5 per cent. of the total cost of attending to the consumer.

Mr. C. A. BAKER (Chief Electrical Assistant, Engineers' Department, London County Council) spoke from the point of view of a large consumer, as the L.C.C. consumed some 2¼ million units per annum, of which about 1½ million were purchased from 27 different supply authorities. He had come in contact with the telephone system, but had never been tempted to adopt it. The standing charges were so large that he did much better on Mr. Seabrook's alternative maximum demand rate with 25 per cent. discount. He suggested that expediency had been depended on too much in framing the telephone system, and pointed out that in the case of a consumer who paid his standing charge in advance, and then went away for the greater part of the year, if the amount worked out at more than 3d. per actual unit consumed, the Corporation were not really entitled to retain all the money. He mentioned the use of the flat rate per kw. in Lombardy at about 15s. per lamp per annum. With regard to the system mentioned for small tenements, he thought that too much light was being supplied for the size of room, and too much was being paid for it. He had worked out from published figures that the Marylebone receipts were equivalent to 37s. per lamp, and would like to know how this compared with the price of supplying the public lamps. The flat rate had the advantage of easy intelligibility, as it involved only one factor, and he saw no reason why a satisfactory flat rate could not be based upon averages obtained from records just as the whole business of the insurance companies was based on averages. A factor which would greatly encourage business-getting would be the abolishing of all objectionable rules and regulations by supply authorities.

Mr. W. R. COOPER had for long advocated the Hopkinson system, and did not understand how anyone could now advocate a flat rate, on which heating and cooking were practically impossible. The system that had been suggested of charging a predetermined number of units at a price of, say, 6d., and all in excess at 1d., amounted substantially to the same result as Mr. Seabrook's system. Mr. Seabrook had a great eye for business, and he congratulated him on being able to obtain 10 per cent. extra on payments made a quarter instead of a year in advance. It was really more important to get plenty of business than to frame a scientifically-accurate tariff. He did not think that consumers could be relied on not to change the candle-power of their lamps, and wished to know what happened in the Marylebone system when a consumer put in more economical lamps.

Mr. A. H. DYKES (Handcock & Dykes) said the most suitable tariff for any given case depended on the nature of the station and the consumers. The flat rate would only be suitable if one could store electricity cheaply and had no apparatus outside the station. The modification of the Hopkinson system proposed by himself and Mr. Handcock three years ago was based on a fixed charge in advance instead of a varying primary charge. He advocated limiters at first, but thought that they could be dispensed with later on. Their system was not as generous as Mr. Seabrook's, as it did not allow current for other purposes at 1d. per unit. He noticed from the figures in one of the appendices to the Paper that the watts supplied for lighting were considerably less than those other purposes at Marylebone. This showed that the actual cost per unit of the lighting to the consumer was really very heavy. He did not think that a system relying on inspection and arbitrary differentiation between useful and "convenience" lights would ever be popular, and thought that the "two-rate" system would be heard of more in the future. With small consumers, however, the only possible system was a fixed charge per lamp, and in this connection he referred at some length to the operations of the Fixed Price Light Co., where a simple form of house-to-house wiring is employed.

Mr. K. A. SCOTT-MONCRIEFF (General Manager, Electric Supply Corporation) thought that the degree of loading of the cables should be taken into account in settling the tariff. He thought that a consumer who was away for the six winter months should certainly not pay as much for his units. The charging of high prices to consumers taking lighting only and a low price for those taking chiefly power or heating was akin to "dumping." Asking consumers to pay as much as five-sixths of the bill in advance could not be done in the majority of districts. There was something to be said, after all, for double wiring, but in time they would come to a very low flat rate all round. With capital expenditure down to £50 per kw., they could, he thought, at 28 per cent. load-factor charge at 1d. per unit. He suggested that the Institution might collect statistics and go into the whole matter.

Mr. F. M. LONG (City Electrical Engineer, Norwich) spoke of the success of his "rateable value" system. He did not claim, however, that it was suitable for every locality, but claimed that it would have advantages for most provincial towns of moderate size. He preferred having a charge on the number and size of the rooms, rather than the number of lamps. At Norwich the primary charge was £4 per kw. instead of £14, and the whole system worked out very satisfactorily.

Mr. J. A. B. HORSLEY (Electrical Engineer, Harrow Electric Light & Power Co.) gave some particulars of the shilling-in-the-slot meter system in use at Harrow. In the method of using these at present in force, the meters were estimated at 8d. per unit, but after the first five shillings in each quarter a rebate of one shilling in three was returned. The system was popular in small tenements, because, while the husbands put in the original shillings, the wives got those that were returned.

At this point a vote was taken as to whether the discussion should be adjourned, and it was finally announced that the subject would be returned to on January 25th.

Royal Institution.—Among the Friday evening discourses before Easter will be one on February 9th by Dr. J. B. Harker on "Very High Temperatures, with Electric Furnace Experiments," and one by Prof. Sir J. J. Thomson on "Results of the Application of Positive Rays to the Study of Chemical Problems."

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—*Member:* B. C. Wilson. *Associate Members:* Q. Arbuckle, A. W. Clegg, J. M. Crawford, A. E. V. Davies, M. B. Dewar, T. Duckitt, A. E. French, G. W. Hammond, A. F. Harmer, J. H. Hartley, W. C. Kennett, P. A. Lundberg, W. Moore, H. Nimmo, E. E. Rogers, H. Rottenburg, C. G. Slack, J. S. Terras, E. W. A. Thomas, W. Watson. *Associate:* G. H. E. Vivian. *Students:* P. C. Batstone, S. K. Chatterjee, A. B. Doyle, O. Howarth, A. S. Sarkeria, C. F. K. Sharrock, C. L. Underwood, V. H. Wells, T. P. Wilson.

Conversazione at Manchester.—A conversazione, arranged jointly by the Manchester local section of the Institution of Electrical Engineers and the Manchester Association of Engineers, was held at the Whitworth Institute, Manchester, on Friday evening last. A reception was held by the Chairman of the Local Section, Mr. Wm. Cramp and Mrs. Cramp, together with the President of the Manchester Association of Engineers, Mr. Michael Longridge, and Mrs. and Miss Longridge. The company present numbered about 260, including Messrs. S. L. Pearce, Miles Walker, M. B. Field, J. S. Peck, and S. J. Watson, Past-Chairmen of the Manchester Section of the I.E.E., and Messrs. W. Fox, J. H. Stubbs, and A. Saxon, Past-Presidents of the Manchester Association of Engineers. An excellent programme of vocal and instrumental music was afterwards provided, which was well rendered, the singing of Miss Florence Webster and Mr. Fowler Burton being greatly appreciated by the company present. The joint Committee are to be congratulated on the manner in which the gathering was arranged, which was an even greater social success than that held last year, and, judged from many personal expressions of appreciation made, it is hoped it may become one of the items on the annual programme of the two Societies.

STANDARDS FOR ELECTRICAL MACHINES

WE give below a report of the discussion on Dr. Pohl's Paper on Standards for Electrical Machinery before the Leeds Local Section of the Institution of Electrical Engineers, on December 6th. An abstract of the Paper and a report of the discussion in London were given in our last issue.

Mr. Emmott (Halifax) said that he was in such general agreement with the author's recommendations that he would not discuss the few points of detail with which he differed. The standards for electrical machinery issued by the Engineering Standards Committee in 1907 had never been any good—he would almost like to say that they were not worth the paper they were written on. If the Institution of Electrical Engineers would get half-a-dozen manufacturers together for the purpose, they would soon lick something into shape.

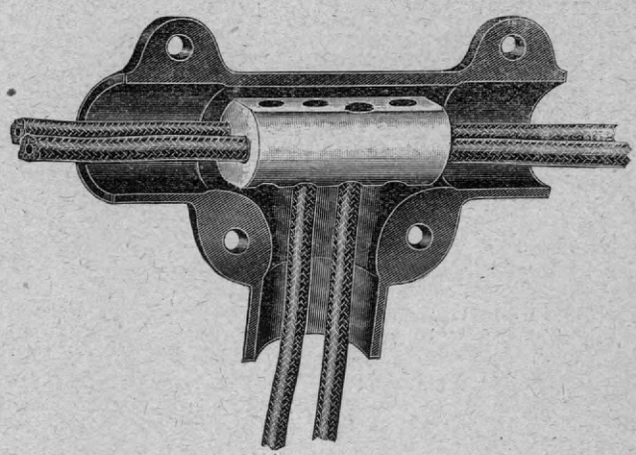
Mr. Wright (Wright and Wood) said that the B.E.A.M.A. might take the matter up. He considered that the German standard specification was too lenient as regards commutation. He approved of Dr. Pohl's suggestion that the flash test should be at 1,500 volts; 2,000 volts was sometimes specified, but might be harmful to 500-volt machines, and leave a permanent strain. Standards for brushes and brush-holders would, he thought, be useful, and would be welcomed by central station engineers who might have many makes of motors to keep in repair. On the question of speeds, he pointed out that fan-makers required accurate speeds, but he thought that Dr. Pohl's list offered sufficient choice.

Mr. Foster (British Engine, Boiler, and Electrical Insurance Co.) said that coal-cutter motors were wrongly rated at present, and their temperature rises at full load were far too high. In all classes of motors the nameplate instructions were not always observed, and makers neglected to indicate whether the ratings were for continuous or intermittent work. He pointed out that the author had not included pipe-ventilated motors in his classification. He agreed with Dr. Pohl's remarks on commutators, but thought that emery cloth should not be used in any circumstances. The French, German, and Belgian standards were too lenient with regard to the shifting of brushes. In testing motors there was too much slackness in allowing for the C^2R losses at the brushes. On the question of temperature rise he said that his people worked to 40° C. surface rise on the armature, and employed the resistance test for the field coils. Dr. Pohl, in referring to the high temperatures that the insulation of field coils would stand, had mentioned the low P.D. between the turns, but the higher P.D. between the coils and frame must not be forgotten. Mr. Foster also asked whether presspahn would not become brittle at these high temperatures. He thought 110° C. too high a temperature rise to allow in the armatures of turbo-generators in view of the greater mechanical stress. One of his inspectors had suggested standardising the watt loss allowed per square inch of radiating surface. He had inquired of a leading firm of manufacturers what this allowance was in their machines, and had been given the following figures: Up to 5 h.p., 0·3 watt. Up to 20 h.p., 0·4. The whole surface area must be taken into account. Another formula was 100 times the watts expended in the coil, divided by the total surface in square inches; this gave an average of about 2 sq. ins. per watt. He agreed with Dr. Pohl that the recommendations of the Engineering Standards Committee as to temperature had made no impression; in fact, he had met specifications of 40° C. temperature rise measured by the resistance method. His company's practice was to allow a surface rise of 100° F. Dr. Pohl's suggestion for the duration of the temperature test was good, and he proposed to adopt it in his company's specifications. On the other hand, he could not endorse the author's proposal to delete 110 and 115 volts from the standard voltages, as the number of private plants at this pressure was increasing. He also disagreed with the omission of 25 cycles, as he said that this frequency did not cause perceptible flicker with metal filament lamps.

Mr. Yerbury (Leeds Corporation Tramways) advocated standardisation of mechanical as well as electrical details, and regretted that several firms considered themselves too big to adopt standards. He also said that he had obtained good results with asbestos insulated coils.

Mr. Wilson Hartnell said that the commutator depths of the E.S.C. were absurd. He could show machines which had run 20 years with copper brushes. In Japan and South Africa, people who tendered to British standard specifications were out of it altogether. On the question of temperature tests, he asked how many motors broke down through high temperature inside the coils.

Mr. French (Leeds University) said that Prof. Bone and himself had investigated the tests which had been made with flame-proof motors, and considered that the Bochum tests were fallacious, as they had been conducted in still atmosphere, and no account had been taken of the effect which the presence of coal dust would have. He proposed that there should be a standard nomenclature for degrees of sparking to avoid the use of such loose expressions as "practically no sparking."



Mr. J. D. Bailie (C. A. Parsons and Co.) objected to the use of forced ventilation through internal tubes, and also advocated that temperature rise should be tested by applying the thermometer at the weakest spots.

The Chairman (Mr. Harding Churton) said that he was surprised that motors in coal mines could do their work at all, as they were handled so roughly. He pointed out that the 25 cycles must be retained as a standard, as it was the frequency of several large power companies. He thought that the importance of standardisation might be overrated, as there were already so many frequencies, and both two-phase and three-phase, and so many speeds, that it was impossible to keep motors in stock. There was also a danger in standardisation checking improvement in design. For instance, if the design of a motor on a standard 10-h.p. frame were improved sufficiently to enable it to be rated at 12 h.p., it would still have to be classified as a 10-h.p. machine if the next standard size were 12½ h.p. The main things that were wanted were standard methods of rating, and standard methods of testing.

Dr. Pohl, in the course of a brief reply to the discussion, said that the standardisation of brushes was a good idea; the Admiralty had already done this. He included pipe-ventilated motors in the classification of ventilated motors. His remark that a temperature of 257° F. would not damage the insulation referred only to the inside layers of field coils, and not armatures. He was surprised that Mr. Foster noticed no flicker on lamps supplied at 25 cycles; he had noticed decided flicker of the lamps on the L.B. & S.C. Railway. He believed in flange protection rather than plate protection for flame-proof motors.

PORCELAIN CONNECTORS

WE illustrate here a convenient form of T connection interior, which Simplex Conduits, Ltd., are introducing. This fits into standard ¾-in. split tee pieces, and is intended for making connections between small wires up to 3/22s. It can also be used in all types of circular boxes, and forms

Simplex Porcelain Connector Interior for Tee-piece.

a very useful and labour-saving accessory. Several other forms of porcelain interiors for making connections are supplied for taking connections to a switch point and a lamp point. The terminals in these are so arranged that it is not necessary to sever the main wires; about half an inch of the insulation is bared back, and the conductor thus exposed is dropped into the slot of the terminals provided and then clamped by means of a screwed ring.

Theatre Lighting.—There are in the United Kingdom 2,900 permanent entertainment houses open every night. They include 300 theatres, 800 music-halls and picture palaces where variety artistes are engaged, and 1,800 picturedromes; 400 of them light with gas, 2,500 have electrical installations, and 500 of these run their own plants. They light 10,000 arcs and 375,000 incandescent lamps nightly.

Electric Welding.—In the course of a Paper entitled "Experiments on the Strength and Fatigue Properties of Welded Joints in Iron and Steel," by Dr. T. E. Stanton and Mr. J. R. Pannell, read before the Institution of Civil Engineers on December 12th, results of experiments were given on the strength of welds made in various ways. The mean results of the tensile tests on the welded joints, expressed as a percentage of the strength of the original material from which the joints were made, were:—Hand-welded iron, 89·3 per cent.; hand-welded steel, 81·6 per cent.; electrically-welded iron, 89·2 per cent.; electrically-welded steel, 93·4 per cent. Joints made by the oxy-acetylene process were also tested, but it was stated that the results were not comparable with those obtained by the hand or electric processes.

HAMPSTEAD STREET LIGHTING

Amazing Disclosures.

Resignation of Borough Electrical Engineer.

A REMARKABLE state of affairs has been disclosed in connection with the scheme for converting the whole of the gas lamps in the streets of the Borough of Hampstead to electricity. At various periods from July, 1909, the Council have sanctioned the conversion of 2,229 lamps, the estimated cost of which was put at £15,073. It appears, however, that the actual cost of the work has come out to £25,398, and this has, not unnaturally, created a considerable amount of consternation in the Council.

The matter has been discussed *in camerâ* by the Council, and also by the Lighting Committee, but there have been somewhat premature disclosures of what transpired there, and of the contents of a private report made by the Lighting Committee to the Council. The result is that the services of Mr. E. Sayer, the Chief Assistant Electrical Engineer, have been dispensed with, and Mr. G. H. Cottam, the Chief Electrical Engineer, has been asked to resign, which, in fact, he has now done. From the extracts of the private report which have been published, the following comparative table has been taken :—

	Estimated.	Actual.
	£	£
Cable	4,572	5,596
Troughing	2,146	4,668
Labour	4,174	6,297
Making good	3,136	7,670
Alterations	807	873
Time Switches ...	238	294
	£15,073	£25,398

These figures show an excess of 68 per cent. on the estimate, a fact which came to the Finance Committee's knowledge in October last. In their report, the Special Sub-Committee which dealt with the matter express the opinion that Mr. Sayer prepared all the estimates in a careless and slipshod manner, and that Mr. Cottam placed them before the Council without checking the figures. Mr. Sayer, it is said, had omitted to include in his estimate the compound used for filling in the cable troughs, which apparently was an item of £1,535. The explanation of the discrepancy on the cost of "making good" is that the estimate for making good the pavements was made upon the basis of Mr. Sayer's own figures, which were lower than those adopted by the Borough Engineer's Department, to whom the work was entrusted, and this fact was not mentioned at the time Mr. Cottam submitted his estimates. Another complaint is also made that certain items which should have been charged to street lighting have been charged to other accounts.

Condensation in Steam Pipes.—A Paper entitled "Methods of Dealing with Losses in Steam Plant due to Condensation," by Mr. G. Wilkinson (Chief Electrical Engineer, Harrogate) and Mr. J. R. Wilkinson, was read at a meeting of the Association of Engineers-in-Charge on December 13th, in which they emphasised the importance of removing the water by condensation regularly as it is formed, and of passing it back immediately at its highest temperature through closed heat insulated pipes direct to the steam generators. In referring to steam traps, they said that there was little to choose between the expansion, bucket, and float types, provided they were properly designed and selected. It was, however, often uneconomical to allow them to drain into the hot well, on account of the decrease in economiser efficiency involved. Proceeding to describe methods of returning the water direct to the boilers, the authors referred to the "steam loop" and Holly systems of the United States, and the modification due to one of the authors known as the "Wilkinson Thermal Column" (see Electrical Engineering, Vol. V., page 923, October 21st, 1909). The efficiency of this apparatus was stated to be so high that condensed steam can be lifted from the sump and returned to the boilers with a maximum drop in temperature of less than one degree per foot of lift. The Bundy tilting steam trap was also described, as well as the Pratt return steam trap with a float, and the Losles system designed by the authors to obviate certain defects in the foregoing systems. This has a separate bottom lifter and top feeder, the former of which has steam inlet and exhaust valves controlled by floats, while the latter contains no moving parts, a separate piece of apparatus called the controller serves to deliver and exhaust steam to and from the feeder in synchronism with the lifter by means of diaphragm-controlled valves. Another special piece of apparatus named the "equi-sump" allows the traps at points of different pressures to drain into one common return system without waste of heat or loss by evaporation.

"UNIT" FITTINGS

WE illustrated on page 683 of our last issue a set of component parts for making up electric light fittings, which Simplex Conduits, Ltd., have put on the market to assist contractors in readily supplying a variety of fittings for all requirements without the necessity of too extensive a stock. The full range of designs that can be formed from these combinations may not perhaps have been quite appreciated simply from the view of the components themselves, and we are very glad of the opportunity afforded us by Simplex

Fittings made up from Simplex "Unit" Components.

Conduits, Ltd., to illustrate two typical examples. It will be seen that, besides its use simply as a bracket, the ornamental bracket arm which is a special feature of the system can be combined with the central components to form a variety of branched pendants for several lamps. A list can be obtained from the company's offices, 116 Charing Cross Road, containing illustrations of a number of other combinations. Although we believe that something of this kind has been attempted previously on a smaller scale, the designs now being produced are entirely new.

The Explosion on Board the "Orion."—A peculiar explosion occurred in the dynamo-room of the *Orion* on Tuesday last week during the tests. So far as can be ascertained, the enclosed crank chamber of the reciprocating engine driving one of the dynamos exploded. Remarkable as it may seem, such accidents, though extremely rare, have happened on previous occasions. Several of those present at the test were slightly injured.

CONDENSING PLANT

We have received from the Mirrlees, Watson Co., Ltd. (Scotland Street, Glasgow), a pamphlet containing an interesting description of a combined steam and water power station at Tuilière, France, for which the French Thomson-Houston Co. were main contractors, while the Mirrlees, Watson Co. supplied the condensing plant. Each of the two 3,500 kw. Curtis turbines has its own condenser, and each set consists of a cylindrical surface condenser with a cooling surface of 10,700 sq. ft., and a set of Mirrlees-Edwards' three throw air pumps, 20 in. diameter by 12 in. stroke, running at 120 revs. per min., driven through gearing from a 40-h.p. three-phase motor at 220 volts. The circulating water is delivered by two 14-in. centrifugal pumps working in parallel. These pumps draw the water from a culvert in the foundations, and the water is discharged into another culvert. The in-take culvert is fed through a conduit connecting to the high-level basin of the river. In the event of the level of the water being lowered, through the opening of the dam, circulating water can be obtained from the river below the station by means of a separate pumping installation, situated in a water-tight pit about 13 ft. above the minimum level of the discharge, and consisting of two centrifugal pumps driven by one 280-h.p. motor.

Another pamphlet draws attention to a new form of rotary air pump which the company are now manufacturing. This is the result of some years' investigations regarding rotary pumps, and embodies certain patented improvements on the original Leblanc pump.

ELECTRIC TRACTION NOTES

The Board of Trade inquiry into the tramway accident in October upon the Stalybridge, Mossley, Hyde and Dukinfield joint tramway system was resumed and concluded last week. We referred to the accident at the time in our issue for October 26th, page 586. A car got out of control upon a very steep road, which after a clear run of half a mile takes a sharp turn to the left, and crosses a railway bridge. At this curve the car left the rails and toppled over on to the railway lines thirty feet below, resulting in the death of five persons and injuries to six others. The Board of Trade inquiry was adjourned to allow of the injured driver giving evidence. He stated that although he had tested the magnetic brake once or twice and found it in good order, when he applied it on the hill he discovered that it was not acting, and the application of sand and the hand-brake had no effect on checking the speed of the car. The witness's opinion that the car left the rails at one part of the hill and regained them again was confirmed by the inspector, Colonel Von Donop, who stated that from his examination of the rails this seemed to have been the case. When nearing the bottom of the hill, the driver tried reversing the motors, which had no effect, and then continued working the magnetic brake, also without effect. The inspector will report in due course.

The Arbitrator's award as to the price to be paid for tramway energy by the Gravesend and Northfleet Electric Tramway Co. to the Gravesend Corporation has been issued. The price paid by the Tramway Co. at present for the first 180,000 units per annum is 2d. per unit, and this under the award remains. Above 180,000 and up to 350,000 units the Company now pay 1¾d., but the Arbitrator has fixed the price of 1·3d. for all units consumed between 180,000 and 280,000 per annum. Above that consumption the charge will be 0·8d. per unit.

The City Corporation have informed the L.C.C. that neither the Parliamentary Authority under which the Southwark Bridge is being reconstructed, nor the dimensions of the new bridge will permit of the construction of tramways. Whilst the City Corporation have stated that no good object could be served by further conference on the matter, the Highways Committee recommend that the Council again approach the City Corporation.

Mr. W. Y. Lewis read a Paper before the Royal Society of Arts on December 13th, in which he described his proposed "continuous" system of transportation, in which the cars are propelled by revolving shafts under the track, provided with screw thread of coarse pitch between stations, and fine pitch at stations, giving sufficient reduction of speed to enable passengers to board them. The system was described by him in a Paper before the British Association last summer (see ELECTRICAL ENGINEERING, September 14th, page 513).

An interesting rail-grinder is described in a recent issue of *The Electric Railway Journal* (New York), by which it is said that corrugations can be ground out at a cost of from ¾d. to 1d. per foot. The apparatus consists of a four-wheeled truck, on which is mounted a motor which drives through friction gear and belts a series of emery wheels, supported by a carriage 5 ft. 10 in. long, resting on four adjustable shoes for sliding along the rails. The machine can propel itself with the grinding wheels raised clear of the track. The trolley stand is 7½ ft. high, and the motor for moving the car is mounted on top of the frame, and drives through a belt and gearing.

According to the *Electric Railway Journal*, the conversion of the Washington, Baltimore & Annapolis Railway from single-phase 600-volt to D.-C. 1,200-volt working has been fully justified by results. The higher working pressure is stated to give no difficulties; the maintenance charges for the electrical equipment are said to have fallen from 0·185d. per car mile for A.-C. to 0·12d. per car mile for D.-C. working, The cost of power consumed from 2·9d. for A.-C. to 1·93d. per car mile for D.-C., and the total running costs from 11·6d. to 9·5d. per car mile. The gross receipts have also increased, and the trains are said to keep much better time.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

In a recent issue of the *Elektrotechnische Zeitschrift*, Prof. L. Zender drew attention to a method of directive wireless telegraphy without antennæ. The transmitter, which should generate at a frequency of about 100,000 cycles per second, is connected by conductors each equivalent to a quarter wave-length to two earth-plates sunk half a wave-length apart. If a similar tuned receiving circuit is placed so that the two receiving earth-plates are in a line with the two transmitting plates, the impulses from the latter will arrive at the coherer in phase, whereas interference between the two impulses will take place in a direction at right angles to the line of the plates, and no signals can be received. Directive telegraphy in two opposite directions is thus achieved. Prof. Zender patented this system in 1905, but states that he dropped the patents as he was unable to develop the system, as financial assistance was withheld on the ground that the method was opposed to the then theory that the atmosphere was the principal medium for the transference of the waves. At a recent meeting of the Deutsche Physikalische Gesellschaft, Herr F. Kiebitz, of the German Post Office, described experiments in directive telephony with very similar arrangements, with which it was stated communication had been established between Germany and Canada, and Prof. Zender has publicly complained that the arrangement used was covered by his patents, and demands recognition. Herr Kiebitz, in a letter to the *Elektrotechnische Zeitschrift*, states that his success was due to certain important modifications of his own, but Prof. Zender claims that these also were covered by his patents. In the original article, Prof. Zender offers an explanation of the fact that greater distances are reached at night, based on his theory that the earth is the main medium of transmission, and also suggests a system of secret codes in which a group of some 30 letters of the alphabet are used in succession for the ordinary letters, the order of the letters in the group being varied each time. This variation is effected automatically by a simple attachment to an ordinary typewriter, and a similar reversed device is used to decipher the message. It is stated that the code is impossible to decipher without the key.

In a Paper read before the Institution of Post Office Electrical Engineers last week, Mr. E. A. Pink advocated the "parallel distribution" method of laying telephone cables in place of the method used hitherto of laying a large multiple cable to a distributing centre, from which a number of smaller cables radiate. He recommended cables containing 40, 80, 120, 160, 200, and 400 wires weighing 10 lbs. to the mile, and laid up in bundles of ten pairs. By adopting a colour scheme, the single-pair subscribers' cables could be tapped off directly from the two smaller sizes. In the case of the larger sizes, he recommended the following arrangement. Assuming a 160-wire cable leaving an exchange, he would open the sheath at the first footway box in the thoroughfare to be served, cut one of the 10-pair bundles and connect to it a 10-pair distribution cable, which he would run in the same pipe as the main cable until it had passed the frontages of twenty probable subscribers. It would then be joined to the next 10-pair group of the main cable, and, by fixing a "traffic centre" between these two points

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Dec. 14, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,205/10. **Commutator Brushes.** THE ELECTRIC CONSTRUCTION COMPANY, LTD., and N. PENSABENE. A method of arranging brush gear so that the brush shall not stick in its holder, and require excessive pressure to keep it bedded on the commutator, is covered by this patent. The brush, which is carried by a metallic holder, obtains the required amount of pressure, which is much less than usual, from a main spring through a secondary spring arranged vertically above the brush. The holder is insulated from its support, and the current is taken direct from the brush by flexibles to a collecting plate fixed to the outside of the support, from which it is insulated, so that no current passes through the holder. Three figures.

29,706/10. **Overhead Conductor Crossings.** E. M. MUNRO and THE RAILLESS ELECTRIC TRACTION CO. In a traction system for trolley omnibuses, where wires of opposite polarity are required to cross, short circuits by arcing are avoided by arranging in the gap between the wires a series of blocks insulated from each other, and bridging a resistance in steps across the live and intermediate blocks, so that after each break current passes to the motors through a step or steps of this resistance and is consequently diminished, thereby reducing the chances of arcing. Another advantage is that the vehicle cannot come to rest on an insulated part and have to be pushed over. One figure.

5,856/11. **Controller Contacts.** E. GARSIDE. To avoid any rocking movement of the contacts when the switch arm passes over them, each contact strip is bent over at one end, on which a tooth and shoulder are formed. This fits into a hole in an insulating base, from which it is spaced a certain distance by the shoulder. The other end is secured by a screw to a bolt, which passes through the base to form a terminal on the rear side for the conductor. This enables renewals to be easily effected, and also reduces the number of parts. Three figures.

10,342/11. **Constant Speed for D.-C. Motors.**—SIEMENS BROS. DYNAMO WORKS, LTD. A speed sufficiently constant for practical purposes can be maintained by connecting an auxiliary machine in parallel with the motor to be controlled, through a field winding, which is in addition to the normal motor field. The field of the auxiliary machine is also connected across the motor terminals, so that should the voltage of the supply drop, the field of the machine will weaken, and a current will flow through the additional field winding, weaken the motor field, and bring the speed up. The two machines can be either mechanically or electrically connected. Four figures.

13,948/11. **Holders for Telephone Receivers.** C. S. BANN. This device has been designed so that the telephone can be used without holding the receiver. It comprises a flexible metal tube, which is detachably fixed to a base piece by a clip. The end has a holder made of springy material, so that the receiver can be pressed in and securely held. The part containing the transmitter and hook switch is fixed to the same base by four claws, one of which is adjustable. Five figures.

15,091/11. **Insulated Wire Terminals.** A. MORGAN. A small flat brass or copper washer is fixed to a thin copper star, and has a central hole of suitable size, wide enough on its face to make good contact. The pared ends of the wire are passed half way round the washer in opposite directions to meet at the top. The arms of the star are then folded over to meet the rim of the hole, and are tapped down on to the wire. Eight figures.

Opposition to Grant of Patents

5,934/10. **Long Electric Arcs.** G. W. JOHNSON. This specification has been granted in spite of opposition. It describes a process for the production and maintenance of long arcs for producing reaction between gases, by means of a blowing device. This consists of two parallel tubes with outlets at any angle to the axis, through which the gas currents flow, and meet together adjacent to the arc.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

30,544 of December 24th, 1897. **Electric Welding.** O. PARPART. This patent relates to apparatus for welding longitudinal tubes. The poles of a transformer are connected to standards, which are insulated from the frame of the machine, and carry supports from copper discs, which revolve in contact with the tube on opposite sides of the joint. These can be adjusted for inclination as well as position. Pressure rolls are provided in front of the discs to complete the welding. The tubes are fed forward by other rolls, and to ensure the joint being upwards a guide is placed before the first pair of feed rolls, and a second guide between them and the welding apparatus. Additional rolls are provided on the delivery side to keep the tubes straight.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad.

Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Electrodes] 710/11; GEB. SIEMENS & CO. [Electrodes] 13,817/11.

Distributing Systems, Cables and Wires, Insulating Materials: THOMAS [Insulating compound] 28,069/10; BEAVER and CLAREMONT [Twin or multicore cables] 9,523/11.

Dynamos and Motors: SIR W. G. ARMSTRONG, WHITWORTH & CO. and HARLOW [Method of synchronising motors for use on cranes, &c.] 27,814/10; MOULD [Reversible variable-speed dynamo] 28,307/10; SIEMENS BROS. DYNAMO WORKS, LTD. [Regulating the frequency of rotary field generators] 2,794/11.

Electric Ignition: SCHTSCHERBAKOFF, 27,300/10.

Electrochemistry: KING'S NORTON METAL CO., BAYLISS and BROWNSDON [Producing metallic coatings on materials] 21,260/10.

Heating and Cooking: READ [Electric heaters] 27,954/10; NIGHTINGALL [Cooking appliances] 79/11 and 15,899/11.

Switchgear, Fuses, and Fittings: SCHEIDEMANN [Electric light switch control] 29,125/10; CHEADLE [Joint fastenings for bayonet lamp holders] 29,425/10; VERITYS, LTD., and HIRSCH [Circuit breaker] 14,812/11.

Traction: MATHER and BARLOW [Trolley wire couplings] 27,711/10; GOTTSCHALK [Overhead wires, safety support] 548/11; THOMPSON and FINNIGAN [Overhead trolley wires] 1,295/11; SIEMENS BROS. & CO. (*Siemens & Halske Akt.-Ges.*) [Devices for supervising the working of points and signals] 18,658/11; WOOD [Railway signalling apparatus] 20,545/11.

Miscellaneous: LOWNE, and LOWNE ELECTRIC CLOCK & APPLIANCES CO. [Electric clocks, &c.] 27,293/10; OLDHAM [Miners' electric lamps] 27,641/10; HENRY MILWARD & SONS, LTD., and SMITH [Electroplating apparatus] 1,573/11; GAUNT and DAIRY OUTFIT CO. [Electric alarm] 4,580/11; ROSING [Electrical telescopy] 5,259/11; MACGREGOR [Means for supporting battery cells] 14,586/11; REBSAMEN [Electric sewing machine] 15,690/11; ROBERT BOSCH [Process for making condensers] 17,438/11; CHEMISCHE FABRIC GRIESHEIM-ELEKTRON [Method of using batteries to supply lamps] 22,441/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Insulating Material: SPECIALFABRIK FUR ALUMINIUM-SPULEN UND LIETUNGEN GES. [Insulation of conductors, coils, &c.] 25,672/11.

Motors: SCHRAGE [Commutator motors] 25,358/11.

Electric Ignition: DIEHL, 25,161/11.

Electrometallurgy: AKTIEBOLAGET ELEKTROMETALL [Electric furnace for ore smelting] 25,862/11.

Telegraphy: AKTIESELSKABET HOVLANDS RADIOTELEGRAF [Type printing telegraph apparatus] 26,039/11.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. BREMER, 15,225/00; J. A. RIGNON [Enclosed clutch type] 19,468/06.

Electric Ignition: R. FOX, W. and W. FAWCETT, 19,190/07; M. A. CODD [Magneto-armatures] 19,546/07.

Electrochemistry: S. O. COWPER-COLES [Electro-deposition] 19,411/06; H. CHAUMAT [Electrolysis; dyes] 19,027/07.

Storage Batteries: H. WADE (*H. Rodman, U.S.A.*) 18,485/03.

Switchgear and Fittings: H. A. AND H. PENDLEBURY [Conduits] 19,113/07; J. LECOCHE [Electro-magnetic circuit-breakers] 19,241/07; E. W. MOORE [Automatic time switch mechanism] 19,447/07.

Telephony and Telegraphy: S. EISENSTEIN [Wireless telegraphy; means to reduce damping] 19,274/07; B. FETT [Clock method of closing telephone circuits] 19,612/07.

Traction: S. P. WOOD [Railway signals] 18,674/98; L. GERARD [Electric tractors] 17,643/05; A. C. BOURNEVIALLE [Signal contacts] 19,378/06.

Miscellaneous: P. LUCAS [Illuminated advertising] 19,185/07.

Hosted by Google

twenty subscribers could be tapped off from the distributing cable, ten on wires coming from the first footway box, and ten on wires coming back from the second point of connection. From this second point the main cable would be reduced to a 120-wire cable, and another 10-pair cable would be connected to the third set of wires in the main cable and be run in the same pipe to a third point, at which it would be connected to the fourth group. From here onwards the main cable would be reduced to an 80-wire cable and the distribution would be direct. All the joints would be plumbed in the usual manner. This is a modification of the "parallel distribution" system which has already been employed by the Post Office to some extent during the past two years with ordinary multiple cables and 14-wire distributing cables. Both arrangements have the same feature that the main cable and one distributing cable are laid in the same pipe, and that each pair of the latter can be cut and employed for connecting two subscribers, one on each side of the traffic centre. One of the advantages claimed by the author for the use of 10-pair cables is that 10-lb. conductors can be employed in the distributing cable as well as in the main cable, whereas with 7-pair distributors 20-lb. copper was employed to give mechanical strength; the diminution in the size of the cable due to the smaller conductor will also enable a thicker lead covering to be employed without increasing the diameter to a greater size than the 14-wire 20-lb. cable. A further advantage is simplification of the system and the jointing arrangements, and a reduction in the number of joints. The Paper was illustrated with a number of slides showing methods of jointing, &c., and was throughout of a thoroughly practical and informative nature.

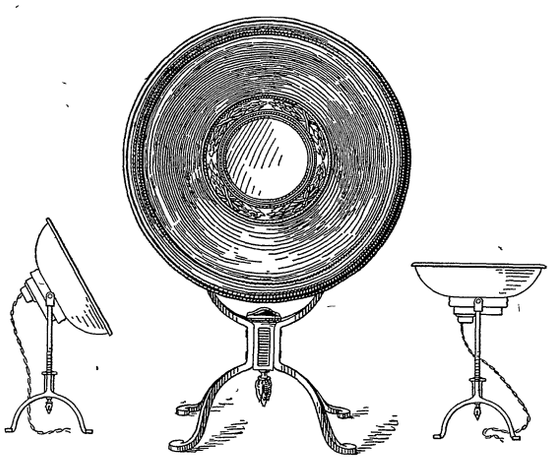
The Bill authorising the Postmaster-General to pay a sum of £3,000,000 to the National Telephone Co. on account of the purchase price of the company's undertaking has passed all its stages in Parliament.

In answer to a question in the House of Commons last week, bearing upon the question raised by Mr. Charles Bright in his recent lecture before the London Chamber of Commerce (ELECTRICAL ENGINEERING, December 7th, p. 669), the Postmaster stated that in view of the conditions appertaining to the ownership of the present submarine cables and land lines in Canada and the United States, and of the substantial reductions now being made in many of the Transatlantic cable rates, the Government have no intention of embarking on the large capital expenditure and annual commitments which would be involved in laying a State-owned cable.

In the House of Commons last week the Postmaster-General was asked on behalf of the Dundee Chamber of Commerce when the conditional promise made last year to carry the underground telegraph system to Dundee would be put into effect. The Postmaster-General replied that he had the matter under consideration.

Arrangements have now been completed by which practically every town of any importance in Great Britain will be placed in telephonic communication with Paris. The main factor in these extensions of the distance over which telephonic speech can be maintained has, of course, been the laying of the cable between England and France fitted with loading coils. A full description of this appeared in our issues for March 17th, 1910, p. 179, and December 22nd, 1910, p. 807.

Mr. C. Llewelyn Davies has been appointed Solicitor to the General Post Office jointly with Sir Robert Hunter, K.C.B., who will continue to act until the arrangements connected with the transfer of the National Telephone Co.'s undertaking are completed.



The Faroe-Iceland cable did not suffer a long interruption, as repairs were effected within a few days, and this rather points to trouble near the shore ends.—We learn that telegrams for Ras el Dabbaa, Marsa, Matroul, Sidi Barrani, and Siwa can only be accepted in plain language and at sender's risk, owing to the war.—No sooner has the French Company put the Paramaribo-Cayenne cable into working order than it is interrupted again. This section ceased working on 18th inst., and telegrams for French Guiana can only be sent "*vid* Salinas," South America.—We have further information that the Malta-Tripoli cable is now working normally, which means that the war traffic is being easily coped with.—The Saint Louis-Teneriffe cable was put into working order on the 19th inst.—We are also able to announce that the Direct United States Cable Company will have to dip into the repair fund, for not only is the main section interrupted, but also the section from Newfoundland to Halifax. It will be remembered that under the lease of the cables to the Western Union Telegraph Company, the Direct Company retained the reserve fund of over £500,000, and undertook the responsibility for the upkeep of the cables.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

ELECTRIC LAMPS.—The Silent Electric Clock Co. (192 Goswell Road, London, E.C.) has issued a second edition of their catalogue. It is profusely illustrated, showing very clearly the various mechanisms which we referred to in this column on August 24th, 1911, p. 479. The popularity of these clocks is evident from a long list of users which accompanies the above issue.

ELECTRICAL NOVELTIES.—A booklet giving details of some new novelties manufactured by Donnison, Sillem & Co. (116 Great Portland Street, London, W.), includes the "ever-ready" electric candles for intermittent use, a torch fitted with a metal filament lamp, and a two-cell dry battery; a combined hand and reading lamp, in which the reflector can be moved up and down, and a travelling lamp with a detachable reflector, as well as the lantern *de luxe*, which is fitted with folding handles and a clip for fastening to a belt, &c.

HEATING AND COOKING APPARATUS.—A revised edition of the catalogue of heating and cooking apparatus of Ferranti, Ltd., gives particulars of a series of appliances utilising the Ferranti-Royce disc-shaped heating unit of mica insulated coiled strip. These include disc stoves of various

FERRANTI "ELECTRIC FIRE."

forms, for which special flat-bottoms utensils are made, and various accessories, ovens, flat-irons, &c. The most attractive item in appearance, however, is the Ferranti "Electric Fire," one of the many patterns of which is illustrated here. This has a quartz-covered heating element in the centre, which emits a pleasant red glow.

ELECTRICALLY-DRIVEN PUMPS.—A leaflet from the Electrical Engineering & Agency, Ltd. (Bank Buildings, 109-111 New Oxford Street, W.C.) gives particulars of a special pattern of high lift centrifugal pumps for electrical driving.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

LIQUID STARTERS.—The Adnil Electric Co., Ltd. (Adnil Building, Artillery Lane, E.C.), have sent us a copy of a new list describing their liquid starters. They claim that these are more satisfactory and cheaper than metallic starters for large motors, and that they do not require the care and attention that a metallic starter does, nor are they nearly so complicated. The tanks and blades are of sheet iron carried on substantial insulators, and the electrolyte used is a solution of soda. Worm gear is provided to ensure slow starting, and a sheet iron protecting cover is fitted over the tanks and blades, and suitable short-circuiting contacts are provided. For direct-current starters field-breaking switches can be mounted on the liquid starters and fitted with an interlocking gear to render it impossible to start the motor up against a weak field. These starters can be supplied in various sizes from 15 up to 1,000 h.p.

TANTALUM LAMPS.—Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), are issuing their well-known "Little Bill" prize poster in the form of a postcard, which can be overprinted free of charge with the name and address of any contractor.

LOCAL NOTES

Burton-on-Trent: *Change of System.*—The scheme referred to in our last issue involving an expenditure of £17,000 upon alterations at the electricity works includes the provision of a 1,000-kw. three-phase generator. At present generation at Burton is upon the high-tension single-phase system with street transformers and two-wire distribution.

Canterbury: *Free Wiring.*—The Corporation have decided to oppose the Bill of the National Electric Construction Co., which seeks to legalise the agreements entered into by various Corporations—Canterbury being one—and the National Free Wiring Co.

Cheltenham: *Municipal Wiring.*—The Chairman of the Electricity Committee disagrees with the decision of the Committee not to recommend that support be given to the Bill of the Incorporated Municipal Electrical Association relating to electric wiring, &c. Mr. Merrett, the gentleman in question, states that the absence of the powers which the Bill seeks to confer had been responsible for retarding the progress of the Cheltenham electricity undertaking, and he was entirely in favour of the Corporation having the necessary powers and using them discreetly and sensibly.

Farnham: *Wiring Small Properties.*—The Farnham Gas and Electricity Co. have applied for the Council's consent to the system of having one service to supply a group of houses, the supply being carried from one to the other by means of a special cable fixed to the fronts of the houses. The Council have informed the company that they are not prepared to give a general consent for the whole of the district, but will be prepared to consider special cases from time to time. We notified in our issue for November 23rd that the Board of Trade had given their consent to this system.

London: *Fulham: Supply to Guardians.*—The electric battery at the workhouse is quite inefficient, and a Committee has been appointed to meet the Electric Light Committee with a view to ascertaining upon what terms the Council will supply electricity to the Guardians.

Hackney: Electricity Works Accounts.—The financial result of the past year's working of the electricity undertaking is a net profit, after meeting capital charges, of £7,186. Of this, the sum of £4,702 is credited to the general rate, £238 is deducted as one-third the cost of the equipment of showroom and offices, and the balance carried forward. The turnover of the Sales Department was £4,172, against £4,272 in the previous twelve months, and after meeting all charges there is a credit balance of £129. The reserve fund stands at £21,261. A table of comparative costs in the Engineer's report shows that the total costs, exclusive of capital charges at Hackney, are 0·62d. per unit with an output of 5,662,795. This is lower than any other Metropolitan electricity undertaking. The load factor was 20·36 per cent.

Hampstead.—At the Marylebone Police Court on Friday, the Electromotor Equipment Co., Ltd., of Old Street, E.C., were fined £5 and two guineas costs for unlawfully making connection with the Borough Council's mains without their consent. It appears that the company, for the purpose of testing some electric lifts which they are erecting at the Home for Incurable Children in College Crescent, Hampstead, temporarily connected up with the Council's mains without consent and without a meter. The Town Clerk, who prosecuted for the Borough Council, pointed out that the company could have been summoned for "stealing" electricity, but it was not the desire to proceed on that charge.

Marylebone: Electricity Testing Stations.—Last year the London County Council were recommended to take proceedings against the Marylebone Borough Council with a view to enforcing the County Council's requirements in regard to the establishment of electricity testing stations (Electrical Engineering, Vol. VI., December 15th, 1910). The County Council required the establishment of five testing stations, but the Borough Council protested against the provision of special premises or boxes in the streets, and pointed out that it had already provided, at a number of places in the borough, instruments for recording the pressure, and that arrangements could be made for a representative of the County Council to inspect these. Further, it was pointed out that there were forty-six pilot cables, and it was possible to ascertain at the generating station the pressure at forty-six feeding points. In February, 1909, the Council agreed that in certain cases generating stations and sub-stations with pilot wires from distant points, should be accepted as testing stations, and, in view of this decision, the Highways Committee now recommend that, subject to certain minor alterations, the pilot wires and recording instruments in the central station be accepted as all that is necessary, on the understanding that the Borough Council provide a standard volt meter for checking the recording instruments, the County Council at the same time reserving the right to make tests from time to time on consumer's premises.

St. Pancras: Electrical Inspector.—The Highways Committee recommend the Council to sanction the appointment of Mr. C. A. Baker as the electrical inspector under the St. Pancras electric lighting Order of 1883. This sanction was necessary under the County Council's Standing Orders, and is the outcome of the recent proceedings at the Clerkenwell Police Court, when two consumers on the St. Pancras mains applied for the appointment of an electrical inspector, owing to a dispute with regard to the Borough Council's regulations concerning fuses. The full facts of the dispute were given in Electrical Engineering for October 12th, November 9th, and November 30th.

Lowestoft: *Electricity Accounts.*—The accounts of the electricity undertaking for the past year show a net profit of £808 after meeting capital expenditure. During the year, interest and sinking fund charges have increased considerably, entirely due to the reduction in periods for the repayment of loans granted by the Local Government Board. Mr. G. A. Bruce, in his report, points out that where originally fifteen or twenty years were granted, the period has been cut down to six or eight years, according to the nature of the plant.

Torquay: *Charges for Heating and Power.*—The Electrical Engineer has been instructed to prepare a report on the possibility of reducing the price of electricity for heating and power purposes.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bray.—The Electrical Engineer, Mr. W. J. U. Sowter, has prepared a report dealing with the proposed extension of the electricity works. He recommends that application be made to the Local Government Board for sanction to borrow £3,500. It is proposed to put down a 150-kw. Diesel-driven alternator, overhead travelling crane, and make certain structural alterations to the existing buildings to accommodate the new plant. The low-tension mains are also to be extended. Mr. Sowter reports that the working of the small Diesel engine, installed some two years ago, has proved so satisfactory that he anticipates it will be possible to reduce the fuel cost by some £350 per annum if the larger set is installed as recommended. The Committee recommend the Council to adopt the Engineer's suggestions.

Burton-on-Trent.—Mains are to be extended at an estimated cost of £678.

Canada.—A company has been formed in Montreal with a capital of £200,000 to carry on an electric light, heat and power business. The name of the company can be obtained at 73 Basinghall Street, E.C.

Dartford.—The Council invite tenders for a high-speed generating set (tandem generators) and three-wire balancer, superheaters, switchboard, and electrically-driven centrifugal pump. Particulars from the Borough Electrical Engineer, and tenders by January 23rd.

Epsom.—New plant is to be provided for the electricity works. Certain mains are to be renewed at an estimated cost of £1,317.

London: *Battersea.*—Services are to be laid to fourteen premises at an estimated cost of £64, and mains are to be laid at an estimated cost of £108.

Hosted by Google

Islington.—The Finance Committee of the L.C.C. recommend sanction to a loan of £2,400 for mains, electrical pressure recorders, and telephones in connection with the electricity undertaking.

Poplar.—The Finance Committee of the L.C.C. recommend sanction to a loan of £3,418 for mains, &c.

Motherwell.—Additional cable is to be laid at a cost of £160.

New Zealand.—The time for receiving tenders for an electric tramway, lighting and power works at Napier has been extended to March 7th. Tenders should be addressed to the Town Clerk, Napier. Copies of the plans and specifications may be seen at 73 Basinghall Street, London, E.C.

Nuneaton.—The Electricity Committee recommend the purchase of new plant at an estimated cost of £7,500.

Swansea.—Tenders are invited by January 6th for water tube boilers, superheaters, and mechanical stokers. Particulars from Borough Electrical Engineer.

Torquay.—The Electricity Committee are contemplating the erection of a new power station.

Tunbridge Wells.—The Electricity Committee recommend application being made for a loan of £6,000 for high and low-tension cable, transformers, services, &c.

Turkey.—Tenders are invited by February 20th for an electric light and power installation in the town of Adalia. Particulars of the concession may be seen at 73 Basinghall Street, London, E.C.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Barnsley.—New public baths.

Bournemouth.—New Law Courts.

Cardiff.—New technical institute in Cathays Park.

Clyde Bank.—New public library.

Dumbarton.—Wiring new poor house and hospital.

Edinburgh.—Tenders are invited by December 28th for an electric lighting and power installation in the Works laboratories at George Heriot's school. Particulars from the Superintendent of Works.

Hamilton.—New Municipal offices.

Hull.—Rebuilding and extension of the Town Hall.

Keighley.—Extensions to the technical institute. Architects, W. H. and A. Sugden, North Street.

Kendal.—Allen Technical Institute. Architects, Stephen Shaw, Kendal.

Leith.—Reconstruction of Bonnington Flour Mills. North British Railway Co.

London.—The sum of £4,000 is to be expended upon renewing the electrical installation in the Blackwall Tunnel.

Macclesfield.—Nurses' Home, extension to Infirmary, &c. Architects, Messrs. Whittaker & Bradburn, 19 King Edward Street.

Manchester.—New Municipal school of domestic economy, High Street.

Portsmouth.—Extensions to Head Post Office. H.M. Office of Works, Storey's Gate, London.

MISCELLANEOUS

Dublin.—The Port and Docks Board require two electric 4-ton portal cranes. Particulars from the Engineer, and tenders to the Secretary, by January 30th.

London: *L.C.C.*—Additional feeder pillars, cable ducts, and cable supports are to be installed in connection with the Victoria Embankment tramways.

South Africa.—The *Board of Trade Journal* states that the Germiston Council propose to raise a loan of £106,690 for electric tramway purposes.

John E. Raworth,
Queen Anne's Chambers, 30, Broadway, Westminster, London, S.W.
Chartered Patent Agent.

REMOVAL. MR. J. G. LORRAIN, M.I.E.E., M.I.Mech.E., Chartered Patent Agent, has removed his office from Norfolk House, Norfolk Street, Strand, W.C., to
Staple Inn Buildings, High Holborn, London, W.C.

TENDERS RECEIVED AND ACCEPTED

Blackpool.—The Electricity Committee have accepted the tenders of the Brush Electrical Engineering Co. for a 800-kw. traction generating set, and the British Thomson-Houston Co. for a 1,500-kw. turbo-alternator.

Dundalk.—Messrs. Siemens Bros. & Co. are supplying the whole of the street-lighting material, comprising standards, cast-iron brackets, lanterns, and "one-watt" lamps for the new street-lighting scheme.

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. T. P. Wilmshurst, Chief Electrical Engineer to the Derby Corporation, has been increased from £600 to £650 per annum, with a further increase to £700 per annum on January 1st, 1913.

Mr. H. S. Ellis, Deputy City Electrical Engineer and Manager, Bradford, has been appointed Chief Electrical Engineer to the South Shields Corporation at a salary of £400 per annum.

Mr. W. C. Bexon, Chief Assistant Electrical Engineer at Kilmarnock, has been appointed Chief Electrical Engineer in succession to Mr. A. H. Burbidge, who, as we have already announced, has been appointed Manager of the Burmah Electric Tramways & Lighting Co., in Mandalay. Mr. Burbidge sails early next month.

Mr. P. H. Buzza, Senior Assistant Electrical Engineer to the Colchester Town Council, has resigned on receiving an appointment in the North of England. The Council have received 134 applications for the post of Shift Engineer, and three applicants have been selected for interview by the Electricity Committee.

Mr. H. Collings Bishop, Engineer and Manager to the Newport (Mon.) Electricity and Tramways undertakings, has resigned.

The following is the short list for the post of Manager to the Newport Electricity and Tramways undertakings:—Messrs. S. T. Allen, Borough Electrical Engineer, Carlisle; H. M. Taylor, Borough Electrical Engineer, Middlesbrough; G. R. Spurr, Borough Electrical Engineer and Tramways Manager, Walthamstow; T. P. Easton, Deputy Manager of the Newcastle-on-Tyne Tramways; A. T. Eardley, Tramway Manager, Stockport; J. H. Rothwell, Commercial Assistant, Wolverhampton Electricity and Tramways Department, and N. J. Young, Bristol Tramways and Carriage Co.

Mr. A. R. Fearnley has resigned his position as Hon. Secretary and Treasurer of the Municipal Tramways Association. In recognition of Mr. Fearnley's services to the Association, he has been presented with an inlaid writing bureau, a set of bookcases, bronze electric lamp, and a pendant for Mrs. Fearnley.

MISCELLANEOUS BUSINESS NOTES

Price of Copper.—Messrs. G. Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars c.i.f. port of arrival, quoted on Tuesday night, was £64 to £64 10s. (last week, £62 5s. to £62 15s.).

Football Challenge Cup.—The following are the results of matches played last Saturday for the "Davis" Challenge Cup:—G.E.C. 9, Edmundsons 0; St. James 6, Drake & Gorham 4; Anti-Attritian 0, Ediswan 9; Siemens 2, Electrical Installations 2.

Change of Address.—Mr. F. B. O. Hawes has now changed his business address to 18 Park Mansions, Vauxhall Park, South Lambeth Road, S.W., to which address all communications both for him and for the Electrical Trades Benevolent Institution should be sent on and after December 23rd.

Mawdsley's, Ltd.—Owing to alterations and extensions to their power plant necessitated by increased output, this firm will be closing their works at Dursley, Gloucestershire, from Friday night, December 22nd, to Tuesday morning, January 2nd.

Meter Approved.—The Board of Trade on Monday last signified their approval of the Electrical Co.'s type E.C. ampere-hour continuous-current meter with self-adjusting brushes and twisted commutator.

The Electrical Apparatus Co.—The new telephone number of the Electrical Apparatus Co., Ltd., Vauxhall Works, South Lambeth Road, is Brixton 2075 and 2076.

Liquidations.—A meeting of the Automatic Trolley Head Co. is to be held at 82 Victoria Street, London, on January 23rd, to hear the liquidator's account of the winding up.

Bankruptcies.—Thomas Topping, electrical and mechanical engineer, 361, Lord Street, Southport, has been adjudicated a bankrupt.

SUMMARY

Under "Electrometallurgy" some notes are given on the electric smelting of iron at Trollhättan, Sweden. (Page 704.)

Two papers have been read before the Birmingham Section of the Institution of Electrical Engineers, dealing respectively with an automatic centrifugal starting device for asynchronous motors, and a circle diagram for three-phase induction motors. In the former a variable ratio gear of particular shape is introduced between the centrifugal force and the tension of the controlling spring. (Page 705.)

At the Newcastle Local Section of the Institution of Electrical Engineers, Mr. A. S. M. Sörensen read an interesting Paper, "A Summary of the Theory of the Production of Electrical Oscillations." (Page 706.)

In an illustrated article the principal features of the equipment of the electrical engineering laboratories of the Birmingham Municipal Technical School are described, with some notes on the methods employed. (Page 707.)

At the last meeting of the Illuminating Engineering Society, Mr. Haydn T. Harrison read a Paper on the lighting of railway premises, drawing attention to the desirability of a definite minimum illumination being agreed upon for railway platforms. (Page 708.)

In his address to the Newcastle Section of the Institution of Electrical Engineers, Mr. C. S. Vesey Brown referred to a number of topics, and gave an interesting comparison of the growth of the capacity and output of central stations and the capital invested in them. He also referred to the wide field now covered by electrical engineering. (Page 708.)

A Paper was read by Mr. P. A. Spalding on small electricity supply undertakings on December 14th, before the Dublin Local Section of the Institution of Electrical Engineers. He favoured suction gas plant for very small stations, and Diesel engines for small towns of over 5,000 population. (Page 709.)

Two patent specifications in connection with overhead trolley wires were published last week. One relates to a coupling which requires no previous preparation of the wires, and the other provides a device for easily replacing and keeping the trolley-wheel on the wire. A bayonet-joint locking device for lampholders is also protected. A patent for a tungsten-nickel alloy has been granted to Siemens & Halske in spite of opposition. Two patents expire during the coming week, after a full life of fourteen years. One describes an electric lift in which two motors drive through worm gear, and the other refers to railway points. (Page 710.)

An illustrated pamphlet on "Motor Drive for Metal Working Machinery" is reviewed on p. 711.

A new shop or shop-window advertising device for displaying goods is described on p. 711.

We describe and illustrate a new high-lift centrifugal pump with several special features, including a patented hydraulic balancing arrangement to eliminate end-thrust. (Page 711.)

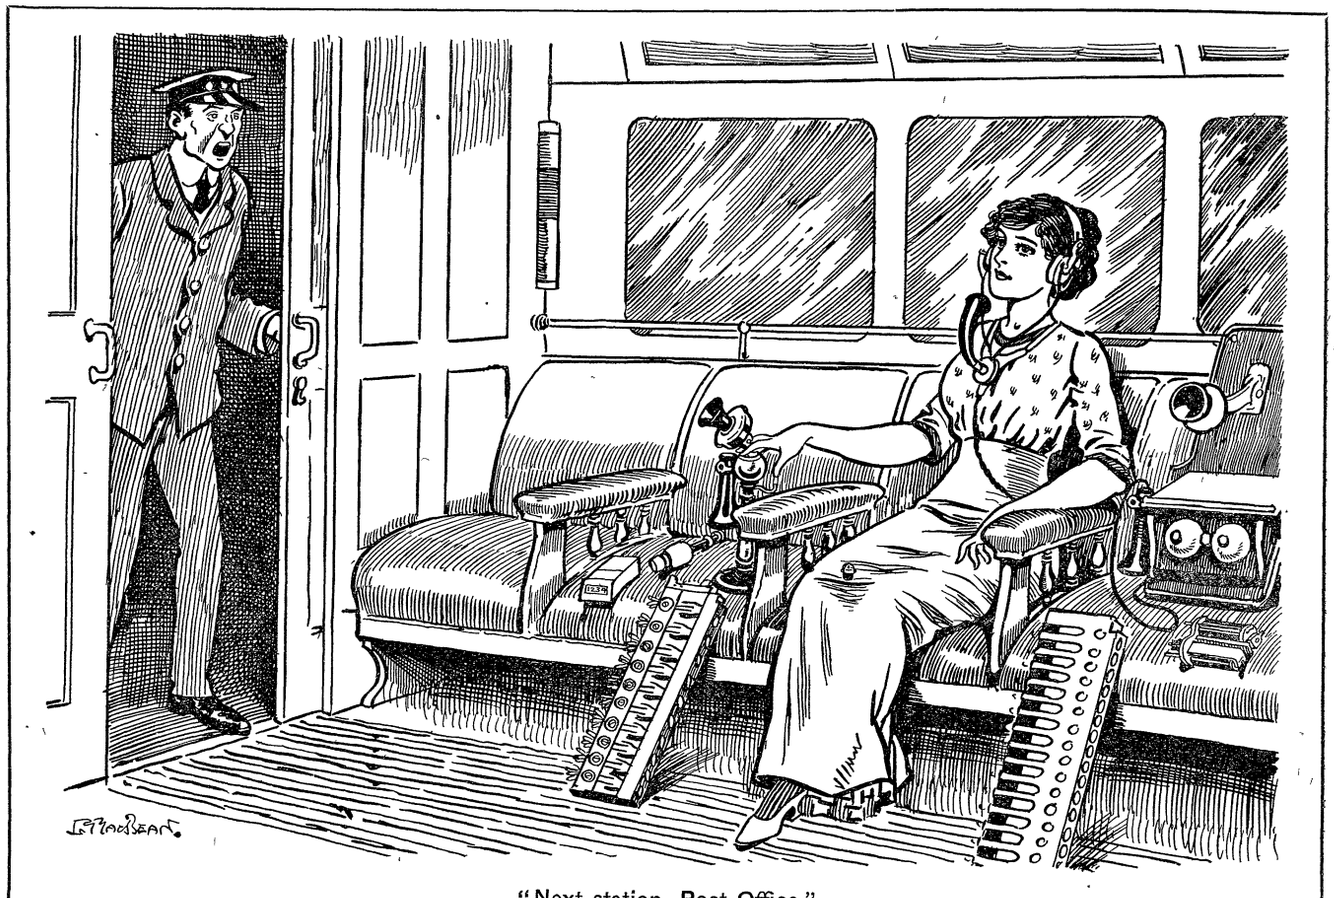
In our "Electric Traction Notes" we give some particulars of the Aurora, Elgin and Chicago Railroad Co.'s power house, which supplies current to 175 miles of third-rail track and 73 miles of trolley lines, besides lighting and power to eight towns. In consequence of a strike the Llanelly tram service has been entirely suspended. (Page 712.)

The automatic telephone exchange at Epsom is expected to be ready by January 15th.—The Postmaster-General is unable at present to continue the underground telegraph line to Dundee and Aberdeen.—Under "Telephony and Telegraphy (including Wireless)" we also give particulars of the present position of the Helsby Wireless Telegraph Co., Ltd. (Page 712.)

Hosted by Google

EXPERIMENTS are to be carried out with street electric lighting in Belfast.—The excess in the estimates of the street lighting at Hampstead is to be met out of reserve and repaid in seven annual instalments.—The Newport (Mon.) Electricity and Tramways Committee are meeting with some criticism of their methods of dealing with the managership of the undertakings.—The output at the Greenock Electricity Works has now reached 1,000,000 units per month. (Page 713.)

A LOAN of £20,000 is to be applied for at Greenock and one for £19,000 at Norwich.—Tramway extensions at an estimated cost of £151,000 are contemplated at Belfast; twelve new tramcars are to be built at Southampton, and fifty at Birmingham.—A scheme for considerable extensions at the Hackney Electricity Works is being prepared. (Page 713.)



THE Newcastle Local Section of the Institution of Electrical Engineers have formed a Students' Section. There is every prospect of a large membership. (Page 714.)

ELECTROMETALLURGY

ACCORDING to Mr. J. A. Leffler's report to the Swedish Association of Iron Masters, the electric smelting of iron ores at Trollhättan in Sweden is making great progress. The furnace, which is the design of Grönwall, Lindblad, and Stahlane, was made to produce 23 tons per day of 24 hours. It consists of two main portions—the shaft and the crucible, or hearth, which is connected by a sand seal. The structure is 45½ ft. high, and the distance from the bottom of the hearth to the furnace top 42 ft. The hearth is made of a shell of steel plates lined with firebrick. A Tholander charging bell and cone is supported at the top of the shaft. The hearth rests on a concrete foundation, and is enclosed by a sheet-iron shell. This hearth or crucible has an arched roof of firebrick, and is supported by the top of the casing, which is suitably reinforced. The hearth is lined with firebrick and magnesite bricks. The bottom, which is dish-shaped, consists of a mixture of magnesite and pitch rammed in so as to extend some way up and along the walls. Four converging electrodes, each made up of four carbons, project through the roof into the crucible at an angle of 65° to the horizontal. The electrodes are surrounded by cooling jackets of copper, which are asbestos packed to prevent leakage of the gases. The gases are drawn from the cool upper portion of the furnace by means of a fan, and, after being freed from dust, are blown under the hot roof of the crucible, the life of which is considerably prolonged thereby, as overheating is prevented. Also the gases, being thus heated, assist in the reduction of the ore within the shaft.

Electrical energy is supplied at 10,000 volts, three-phase, 25 cycles, and two 1,100-kw. transformers step down to 50 to 90 volts, or 100 to 180 volts two-phase. The low tension leads from the transformers are made of six copper bars for each electrode, and 48 cables are used to conduct the current to each electrode. During five months' working the following are the mean results obtained: Iron in ore, 61·54 per cent.; iron in charge, 57·00 per cent.; slag per ton of iron, 327 kilog.; energy used per ton of iron, 2,391 kw. hours; iron per kilowatt-year, 3·66 tons; electrode consumption per ton of iron gross, 10·28 kilog; nett 5·27 kilog. The pig iron contained on the average carbon 3·2 per cent., silicon 0·3 per cent., manganese 0·3 per cent., sulphur 0·028 per cent., and phosphorus 0·015 per cent.

T. D. Robertson gives some further particulars in *Metallurgical and Chemical Engineering*, 1911, IX., 525. After working for five months, the thermal efficiency was found to be 80 per cent. This compares with 82 per cent. in the Swedish charcoal blast furnace, and 70 per cent. in the British blast furnace. The conditions which govern the grade of the iron produced in this electric furnace are the same as those which obtain in the ordinary blast furnace, with this difference, that the irregular influence of the air-blast is absent. The best output of the furnace is obtained when white iron is being made. Grey iron requires a higher temperature, and, therefore, a greater power consumption. Certain improvements have been made in the electrodes, which are now cylindrical and have screw joints; consequently, when an electrode gets too short, a new one can be screwed on above it, thus preventing loss owing to stump ends. The electrical contact also is now made at the point at which the electrode enters the roof of the furnace. Owing to this there is a saving of 60 kws., and the furnace can now take up 3,000 h.p. instead of 2,500 h.p. Improvements have also been made in connection with the gas circulation.

"Next station, Post Office."

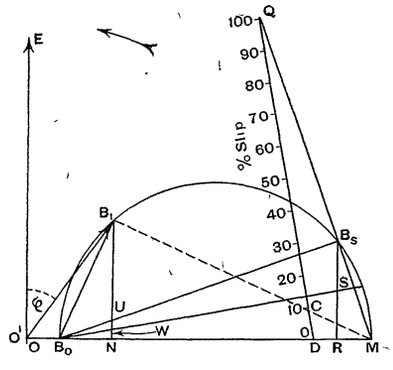
INDUCTION MOTOR PROBLEMS

Automatic Starting



A PAPER was read on December 13th by N. Pensabene-Perez before the Birmingham Section of the Institution of Electrical Engineers, dealing with the automatic starting of induction motors. The arrangement considered is that of resistances placed in the rotor phases, which are cut out gradually by contacts attached to arms by centrifugal force against the action of a spring, as the speed increases. In order to keep the starting current constant, there must be equilibrium between the centrifugal force, the tension of the spring, and the friction for any position of the contacts, that is, for a certain resistance of the starter and a speed corresponding to the slip at this resistance. These three functions are then embodied in a general equation of equilibrium for constant current starting, in which a variable ratio gear is introduced between the centrifugal force and the tension of the spring, so that the equation may be satisfied for all positions of the contacts if the value of the ratio gear be conveniently varied.

The author then proceeded to describe his device for a three-phase wound rotor that will fulfil the above conditions. This consists of three discs wound with flat German silver strip, insulated with asbestos paper, and clamped together with two cast-iron end discs. On the periphery of these, a pivoted bar is mounted for carrying the arms and contacts, which slide along the polished faces of the discs. The resistances are so connected to the phases that the weight of the arms opposes the motion of the contacts. Besides the ratio gear, an auxiliary weight is also provided, the combination of the two moving the arms, by centrifugal force, against the action of the spring.

A differential equation is deduced analytically for determining the shape of the ratio gear, and a graphical solution is also given. In considering the reliability of working, it was found that the sticking action, that is, the difference between the dynamic and static friction, caused very irregular working; the motor would stop accelerating if the load exceeded a certain value, while if it were reduced, the speed would suddenly increase to that of full load, accompanied by a rush of current. In order to reduce this increase of speed to overcome this action, the ratio between the spring tension and the static friction must be as large as possible. The time necessary for starting is calculated by a graphical method, which shows clearly the advantage of having a large number of contacts.

The Circle Diagram for Induction Motors

THE performance of the induction motor as shown by a circle diagram was the subject of a Paper read by T. F. Wall, at the Birmingham Section of the Institution of Electrical Engineers, on Wednesday, December 13th. As a preliminary, curves were given to show that the rotating field lagged by 90° in phase behind the current, the rotating field vector being drawn in the same direction as the e.m.f. induced by it. A figure showing vectors drawn in this way

CURRENT CIRCLE DIAGRAM.

was then considered, from which an expression for the torque of the motor was deduced, namely, the height of the extremity of the current vector above the diameter of the circle. This is represented in the accompanying diagram by B_1N, on which the author now proceeds to represent the power, slip and losses of the machine. Neglecting the stator resistance, which is very small, the power developed is given by the

Hosted by Google

input minus the C^2R losses in the rotor winding. If OB_1 is the stator current, and the applied pressure be assumed constant, then B_1N also represents the stator input. From the similar triangles B_0B_1N and B_0MB_1 it can be proved that UN is proportional to the square of the rotor current. Again, when B_1 coincides with the short-circuit point B_s the stator input B_sR is equal to the rotor C^2R loss, so that B_1U is proportional to the stator input minus the rotor C^2R losses, that is, to the motor horse-power. The difference between the power supplied to, and the power developed by, the rotor, viz., the torque multiplied by the slip, gives the power lost in the rotor windings, and since the iron losses are very small, the product of the torque and the slip may be said to be equal to the rotor C^2R loss, that is, on the diagram

$$\text{slip} = \text{constant } \frac{UN}{B_1N}.$$

Then, by joining MB_s and producing to Q, from which a perpendicular QD is dropped, and taking similar triangles MCD and B_1NB_0, QMD and UB_0N, the slip is proved to be proportional to CD. The stator resistance is now introduced, and assumed to be so small that the stator flux remains constant. The current necessary to supply the iron losses assumed constant is represented by O_1O. If O be taken as the origin of the stator current vectors instead of O_1, the circle diagram will give the total stator current per phase. Supposing that B_0B_1 be the stator current vector, which, by neglecting the C^2R loss due to the magnetising current O_1B_1, makes B_0B_1 equal to O_1B_1. Then, by similar reasoning as before, UN will give the C^2R losses for the stator current O^1B_1, and this will be the case for any point B_1 on the circle. These losses may be split up between the stator and the rotor, by dividing B_sR into two parts, SR and SB_s, representing the stator and rotor resistances respectively. Then UW will always give the rotor C^2R loss, and WN that of the stator, so that B_1W will be the power supplied to the rotor, that is, the torque of the motor. The slip is found, as before, to be proportional to CD. An example to show the accuracy of this diagram was then given.

DISCUSSION.

The discussion of the two Papers was taken together.

Mr. LINDSAY FORSTER (Chance Bros.), in commenting on the first of the two Papers, pointed out that the problem resembled to a considerable extent that involved in the design of centrifugal governor gear for steam engines. If the direction of rotation was clockwise, the outward movement of the weight and arms would be assisted and *vice versâ* for counter-clockwise rotation. In governor design it was very essential to provide for a considerable excess of operating force over the pull of the spring so as to overcome the difficulty due to static friction. The position in which the spring was fixed was of great importance.

Dr. C. G. GARRARD (General Electric Co.) disagreed with the claim of Mr. Pensabene-Perez that a considerable saving was effected by his arrangement as compared with the cost of a slip-ring motor and separate starter. Mr. Pensabene-Perez started by a mathematical analysis of the problem, and further on in the Paper discarded mathematics for graphics. The whole point of this analysis was to prove that the operating force must be large in comparison with the friction, and it did not appear to him necessary to make use of mathematics to demonstrate. As far as he could understand the device, it was only suited for starting against a particular torque; he wished to know whether it would adjust itself to torques of different values.

Mr. S. P. SMITH congratulated Mr. Wall on the new method of developing the circle diagram, but he confessed that he did not think it simple. He could not understand the rotating vector to represent the rotating field, nor did he see how the E.M.F. vector could be made to coincide with that of the rotating field. Further, he could not follow the author in his statement that the rotor current was in phase with the rotor flux which produced it. The rotor current was practically in phase with the rotor E.M.F., and the rotor E.M.F. was 90° behind the rotor flux. He considered the circle diagram was not of much use for small motors up to 50 h.p., but found it very valuable for the design of large motors.

Dr. COALES thought the method indicated by Mr. Wall for finding the B.H.P. and torque would be very useful. He described a method of developing the circle diagram which was derived from Dr. Kapp's transformer diagram. In view of a demonstration by Dr. Kapp at the same meeting of an apparatus for testing the endurance of metals under often-repeated stresses, the two authors were requested to communicate their replies to the discussion in writing.

At the end of the meeting an oscillograph demonstration was given of the starting current of two motors, one fitted with the Pensabene centrifugal starting device, and the other connected to an ordinary starting rheostat. The current reached far higher momentary values with the latter motor.

ELECTRIC OSCILLATIONS

A PAPER entitled "A Summary of the Theory of the Production of Electric Oscillations," by Mr. A. S. M. Sörensen, was read on November 27th before the Newcastle Local Section of the Institution of Electrieal Engineers. Treating first the single circuit, the author deduced the Thomson-Kirchhoff approximate value $2\pi\sqrt{LC}$ for the period of the discharge, and the expression R/2NL for the logarithmic decrement. He distinguished between the reckoning of the decrement on the basis of the full and half period, but showed that it was possible for two consecutive periods to show a considerable difference, while all complete periods were exactly alike. It was more consistent to distinguish between damping in relation to a wave train and distortion in wave form in relation to a single oscillation. The selectivity of a wave train depended on the damping of the train.

Formulæ were then worked out for coupled circuits, and it was then pointed out that in practice the logarithmic decrement was not constant, owing to the various additional losses due to such causes as dielectric hysteresis, brush discharge, radiation, and the spark itself. It was necessary to know the relation between the difference of potential at the electrodes, and the current in the discharge, or, as it was sometimes called, the characteristic. For an ordinary conductor possessing only ohmic resistance, the characteristic was a straight line, and for a continuous current arc it was a hyperbola. In the case of an alternating arc, or a continuous current arc with superimposed alternations, it was a closed curve called the dynamic characteristic, exhibiting a sort of arc-hysteresis.

There were three different types of oscillations to be considered. The first type of oscillations occur when the amplitude of the oscillations is smaller than the direct current. The dynamic characteristic is of the closed (elliptical) type, and the current curve nearly a pure sine-wave. With increasing frequency the arc-hysteresis will increase the phase-difference between potential and current, and therefore the output decreases. This case is represented by the Duddell singing arc, and as is known, this generator cannot produce any appreciable amount of energy for the frequencies used in radiotelegraphy. In the second type, the oscillation amplitude is greater than the direct current, showing a very different procedure. The current in the arc must be the sum of the direct current and the alternating current, and consequently at a certain moment becomes zero, *i.e.*, the arc is extinguished, and the potential difference at the electrodes falls from the value belonging to the burning arc to that of the condenser, which will then charge up under constant current (the direct current), and the potential will accordingly rise, along a straight line. At the moment this potential reaches a sufficiently high value to bridge the arc-gap, the arc is re-lighted, and the arc potential immediately falls to that corresponding to the arc when burning. When the arc is re-lighted the condenser discharges through the burning arc until this again causes the arc to be extinguished, and so on; but if at this moment the condenser potential is sufficient to break down the gap, the arc will re-light in the opposite direction—in other words, the condenser discharge will be continued; and this may go on for several oscillations, until the arc finally dies out; then a second interval, as in the case of oscillations of the second type, sets in, the condenser charges up, and the process is repeated. During the condenser discharge, however, no energy is supplied to the condenser, so that a short train of strongly damped oscillations of the third type is generated in each period. A special case of the third type of oscillation with a very long second interval is nothing but the ordinary oscillatory spark discharge.

New Squirrel-cage Induction Motor.—A recent issue of the *Elektrotechnische Zeitschrift* describes an induction motor constructed by the firm of Paul Dassenoy, of Metz. The stator is of the normal design, but the rotor is divided into two portions. One is simply a short length of unwound stampings, while the other is an ordinary squirrel-rotor. These two are connected together and are moved relatively to the stator automatically or by means of a lever or screw action. When the machine is connected, the squirrel-cage rotor is hardly in the field, and the auxiliary rotor merely provides a magnetic circuit of low resistance, so that the starting current is low. On pushing in the other rotor, both torque and speed increase.

Faraday House.—The next term opens on January 8th, when a fresh course of instruction will be commenced. The entrance examination will be held on Friday, January 5th.

THE ADVANCED ELECTRICAL ENGINEERING LABORATORIES OF THE BIRMINGHAM MUNICIPAL TECHNICAL SCHOOL

THE Electrical Engineering Department of the Municipal Technical School, Suffolk Street, Birmingham, has not only an extensive and complete equipment, but there are a number of points of interest in the way it is used for educational purposes, and the systematic scheme which has been developed for the students to follow the various tests and experiments, after having completed two years' elementary work. Mr. H. B. Matthews, who is senior lecturer and demonstrator in electrical engineering under Dr. W. E. Sumpner, the Principal, has put before us a quantity of information regarding the department, from which we have made the following notes on the general features of the equipment and the methods employed. A general view of the main dynamo room with its switchboard is seen in Fig. 1, while Fig. 2 shows another test room.

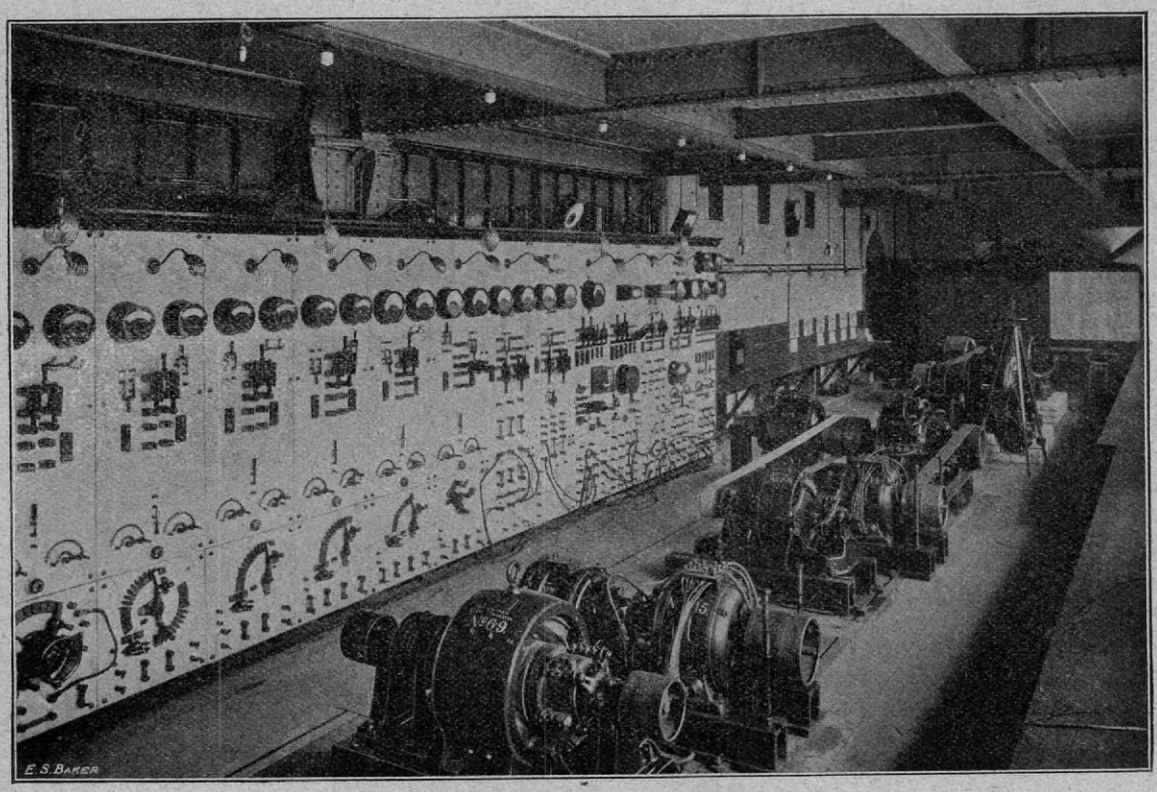

FIG. 1.—MAIN DYNAMO ROOM, SHOWING SWITCHBOARD.

As far as possible the design of the different panels of the switchboards is uniform; double or triple pole switches and fuses are employed throughout, and the respective poles or phases are distinguished by colours as well as position. All D.-C. generators are connected directly to switch centres, and A.-C. generators to terminals easily linked to switch centres. By switching the double throw switches up the machine is put on its bus-bars, and by switching down it is put on experimental terminals and may then be easily linked to experimental bus-bars or other points. All instruments and fuses are, of course, on the machine side of these switches. Wattmeter and distribution panels are disposed in the centre of the alternating-current part of the large main 14-panel switchboard, and the latter are arranged somewhat on the plan of a telephone board, so that it is possible with very little trouble to insert extra instruments in any part of the laboratory in the circuit of any generator, and also to connect any other board with the main switchboard. The labelling and numbering of terminals, &c., is very complete. The proper storage places are marked on all portable instruments, as well as being given in printed lists. Everything is standardised where possible. The normal peripheral speed of all the driving pulleys is the same, so that any machine may be used for driving any other, and the disposition of the machines in the large laboratory is such that all may be driven by any one as motor by means of direct coupling, belts and special double pulleys. Also, in general, any machine may be driven by any of the three neighbouring machines without change of position.

In allotting the work to the students, a large chart is first made showing work for seventeen evenings employing a maximum of 36 students in six groups, giving a separate duty for each student. Each group has one machine assigned to it to carry out various tests on successive attendances. A large diagram shows the permanent and temporary connections

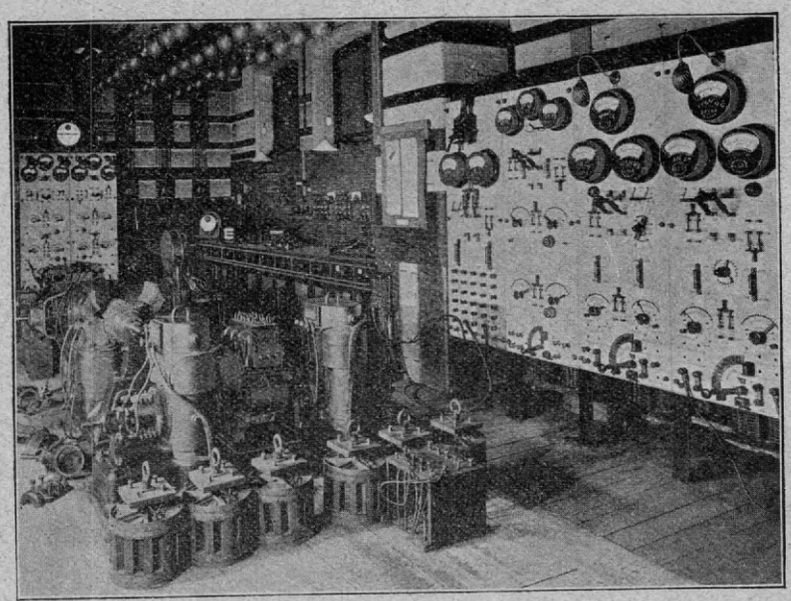

FIG. 2.—ONE OF THE SMALLER ELECTRICAL LABORATORIES.

Hosted by Google

for each evening's work with those relating to each group, in different colours, and each student is supplied a week in advance with a six-page book relating to the test, consisting of a text sheet with a general description of the test, a tabulated sheet of typical results, a similar blank sheet to enter up the results, a typical curve sheet, a blank curve sheet, and a diagram of connections. Inserted in each book is a direction form, which indicates the individual duties of the student, the instruments he uses, with any necessary caution concerning them, and the columns of record sheet, for which he is responsible. At the beginning of the course, the student is supplied with a file for these test books containing also diagrams of connections of the switchboard panels which he will use, explanatory sheets relating to the organisation and arrangement of the laboratory, the procedure in group testing, &c., and lists of instruments, machines, tests, and official abbreviations, symbols, &c. Each group is under a "charge man," who is supplied with an assignment form indicating the duties of each member of the group.

A special feature of the equipment is a Duddell double projection oscillograph, fitted up in a dark room in such a way that while testing students are able to see wave forms from their machines. A special switchboard enables this to be connected to any two circuits in the laboratory. Various demonstrations are given with the apparatus.

It is impossible to particularise all the plant and apparatus composing the equipment, but some idea of the extent may be gained from the statements that there are about 60 voltmeters and 60 ammeters; 12 wattmeters, and 6 power factor meters, in addition to frequency meters and synchronisers mentioned in the lists, 24 machines ranging from 0·75 to 25 kw., over a dozen transformers, and that the eight switchboards include over thirty panels, in addition to 22 terminal boards in various parts of the laboratories. There are many other details which could be mentioned to show the completeness of the organisation, which is evidently well suited to the handling of numbers of students too large to rely on individual attention, and at the same time avoiding delays in the work and inculcating methodical habits.

ILLUMINATION OF RAILWAY PREMISES.

IN a paper read before the Illuminating Engineering Society on December 19th, Mr. Haydn T. Harrison dealt with some aspects of railway station and goods yard illumination. He drew attention to the desirability of a definite minimum illumination being agreed upon for railway stations of various classes, and suggested 0·25ft. candles. In the case of stations with lofty roofs, his contention that arc lamps hung high up should be used as a general illumination, in addition to small units of light, such as tungsten lamps, at a lower level, received the assent of most of the speakers on the discussion, including Mr. Roger T. Smith, of the Great Western Railway Co. Mr. Smith, however, regards the minimum of 0·25ft. candles as unduly extravagant, and whilst willing to adopt it for terminal stations, preferred to take 0·15ft. candles for large intermediate stations and for small wayside stations, what Mr. Trotter once called "beacon" lighting only would be necessary. Mr. Harrison's views may be summarised as follows: as all railway stations are used for similar purposes, though in different degrees, the standard of illumination should be similar, but means should be provided at those stations where such a degree of illumination is not required except at rare intervals, whereby the cost of lighting is reduced, but by reducing the illumination to a lower value when the platforms are not in use. For goods-yard lighting, Mr. Harrison recommends large units of light, such as 12 amp. flame arc lamps with dioptric or similar globes on masts 50ft. high. Such a lamp would, he said, cover a radius of 125ft. with a minimum horizontal illumination of 0·1ft. candle. The maximum illumination would not exceed 2ft. candles.

The discussion rather tended to emphasise that the lighting of railway premises is taken somewhat out of the category of ordinary illumination to the extent that policy plays a very important part indeed, and frequently outweighs any question of merit. For instance, Mr. Roger Smith gave a case where with gas at 5s. 6d. per thousand and electricity at ½d. per unit, it would pay the railway company to use gas on account of the business it had of carrying the coals for the gas undertaking. Further, whilst the railway companies give sufficient illumination to ensure the safety of the public, they do not feel called upon to aim at any ideal, especially where this entails considerable expense.

In the case of the London tube railways, the position is very different. Here, as Mr. Harrison pointed out, every care has been taken to give ample illumination at the stations. Especially good are the stations where 100 c.p. tungsten lamps with obscured lower parts are used, suspended in large opal glass shades. Not only is the average illumination good, viz., 0·3 ft. candles, but the maximum, which is generally found to be 2·5, is not excessive. Further, the cost is very moderate, as the total candle-power and watts per 1,000 ft. of platform being about 3,500, the consumption of energy is very low. At the same time, Mr. Harrison expressed surprise that more advantage is not taken of the excellent reflecting properties of the glazed white walls which predominate in these stations. Mr. J. S. Dow had taken a reading of the illumination at a considerable number of London tube stations, and obtained figures more or less in agreement with those given by Mr. Harrison. In many cases they showed that a great development is taking place towards getting an absolutely uniform illumination, this being particularly noticeable at the British Museum and Golders Green stations. The use of lamps fitted in recesses in the roof and covered with Holophane reflectors are important factors in this result. With regard to taking more advantage of the reflecting properties of the white glazed tiles in tube railway stations, Mr. C. Grove, of the Central London Railway, said that these were now becoming more and more covered with advertisements, and hinted that this was, at any rate, one of the reasons for the improved lighting schemes now being put into force, viz., to fulfil the railway company's side of the bargain with the advertiser.

INAUGURAL ADDRESS TO THE NEWCASTLE SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS

MR. C. S. VESEY BROWN delivered his inaugural address as Chairman of the Newcastle Local Section of the Institution of Electrical Engineers, on Monday, December 11th. After thanking the members for electing him to be Chairman for the current session, he proceeded to review briefly the history of the Institution, the formation of Local Sections, and the training of electrical engineers. He pointed out that the Local Sections were formed some ten or eleven years ago to obviate the multiplication of local societies, which were being formed by groups of engineers interested in particular applications of electricity. It had been arranged to form a Students' Section in Newcastle, as it was felt that there was a large number of young engineers in the district who did not care to speak at the meetings held at present, but who would willingly take part in discussions amongst younger members. The kw. capacity of public generating stations had increased nearly tenfold during the last ten years, while the output in units had increased about fiftyfold and the capital invested nearly eightfold. The only large increase he could foresee was in the direction of railway electrification, and in electrochemical and metallurgical processes requiring a cheap and reliable power supply. Regarding the training of electrical engineers, he pointed out how wide a knowledge a man in their profession had to have, and how this could only be compared with the medical profession in the variety and rigidness of the knowledge required.

He thought that the objects outlined in the Charter of the I.C.E. applied to the I.E.E., as nearly all the members were engaged in the application of "one of the great sources of power in Nature." In his opinion the mental training induced by the logical sequence of problems which Euclid presented was the finest exercise for the balanced mind required in the solution of engineering problems. With regard to examinations, he thought that little or no account could be taken in them of a student's ability to express his ideas in writing. The system of allotting marks was also open to criticism.

SMALL ELECTRICITY SUPPLY UNDERTAKINGS

A PAPER, by Mr. P. A. Spalding, with the above title was read before the Dublin Local Section of the Institution of Electrical Engineers on December 14th. The author remarked that it was the ambition of some of the larger supply companies to control as extensive an area as possible, and to supply in bulk all the small towns and villages that are within this area. Under the improved conditions brought about by recent developments in gas and oil engines, and the introduction of the metal filament lamp, however, electricity could now be generated locally at a price against which the large supply company would find it hard to compete.

Taking first small areas and populations from 1,000 to 5,000, the importance of initial capital expenditure being just within the smallest possible limits was emphasised. The station buildings should be of simple design and economically constructed, and the site should be central in the area of supply. Below 100 b.h.p. the author preferred suction gas engines to any other form of plant, although the repairs and depreciation were, in his opinion, higher than with Diesel engines, and regarded accumulators as essential. The size of the initial plant installed should be based on the estimated probable maximum demand during the first two years only. The distribution should be on the 220-volt continuous current two-wire system, using overhead uninsulated mains wherever possible. The tariff should be on the contract system for lighting, with a free wiring scheme for small consumers, and meters should be avoided.

For small towns of population 5,000 to 15,000, the generating plant will be of such a size that Diesel oil engines will have a decided advantage, especially as regards their rapid starting up and economy on light load, although their capital cost is higher than that of suction plants. Steam plant cannot compete unless coal can be obtained at less than 9s. per ton. Even for undertakings of this size, the author sees little advantage with the three-wire system, while with pressures above 220 volts it will probably be forbidden. The only real necessity for 400 or 500 volts is for power or traction purposes. The author briefly reviews the subject of tariffs, favouring generally some form of contract system rather than prepayment meters for small consumers.

The latter part of the Paper describes some features of the system at Galway put down twenty years ago, where water power is used, with a suction gas plant as a stand-by. The mains originally laid were thin split copper tubes covered with shellac varnish, supported on glazed earthenware insulators at 6-ft. intervals in 6-in. sewer pipes, with six conductors in each pipe. Recently some new feeders of this tubing were put down in fibre conduits. The latter were ordered in 6-ft. lengths; each tube is of split, hard-drawn copper, tinned at the ends; the internal and external diameters are respectively $\frac{3}{4}$ in. and $\frac{7}{8}$ in. The fibre conduit was supplied in 5-ft. lengths, each 2 in. internal diameter, with sleeve joints which were made watertight by means of a paste composed of linseed oil and whiting. The copper tubes were joined by driving the ends into one another and running solder through the joints. A special ring insulator of glazed porcelain was fitted to each length before the tubes were jointed; these insulators are an easy fit inside the conduit, and serve the purpose of supporting the copper tubes centrally along and clear of the conduit. The capacity of each conductor is 200 amperes, at a density of 800 amperes per square inch; the total cost of each feeder, including all material and labour, averaged, roughly, 7s. 6d. per yard of trench. A special overhead bare copper main supplies a seaside suburb $1\frac{3}{4}$ miles from the generating station.

In conclusion, the author analyses some average figures from electricity supply accounts, and observes that to ensure a reasonable profit, the average revenue per unit sold should not be less than twice the working costs.

Discussion.

Mr. W. J. U. Sowter (Electrical Engineer, Bray) thought many people rather lost sight of the fact that the cost of maintenance of water-power plant was often so heavy that it would have been a better policy to have gone in for internal combustion engines. He was under the impression that suction gas plants were too troublesome and unreliable for small schemes where they had to be run with as little skilled labour as possible. He had had some experience with Diesel plant, and was of opinion that it was entirely suitable for any scheme up to 600 kw., and even for larger plants where coal was expensive. With Wolf locomobile plant, the working costs would probably be substantially less than either suction gas or Diesels if steam coal could be obtained at a reasonable price. There were very few districts in which anthacite beans, suitable for producer plants, could be obtained under 25s. per ton. Mr. Sowter doubted whether it was always policy to instal accumulators in these small places owing to the difficulty of expert supervision. Gas or Diesel engines cost very little to run continuously, and if there was any day load at all, it would probably be better to dispense with batteries altogether. Continuous current had had altogether too good a time in the Paper, and the speaker suggested that there were many quite small places where alternating current could be used with advantage, particularly on the score of low capital cost.

Mr. A. E. Porte had put down a small scheme recently, and the prices he obtained for a complete system, including mains, wiring, buildings, and general equipment, including two 30-kw. generating sets, were, for Diesel plant, £4,400, and suction gas plant, £3,830. The Diesel plant was undoubtedly better in every way than the gas plant. There was only one-half the weight of fuel to handle, while there was no dirt or refuse to be dealt with. The running costs of three similar plants with the different type engines were as follows: Diesel, £189; ordinary oil engines, £383; and suction gas, £224. Mr. Porte did not consider that the prospects of these small undertakings were any better than a few years ago, as the plant was no cheaper, and, owing to the introduction of metal filament lamps, very much larger areas had to be covered than formerly to sell the same amount of energy, which naturally added to the capital costs.

Mr. G. F. Pilditch (Chief Electrical Engineer, Rathmines) thought that the plant of the future for small undertakings was undoubtedly either gas or oil engines, as their low running cost was a generally accepted fact. It was impossible to say generally whether batteries should be used or not—each case must be decided individually. Regarding the contract system, the cost of meters was now very low, and, moreover, they could obtain sufficient rental to pay for repairs and capital charges. He would like to know how the author proposed to deal with heating and cooking demands where the contract system was in use; double systems of wiring for the two classes of supply were bad. Free wiring was an absolute necessity in many cases. The hiring charge, however, should be based on the cost of the installation, and not be an extra charge per unit consumed.

Mr. G. M. Harriss (Dublin United Tramway Co.) considered that alternating current was preferable in many cases, and he did not think balancing was a very difficult matter where three-wire systems were used. Overhead mains where the houses to be supplied were near each other were a mistake, and underground mains came out cheaper in the end. Having had experience of contract systems, he could not say too much to condemn them, and any undertaking starting such a system was putting a millstone round its neck—it was not business, and consumers should pay for what they actually used.

Major Davy considered that a low voltage was preferable to a higher one for the object in view. He had noticed that in Switzerland every village had its supply, which was probably due to cheap power, cheap distribution, and cheap house wiring. Major Davy thought that the reason why developments were so slow was probably due to the fact that the new lamps were so efficient that it was realised the demand was now so small that it would not pay in many cases to put down a station at all in many instances; he did not agree with the contract system, and noticed that while Mr. Spalding got more revenue per lamp on the contract system, he did not state how much the cost of supplying a lamp on that system had increased.

Mr. Wm. Tailow thought that low-pressure systems would be difficult to work in many small places, because the houses were very straggly and covered a large area. Overhead wiring need not be the unsightly job it was often made. Prepayment meters would be the most suitable method of supplying the working classes, but, unfortunately, he had never seen a prepayment meter which was mechanically good.

Mr. P. A. Spalding, who briefly replied, said he thought that most of the apathy in starting these schemes was due to the action of local authorities, who obtained an order simply for the purpose of stopping private enterprise, or else were afraid to embark upon a scheme which might not be financially successful. With reference to contract systems of charging, the running costs of charging, the running costs of modern plant were very small, and the contract charge guaranteed all the fixed charges and a good deal over for running costs and profit; in Galway he had succeeded in doubling the number of consumers in a period of four years, while the station had previously been running seventeen years, which, he thought, was strong testimony as to the popularity and efficacy of the system. He was strongly in favour of the I.M.E.A. Bill; free wiring was very remunerative; he advocated two systems; one deferred payment spread over, say, 18 months, or possibly a pure hire system, charging 10 per cent. of the cost of the installation as rental.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Dec. 21, 1911

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

27,711/10. **Trolley Wire Couplings.** A. MATHER and A. BARLOW. A tubular casing is provided with two pairs of lugs, between each of which a steel grip is eccentrically pivoted. The tops of the grips are connected by a spring, while the bottom of each, which extend through slots in the casing, is toothed. The teeth are directed towards one another, so that the greater the outer pull on the wire the tighter will be the grip. This makes a simple device, as the wires have only to be inserted in the casing. Three figures.

29,425/10. **Lamp Locking Device.** E. CHEADLE. A metal ring, which is grooved inside, contains a tongue spring with a catch and two slots parallel with the existing bayonet slots in the holder, so that the action of inserting the lamp causes an automatic movement of the ring, the spring fixing itself into the slots in the holder, and forming a perfect lock, which can only be released by a special key. Fourteen figures.

1,295/11. **Overhead Trolley Wires.** J. W. THOMPSON and J. FINNIGAN. A device for easily replacing the trolley wheel on the wire, consists of attaching a metallic cover of angular shape in electrical contact with a support which is fixed to the wire. The trolley wheel coming into contact with the inclined sides of the cover at once lights up the car, and is directed on to the wire at the apex. Four figures.

Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, E.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

Arc Lamps: GES. FÜR MASCHINEN- UND METALL-INDUSTRIE, 27,942/10; SCHIFF [Carbon electrodes] 17,690/11.

Dynamos and Motors: BROWN, BOVERI ET CIE. [Excitation of induction machines] 25,397/10; SIEMENS BROS. DYNAMO WORKS [Regulating frequency of rotary field generators] 28,081/10; BOTTONE [Current generators] 28,612/10; SIEMENS SCHUCKERTWERKE GES. [Speed regulation of polyphase series motors] 13,877/11.

Heating and Cooking: OGDEN, HAY, and TEMPLETON [Ovens] 28,129/10; TRUMPLER [Regulation of heating apparatus] 30,201/10; VERITY'S, LTD., and FLETCHER [Oven construction] 22,021/11.

Storage Batteries: KAMPERDYK [Plates] 28,419/10.

Switchgear: LOFQUIST [Electromagnetic switches] 10,652/11; TURNER and WILKINSON [Controller for lifts] 13,469/11; FAGERLUND [Automatic switches] 17,284/11.

Telephony, Telegraphy, and Signalling: VARLEY [Making and breaking contacts in wireless signalling] 20,585/10; LEETE [Cover for telephone mouthpieces] 4,000/11; O'NEIL [Signalling apparatus for ships] 9.428/11; VON KRAMER [Inductive wireless installations] 10,857/11.

Traction: FEHR [Automatically actuating track points] 29,410/10; KLOSE [Actuating signals on trains, &c.] 2,600/11; LAKE (*United States Light & Heating Co.*) [Mounting dynamos on trains, &c.] 3,722/11; BALACHOWSKY and CAIRE [Electrically-propelled vehicles] 7,062/11.

Miscellaneous: RAY [Massage, electric, &c.] 23,225/10; ALEXANDER (*Anderson Winding Machine Co.*) [Winding coil machines] 28,330/10, and [Windings, and methods of binding turns and layers] 18,921/11 and 18,922/11; MERSHON [Forming dielectric films in electrolytic cells] 28,352/10; MCNEIL [Automatic fire-alarm systems] 28,978/10; RUSSELL [Batteries] 28,986/10; THOMPSON [Magnetic separators] 29,052/10; WESTMANCOTT [Hand-lamp] 3,374/11; MCQUOWN [Lantern for exterior illumination] 3,392/11; GOLDSTEIN [Electric alarm system] 7,671/11; SANDRINI and SANGUINETI [Primary batteries] 9,528/11; ANDERSON and BURNSIDE [Vapour-electric apparatus] 16,187/11.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distribution: PAUL [Overhead transmitting system] 25,364/11.

Electric Ignition: SOC. RÉNÉ GILLET ET CIE. [Timing method] 9,948/11; DAIMLER MOTOREN GES., 13,788/11; DIEHL [Automatic timing control] 24,697/11.

Electrometallurgy: HELFENSTEIN [Gas-reactions in electric furnace] 26,371/11.

Telephony: GWOZDZ [Telephones] 17,278/11 and 17,300/11.

Miscellaneous: ANSCHÜTZ & Co., [Electrical contacts] 16,440/11.

The following amended Specification can now be obtained.

ROSENBERG and PECK [Braking induction motors] 17,010/10.

Opposition to Grant of Patents

17,438/08. **Tungsten-Nickel Alloy.** SIEMENS & HALSKE AKT.-GES. This patent has been granted in spite of appeal, an account of which appeared in our issue of January 6th, 1910, p. 5. It relates to a method of producing tungsten filaments by mixing it with nickel and sintering the metals together by heating below the melting point of tungsten, the nickel being subsequently expelled by strongly heating in a vacuum. A fuller abstract appeared in ELECTRICAL ENGINEERING, April 29th, 1909, p. 406.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

30,848, of December 31st, 1897. **Railway Point Operation.** I. A. TIMMIS. A motor is placed near the points to be operated, to which it is connected by worm gearing. A bolt locking the points is first drawn out, the points being moved over, and on completing their travel, the bolt locks them again automatically. The points are controlled from the signal cabin, in which interlocked levers or switches are fitted to control the current passing to the points. They are so arranged that they cannot be operated until all the signals in the section are at danger.

30,923, of December 31st, 1897. **Electric Lifts.** H. H. LEIGH (*F. J. Sprague, U.S.A.*). Two motors in series are employed, each armature shaft having a pair of worms, one of each engaging with worm-wheels on the shaft of the driving drum, whilst the other two engage wheels on another shaft which is geared to the drum shaft by spur wheels, thus ensuring synchronous working of the motors. Right and left hand grooves are provided on the two halves of the drum. The middle of the drum is occupied by two pairs of ropes leading to the cage, the balance weight ropes being coiled on the ends. Guide pulleys for the cage ropes are mounted on a shaft threaded oppositely at its ends with a pitch equal to that of the drum grooves, and driven from the shaft which is spur geared to the drum shaft, through gearing and an intermediate shaft. The armature shafts have shoe brakes applied by springs, and kept out of action by solenoids acting through topple levers, and a switch is provided to stop the motors should the ropes slacken or mount the grooves.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: O. GROSS, 19,734/07; D. TIMAR and K. VON DREGER [Solenoid feed] 23,199/07, [Feed by electromagnetic device] 23,225/07, and [Parallel carbon type] 24,027/07.

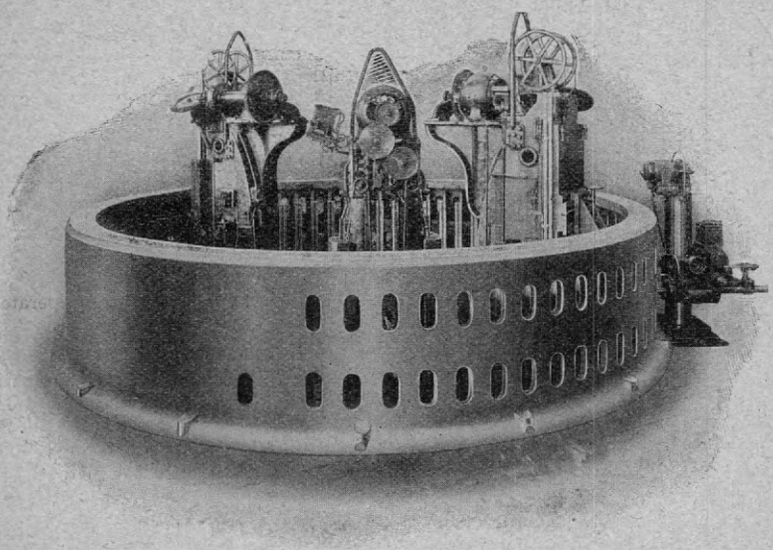
Distributing Systems, Cables, and Wires: BRITISH THOMSON-HOUSTON CO. (*General Electric Co., U.S.A.*) [Machine for coating conductors] 17,842/05; H. HIRST and C. E. GUNNER [Couplings for mains] 19,690/06.

Dynamos, Motors, and Transformers: C. CONTAL and P. GASNIER [Construction of enclosed motor] 15,957/00; W. P. THOMSON (*Berliner Maschinenbau Akt.-Ges. vorm Schwartzkopff*) [Armatures, field magnets] 19,168/04; F. DARLINGTON [Cooling transformers] 18,876/06; SIEMENS BROS. DYNAMO WORKS [Motor control] 19,593/06, and [Couplings] 19,856/07; H. W. LAKE (*Fabrik Elektrischer Zünder Ges.*) [Dynamo for exploding mines] 19,800/07.

Incandescent Lamps: W. E. BARRAS and G. WEDDELL [Method for closing neck of bulb] 19,808/07; H. GILMORE [Reflector supported inside bulb] 19,829/07.

Switchgear and Fuses: J. H. HOLMES [Combined switches and automatic circuit-breakers] 17,888/05; T. L. BOYDEN [Switches] 19,855/07; F. F. BOURDIL [Cut-outs] 19,891/07; J. HUNTINGTON [Combined switch and plug] 20,068/07; K. EDGCUMBE and E. I. EVERETT [Cut-outs and relays] 20,095/07; J. N. KELMAN [Oil switches] 20,110/07.

Telephony and Telegraphy: T. CUSHING [Insulators] 17,997/05; J. GARDNER [Controlling apparatus by sound waves] 18,173/05; K. WACKERMANN [Telegraphs] 19,805/07; S. EISENSTEIN [Wireless telegraphy] 20,128/07.



Traction: M. ALBRECHT [Power transmission for motor vehicles] 5,996/07; E. SUGHROUE [Signals: stopping trains] 19,755/07.

Miscellaneous: T. B. POWERS, M. R. JEWELL, and MAGNETIC PIANO CO. [Electrical piano] 17,617/01; W. J. L. SANDY and H. T. MIDDLETON [Primary batteries] 19,623/06; B. KOHLEN [Electric fire-alarm, &c.] 19,870/07.

ELECTRIC DRIVING OF MACHINE TOOLS

A VERY attractive pamphlet entitled "Motor drive for Metal Working Machinery" has just been issued by the British Thomson-Houston Co. This takes the form of a book of illustrations indicating a few of the many excellent methods of properly and economically applying either alternating or continuous current motor drive to machine tools. As electric driving has been successfully employed for a number of years and the resultant benefits are so widely appreciated, only a few of the particularly salient points of merit attending the adaptation of this efficient, flexible, and economical form of power are given in the pamphlet. We reproduce here an illustration showing the application of individually-driven tools to machinery, the frame casting of a large alternator enabling the tools to be taken to the work rather than the work to the tools, an important consideration where the work is of a heavy character. Other illustrations show individually driven drills, shapers, punches and shears, wheel presses, lathes, slotters, planers, grinders, millers, rotary planers, and boring mills.

Portable Individually-Driven Tools at Work on Large Alternator Frame.

A NEW ADVERTISING DEVICE

A MOST ingenious piece of apparatus has been brought out by the Sun Electrical Co., Ltd. (118 and 124 Charing Cross Road, W.C.). This appliance, known as the "Fortuna" is described in a booklet which the firm are issuing, entitled "The Story of a Dumb Salesman," and the apparatus consists of an upright polished metal cylinder with a dome-shaped top on a stand. When in use the goods that are to be displayed are seen to adhere without any visible means of attachment to the metal jacket in all sorts of positions, and to travel slowly round, although no external part of the apparatus is rotating. The whole device is about two feet high and one foot in diameter, and is suitable for standing on a counter or in the window. The booklet does not reveal the mystery of "how it is done," but a little imagination regarding rotating magnetic systems and masses of iron concealed in cigar-boxes, &c., may suggest an explanation to our readers. Anyway, the appliance is no more greedy of current than a 16-c.p. lamp.

CATALOGUES AND PAMPHLETS, &c., RECEIVED

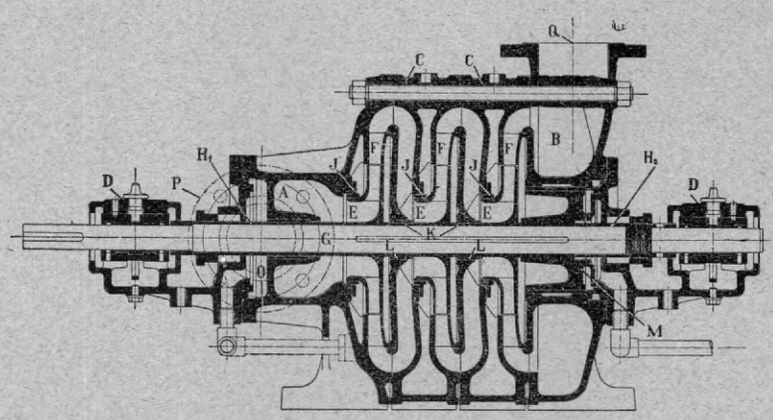
SUPPLY ADVERTISING.—We have received a copy of the first number of the *Journal of the Electric Supply Publicity Committee*, which is intended to keep the committee in touch with its supporters and stimulate supply advertising campaigns. The work already accomplished by the committee is reviewed in a special article.

RADIATORS AND CONVECTORS.—Some very effective designs of electric radiators and convectors appear in a catalogue from the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, London, W.C.), in which we note a special cheap line of radiator, wrought iron with copper convector, complete for 22s. with two lamps, or 30s. with four lamps. They can be had in combined form, each of which can be switched on independently. The standard size radiator lamp consumes ¼ unit each per hour, and the convector elements are standardised for a similar consumption for all standard voltages. Factory heaters and fresh air heaters are also included.

D.-C. MOTORS.—A complete and up-to-date list of direct-current motors of ¼ to 50 h.p., for voltages from 110 to 550, has been received from the Union Electric Co., Ltd. (Park Street, Southwark, London, S.E.). Details of the component parts are given as well as the prices and the usual weights and dimensions.

THE COMPLIMENTS OF THE SEASON

A collection of useful small writing pads accompany the compliments of the Union Electric Co.



A most effective calendar is being issued by the United States Metallic Packing Co., Ltd., decorated with a statue of "Echo" embossed in relief.

The Electric Construction Co. have sent us a particularly neat leather card and stamp case with almanac.

HIGH LIFT CENTRIFUGAL PUMPS

A PATTERN of high lift centrifugal pump which is being put on the market by the Electrical Engineering and Agency Co., Ltd. (109 to 111 New Oxford Street, W.C.), is illustrated in section here. The design has several special features which ensure high efficiency as well as reliability, and a patented hydraulic balancing arrangement eliminates all end-thrust. The pump illustrated is of the three-stage type.

The pump shell consists of the suction stage A, the delivery stage B, and the intermediate stage C. Uniform sections similar to C may be interposed between A and B for four, five, or six stage pumps. All these parts are held together by strong through-bolts. The bearings D are bolted to the suction and delivery sections. The parts A, B, and C are all provided with substantial feet, so that each section will stand separately when the pump is being dismantled. The runners or impellers E and guide channels F are made of special bronze, and these, together with the cast-iron intermediate pieces C form the water passage in the interior of the pump. In most cases the guide channel and intermediate piece for each stage are one casting. The shaft is of steel or nickel steel, and of ample size. In the larger sizes of pumps the shaft is provided with interchangeable sleeves H1 and H2. Renewable packing rings J are also fitted to reduce to a minimum the leakage back to the impeller inlet. Distance bushes K between the various impellers on the shaft run in interchangeable boxes L. The balancing of the end thrust is effected by means of the patent hydraulic balancing arrangement M, which automatically adjusts itself while the pump is running for any variation of head and output, or for any wear that may take place. No special stuffing boxes are required at the delivery, or pressure end, and this is usually a constant source of trouble, being ordinarily subjected to maximum pump pressure. Air leakage into the pump on the suction side is prevented by the gland O, which, in addition to ordinary packing, is water sealed.

Section of High-lift Centrifugal Pump.

ELECTRIC TRACTION NOTES

The Llanelly and District Electric Lighting and Traction Co., which only started operations a few months ago, has early met with labour troubles. Last week the tramway-men struck, and the Company were at first forced to run a limited service of cars during daylight hours only, with the managers and other officials in charge. As the authorities were unable to guarantee protection, the whole service was suspended on Tuesday. The stokers at the power station have since joined the strikers, but at the time of going to press a supply of current for public lighting was being maintained. The dispute concerns the recognition of the tramway workers' union.

Some interesting articles on the Aurora, Elgin & Chicago Railroad Co.'s power house were published this year in three issues of the *Electric Railway Journal* of New York. Current is supplied to a frequent service of trains on a high-speed, third-rail line between Chicago and 40 miles west, covering altogether 175 miles of track. It also supplies three trolley lines in Elgin and Aurora, covering 73 miles, besides lighting and power to eight other towns. There are four 1,500-kw., 2,300-volt, three-phase, 25-cycle alternators in the station, driven by Cooper-Corliss horizontal cross-compound engines, and to increase the capacity of the station a new mixed pressure turbo-generator has now been put in. At present the high pressure is only used for starting, and as soon as the turbo-generator has been synchronised with the engine-driven sets the steam supply is cut off, and the unit run on the exhaust from the combined two of the four reciprocating-engine sets. By means of suitable motor-driven sectionalising valves in the exhaust header, any combination of two engines supplying the turbine can be obtained, leaving the other two to work independently on their own condensers. The turbo-generator was purchased as a 2,500-kw. machine on the old railway rating of a 35° C. rise for continuous operation. On the basis of the so-called "maximum continuous load" rating, however, this corresponds to about 3,700 kw., at which the machine worked for considerable periods, and even generated 4,000 kw. for short intervals. With the turbine floating on the system it has been found that most of the load fluctuations are absorbed by the turbine, and the engines can run with approximately constant load.

The articles contains some notes on the overhead transmission system, which is at 26,400 volts. Aluminium cable is employed, and the three cables were originally spaced 30 ins. apart, but this was increased to 65 inches, as it was found that short circuiting could easily take place, and a 26,400-volt arc would hold long enough to burn through or blister the wires, so that they would snap in cold weather. The high-tension line was reconstructed without stopping the service. The railway is supplied at 600 volts by seven rotary converter sub-stations, in which 500-kw. units are now employed, but for future additions 1,000-kw. units will be installed. The third rail is of 100 lb. T-section of soft steel, and is supported by white oak sleepers, 6 in. by 8 in. by 9 ft., spaced 10 ft. apart. The steel is low carbon, and has a conductivity as compared with copper of 1 to 8. The insulators are of wood impregnated with paraffin, and provided with malleable-iron bores and caps.

Tests have shown that the leakage from the third rail averages 0·6 amperes per mile of track. Four-motor passenger cars and trailers were originally employed on the line, but the severity of the service made it advisable to equip most of the former trailers with motors. At the beginning, there was considerable difficulty in collecting current from the third-rail during sleet storms, and a method of melting the sleet by the distribution of a solution of calcium chloride was devised. Cans of the solution were carried in the front ends of trains, and the mixture was led to the top of the third-rail and distributed in advance of the shoe. While this method served to keep the trains running during severe sleet conditions, it had a bad effect on the insulation of the third-rail and the car wiring, and led to the development of a side-contact shoe. These shoes as now used have a cross-section similar to the letter "V" inverted. They ride on the edges of the rail head, and thus either remove the sleet mechanically or make contact where it is thinnest. The article contains an interesting table of the causes of failure on the third-rail lines during 1910. The number of passenger car-miles run was 3,199,044, and the total number of failures 651. Of these 20 per cent. were motor troubles, 16 per cent. hot journals, 4·9 per cent. hot motor bearings, 14·5 per cent. due to control apparatus, 7·8 per cent. brake troubles, 2 per cent. gears and pinions, and only 0·4 per cent. due to third-rail shoes.

It was rumoured in the City last week that the London General Omnibus Co. have come to an agreement with the Underground Electric Railways Co. of London, by which a new company will come into existence which will control both the Railway Company and the Omnibus Company.

The Newcastle Corporation have put into service a new type of tramcar with glass shields for the protection of the drivers.

OSRAM·LAMPS

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The *New York Times* recently forwarded a telegram round the world to its own address *viâ* Honolulu, Manila, Hong Kong, Singapore, Bombay, Suez, Gibraltar, and Fayal. The whole distance of some 32,000 miles was travelled in 16½ minutes. This is greater than the "record" time of 9½ minutes, which record was accomplished at the opening of the Pacific cable in 1900. On that occasion, however, careful preparations were made beforehand, whereas the *New York Times* telegram was handled as an ordinary business telegram.

The new wireless telegraph station at Port Said is now in full working order, and has been in communication with vessels 900 miles distant.

Following on his answer in the House of Commons a short time ago with regard to the extensions of the underground telegraph system to Dundee, the Postmaster-General has now informed the Local Chamber of Commerce that owing to the cost, viz., £70,000, such an extension cannot at present be justified. He also states that experiments are being made to ascertain to what extent it will be possible to send telegrams by means of the telephone trunk wires, with a view to improving the present service. In a similar letter to the Aberdeen Chamber of Commerce, the Postmaster-General points out that the cost of extending the underground route to that town would be £130,000.

It is stated that the automatic telephone exchange which the Post Office authorities are installing at Epsom is expected to be ready by January 15th.

The report of the Helsby Wireless Telegraph Co. for the year to July 4th, contains the directors' regrets that the year's working has not been a satisfactory one. When the judgment in favour of the Marconi Co. was given against the British Radio Telegraph Co., the Helsby Co., approached the former with a view to working under a licence, but the negotiations fell through. Shortly afterwards the Lodge-Muirhead Syndicate obtained an extension of the patent for seven years, and negotiations were opened up with that company with a view to a licence, but these were suddenly broken off when the Lodge-Muirhead Syndicate amalgamated with the Marconi Co. An arbitrator has since been appointed to settle the terms upon which the company shall take a licence from the Marconi Co., and it is hoped that these will shortly be fixed. In the meantime the company's business has been practically at a standstill, and in an endeavour to put it upon a satisfactory basis, the commercial management has been placed in the hands of the British Insulated & Helsby Cables, Ltd., and their subsidiary company, the Automatic Telephone Manufacturing Co., Ltd., and at the same time the capital of the Helsby Co. is to be reduced by £10,000.

Junior Institution of Engineers.—Mr. G. Marconi will deliver his Presidential Address on January 5th.

Association of Mining Electrical Engineers.—An ordinary meeting of the South Wales Branch will be held on Saturday, December 30th, at the offices of Messrs. Haslam & Schontheil, Ltd., Windsor Place, Cardiff. The discussion on the paper by Mr. C. Jones, "Earthing, Earth-plates, and Earth Detectors," will be resumed, and a paper will be read by Mr. E. Beadsmore on "Shaft Signalling."

Hosted by Google

LOCAL NOTES

Belfast: *Street Lighting.*—The Tramways Committee have agreed to the Police Committee, which has control of the public lighting, carrying out experiments with gas lamps on the tramway poles for a month on condition that similar experiments with electric lamps are subsequently carried out.

Chester: *Refuse Destruction and Electricity.*—A motion that the Electricity and Sub-Committee should consider the advisability of the erection of a joint electricity and refuse destructor works has been adopted by the Council.

Chili: *State Power Supply.*—According to the *Board of Trade Journal*, the Chilian Ministry of Industry and Public Works proposes to divide the Hydraulic Works Department into three sub-sections, viz., Hydraulic Surveys, Power Stations, and Power Transmission. It is also considered expedient to expropriate as soon as possible all Hydraulic Works which it may be thought suitable for the State to work, for the purpose of electric supply in connection with the State railways as well as for military and naval purposes. Further particulars may be obtained at the Commercial Intelligence Branch of the Board of Trade.

Greenock: *Electricity Output.*—At the last meeting of the Corporation it was reported that the output from the electricity works now reaches 1,000,000 units per month, which is 61 per cent. higher than at the same period of last year.

Grimsby: *Additional Generating Plant.*—Mr. W. A. Vignoles, the Borough Electrical Engineer, who will shortly be on the Continent, proposes to take the opportunity of inspecting a number of engine works with a view to helping him to come to a decision as to whether an exhaust steam turbine or Diesel engine should be used for extensions at the electricity works.

Holyhead: *Electric Lighting Tariff:* A recommendation by the Electric Light Committee that the charge for current should be reduced to 4½d. per unit has been referred back.

Launceston (Tas.): *Electric Lighting Accounts.*—The electric lighting accounts for the year to July 31st, 1911, show a net surplus of £4,218, an increase of £1,319 over the previous year. The reserve fund stands at £8,359. The past year has been one of the most prosperous in the history of the undertaking, and the output of the works will be still further increased in the future by the demands of the tramway system which is now under construction.

London: *Bethnal Green: Electricity Supply.*—The Council have agreed to the Shoreditch Borough Council giving a supply of electricity to certain premises in Bethnal Green on the condition that their interests are not prejudiced in any way.

Hampstead: Street Lighting Cost.—In connection with the estimates for the conversion of the street lighting in Hampstead, referred to in our last issue, the Finance Committee now report that an additional sum of £10,398 is required, the loan which was passed upon the original estimates being £15,000. A sum of £1,536 has already been transferred from the reserve fund, and it is proposed to transfer the remainder from reserve and repay it in seven annual instalments as from April 1st last.

Islington: Street Lighting.—The question of improving the street lighting by the adoption of metal filament lamps has come under discussion. The Lighting Committee's recommendation that they should inspect the lighting of streets in other districts has been passed by the Council.

Mexico: *Electric Supply and Tramways.*—The *Board of Trade Journal* states that a company has been incorporated in Canada with a capital of £3,000,000 for the purpose of carrying on in Mexico an electric light, heat, and power business, and also for the construction of railways, tramways, telephone and telegraph works, &c. The company proposes to obtain power from certain rivers, and it is stated that contracts have been let for the hydraulic works and power station, and also for the transmission lines. Names and addresses to which communications may be sent can be obtained at 73 Basinghall Street, London.

Newport, Mon.: *Management of Electricity Undertaking.*—The methods which are being adopted by the Electricity and Tramways Committee with regard to the management of their undertaking are meeting with some criticism. A short while ago the Committee reported that it was not in the best interests of the undertaking that the Engineer and Manager should be one and the same person. They consequently decided to appoint a commercial manager of the undertakings and to relieve Mr. H. Collings Bishop of the commercial side of the undertaking, leaving him free to develop to the full the technical aspect. Advertisements were then issued for a manager, but it has been pointed out that most of the applications for the post have come from engineers. Mr. Collings Bishop has since resigned, and so far as can be gathered at present, the Committee's intention appears to be to appoint one gentleman to manage the undertakings, and presumably to follow a policy which they themselves have said is not the best for the undertaking. Mr. Collings Bishop's resignation takes place in the spring, and, of course, there is yet time for the Committee to reconsider the whole matter.

TENDERS INVITED AND PROSPECTIVE BUSINESS

GENERATING STATIONS, SUB-STATIONS, MAINS, &c.

Bolton.—The Engineer has submitted his plans for the proposed new electricity works recently referred to in our columns. He also calls the attention of the Electricity Committee to the fact that unless additional plant is installed immediately he will not be in a position to entertain applications for the supply of current during the next winter. The Engineer has been instructed to submit a report upon the additional plant which, in his opinion, it will be necessary to instal.

Greenock.—A loan of £20,000 is to be taken up for extensions at the electricity works.

London: *Hackney.*—The Borough Electrical Engineer has submitted a report pointing out that in his opinion the safe load of the generating plant has been reached, and he is preparing details and estimates of a comprehensive scheme for dealing with future demands. The Electricity Committee recommend that an independent electrical engineer be called in to report upon the scheme at a fee of fifty guineas.

Norwich.—An application is to be made to the Local Government Board for a loan of £19,000 for mains, services, and a steam turbine with tandem generators.

WIRING

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Barking.—Elementary school in Ripple Road. Architect, C. J. Dawson, 16 Cambridge Road, Barking.

Blackburn.—Asylum for 2,000 patients. Architect, Mr. H. Littler, 16 Ribblesdale Place, Preston.

Bradford.—Warehouse. Architect, W. Illingworth, 9 Market Street.

Additions at Ryan Street School. City Architect, Town Hall.

Croydon.—Eighteen houses in Alderton Road. J. W. Hall, 315 Portland Road, Croydon.

Glasgow.—New buildings for Glasgow Royal Infirmary in Cathedral Street. Architect, James Miller.

Large additions to Messrs. J. Buchanan and Brothers' works in Ann Street.

Hamilton.—New school at Silvertonhill.

Launceston.—Inquiries are being made as to the cost of installing electric light at the Town Hall, Guildhall, and Free Library.

London.—New church at Golders Green.

Sheffield.—New telephone exchange at Attercliffe. H.M. Office of Works, London.

Southsea.—New Art Gallery near Town Hall.

South Shields.—Cinematograph theatre. R. Scott, Newcastle-on-Tyne.

Walthamstow.—County High School for girls at Church Hill. Architect, C. J. Dawson, 11 Cranbrook Road, Ilford.

Hosted by Google

MISCELLANEOUS

Belfast.—The Tramway Manager recommends the Corporation to proceed at once with a number of tramway extensions at an estimated cost of £151,000.

Birmingham.—Tenders are invited by January 8th for fifty electric tramcars. Particulars from General Manager.

Bradford.—The Council have been asked to authorise the commencement of the extensions of the tramways from Wyke terminus to Bailiffe Bridge, a distance of one and three-quarter miles.

Southampton.—Application is to be made to the Local Government Board for sanction to borrow £7,200, the estimated cost of building twelve new tramcars.

TENDERS RECEIVED AND ACCEPTED

Liverpool.—At the meeting of the City Council on Wednesday, considerable discussion took place upon the proposal of the Tramways and Electric Power and Lighting Committee to accept tenders by the British Westinghouse Co., the British Thomson-Houston Co., and the Worthington Pump Co., for new generating plant at the Lister Drive power station. The recommendation was finally adopted. Previously, an amendment had been moved to send the report back to the committee with instructions to engage an independent expert to report on the existing system of generating electricity and generally to advise the committee on their future action. Although this received some support, there was considerable feeling that this implied a want of confidence in the existing officials. Sir Charles Petrie, chairman of the committee, said that this was the first portion of a scheme to re-model the Lister Drive station, and would involve the scrapping of a considerable amount of old plant. At the same time the cost would come out of the reserve fund, which now amounts to £300,000, and from which only £56,000 has been withdrawn since the commencement of the undertaking.

London.—Messrs. Siemens Bros. Dynamo Works, Ltd., have obtained a contract for the supply of tantalum traction-type lamps for ship lighting, &c., from the Royal Mail Steam Packet Co., for a period of six months commencing January 1st.

APPOINTMENTS AND PERSONAL NOTES

Applications are invited for a commercial assistant in the Bradford Electricity Department. Salary £250 per annum. (See an advertisement on another page.)

Mr. J. Pilling, Borough Electrical Engineer at Kings Lynn, has resigned his appointment. Mr. C. W. Jackson, at present Chief Assistant Electrical Engineer, has been appointed Mr. Pilling's successor at a salary of £150 per annum, rising by increments of £10 to £200, with house, coal, rates, and light provided, and with permission to take two pupils.

The Bradford Tramways Committee have again recommended an increase in the salary of the Manager, Mr. C. J. Spencer.

It is announced that Sir Charles Rivers-Wilson and Sir Charles Freemantle have resigned from the Board of the British Electric Traction Co.

The Bridlington Electric Lighting Committee recommend that the salary of the Borough Electrical Engineer, Mr. A. J. Beckett, be increased from £300 per annum, by five annual increments of £20, to £400, commencing from January 12th, 1912. This recommendation is subject to Mr. Beckett agreeing to remain with the Corporation for five years, and to forego the commission which he at present receives as consulting engineer.

Mr. E. C. Reed, chief publicity writer to the Westinghouse Companies Publishing Department, has been appointed Sales Manager to Messrs. Miles, Sykes & Sons, Calder Works, Sowerby Bridge. Mr. Reed will take up his new duties early in the new year.

Mr. A. S. M. Sörensen has taken up a position as radio-telegraph engineer with Professor Dr. Goldschmidt, of Berlin.

MISCELLANEOUS BUSINESS NOTES

Meter Approved.—The Board of Trade have approved of the "Gunfire" time-switch supplied by the British, Foreign and Colonial Automatic Light Controlling Co., Ltd., Bournemouth, and of the means provided for fixing same.

Change of Address.—The Adams Manufacturing Co., Ltd., have transferred their head office from New Bond Street to Balfour House, Finsbury Pavement, E.C. Telephone: City 4,841; telegrams, Admocar, London.

Moncrieff P. Ford and Co., 57 Colmore Row, Birmingham, are moving on January 1st to more commodious premises at 12 Bromsgrove Street, and 64–65 Dean Street, where they are fitting up large showrooms for machine tools.

Illuminating Engineering.—The British Thomson-Houston Co. have opened an illuminating engineering department with offices at Rugby, London, Manchester, and Sheffield, to give expert assistance to architects, engineers, and contractors in the planning of large or small lighting schemes.

"Foster Festivities."—The Foster Engineering Co., Ltd., celebrated the opening of their metal lamp factory extensions at a tea and concert on December 22nd. Both events were a distinct success. About three hundred sat down to tea, and the subsequent concert was given solely by the workers in the metal lamp factory, the members of the staff being in the position of honoured guests. The proceedings throughout emphasised the cordial relations which exist between all departments and the directors and staff.

Liquidations.—A meeting of the Tramways Extension Syndicate, Ltd., will be held on January 31st at 3 p.m., at 5 London Wall Buildings, E.C., to hear the liquidator's account of the winding-up.

The Rugby School Electric Lighting Co. is to be wound up voluntarily. Mr. E. Donkin is liquidator.

A petition for the compulsory winding up of the Davis Electrical Co., Ltd., will be heard before Mr. Justice Neville.

Dissolution of Partnership.—J. N. Davenport and H. A. Sparrow, Electrical Engineers and Factors, 44 Brazenose Street, Manchester, have dissolved partnership. Debts by J. N. Davenport.

Bankruptcy.—The public examination of Thomas Topping, 361 Lord Street, Southport, will take place at 35 Victoria Street, Liverpool, on January 15th.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Siemens-Schuckert Works.—The report for the last completed year states that in spite of the large extensions made to the company's works, a considerable amount of night work has been necessary, and this activity seems likely to continue. Orders booked since the beginning of the current financial year are much in excess of those of the corresponding period of last year. The most unsatisfactory feature, it is pointed out, is the further fall in prices. The total horse-power of engines, motors, and transformers turned out during the year was 2,646,327, against 2,071,970 in the previous twelve months.

Siemens & Halske.—The report just issued refers to the agreement between the General Electric Co., the A.E.G. and the Auer Co., with regard to the sale of metal filament lamps. Messrs. Siemens & Halske, it is stated, are finding an increased demand for their tantalum lamps, and it is not thought that the agreement with regard to Osram lamps will injure them.

Newcastle Students' Section, I.E.E.—Mr. Vesey-Brown, chairman of the Newcastle Local Section, presided over a meeting of students at Armstrong College on Friday, December 15th, at which it was decided to hold meetings for students every fortnight and to arrange visits. The following Committee of students was appointed:—Messrs. A. H. Browett, B. A. M. Cooper, W. A. Hatch, A. G. Stamatopoulos, W. A. Aldridge, E. G. Townshend, J. D. Dodds, M. Shuttleworth, E. H. E. Woodward, Christianson, Armstrong, B. A. Robinson, A. Douglas. The chairman clearly explained the working of students' sections in London, Manchester, and other sections. As regards the proposed modifications to the Articles, he stated that advice had been received from London of the present intention of the Council that students should not exceed the age of 27 years, and that the subscription for students should be one guinea per annum up to the twenty-first birthday, and one and a half guineas after. There was to be no entrance fee. A large number of engineers engaged in the district signified their intention of joining the Institution. The enthusiasm shown at this and other recent meetings by students augurs well for the organisation of a strong and successful Students' Section in Newcastle. Those interested in this movement who have not already obtained application forms are advised to communicate without delay with the honorary secretary, Mr. H. W. Clothier, Hawthorn Villas, The Green, Wallsend-on-Tyne.

OFFICIAL ANNOUNCEMENTS AND SMALL ADVERTISEMENTS.

Official Advertisements are charged at the rate of 9d. per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to The Kilowatt Publishing Co., Ltd., 203–6, Temple Chambers, London, E C.

APPOINTMENT VACANT.

CITY OF BRADFORD.

Electricity Department.

COMMERCIAL ASSISTANT.

Applications are invited for the post of COMMERCIAL ASSISTANT in the Corporation Electricity Department.

Applicants, who must not be over 40 years of age, must have had a sound technical education in subjects relating to electrical and mechanical engineering, and practical training as electrical engineers, and preferably should have obtained commercial experience with a firm of electrical engineers whose business is to supply motors, arc lamps, heating, cooking, and other apparatus. Experience in connection with an electricity supply undertaking is desirable, but not absolutely necessary.

The chief duties will be to supervise all canvassing and publicity work and the staff engaged in connection therewith, to personally interview power users and other persons with a view to securing the use of electrical energy in textile works, factories, workshops, &c., and in other ways extend the use of electricity in the City; and to carry out such other work and perform such duties as required by the City Electrical Engineer and Manager.

Canvassing is strictly prohibited.

The person appointed will be required to devote his whole time to the duties of the office, and to reside within the City.

Salary, £250 per annum.

Applications are to be made on a special form to be obtained from Mr. Thomas Roles, City Electrical Engineer and Manager, Town Hall, Bradford, and are to be sent, together with copies of not more than three recent testimonials, in time to reach the undersigned not later than first post on Tuesday, 9th January, 1912, endorsed "Commercial Assistant—Electricity Department."

By order,
FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford,
23rd December, 1911.

CRYSTAL PALACE SCHOOL OF PRACTICAL ENGINEERING.

Principal J. W. Wilson, M.I.C.E., M.I.Mech.E.

The new course will commence on Wednesday, January 10th. New Students should attend at the School on previous day between 10 a.m. and 1 p.m. for examination. Prospectus forwarded on application to the Registrar, School of Engineering, Crystal Palace, S.E.

FOR SALE.

MOTORS.—One 40 and one 16-B.H.P., 460 volts, by the Phœnix Dynamo Co., equal to new; one 25-B.H.P., 230 volts, by Greenwood & Batley; one 50-B.H.P., with new spare armature, and one 4-B.H.P., 230 volts, by the Keighley Electrical Engineering Co. The above are in complete running order. For sale owing to change-over from D.C. to three-phase. Can be inspected here any time.—Geo. Hattersley & Sons, Ltd., Keighley.

ELECTRIC LIGHTING CASING. Special clean white 1½ in. at 22/6, 2 in. at 35/6 1,000 ft. Refuse foreign. Support BRITISH industry. We compete, own make. All sizes in stock, also cable troughs for underground, woodwork all descriptions. Send trade card. Jennings & Co., 955 Pennywell Road, Bristol.

THE HALL-MARK OF QUALITY.

Electric motors bearing the above trade-mark embody all the latest improvements in electrical and mechanical design and construction. They also enjoy an enviable reputation for low maintenance costs, high efficiency, and absolute reliability in service.

B.T.H. motors are manufactured in such a wide range of designs and capacities that they can be supplied to meet every condition of modern power drive, not nearly — BUT EXACTLY — they will therefore operate industrial machinery at the highest efficiency, resulting in a maximum output at a minimum cost.

THE BRITISH THOMSON-HOUSTON CO., LTD.,

ELECTRICAL ENGINEERS AND MANUFACTURERS,

Head Office & Works - - - - Rugby, England.

BRANCH OFFICES:

LONDON—83, Cannon Street, E.C.
SHEFFIELD—41, Church Street.
LEEDS—Standard Buildings, City Square.
BIRMINGHAM—115, Colmore Row.

STEAM TURBINES.

from 200 Kilowatt upwards.

THE INDIAN TRADE

of

BRITISH MANUFACTURERS

can be largely increased if the advertising columns of

"Indian Industries & Power"

(incorporating "INDIAN MOTOR NEWS")

are made judicious use of.

This Journal, published at Bombay, is acknowledged to be the leading Engineering and Industrial journal in Western India. It is officially subscribed to by the Government of India, the Indian Provincial Governments and Native States throughout India.

MAKERS OF MOTOR CARS AND ACCESSORIES

will in particular find it an admirable medium. It was the first journal to deal with Motoring and Automobilism in the East.

Bombay: 115, Hornby Road.
Telegrams: "Indopower" Bombay.

LONDON: 204, Temple Chambers, E.C.

Write for a specimen copy.

Telephone 5509 Holborn.

FROSTING LACQUERS

(or Coloured)

do sometimes come into your list of requirements. These are but a few of many

CRANE SPECIALITIES.

Others include

CRANCO ALUMINIUM PAINT

for Tramway Standards and exposed outdoor work in general.

LIQUID CELLULOIDS, INSULATING VARNISHES, "BRASSOLINE." "ENAMELOID," ZAPON ENAMEL, &c., &c.,

all in the Current List.

May we post you Copy of List C?

FREDk. CRANE CHEMICAL CO.,

22/23, Newhall Hill, BIRMINGHAM.

PATENT

LOUD SPEAKING TELEPHONES

COMPLETE INSTALLATIONS FOR

WARSHIPS, MERCANTILE VESSELS, MINES, POWER STATIONS, ETC.

Adopted by the British Admiralty, Foreign Governments, the Leading Shipping Companies, and as used in many Electrical Generating Stations.
